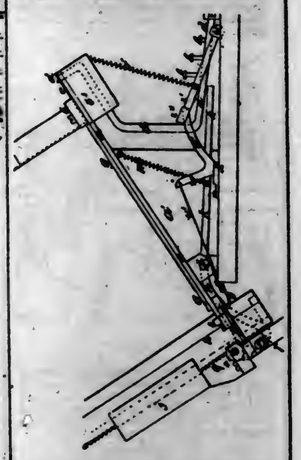
3. The combination, in a stock-car in which the feed and water troughs cross the doorways thereof, of hinged platforms B and interior platforms D, both forming a junction with the feed and water trough and a continuous platform therewith, for loading and unloading stock over said feed and water trough.

4. The combination, in a stock-car having rotatable feed and water troughs turned into and out of positions by the conduits E, by which they are supplied with water, of fixed pipes G G^2, connecting with said conduits and the elevated reservoir F, whereby the movable trough-conduits form extensions or continuations of supply-pipes fixed upon the end of the car.

5. The troughs of a stock-car, provided with overflow mouths or spouts *f*, in combination with the conduits E, which carry and supply said troughs, and the water-shoots *f*, whereby any overflow will pass off outside of the car while the stock are drinking.

6. The combination, with a rotatable trough of a stock-car, of the feeder-bars *e* extending longitudinally in the wall-openings and having the rotation with the troughs, substantially as and for the purpose herein set forth.

7. The combination, with feed and water troughs adapted for double-deck cars, of branch pipes G G^2, connecting the supplying conduits of said troughs with the reservoir F above, whereby both the upper and lower troughs are supplied by the same pipe.



8. The combination, with feed and water troughs adapted for double-deck cars, of branch pipes G G^2, connecting the upper and lower trough-conduits E with sections of different diameter, whereby a uniform circulation through all the conduits and an equal water-supply in the troughs or basins are obtained.

9. The combination, with the sectional doors B B^2 in a stock-car, of the bolts *b b*, provided with right-angled ends *c c* and confining-eyes *b'*, occupying positions on the upper edge of the lower door when closed and held in their fastened positions by the upper door closing over the abutting ends *c c* of said bolts, as herein set forth.

10. The combination, with the trough-section crossing the doorway, of the branch pipes H H^2 and the elevated wall-bin, whereby the said trough is supplied with feed without obstructing the doorway.

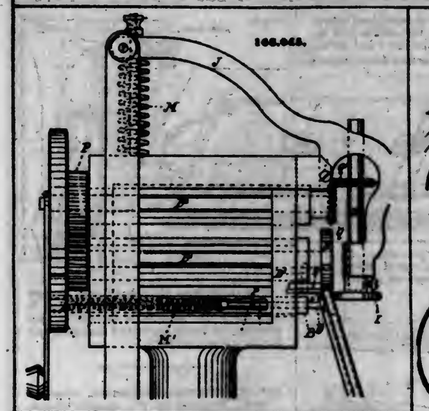
168,044. TYPE-SETTING MACHINES. Adam Miller, Malvern, England. (Filed Nov. 2, 1874.)

Brief.—The letters are pushed out of their respective tubes by pushers operated by keys. They then slide fast first down an incline having side guides, which gather them into a narrow throat. They then pass into a stick, which moves down to make a place for next letter.

1. The composing-stick A, arranged within the fixed rest *f* at right angles to an inclined plane, *a*, and having the rest *f* on its edge, in combination with the ratchet-wheel *c*, pinion *p'*, rectangular frame *h i*, having the bent end *n* and pawl *h'*, and the pivoted levers *S' S²* for vibrating the frame *h i* in order to operate the ratchet-wheel and impart a downward movement to the composing-stick, substantially as herein set forth and illustrated.

2. In combination with the pivoted lever for discharging the types, the pivoted forked lever *s' s²*, lever *u u'*, cord *o'*, cam *s*, and composing-stick A, substantially as and for the purpose herein set forth and shown.

3. The trough-shaped composing-stick A arranged at right angles to the inclined plane as the lower end thereof, in connection with the supplementary operation for moving the stick downward, independently of the lever for discharging the types, the same consisting of the pivoted arm *s*, the cord *o'*, pulley *b*, and the pivoted lever *u u'*, substantially as herein specified.

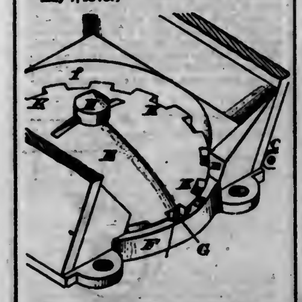


168,045. CHANNEL-CUTTING AND MOLDING FOR DOORS AND SHUTTERS. Thomas L. Miller, Philadelphia, Pa. (Filed July 8th, 1875.)

1. The combination of the channel-opener G, gage-wheel H, and molding-wheels H and I, arranged and operating in relation to each other, substantially as and for the purpose set forth.

2. The combination of the wheel I and shaft I^2 with the lever J, substantially as and for the purpose set forth.

3. The combination of the spring M' with the hollow shaft H, and channel-opener G, as and for the purpose set forth.



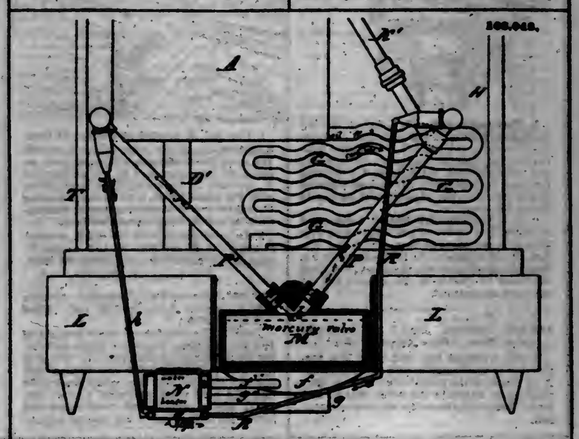
168,046.

168,047.

168,046. COOK-PLANTERS. Edmond Morgan, Dublin, Ind., assignor to himself and L. Lovell Lawrence, same place. (Filed May 7, 1875.)

In combination with the notched hopper-back B *b*, the conical revolving dropper-disk E, seated in a circular depression of the bottom F, and having peripheral indentations E corresponding to the size of the grain on edge, a portion of said notched disk E and of said bottom F protruding in rear of the hopper, and bottom protrusion F' having the orifice G and shallow peripheral curb *g g'*, to insure and enable observation of the grain dropping, as and for the purpose set forth.

168,047. MASSIMUS COOKING-STOVES. J. S. Perry, A. Dibley, and E. S. Liddle, Albany, N. Y., assignors to J. S. Perry, trustee and executor, W. S. Perry, and A. Dibley, same place. (Filed Mar. 4, 1875.)



1. The combination of a culinary attachment, having flues and openings, substantially as described, with a heating-stove, having an ascending and descending flue upon the rear, and openings by which the said flues may be made to co-operate with those of the culinary attachment, all substantially as and for the purpose specified.

2. The combination described of the flues D, Q, and T of the culinary attachment, with the ascending and descending flue on the rear of the heating-stove.

3. The combination described of the flues F, Q, and T of the culinary attachment, with the diagonal flue in the base of the stove, and the ascending and descending flues at the rear of the same, all as set forth.

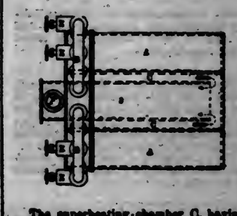
4. The combination of a heating-stove, having an ascending and descending flue at the rear, with the side plates of the culinary attachment, by which plates, in conjunction with the stove-chambers *a' b'*, are formed the heating air preparatory to its admission into the oven, all substantially as described.

168,048.

168,048. AIR AND GAS CARBURETORS. A. W. Porter and F. M. Grimes, New York, N. Y. (Filed July 14, 1875.)

Brief.—The inflow of oil is automatically regulated by a valve and float. The carbureter is set in a water-tank, which is provided with an annular water-heater and connecting-pipes. A mercury-valve automatically shuts off the supply of gas to the burner under the water-heater, when the temperature of the water in tank rises to 70° Fahrenheit. A taper-burner, however, remains constant, and relights the main burner when the temperature falls, and allows a renewed flow of gas.

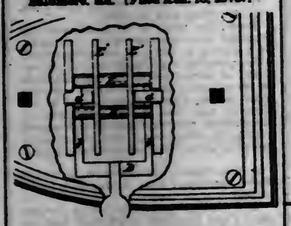
1. The vaporizing-conduit G, formed of hollow corrugated folds, substantially as described.



2. A carbureting-chamber having the passages J and partitions *c*, combined with the conduit G and the chamber E, containing a float, D', substantially as described.

3. In a carbureting apparatus, the tank L, main *f g*, pipes *f' g'*, heater N, burner S, and its taper, in combination with the mercury-vessel M and pipes P P^2 K K', substantially as described.

4. In an air or gas carbureting machine, a broad horizontal corrugated vaporizing fold or conduit, with intermediate spaces between the folds, combined with an automatic feeding device, substantially as described.



168,049. GAS APPARATUS. John H. Pugh, Baltimore, Md. (Filed July 20, 1875.)

Brief.—Distilling-retorts connected severally with a fining-retorts, having an inner chamber communicating with the single stand-pipe. Such inner chamber may be removable. Dispenses with hydraulic seal.

The superheating-chamber C, having the stand-pipe F, and consisting of the inner and outer cylinders b and *a*, the cylinder b being open at its lower end, and a space left between said end and the rear wall of the outer cylinder *a*, in combination with the retorts A, pipes B, and valves E, whereby a communication is established or cut off between said retorts and the space existing between the walls of the cylinders *a* and *b*, substantially as and for the purpose specified.

168,049. SAD-IRONS. Henry B. Robbins, Baltimore, Md. (Filed Aug. 16, 1875.)

1. The combination, in a sad-iron, of the handle-wedge e, having side concavities *d' d'* thereabove, with rollers E E that are moved up and down in oblique slots of bearings, to lock and unlock the handle, as described.

2. The combination, with loose rollers E E, of the spring-jointed wedges D D, having arms *d*, and the bifurcated hand-lever B, to move said rollers at the time and in the manner specified.

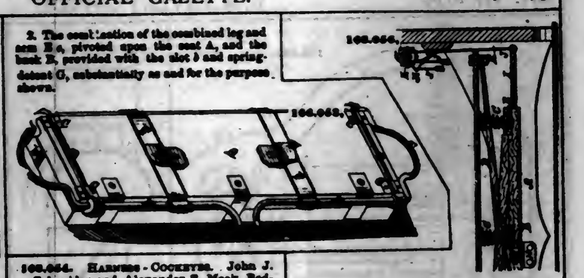
168,050. BOOTS AND SHOES. Mathias Robbins, Scranton, Pa., assignor of one-half his right to Peter Robbins, same place. (Filed June 10, 1875.)

1. The combination of the wooden sole and heel A B, with transverse grooves or slits *a*, the sole-leather casing or facing C, the upper D, and the horizontal staples B B', applied as specified, to secure the parts together without crossing or spanning the grooves *a*.

2. The combination of the wooden sole A B, sole-leather casing or facing C, and sheet-metal covering G, as set forth.

168,051. SPOON. Lafayette Robinson, Medina, N. Y. (Filed June 9, 1875.)

Brief.—The sink has three strainers. The upper one serves to separate and retain coarse particles, and also as a support for vessels. The two lower strainers serve the purpose described.



1. The combination, with a sink, A, having an inclined bottom, i, and depressed chamber *d*, of the stationary grate E, constructed with the vertical flange *n* resting on the offset *c*, and provided with the notches *o o*, forming strainers for separating the coarser particles before reaching the pipe-strainer, as herein shown and described.

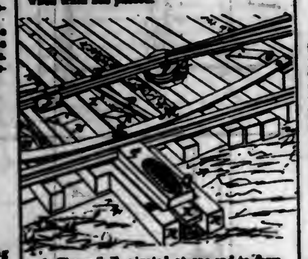
2. In a cast-iron sink having a depressed chamber, *d*, the notched grate E, resting over said chamber, the disk-strainer *f* at the bottom of said chamber, and the strainer-pipe *f*, located beneath and over the pipe C, the whole combined to operate in the manner and for the purpose specified.

168,052. SPITTOON. John F. Hayles, Stockbridge, Mass. (Filed Apr. 2, 1875.)

1. The combined legs and arms B *a*, constructed as shown, and combined with the seat A by means of the chain D *d d'*, which is journaled upon or within the lower side of said seat, substantially as and for the purpose specified.

2. The combination of the combined leg and arm B *a*, pivoted upon the seat A, and the bank E, provided with the slot *b* and spring-detent G, substantially as and for the purpose shown.

168,053. HARNESS-COCKEYE. John J. Schneider and Alexander S. Mock, Bedford, Iowa. (Filed June 29, 1875.)



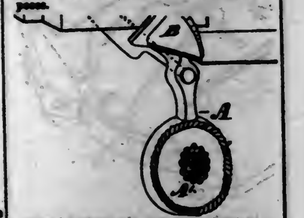
The tees A, provided with the arm *a*, and having a slotted chamber, in combination with the clip B, provided with the arms and bevel heads *b b*, and plug C, constructed to operate substantially as and for the purpose set forth.

168,054. RAILWAY-CROSSINGS. Christopher C. Shelby, Jersey City, N. J. (Filed Mar. 18, 1875.)

Brief.—An improved frog-crossing, in which a pivoted swinging rail is substituted for the ordinary frog, said rail being actuated through a curved thrust-lever, which is moved by the flanges of the passing wheels on the side track, the main line being open at all times. A spring returns the movable rail to proper position when train has passed.

1. The rail B, pivoted at one end to form a continuation of the inner rails B D of both the main track and the side track, and connected at the other end to the sliding bar K, operated by the spring Q, in combination with the guard-rail M, pivoted to the bearing O, and secured to the sliding bar K, substantially as and for the purposes set forth.

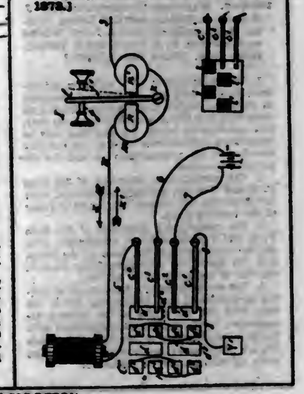
2. In combination with the rail B, secured to the plate F, the plate G and washer H, substantially as and for the purposes set forth.



168,055. BEDDING-BED-BOTTOMS. Andrew T. Sherwood, Amador City, Cal. (Filed Aug. 4, 1875.)

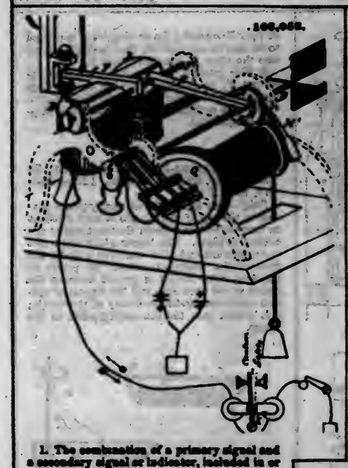
Brief.—The foundation-frame consists of two side and three cross-bars, upon which latter the coiled springs are attached. Two side spring-supporting rails either are attached and connect with the cross-bars, which receive the chain A, and winding around a shaft, provided with a ratchet and pawl, raises and lowers the bed-bottom to any desired height.

The combination of the bar I, cord J, short shaft K, ratchet-wheel L, and spring-pawl M with the pivoted bed-bottom H U D E F G, substantially as herein shown and described, and for the purpose set forth.



168,057. SHUTTER-FASTENERS. Chas. A. Smith, Philadelphia, Pa., assignor of one-half his right to Daniel Hoffer, same place. (Filed Aug. 20, 1875.)

Brief.—An ordinary swivaled turn-buckle, having a weighted button, is provided with a triangular head or catch, arranged on a short arm, at an angle of about forty-five degrees to the shank. The rear edge of this triangular catch is formed with a laterally-projecting ear or flange, nearly at right angles thereto, thus providing a wide surface, upon or against which the shutter impinges, preventing injury to the wood-work, and for anti-rattling purposes.



The improved swivaled turn-buckle, consisting of the shank A, having the weight A', and provided with the triangular catch B, arranged obliquely thereon, and having its front and rear edges inclined, as shown, and its rear edge formed with the laterally-projecting ear or flange *a*, substantially as shown and described, for the purpose set forth.

168,058. RAILROAD-SIGNALS. H. W. Spang, Reading, Pa. (Filed Dec. 22, 1875.)

168,059.

1. The combination of a primary signal and a secondary signal or indicator, instituted in or operated by the same circuit of electrical conductors, when the movements of the secondary signal are dependent upon or controlled by the reversal of a battery-current through said circuit, effected by the movement of the primary signal, substantially as herein set forth.

2. The combination of primary signal S, circuit-changer C, one or more galvanic batteries, intermediate conductors, and a polarized electro-magnet, which operates or controls a secondary signal or indicator, substantially as described.

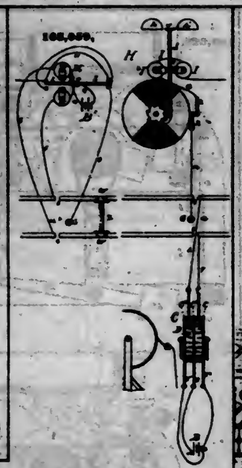
3. The combination of shaft D, signal S, spring H', and wheel H, having in its periphery the curved fixed notches *c*, substantially as and for the purpose set forth.

168,060. RESETTING RAILWAY-SIGNALS. H. W. Spang, Reading, Pa. (Filed Mar. 17, 1875.)

1. The combination of one or more insulated sections of railway-track, a main or primary battery and connector, electro-charging relay-magnets, and local or secondary batteries as electric signaling apparatus, and intermediate conductors between the foregoing, arranged and operated for producing a series of signals in said signaling apparatus, or a change signal by a series of reverse currents, substantially as described.

2. The combination of insulated section A of railway-track, battery B, commutator C, relay-magnet M, levers I P, metallic points *p p' p' p'*, battery B', wires 5, 6, 8, 9, 10, 11, 12, 13, and L', electric signaling apparatus H, arranged and operating substantially as described.

3. The combination of two insulated sections of railway-track, A A', main or primary battery B, commutator C, relay-magnet M, levers I P, metallic points *p p' p' p'*, battery B', wires 5, 6, 8, 10, 11, 12, 13, 14, 4, and L', electric signaling apparatus H, and relay-magnet M', battery B', ground-plates G G', and intermediate conductors connecting the two sections A A', all arranged and operating substantially as shown and described.



4. The combination of signal-disk Y, shaft *s*, toothed wheel E, escapement *j*, lever J, and poles *l l'* of an electro-magnet, substantially as described.

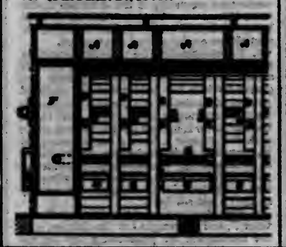
5. Relay-magnet M, having levers I P, which are insulated from each other and vibrate respectively between metallic points *p p' p' p'*, in combination with battery B', signaling apparatus H, and intermediate conductors of a local or secondary circuit, substantially as described.

6. Magneto-electric inductor P', the armature D' of which and wire coil are vibrated by lever L' between magnets S S', in combination with the rails of a railway-track, substantially as and for the purpose set forth.

7. Galvanic tube U, in combination with an induction-coil, in which the primary current of battery B' is opened and closed by lever P of relay M', oscillating between metallic points *p p'*, as described.

168,061.

2. An insulated section of single-track railway, having arranged at each end thereof a main or primary battery and commutator connected with a polarized relay-magnet at the end of section opposite the end where the battery is, each of said relays controlling an electric signal at a distance from it, substantially as described.

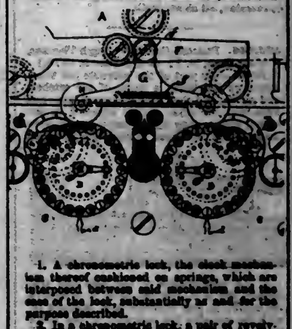


168,062. APPARATUS FOR CONDENSING VAPORS, &c. Robert Rowe, Greenock, and John Mather, Cathcart-on-Tyne, North Britain. (Filed July 10, 1875.)

Brief.—Vapor to be condensed is drawn into the apparatus by a current of air laden with moisture. The partially-condensed vapor strikes a baffle-plate, and, being deflected downward out of the line of the blast, flows quietly backward along the shaft, and out through a hole bored in the shaft into the cool compartment below.

The apparatus herein described, consisting of the shelves B, blocks C, provided with tapered openings D, baffle-plates F, pipes H, *d*, and *e*, and tanks G, all combined and operating together as described.

168,063. STEAM-GAGE. ABM. M. Shrewsbury and Thomas F. Medrath, Newark, assignors to John B. MacPherson, Jersey City, N. J. (Filed Apr. 27, 1875.)



1. In a stock-car, a feed and water trough composed of separate sections, each section fitting between two wall-posts, and supported upon a continuous chain, whereby all the troughs may be simultaneously turned into position for feeding or watering, or turned up out of the way, substantially as described.

2. In a car for transporting live stock, the combination of the bins A, provided with the supply-openings E and chutes D, partitions *c*, operated by the rods *b*, and levers *a*, arranged to operate substantially as and for the purpose described.

3. In a car for transporting live stock, the combination of troughs C, chafts D, and levers E, substantially as and for the purposes set forth and shown.

168,065. TIME-LOCKS. Henry Stockwell, Stamford, Conn. (Filed Mar. 10, 1875.)

1. A chronometric lock, the clock mechanism thereof enshrined on springs, which are interposed between said mechanism and the case of the lock, substantially as and for the purpose described.

2. In a chronometric lock, a pair of revolving disks provided with a series of adjustable pins, whereby the locking and unlocking of the lock may be fixed at any desired hours or periods of time, substantially as and for the purpose described.

3. In a chronometric lock, the adjustable pins for determining the time of locking or unlocking, in combination with friction-stops, for securing them in the desired positions, substantially as and for the purpose described.

4. In a chronometric lock, the combination of two separate and independent clock mechanisms, each having a revolving disk provided with a series of adjustable pins, over which the yoke rides, with locking or dogging mechanism connected to lock, and operated by either one or both of said disks, substantially as and for the purpose set forth.

5. In a chronometric lock, a yoke resting upon moving supports, which are actuated by independent clock mechanisms, the motion of any one of which supports will, through said yoke, effect the locking and unlocking of the lock, substantially as shown and described.

6. In a chronometric lock constructed to automatically lock and unlock, a yoke-device operated and released by the clock mechanism, and intermediately between the clock mechanism and the locking mechanism, to prevent the operation of the clock mechanism from being stopped by the blocking of the bolt mechanism of the lock, substantially as shown and described.

7. In a chronometric lock, two revolving disks, with a series of adjustable pins, and connected, to be reversed independently of their axes or not, as may be desired, substantially as and for the purpose described.

8. In a chronometric lock, the combination of the yoke, pivoted to the lever, with one or more revolving disks, and with rollers bearing thereon, substantially as and for the purpose described.

9. In a chronometric lock, the combination of the yoke, having a pitching device, with the lever and gate or dog, substantially as and for the purpose described.

10. In a chronometric lock, the yoke pivoted to and in connection with the locking lever, as and for the purposes described.

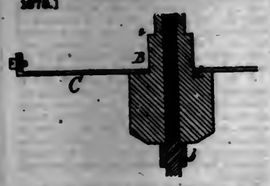
11. In a chronometric lock, the combination of an oscillating lever with the yoke pivoted to it, and with a sliding dog or block, substantially as and for the purpose described.

12. In a chronometric lock, the combination of an oscillating lever with a counter-weight and yoke, substantially as and for the purpose specified.

168,666. SHEET-IRON BLANKS. G. B. Taylor, Philadelphia, Pa. [Filed May 26, 1875.]

As a new article of manufacture and commerce, plates of sheet-iron tinned on both sides and at all the edges, and shaped for convenience into, or forming parts of, articles of tin-ware without being sheared prior to such conversion, all as set forth.

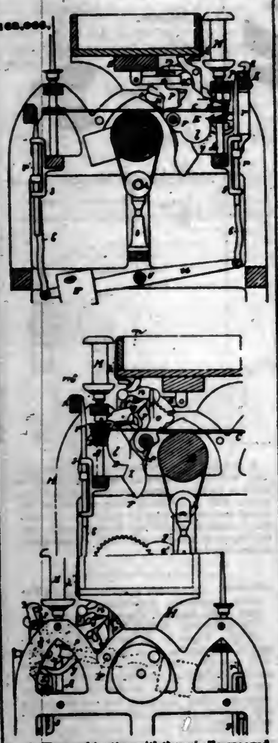
168,667. PLANER-CUTTERS. Hugh Thomas, New York, N. Y. [Filed June 8, 1875.]



Brief.—One part of the movable jaw is adjusted on the base by means of the ratchets and pawls, and then fixed by screw-bolts and nuts, and the other part is adjusted by entablature, and fixed by screws and nuts. Supplementary jaws are used to hold small articles.

1. The combination of the base and stationary jaw A B, grooved, as at E, to receive the screw H, and provided with ratchets D, with the movable jaw composed of the parts C O O, shown as being slotted, the part C provided with pawls N, and adjustably attached to the base, and the part O adjustably attached to the part C by screw-bolts, through their respective slots, substantially as shown and described.

2. The pins R, constructed with their faces tapering to their edges r, and with tongues s s on the upper parts of their jaws having grooved backs in combination with jaws B C, having the grooves t, substantially as and for the purpose herein described.



168,668. COMPOUND BALANCE-STAFFS FOR WATCHES. John J. Thornton, Cleveland, Ohio, assignor of one-half his right to Dan E. Ridgway, same place. [Filed May 18, 1875.]

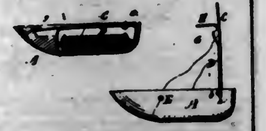
The compound balance-staff for watches described, consisting of the staff proper, A, having the pivots turned on its ends, and a shoulder near its middle, above which it is screw-threaded, and the internally-threaded sleeve or collet B, which screws onto the said staff proper until it abuts against the said shoulder, the said sleeve or collet B being provided with shoulders d d, for supporting the hub of the balance C and the hair-spring collet, substantially as described and shown.

168,669. MACHINERY FOR SPOOLING YARNS. Axel M. Wade, Lawrence, Mass. [Filed July 8, 1875.]

Brief.—The rate of revolution of the bobbin-spindle is automatically increased on the upward movement of the bolt from a lower to the next higher groove of a conical pulley, and when the upward is full and the belt has reached the highest groove, it is automatically returned by one stroke of the shifter to the lowest groove.

1. The combination, with the spindle-grooved conical pulley B, as described, and the belt-shipper E, of mechanism, substantially as specified, for periodically moving the shipper E, whereby the driving-band is caused to move successively from one groove up into the next one of a series of grooves, a b c d e, of said pulley, said mechanism consisting of the rack m and its catch-pawl G, the hook n', lever I, hooked pawl n, toothed sector o, shaft F, stopper p, catch q, reciprocating bar K, (provided with mechanism for operating it as described,) ratchet-wheel s, retaining-pawl p, lever-pawl r, stud s', and vibrating arm M', all applied and arranged substantially as shown and set forth.

2. The combination of the spindle-grooved conical pulley B, as described, the belt-shipper E, and the mechanism for periodically moving the shipper to cause the driving-band to be moved upward successively from groove to groove of said pulley B, with mechanism, substantially as described, which, as the spool-head having been completed, causes the driving-band to pass from the highest down into the lowest of the grooves of the pulley, said mechanism consisting of the detacher O, elevator F, and the weight l of the shipper, all being connected, applied, and arranged essentially as explained.



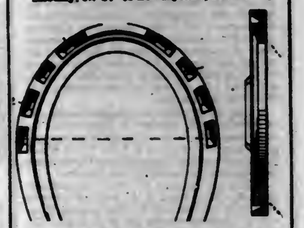
3. The combination, for periodically moving the shipper E, whereby the driving-band is caused to be moved successively from one groove up into the next one of the series of grooves of the conical and grooved spindle-pulley B, of the rack m and its catch-pawl G, the hook n', lever I, hooked pawl n, toothed sector o, shaft F, stopper p, catch q, reciprocating bar K, (provided with mechanism for operating it, as described,) ratchet-wheel s, retaining-pawl p, lever-pawl r, stud s', and vibratory arm M', all applied and arranged substantially as shown and set forth.

4. The combination of the detacher O, elevator F, and the weight l of the shipper, with the mechanism for periodically moving the shipper E, whereby the driving-band is caused to be moved successively from one groove up into the next one of the series of grooves of the conical pulley B, substantially as specified, for periodically moving the shipper E, whereby the driving-band is caused to be moved successively from one groove up into the other of the said pulley B.

5. The guide-wheel h and its gravitating-carrier a', in combination with the driving-band, the spindle-pulley, and the shipper, provided with mechanism for operating the shipper, as specified.

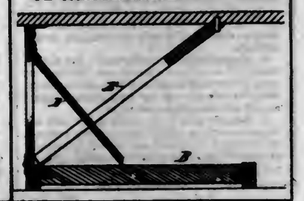
168,670. SEWING-MACHINE SHUTTLES. H. L. Walker, Guelph, Canada. [Filed May 17, 1875.]

Brief.—The lower of two spring-plates pivoted in the top of the shuttle is bent down at its forward end, and holds the front end of the bobbin in place. The upper plate has a slot in its forward end, that fits over a pin in the front of the shuttle, to retain the plates in position. The thread is passed between the plates at the open end, and the degree of tension regulated by its proximity of the notch; it is placed into the connecting-point of the plates.



1. The spring-plate D, having the notches a, the slotted bent rod H, and the bridge G, combined with the spring-plate C, provided with the notch F, and plates being fastened together and pivoted to the shuttle, substantially as and for the purposes specified.

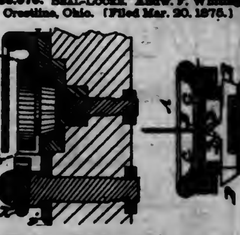
2. The spring-plate C, having the slot b and spring-plate D, provided with the slot f, pivoted to the shuttle and riveted together, as shown, combined with the bobbin B and pin g, substantially as and for the purposes specified.



3. The shuttle-body A, provided with the pin g, in combination with the plate C, having the slot b, substantially as and for the purpose specified.

168,671. HORSESHOES. James T. Walker, Albany, N. Y. [Filed Apr. 17, 1875.]

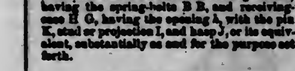
The herein-described horseshoe, formed of a single piece of metal, with the outer ridge b, having the toe-calk projecting from and formed therewith, and of a width equal to one-half the width of the shoe, and having the nail-holes c, all as set forth.



168,672. INCRUSTE-BOARDS. John Watson, Williamsport, assignor of one-half his right to William T. Wagner, Philadelphia, Pa. [Filed Dec. 8, 1874.]

The combination of the base B, ironing-board A, frame C hinged to both ironing-board and base, and the braces D and E, the former being hinged at the top to the frame C, and the latter being forked, jointed at its lower end to the base, crossing the brace D at right angles, and having at its upper end a recess for receiving a stud upon the ironing-board, all as set forth.

168,673. FLY-TRAPS. J. Spence White, Prescott, Wis. [Filed Aug. 20, 1875.]



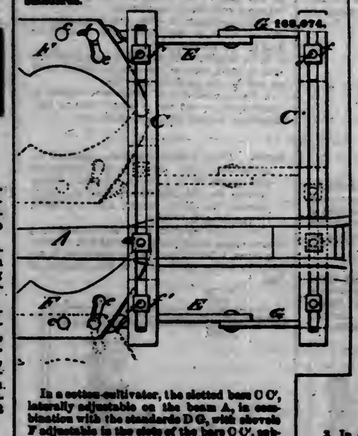
Brief.—A spring-hoop for closing the entrance to the trap, and sustaining the light from the feeding-board.

A fly-trap, having a conical-shaped bowl, open in the center, and made of glass, wire, or other suitable material, surmounted by a glass receiver, and having a spring-hoop with thumb-piece, all combined for the purpose and in the manner herein shown and described.

168,674. TUBE-CLEANERS. John Williams, Canton, Mass. [Filed May 26, 1875.]

Brief.—The scraper or cutters may be expanded or contracted to fit varying-sized tubes.

1. The improved tube-cleaner described, consisting of the staff A, collet I, spring H, stocks B B', plates F, and blade C, combined to operate substantially as and for the purpose set forth.

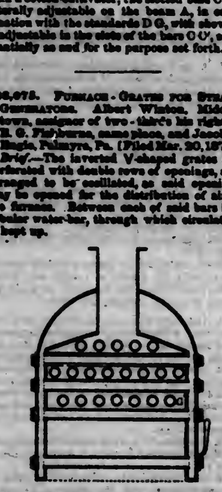


2. In a tube-cleaner, substantially such as described, the plate F, provided with the plate e e, substantially as and for the purpose set forth and specified.

168,675. PROCESSES OF PRESERVING MEAT. John A. Wilson, Chicago, Ill. [Filed June 30, 1875.]

The above-described process of preserving cooked meat in a solid form—that is to say, cooking the meat, freeing it from bone and gristle, packing it compactively dry, without gravy or added liquid, into a can of suitable form to collapse readily, until the can is full of meat, then sealing the can and heating it, and puncturing and resealing, substantially as specified.

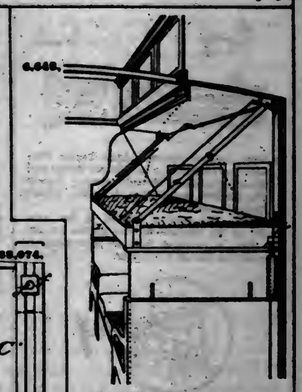
168,676. CULTIVATORS. Henry Winfield and Wm. P. Flynn, Pantego, N. C. [Filed June 5, 1875.]



Brief.—Arrangement and adjustability of the cross-bars upon the beam, of the standards in the bars, and of the shovels upon the standards.

In a cotton-cultivator, the slotted bars C C', laterally adjustable on the beam A, in combination with the standards D G, with shovels F adjustable in the slots of the bars C C', substantially as and for the purpose set forth.

168,677. FURNACE-GRATES FOR STEAM-GENERATORS. Albert Whitlock, Middletown, assignor of two-thirds his right to H. G. Fitzburne, same place, and Josiah S. Hagin, Palmyra, Pa. [Filed Mar. 20, 1875.]



Brief.—The inverted V-shaped grates are perforated with double rows of openings, and arranged to be oscillated, so said openings may be opened for the distribution of air to the furnace. Between each of said bars is a tubular water-bar, through which circulation is kept up.

The combination, in a steam-generator, of alternate inverted V-shaped oscillating grate-bars and tubular water-bars, they being arranged to operate substantially as set forth.

REISSUES.

6,646. SLEEPING-CARS. Ben Field, Albion, N. Y., and Geo. M. Pullman, Chicago, Ill., assignors, by mesne assignments, to Geo. M. Pullman. Patent No. 60,093, dated Sept. 19, 1866; reissue No. 2,925, dated Feb. 11, 1868; reissue No. 3,254, dated Jan. 6, 1869. [Filed July 27, 1875.]

In combination with the upper berth, a recess formed against the side of the car, the parts being so constructed that the berth may occupy a horizontal position at night, and be turned up into such recess by day, substantially as described.

4. In combination with the stationary back of the seat-frame, a movable piece, which, when placed in position for night use, extends substantially from the cloth to the wall of the car, and operates to complete the partition between the adjoining lower berths, substantially as set forth.

5. In combination with two adjoining upper berths, but separate therefrom, a movable partition in one piece, which, when placed in position for night use, serves as the head-board of the one berth and the foot-board of the other, and which can be moved away from between the sections, so as to leave the upper part of the car clear by day, substantially as described.

6. A box or tray adapted to contain a mattress, and connected with the wall of the car at the upper edge of one of its sides, substantially as set forth, whereby it can be made to occupy a lower position at night and leave more room under it by day than if otherwise constructed and supported.

7. An upper berth, having its outer or wall side made inclined or sloping, substantially as and for the purpose set forth.

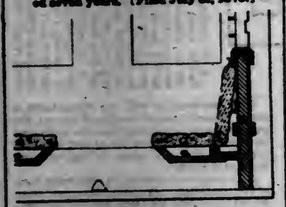
8. The construction and arrangement of a seat-back, with the back and seat-cushion hinged together and disconnected from the seat-frame, so that the back-cushion may be placed horizontally on the seat-frame, and the seat-cushion extended to meet the seat-cushion of the opposite seat, substantially as described.

6,650. PUMPS. Wm. J. Johnson, Newton, Mass. Patent No. 30,480, dated Oct. 30, 1860; extended seven years. [Filed Aug. 4, 1875.]

Brief.—A stirrup is attached to the cylinder above the suction-orifice, to receive pressure by the foot of the operator, and so hold the pump in position.

A stirrup, in combination with and arranged upon the cylinder of a pump above the suction-orifice or water-inlet, substantially as described.

6,660.

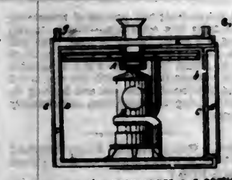


6,660. LAMP-BURNERS. Alvin Taplin, Forestville, assignor to the Bristol Brass and Clock Company, Bristol, Conn. Patent No. 119,061, dated Sept. 19, 1871. [Filed Sept. 11, 1876.]

Brief.—The wick is pressed to the inner tube by the ratchets as it is moved up, and its form is changed from an approximately flat field to that of a cylinder.

The ratchets C C', having their two shafts *e e'* geared together by spur-wheels *d* at one end of each, in combination with the inner tube of a V or U shape, the sides of which are parallel with the axes of the ratchets, essentially as shown and described.

6,661. SLEEPING-CARS. Eli Wheeler, Sherrill, N. Y., assignor, by mesne assignments, to Geo. M. Pullman, Chicago, Ill. Patent No. 88,499, dated Sept. 30, 1869; extended seven years. [Filed July 31, 1876.]



1. Movable diaphragms or partitions, which aid in dividing the car into compartments when the berths are arranged for sleeping, and which can be moved out of the way to afford ventilation and otherwise accommodate the passengers during the day, substantially as described.

2. Movable diaphragms or partitions, which aid in supporting the upper berths, and in dividing the car into compartments when the berths are arranged for sleeping, and which can be moved out of the way during the day, to afford ventilation and otherwise accommodate the passengers, substantially as described.

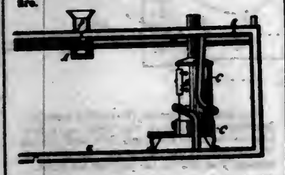
3. In combination with the upper berths, movable diaphragms or partitions, constructed and arranged to operate substantially as set forth, so that while forming the head and foot boards of such berths at night, with capacity of being moved out of the way by day, they will also permit the circulation of the air above the berths, as described.

4. In combination with the box-formed supports of the seats, the seat bottoms and backs, constructed and arranged to operate in the manner specified, so that when the bottoms of the seats are turned over to fill up the space between each pair of seats the bed clothing in the box will be exposed, so as to be readily removed, and, when the seats are turned down to fit the place occupied by the bottoms, the boxes will thereby be closed up and a continuous bed formed from the one partition to the other, substantially as set forth.

6,662. RAILROAD-CAR HEATERS. Edward H. Ashcroft, Lynn, assignor, by mesne assignments, to E. A. Ballou, Boston, Mass., assignor to Edward H. Ashcroft. Patent No. 54,062, dated May 15, 1866; reissue No. 2,917, dated Apr. 14, 1868. [Filed Aug. 2, 1875.]

6,662.

1. In a car, the water-space *c*, a portion of which is led or conducted through or around a stove or furnace, whereby the entire water in the space *c* is heated for the purpose of warming said car or apartment.



2. In combination with the water-space *c* the induction or feed pipe *f*, substantially as and for the purposes shown.

3. In combination with the water-space *c*, one or more vents or escapes, *g*, substantially as and for the purpose described.

4. The combination of the stove or furnace S, water-space *c*, and one or more vents, *g*, substantially as and for purposes shown.

6,663. FIRE-EXTINGUISHERS. Edward H. Ashcroft, Lynn, assignor, by mesne assignments, to E. A. Ballou, Boston, Mass. Patent No. 54,062, dated May 15, 1866; reissue No. 2,917, dated Apr. 14, 1868. [Filed Aug. 2, 1875.]

Brief.—The apartment is surrounded by a water-space, which communicates with shower-ing-pipes, a fusible plug being employed to arrest the water, until fused by the presence of fire.

1. A car or other apartment, provided with a water tank or space, *c*, in combination with one or more showering-pipes, *f*, and a fusible-plug apparatus, substantially as and for the purpose shown.

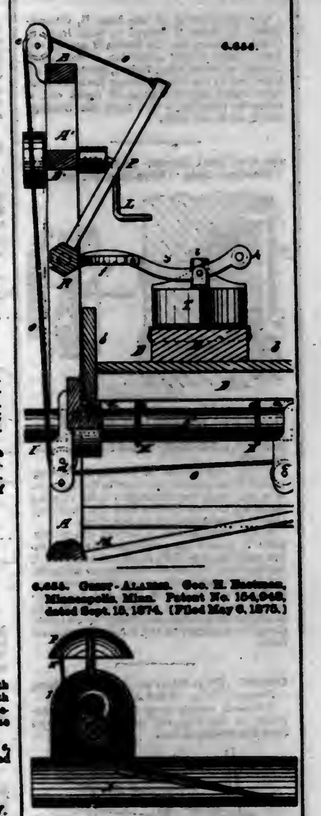
2. In combination with the water-space *c*, the fusible plug A and *i*, substantially as and for the purpose shown.

6,664. INCRUSTATION APPARATUS. Gideon W. Cottingham, Rockport, Tex., assignor, by mesne assignments, to the Cottingham Boiling Machine Company. Patent No. 144,742, dated Nov. 18, 1873. [Filed Aug. 19, 1876.]

Brief.—In a suitable frame a table is moved horizontally by means of rollers and cords under a sad-iron, which is moved vertically by means of levers, pulleys, and cords.

1. The vertically-moving iron, in combination with a horizontally-reciprocating table, and mechanism to operate both the iron and table, as and for the purpose herein specified.

2. In an ironing-machine, the vertically-moving iron and horizontally-reciprocating table, and the crank L, arranged on the front, whereby one person can operate the table and govern the iron, substantially as and for the purpose described.



3. The table D, having base *b*, vertical parts *b' b'*, and elevated portion E, substantially as and for the purposes herein set forth.

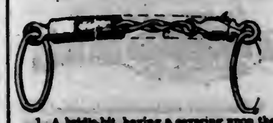
4. The horizontally-reciprocating table D, in combination with the rollers *a*, rollers F, and cords H H, substantially as and for the purposes herein set forth.

5. The table D, having base *b*, vertical parts *b' b'*, and elevated portion E, in combination with the guides C C and rollers *a a*, substantially as and for the purpose specified.

6. The curved arm S, having handle *h* and bracket *f' f'*, in combination with the pivoted iron T, rock-shaft R, and uprights S S, all constructed and arranged for operation, as and for the purpose specified.

7. In combination with the iron T, the arm S, rock-shaft R, lever P, cord O, and treadle M, all constructed for operation as and for the purpose specified.

6,664.



6,665. GRIST-ALARMS. Geo. H. Eastman, Minneapolis, Minn. Patent No. 164,048, dated Sept. 15, 1874. [Filed May 6, 1875.]

1. The combination of a grist-alarm with the conduit-pipe for the passage of grain in a mill, substantially as and for the purpose set forth.

2. In combination with the grain-conduit A, a swinging pallet, B, and suitable mechanism for giving an alarm, substantially as and for the purpose set forth.

3. The grain-conduit A and the swinging pallet B, in combination with the detent-pawl H, clock-mechanism E F', hammer K, and alarm P, all constructed, arranged, and operated substantially as set forth.

6,666. BITS FOR BRIDLES. S. L. Bowley, New Britain, Conn. Patent No. 76,921, dated Apr. 14, 1868. [Filed Aug. 9, 1876.]

1. A bridle-bit, having a covering upon the mouth-piece of soft vulcanized compound, molded upon the bit and fixed thereon by heat, substantially as specified.

2. In a bridle-bit the combination of the covering of vulcanizable compound and the end ferrules or abutting pieces, substantially as described.

3. In a bridle-bit the combination of a chain or flexible mouth-piece, with a covering of soft vulcanized rubber or gum, so as to form a flexible bit, substantially as specified.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 13. TUESDAY, SEPTEMBER 28, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

WATERS, FARRINGTON, AND POWELL *vs.* YOST AND WALLACE.—*Interference.*

[*Appeal from the Examiners-in-Chief in the matter of the interference between the application of Benj. F. Waters, Joel Farrington, and Charles R. Powell, and the application of George W. N. Yost and O. D. Wallace, for letters patent for an* "IMPROVEMENT IN HARVESTERS."—*Decided May* 3, 1875.]

In a claim for a combination of devices, the only novel element therein being entirely separate and distinct from the others, and accomplishing in itself an entirely independent result: *Held*, that as this feature was not the joint invention of either of the respective joint parties to the record, neither party was entitled to a patent, and the interference must therefore be dissolved.

THACHER, *Commissioner:*

The invention in controversy consists of a combination of devices for raising the cutting apparatus of a harvester. These devices consist of a lever pivoted to the tongue, and provided at its lower end with a cogged segment which gears into a cogged rack-horn rigidly attached to the front end of the main frame; a chain depending from the rack-horn, the lower end of which is secured to a coupling-arm, and a second chain secured to the tongue, and then extended up over a pulley on the extremity of the rack-horn, then downward and attached to a tilting-lever, which is pivoted to the coupling-arm near its outer end, and the lower end of which rests upon the projecting heel of the cutter-bar. The coupling-bar is attached to the front end of the main frame, and the cutter-bar is hinged to the outer end of the coupling-arm. By pulling back the lifting-lever, the rack-horn and end of the main frame are raised, carrying with them the chains attached thereto, which in turn raise the coupling-arm and cutter-bar. The outer end of the cutter-bar is raised much faster and higher than its inner end by the operation of the second chain fastened at one end to the tongue and at the other to the tilting-lever, after passing over the pulley on the end of the rack-horn. The accelerated speed of this chain also takes up the slack necessary to be had in giving freedom of movement to the cutter-bar.

The first feature of the combination above described—viz, the lever pivoted to the tongue, or to one side of the main frame, with a cogged segment upon its end and gearing with a cogged rack, for the purpose of hoisting the front end of a vibrating frame and cutter-bar of a mowing-machine—is old, as may be seen by reference to the patent of S. S. Allen, April 7, 1857, and others that might be mentioned.

The only really novel feature in the combination in question is the manner of connecting the lever with the cutter-bar by means of the chain connected at one end to the tongue, then passed over a pulley on the end of the rack-horn and attached at the other end to the lever fixed upon the heel of the cutter-bar. The operation of the latter-named feature, by which an accelerated motion is given to the chain, thereby raising the end of the cutter-bar to a greater height than the remaining parts of the apparatus, does not depend for its merit upon its connection with the lever and cog arrangement, but accomplishes an entirely separate and independent result in itself. It being, too, the only novel feature of this invention, the right of priority in this contest should be awarded to that party who was the first to clearly describe its advantages, propose its adoption upon a mowing-machine substantially in the manner and form now claimed, and who actually embodied it in that form, or was diligently proceeding thereto. Now, upon carefully considering the testimony adduced in this case, I find that neither of the joint parties to this interference is the inventor of this device, or claims to be. Of the parties upon whom rests the burden of proof in this case—Waters, Farrington, and Powell—

Waters and Farrington admit that Powell originated and adopted this particular feature, while they simply urged upon him its connection with the lever and cog rack arrangement, of which they claim to be the inventors. On the other hand, Yost gives credit to Wallace for the lever arrangement, and both concede to one R. D. Warner the origin of the pulley upon the end of the rack-horn and the passing over it of the chain from the tongue to the cutter-bar.

It would be difficult to decide, upon the contradictory testimony in this case, to which of the persons named (Powell or Warner) belongs the title of prior inventor, and until these parties appear as contesting applicants, such a decision would be unnecessary and uncalled for.

Neither of the parties, as they appear upon the record, being inventors of the essential subject-matter in dispute, neither is entitled to receive a patent, and the interference is therefore dissolved.

CARTER AND DWYER *vs.* PERRY AND DICKEY.—*Interference.*

[Appeal from the Examiner of Interferences in the matter of the interference of Carter and Dwyer against Perry and Dickey, relating to applications for patents for "IMPROVEMENT IN STOVES."—*Decided September 20, 1875.]*

Rules relating to the right of parties to make a joint application will not be enforced more rigidly by the Office than by the courts. The oath, therefore, of the joint applicants will be considered as strong presumptive proof in their favor, and they will be given the benefit of all doubts.

It is well settled that if two inventors are on equal terms in respect to the invention, such as partners in the business, and both contribute to the essential parts of the organization regarded as a whole, the patent would be invalid if issued to one of them.

The interference being on the following claims of one of the joint parties: First, the combination of ascending and descending flues placed on the rear side of a stove, illuminating windows or doors in the draft-chamber, base-section, and the free open space R between the top surface of the grate or fire bed and the base of the fire pot or combustion chamber proper; and, third, the grate-frame constructed with legs, supported upon and in combination with a flange or projections upon the side wall of the draft-chamber base-section, substantially as described: *Held*, that, considered apart from the question of novelty, the claims were for two combinations of elements intimately related, accomplishing a new result when so combined, and forming an essential part of one complete organization. The case on this point distinguished from *Potter & Wilson* (2 Fish., 102) and *Birdsell* vs. *McDonald* et al. (6 O. G., 682) cited in support.

These combinations being the product of the mutual suggestions and joint efforts of the respective joint applicants, the origin of each of their mental conceptions, or the order of them in time, has no material weight, and their applications held to have been properly made.

SPEAR, *Acting Commissioner:*

It appears from the record in this case that the Examiner of Interferences discussed the question of priority of invention, and came to certain conclusions in regard to it, but he also found that, in accordance with his view of the case, neither Carter and Dwyer, on the one hand, nor Perry and Dickey on the other, were properly joined in their respective applications. He, therefore, dissolved the interference, and assigned a limit of thirty days for appeal from his decision upon this point. Some question has been raised as to the propriety of his action, or rather, in relation, more especially to the form of it, and a motion was made simultaneously with this appeal, for the purpose of setting aside this decision on the ground that it was improperly made, and that the action taken by the Examiner should have been a suspension of the interference with reference to the Primary Examiner for determining this question of joint or several invention.

I need not go into any extended discussion of this matter, since it is one of form merely, or will be with my view of the case as brought before me by this appeal. Rule 59 provides for a dissolution of the interference when there has been such irregularity in declaring it as would preclude proper determination of the question of right between the parties, in which case appeal lies to the Commissioner in person. In case some statutory bar appeared during the prosecution of the interference to the issue of any patent for the invention in dispute, then it was provided that the interference should be suspended, and the Commissioner's attention be called to it, in order that he might decide whether or not it should be referred to the Primary Examiner for determination by *ex parte* proceeding of the question of patentability.

I believe it has been the custom of the Commissioner, although such matters are purely *ex parte*, to hear both parties, in order that he might be as fully informed as possible in relation to the merits of the case. I have, therefore, listened to the arguments of counsel representing both parties to this controversy. In point of fact, as the matter stands, it is impossible to determine the question of right between the parties until this preliminary question raised by the appeal be settled. This question is not whether there be anything patentable to award the one party or the other, but whether there be any party to whom the invention could be awarded. The patentability of the subject-matter has not been called in question by either party. The Examiner found that there was no proper party on either side to whom the patent could issue. In his judgment the testimony taken showed that neither Perry and Dickey on the one hand nor Carter and Dwyer on the other could properly apply as joint inventors of the device claimed in the first and third clauses in their respective applications. In relation to the attitude of the parties it should be stated that the appeal is taken by Perry and Dickey. They assert for themselves joint invention, and admit that Carter and Dwyer, so far as the evidence goes, are properly joined in their application. Carter and Dwyer, though taking no appeal, content themselves with denying the correctness of the Examiner's decision against themselves, and the whole force of their argument was spent in the effort to show that the decision is correct as against Perry and Dickey. The appeal, however, by one party, inevitably brings up the whole matter, since I could not properly overrule the decision of the Examiner unless satisfied as to the proper standing of both. It was urged by counsel for Carter and Dwyer, first, that Perry and Dickey were not joint inventors of the subject-matter of the first and third claims; and that, as the Examiner decided, Perry was the inventor of the subject-matter of the first and Dickey of that of the third claim; further, that Williams, an employé of Perry and Dickey, should be joined with them in the application. I cannot think it my duty, as urged by counsel for Carter and Dwyer, to enforce the rules relating to this matter more rigidly against these joint applicants than would the courts if the same question were before them. Undoubtedly the courts might overlook defects in mere form, in order to save the rights of parties, but this is not strictly a question of form, like the omission of an oath or a defect in the form of a claim, but an inquiry as to the proper parties to whom the patent should issue. Indeed, if any reason exists for variation from what would be considered the ruling of the courts, it would seem to point to greater leniency in such a matter as this, for the purpose of the interference, under the law, is simply to determine the question of priority of invention. That was the issue defined by the Office, and I am bound to believe that it was that issue, and that alone, which Perry and Dickey had in view in giving their testimony in this case. So that, even if the Commissioner pursued the ordinary practice of the Office and searched in the testimony for evidence bearing upon matters outside of the issue prescribed by the law, it would seem to be unwise in considering this testimony to set up any presumption against applicant's oath of joint invention. Further than this, leaving the alleged claim of Williams out of consideration (and he is not asserting any for himself) it does not concern the public or the Office, nor could it rightfully concern Carter and Dwyer, whether Perry and Dickey should make application jointly or severally. For if they are the prior inventors of separate and independent parts no patent could issue to their opponents, or would be valid if issued, and it is the same thing whether Perry and Dickey have joint or separate patents. Since, therefore, the rights of no other parties are concerned, and the patent is taken at the risk of the applicants themselves, it would seem good policy, in considering questions like this to give the joint applicants the benefit of any doubt which might exist; to leave the matter (as was said in *Neal* and *Adams* vs. *Daniels*, C. D., 1871) where the parties themselves have placed it; or, (as was said in *Wheeler* vs. *Russell* and *Miller*, C. D., 1872,) not to allow the presumption of joint invention once created by filing an application upon a joint oath to be overthrown, except by evidence of the most unequivocal character. The inquiry raised by this appeal leads into metaphysical subtleties difficult if not impossible to disentangle, and may concern operations of the human mind known only, if known at all, to the parties themselves. Only upon two conditions can the way in such an inquiry be plain and sure. One is when the invention is not a unit, and it is clear or conceded that each of the parties made distinct and independent improvements on the same machine, (*Potter* vs. *Wilson*, 2 Fish., 107,) and the other is where the invention was made by one party without any possibility of communication with the other. If, therefore, in this case the invention be an entirety, a single complete organization, not properly separable into its elements without detriment to the whole structure, or, if, being separable into parts, each of which could properly be subject of claims as a distinct improvement upon the same stove, and the parties are proven to have been in conference, and to have made mutual suggestions in the course of the contriving and experimenting by which the stove was produced, I do not think I should be justified in going behind their oath, unless constrained by evidence perfectly clear and inexplicable on any other hypothesis than that of independent invention. It should be observed that the applicants Perry and Dickey are on equal terms in respect to the invention, partners in the business, and not in any relation of employer and employé, and neither can have any ground for appropriating the efforts or suggestions of the other in any way whatever. In such a case it is well settled that if both contribute to the essential parts of the organization regarded as a whole, the patent would be invalid if issued to one, (*Watson* vs. *Blagden*, 4 Washington C. C. Reports, 580.) The claims of Perry and Dickey, covering matters which are the subjects of this controversy, are as follows:

1. The combination of ascending and descending flues placed on the rear side of a stove, illuminating windows or doors in the draft-chamber base section, and the free open space R between the top surface of the grate or fire bed, and the base of the fire-pot or combustion-chamber proper.

3. The grate-frame constructed with legs, supported upon and in combination with a flange or projections upon the side wall of the draft-chamber base-section, substantially as described.

I proceed first to consider whether in any way or to any extent these two combinations form a part of one complete whole. The first and third claims of Carter and Dwyer are the same in substance as those quoted, and the Examiner decided in relation to them that Carter is the inventor of one and Dwyer of the other. I must assume that the combinations are new and patentable. I could not go into any consideration of the questions of invention or novelty at this stage of the proceedings unless there were manifest error; but even on the hypothesis that the combinations were old or were separately conceived of, yet if being put into one stove any new result or improved result were produced, not due to the action of the separate parts alone, that would constitute an invention, and make those who had first embodied them in a stove, joint inventors. Referring to the parts specified in the claim, and viewing them in relation to each other, I find that the location of the ascending and descending flues, with reference to the illuminating windows or doors in the draft-chamber base-section, is such as to give ample space for those windows or doors; that the open space between the top surface of the grate and the base of the fire-pot is opposite the window or door, for the purpose of allowing the light from the incandescent coal exposed in that free space to radiate through the windows, and also to allow clinkers to be removed by a poker introduced through the opening. In this construction it further appears that this grate must be isolated from the sides of the draft-chamber base-section, in order to allow a free circulation of air, which must rise around the grate, and be fed freely to the burning coal, in order to produce the required vivid combustion. Further, that the grate must be made capable of adjustment at different heights, in order to adapt it to different sizes of coal which may be used in the stove, and that the coal of whatever size may be properly exposed in the free space opposite the windows. Now the legs occupying but little room allow free circulation of air around the grate, and, at the same time, admit of the easy adjustment of the grate by replacement or otherwise, to regulate the space between the grate and fire-pot. There seems to me to be a close and intimate connection between all these parts. The illuminating windows are allowed room by the location of the flues. They depend for their function upon the open space between the grates, and, more remotely, upon the open space for the admission of the air around the grate.

The open spaces above the grate and around it have certain relations to the supports.

This is a very different case from that considered in *Potter* vs. *Wilson*, cited above, where the improvement in the feed of a sewing-machine was the subject-matter of one claim, and the improvement in set-screw above the needle the subject matter of the other, parts manifestly independent in construction and operation, though used on the same machine.

In the case of *Birdsell* vs. *McDonald* et al., (6 O. G., 682,) which was a suit founded upon a patent for machine for getting out clover-seed, the machine consisted of separate parts for thrashing, hulling, bolting, screening, fanning, and conveying, claimed in combination, all of which, in themselves, were old. The court held:

> The machine, though made up of several elements, is a unit. Its purpose is to get out clover-seed and prepare it for use. All its parts co-operate for that result, and are necessary to that end. Without either there would be a failure to the extent of the function which it performs, and the work intended to be accomplished would be imperfectly done. It is not necessary that every function should be performed simultaneously.

The organization under discussion is more clearly a unit than was that before the court in the case just referred to. The parts are intimately related, and the result appears to me to be a new result by reason of the union of the combinations claimed in the two clauses of claim. The stove thus made up and presented as the subject of letters patent was unquestionably made under the joint direction and joint efforts of Perry and Dickey. Does the fact (even if it be a fact) that one party separately conceived of one part and the other of the other part, or that, for their better protection, two claims are made, each covering less than the whole, constitute them any the less joint inventors? Further, in relation to the invention of Perry and Dickey, the elements which are included in the first and third claims, so far as I am informed, had no legal existence prior to their embodiment in the stove, which is the subject of this controversy. I believe that the attempts at separate embodiments of the claims were mere experiments which could not be the foundation of a patent. Whatever, therefore, may have been the original conceptions, or by whichever party originated, the embodiment is the only patentable invention, and that (leaving out the claim set up for Williams) was made by both in co-operation. Neither the origin of the mental conceptions, therefore, nor the order of them in time, has any material weight in the consideration of this question. It is not the conceptions that we deal with here, but the joint production. When the complete stove was made then the invention was made, and those who made the completed stove were the inventors of it. Therefore, without going any further into the investigation of the relation of the parties in respect to the combinations claimed in the two clauses taken separately, I should not feel justified in overturning the oath of these applicants, and putting them to the risk of taking out separate patents against their own wish; and on this ground, so far as I am informed, Carter and Dwyer have the same standing as the appellants, and must be considered joint inventors for the same reason.

The testimony of Perry and Dickey and Williams in relation to their respective acts and suggestions in the production of the invention in controversy entered so largely into the discussion at the hearing that I cannot dismiss it without some notice. I have examined, so far as seemed necessary or profitable, the very voluminous testimony submitted in the case. It seems clear that Perry's was the leading mind in the conception of the subject-matter of the first claim, and that Dickey was more prominent in bringing forward the subject of the third claim. Yet it is equally clear that there was mutual consultation at almost every step in the organization of the stove. This is repeatedly asserted by the witnesses, Perry and Dickey. Now, granting that Perry conceived the subject-matter of the first and Dickey the subject-matter of the third claim, yet, if in perfecting and embodying the invention each received suggestions from the other, it is absolutely impossible for any one, excepting themselves, to determine to what extent those suggestions modified the original conceptions of the other, or entered into the invention. Whatever statements either party may have made, therefore, in regard to the invention which might appear to indicate that each regarded himself as separate inventor of the respective combinations, I am bound to consider these declarations in the light of their oath, and of the further declarations in respect to the mutual suggestions made by each party; and it is not any matter of surprise if each party, being first to conceive of one or the other of the inventions, and having in view, in giving the testimony, only the matter of priority, should have spoken of the combination as his own invention. To take those unguarded expressions as conclusive and as sufficient to destroy the force of their oath and their testimony as to the mutual suggestions, would seem to me unwise and unsafe.

In respect to the part which Williams is alleged to have taken in the invention, it seems necessary only to say that the Examiner did not find him to be a joint inventor of the matter in controversy. I am satisfied that there is nothing in the evidence to sustain the claim set up for him. Whatever he may have done he did as a skilled workman, and contributed nothing of his own, amounting to a new and complete organization. I agree with the Examiner in that respect, but must overrule his decision and adjudge the parties to be joint inventors in accordance with their oath. The case is, therefore, remanded to the Examiner of Interferences, who will proceed, as soon as practicable, to determine the question of priority between the parties.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date September 28, 1875.]

8,663.—Glassware.—JAMES C. GILL, Pittsburg, Pa. Application filed September 4, 1875. Term of patent 7 years.

8,664.—Children's Carriages.—LEONARD B. HARRINGTON, Jr., Boston, Mass. Application filed March 6, 1875. Term of patent 7 years.

8,665.—Handles for Dinner, Tea, and Toilet Sets.—CHARLES F. HAVILAND, Paris, France. Application filed July 15, 1875. Term of patent 3½ years.

8,666.—Bottles.—GEORGE C. OVENS, Red Bank, N. J. Application filed September 17, 1875. Term of patent 7 years.

8,667 and 8,668.—Pans.—CHARLES ROWLAND, New York, N. Y.—Cases A and B. Applications filed August 26, 1875. Term of patents 3½ years.

8,669.—Illuminating-Sign.—FREDERICK MCLEWEE, New York, N. Y. Application filed September 17, 1875. Term of patent 7 years.

8,670.—Druggists' Shop-Bottles.—WILLIAM R. WARNER, Philadelphia, Pa., assignor to WILLIAM R. WARNER & Co., same place. Application filed September 1, 1875. Term of patent 7 years.

8,671.—Druggists' Shop-Bottle.—WILLIAM R. WARNER, Philadelphia, Pa., assignor to WILLIAM R. WARNER & Co., same place.—Case B. Application filed September 22, 1875. Term of patent 7 years.

8,672.—Bases for Inkstands.—BLOOMFIELD BROWER, New York, N. Y. Application filed July 7, 1875. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date September 28, 1875.]

2,987.—Corsets.—M. K. BORTREE & Co., Jackson, Mich. Application filed August 18, 1875.
"words 'DUPLEX CORSET.'"

2,988.—Cod-Liver Oil.—BURTIN & ARMSTRONG, Terre Haute, Ind. Application filed August 4, 1875.
"words 'Glyconin and Cod Liver Oil'" and the monogram 'B. A.'"

2,989.—Washing-Blue.—C. H. FISCHER & Co., New York, N. Y. Application filed July 2, 1875.
"a representation of a group or series of balls."

2,990.—Liquid and Paste Paints.—FRENCH, RICHARDS & Co., Philadelphia, Pa. Application filed July 17, 1875.
"figure of the buck's head and the word 'Trade-Mark' between the antlers."

2,991.—Cigars, &c.—HEPPENHEIMER & MAURER, New York, N. Y. Application filed June 18, 1875.
"words 'THE BIG BONANZA.'"

2,992.—Medicine.—T. F. X. KISSLING & Co., Lockport, N. Y. Application filed August 25, 1875.
"letters 'T. F. X. K. & Co.,'" and the word 'Lauingen,' and the arrangement of said letters and word."

2,993.—Leaf Tobacco.—MAYER BROS., New Orleans, La. Application filed August 16, 1875.
"figure of an elephant and the words 'Black Elephant.'"

2,994.—Whisky.—MILLS, JOHNSON & Co., Cincinnati, Ohio. Application filed August 25, 1875.
"stag and the word 'Antler.'"

2,995.—Paper Collars.—MOSELEY & MOODY, New York, N. Y. Application filed July 17, 1875.
"word 'BRIGNOLI.'"

2,996.—Polish for Linen, Muslin, &c.—JAMES M. MUNYON, Philadelphia, Pa. Application filed August 30, 1875.
"word 'STARCHOLINE.'"

2,997.—Cords, Fringes, Ribbons, &c.—SILBERMANN, HEINEMANN & Co., New York, N. Y. (Re-registration.) Application filed December 13, 1870.
"words 'Honest Measure.'"

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date September 28, 1875.]

330.—Title: **"Pepsinated Food for Infants and Invalids."**—ALEXANDER GARCEAU, Boston, Mass. Application filed September 20, 1875.

331.—Title: **"Teethina—The only Tooth-Powder approved by the Tremont Dentistry of Boston."**—JAMES L. OLIVER, Boston, Mass. Application filed September 18, 1875.

332.—Title: **"50 Superior Carriage-Bolts of Best Refined Iron."**—THE PECK, STOW AND WILCOX COMPANY, Southington, Conn. Application filed September 20, 1875.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 13, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 30, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture.	2,500
FELTING and HATS; including caps, bonnets, flock, &c.	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS	6,000
BRIDGES; including ferry-guards, girders and columns, piers	408
CARDING, CLOTH, CORDAGE, KNITTING, SILK, SPINNING, WEAVING	4,800
RAILWAYS, complete, about	3,500
ELECTRICITY, (in progress,) to July, 1871	888
TEXTILE, (in progress,) to July, 1871, about	4,800

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

INDEX OF INVENTIONS PATENTED SEPTEMBER 28, 1875.

	Class No.	No. of Patent.
Addressing machine, A. Baker	117	168,079
Alarm and door fastener, combined burglar, W. S. Watkins	24	168,200
Ash pan, J. M. McHelm	154	168,168
Awning, A. Inghels	162	168 257
Awning, blind, J. David	162	168,236
Bed bottom, spring, Oothoudt, Heaberlin, and Sweet	62	168,279
Bed bug trap, E. G. Watkins	62	168,306
Bed, sofa, J. B. Harlow	62	168 155
Bee hive, D. Latchaw	9	168,261
Bee hive, J. P. Peeler	9	168,283
Beer and ale, manufacture of, J. Matthews	19	168,268
Bell punch, H. E. Towle	146	168,195
Binder, temporary, N. S. Otis	15	168,179
Blind, inside, J. Bryan	30	168,221
Boiler feeder, V. D. Anderson	148	168,077
Boiler, wash, F. Mackll	91	168,266
Boilers, composition for covering steam, Webber and Stedman	148	168,308
Book holder, L. A. Moulton	146	168 276
Boot and shoe heel protector, L. W. Buxton	16	168,224
Boot jack, M. A. Richardson	16	168,107
Boot shank spring, T. C. Walker	16	168,301
Boring machine, D. Minich	173	168,170
Bottles, molding and perforating faucet holes in glass, J. N. Fort	68	168,149

	Class No.	No. of Patent.
Brakes, ejector attachment for vacuum, G. Westinghouse, Jr.	122	168,119
Bridges, cover for the upper chords of, M. Lassig	21	168 260
Bridle blinds, winker strap for, Easton and Scott	72	168,241
Brush handle, paint, G. W. Schermerhorn	22	168,187
Brush, water, H. T. Helmbold	22	168,093
Buckle, W. C. Downs	13	168,238
Burner, lamp, G. Stobwasser	90	168,295
Buttle, R. Biering	80	168,130
Button holes, machine for forming imitation, J. Kenny	38	168 161
Cakes and biscuits, steam washer for, D. Carrick	6	168,138
Calculating machine, E. D. Barbour	42	168,080
Cane and umbrella combined, Harris and Kindermann	165	168 092
Car coupling, C. Maus	122	168 270
Car coupling, L. Sibley	122	168,190
Car coupling, S. Ustick	122	168 197
Car, sleeping, C. E. Lucas	121	168,098
Car starter, T. Murgatroyd	123	168,172
Carpet lining, C. Amaseen	95	168,076
Carriage, child's, R. G. Elder, (reissue)	31	6,657
Carriage coupling, S. E. Foster	31	168,246
Chair, spring rocking, S. Fallon	62	168,148
Chairs, foot rest for, J. H. Travis	62	168,298
Chimneys, ventilator for, P. Mihan	166	168,169
Chopping block for meat cutters, H. P. Rankin	25	168,286
Churn, J. C. Baker	45	168,123
Churn, F. H. Boggs	45	168,218
Cigar, Wilcox and Carr	160	168,310
Cigar boxes, lock for, H. Silberman	93	168,112
Cigar mold, F. C. Miller, (reissue)	160	6,662
Clock work, electric circuit breaking, D. Rousseau	36	168,185
Clothes drier, Osborne and Hay	91	168,178
Clothes pounder, S. M. Allen	91	168,206
Clothes pounder, French and Lash	91	168,247
Coffee mill, R. L. Webb	88	168,307
Coffin, F. S. Haden	39	168,250
Compound, anti-incrustating, H. Burgess	148	168,222
Cooler, milk, L. C. Palmer	45	168,104
Corset, I. D. V. Warner	80	168,304
Cotton cleaner, A. C. Pearce	41	168,282
Cradle, J. B. Nelbach	62	168,173
Cream of tartar, machine for purifying, A. Reisert	35	168,287
Cultivator, J. A. Thompson	43	168,296
Cultivator and harrow combined, I. P. Pickering	43	168,181
Disinfecting, deodorizing, and antiseptic composition, C. H. Bowen	98	168,219
Door check, E. S. Gruel	24	168,151
Doubling and twisting machine, J. F. Wicks	142	168,309
Dredging apparatus, W. H. Newton	51	168,278
Dry goods stand, revolving, J. J. Bisel	54	168,131
Eaves trough, C. A. Codding	126	168,231
Engine governor, J. W. Mathieson	69	168,165
Engine governor, marine, J. Everding	69	168,147
Engine, portable, J. Uhr	94	168 117
Engine, rotary, Reily and Waldo	150	168,184
Engine, rotary, J. C. Titus	150	168,114
Engine, steam, E. V. Oefele	150	168,102
Engines, valve for pumping, W. H. Harrison	118	168 251
Equalizer, draft, E. Graham	31	168,248
Excavations, extensible brace for, Dunn and Silliman	51	168,085
Explosive caps, protector for, F. A. Canfield	124	168,225
Eye glass, J. T. L. Anderson	157	168,122
Faucet, beer, A. L. Bobet	167	168,132
Faucets, device for attaching, J. S. Morton	167	168,171
Fence post, Latcher and Smith	52	168,097
Fire plugs, street lamp signal for locating, G. H. Dougherty	167	168,239
Floor cloth, machine for making plastic, F. Walton	56	168,199
Furnace, N. L. Newcomb	149	168,174
Furnace, smoke burning, S. A. Ford, (reissue)	149	6,666
Furnaces, heat regulator for hot air, A. H. Tingley	149	168 297
Game apparatus, A. Miller	143	168,274
Garden implement, J. Christy	114	168,234
Gas apparatus, P. W. Mackenzie	66	168,265
Gas apparatus, hydrocarbon, C. F. Schüssler	27	168,290
Gas, apparatus for generating and washing carbonic acid, H. Voigt	1	168,300
Gas works, tar gate for hydraulic mains in, J. M. Slaney	66	168,191
Generator, sectional steam, Walker and Pratt	148,	168,198
Grain binder, J. H. Whitney	74	168,120
Grain drier, A. Nash	48	168,101
Gun lock, J. O. Scott	55	168,188
Harrow, J. C. Williams	73	168,311
Harvester, R. H. McCormick	74	168,271
Hat bodies, machine for stretching, J. G. Meeker	76	168,272
Hat pouncing roll, J. Natt	76	168,175
Heater, lunch, M. Bradley	65	168 133
Heater, school room, J. M. Reddy	147	168,106
Heddle frames, device for securing the bars in, L. J. Knowles	95	168 095
Hoeing machine, H. N. Prout	43	168,105
Hoisting apparatus, W. Turner	79	168,196
Horses, device for detaching, J. Carpenter	31	168,227
Horses from jumping, &c., device for preventing, G. D. Chisholm	144	168,082
Horseshoe blanks, machine for rolling, W. D. Young	60	168,205
Horseshoe nail machine, D. J. and S. Farmer	103	168,244
Hose or tubing, vulcanizing, J. B. Forsyth	81	168,087
Hose or tubing, vulcanizing, J. B. Forsyth	81	168,088
Husking pin, G. Armstrong	59	168,078
Ice cream carrier, H. W. Wyman	58	168,303
Indicator, high and low water, F. Millward, (reissue)	148	6,668
Ink, preparing carmine printing, C. J. and C. Briedbach	35	168,134
Iron, manufacture of, A. C. Lewis	85	168,263
Iron, melting and treating, W. Sleicher, Jr.	85	168,293
Jack, ratchet carriage, C. P. Willis	79	168,312
Key ring, G. W. Jopson	93	168,258
Knife polisher, A. M. De Hart	70	168,237
Knife scourer, J. H. Clapham	70	168,083
Knitting machine, D. Bickford	89	168,216
Ladder, firemen's, M. Cronin	30	168,233
Leather, machine for beating, J. H. Hussey	16	168,256
Leg, artificial, Collins and McCalla	5	168,140
Lever power, portable, W. F. Hale	79	168,153
Link, studded, C. A. Chamberlin	60	168,081
Lock, combination, C. D. Judd	93	168,094
Lock for cigar boxes, H. Silberman	93	168,112
Locomotive spark arrester, W. G. Van Buskirk	94	168,299
Looms, take up mechanism for, H. Carstaedt	95	168,228
Lubricating device, G. A. Sawyer	87	168,109
Lunch heater, M. Bradley	65	168,133
Mast hoops to sails, means for attaching, C. S. Barnard	138	168,127
Metal machine, shearing, I. Hahn	119	168,090
Milk, testing, A. Meucci	45	168,273
Nut lock, A. E. Harris	14	168,156
Oil, compound resembling linseed, A. Rieder	107	168,106
Oiler for crank wrists, C. Kurth	87	168,163
Oleaginous seeds, treating, A. B. Lawther	36	168,164
Ore stamp, Ferguson and Jones	3	168,245
Organ bellows, apparatus for operating, G. Beach	106	168,212
Ornamenting and marking wheel, F. Tuchfarber	117	168,115
Packing for steam condenser tubes, W. A. Lighthall, (reissue)	151	6,661
Pan, baking, L. A. Fristoe	154	168,089
Paper tube machine, L. Smith	109	168,193
Pasteboard, manufacture of, G. W. Russell	109	168,186
Piano stool, E. I. Seavey	62	168,110
Picture hanger, C. M. Smith	62	168,113
Pictures for transferring, manufacture of oil, W. Kuehn	54	168,096
Pillow, G. T. Barker	62	168,126
Pills, manufacture of, J. Dunton	156	168,240
Pipe tongs, A. McDonald	100	168,166
Pipe tongs, G. Selden	100	168,291
Pipe tongs, G. Selden	100	168,292
Pipes, hanger for steam and gas, G. W. Blake	64	168,217
Pipes, machine for punching, O. B. Olmsted	119	168,176
Piston rod stuffing box, J. M. Searle	151	168,189
Pitman connection, S. B. Howard	67	168,254
Planter, seed, A. M. Kanouse	133	168 250
Plastering, corner bead for, G. P. Atherton	4	168,207
Plastic compound for making ornamental articles, F. B. Duffey	153	168 086
Plow, W. H. Daniels	114	168,235
Plow, reversible, M. R. Hubbell	114	168,157
Pots, attachment to coffee, S. S. Hoover	136	168,253
Poultry coop, J. Shepard	116	168,111
Presses, hydraulic attachment to cotton, S. Hughes, (reissue)	7	6,667
Prisons, construction of, Cook and Heath	4	168,239
Pump, A. N. Parkhurst, (reissue)	116	6,669
Pumps, air valve for, Smith and Colline	118	168,192
Purifier, middlings, A. F. Ordway	57	168,177
Railroad frogs, machine for welding, O'Leary and Turner	120	168,103
Rake, horse, J. J. Squire, (reissue)	77	6,670
Range, cooking, T. Groom	154	168,172
Roof, fire proof, A. B. Mullett	126	168,277
Roofing compound, J. A. Craig	126	168,142
Rubber from waste, extracting, M. W. Beylikgy	84	168,129
Running gear, G. Burge	31	168,136
Saddle tree, H. Cruikshank	72	168,145
Safe door, Walton and Hemler	128	168,118
Saw frame, buck, P. B. Towle	131	168,194
Saw gumming and setting machine, H. A. Kimball	131	168,162
Sawing machine, F. M. Carnahan	130	168,226
Screw threads, die for swaging right and left intersecting, Beddow and Jackson	14	168,214
Screws, machine for making metal, A. W. Gifford	100	168,150
Sewing machine caster, B. P. Pratt	134	168,182
Sewing machine ruffling attachment, W. H. Convers	134	168,141
Shaft tug, A. F. Morse	72	168,275
Shearing metal, machine for, I. Hahn	119	168,090
Ship yards, truss for, Jordan and Stevens	137	168,159
Shoes, &c., composition dressing for, Brown and Whiteside	16	168,220
Sign, D. D. Young	146	168,204
Sleigh, R. B. Parks	31	168,180
Soap, bleaching, P. Burns	26	168,223
Soda fountain with double faucets, F. T. Paine	1	168,280
Soda water, draft tube for, J. C. Wharton	1	168,201
Spark arrester, W. Halsted	94	168,091
Spark arrester for locomotives, W. G. Van Buskirk	94	168,299
Speaking tube, Campbell and Creighton	158	168,137
Spike and nail extractor, J. Passono	29	168,281
Staves, machine for jointing, B. Barker	40	168,125
Stilt, F. Beaumont, Jr.	143	168,213
Stove, W. Burrows, (reissue)	154	6,663
Stove, cooking, G. Comstock	154	168,084
Stove, heating, M. Roberts	154	168,289
Strap for bridle blinds, winker, Easton and Scott	72	168,241
Street sweeping machine, J. Edson, (reissue)	110	6,658
Street sweeping machine, J. Edson, (reissue)	110	6,659
Table, advertising, J. M. Plessner	146	168,284
Table, extension, Hantsche and Wagner	62	168,154
Table, folding, H. Baldwin	62	168,124
Table, kitchen, J. C. Ricketts	62	168,288
Tag fastener, T. P. Marston	146	168,267
Telegraph, automatic, T. A. Edison	158	168,243
Telegraph key, automatic, L. S. Crandall	158	168,143
Telegraph key, automatic, L. S. Crandall	158	168,144
Telegraph printing, E. Gray	158	168,249
Telegraphs, transmitter and receiver for automatic, T. A. Edison	158	168,242
Thill coupling, W. Katon	31	168,160
Thill coupling, B. C. Walter	31	168,303
Thrashing machine teeth, J. W. Waterman	159	168,305
Toy building block, G. H. Chinnock	143	168,229
Toy figure, articulated, G. H. Chinnock	143	168,230
Track lifter, G. W. Hunter	79	168,255
Trap and bend, Adee and Foley	8	168,121
Truss, L. T. Lubin	156	168,264
Tube, sheet metal, J. C. Milligan	163	168,100
Tunnel, O. B. Dowd	51	168,146
Valve gear, H. J. Behrens	152	168,215
Valve grinder, L. P. Law	70	168,262
Vehicle axle, E. Ball	31	168,208
Vehicle hub, E. Ball	31	168,210
Vehicle spring, W. Beers	31	168,198
Vehicle spring, R. Walker	31	168,302
Vehicle wheel, E. Ball	31	168 209
Vehicle wheel tire, E. Ball	31	168,211
Ventilator for chimneys, P. Mihan	166	168,169
Wagon, E. Hnson, (reissue)	31	6 660
Wagon, ice, C. Rauch	31	168,183
Wagon reach, A. B. Wroth	31	168,313
Wash board, E. S. Heath	91	168,252
Washer and separator, gold, B. Tyson	3	168,116
Washer for cakes and biscuits, steam, D. Carrick	6	168,138
Washing machine, D. B. Pond	91	168,285
Water, aerated sea, J. Matthews	1	168 269
Water trap, W. A. Butler, (reissue)	8	6 664
Water trap, W. A. Butler, (reissue)	8	6 665
Water wheel, R. Wilson	168	168,202
Weft stop mechanism, T. Isherwood	95	168 158
Well boring machine, R. H. Metzker	51	168,099
Whiffletree, P. McGlew	31	168,167
Windlass and capstan, D. N. B. Coffin, Jr.	79	168,139
Windmill, Stephens and Shay	118	168,294
Wrench bar heads, machine for forging, G. C. Burdict	29	168,135

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED SEPTEMBER 28, 1875.

	Patent No
Adee, F., and J. Foley, Trap and bend	168,121
Adler, A. S., assignee	168,256
Allen, S. M., Clothes pounder	168,206
Amaseen, C., Carpet lining	168,076
American Linoleum Manufacturing Company, assignee	164,199
Anderson, J. T. L., Churn	168,122
Anderson, V. D., Boiler feeder	168 077
Armstrong, F. S. and H. K., assignees	168,244
Armstrong, G., Husking pin	168,078
Atherton, G. P., Corner bead for plastering	168,207
Baker, A., Addressing machine	168,079

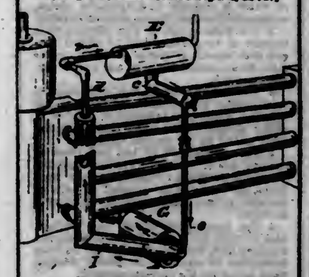
TITLES, DRAWINGS, AND CLAIMS

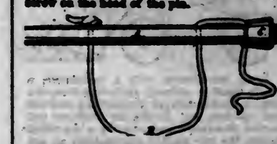
OF



PATENTS GRANTED SEPT. 28, 1875

168,076. CARPET-LINING. C. Arnesen, Boston, Mass. [Filed May 1, 1875.]

A quilted carpet-lining having strips of paper pasted to the lines of loops and to the adjacent paper envelops over the said lines of loops and paper envelops on one or both sides, substantially as shown and described, for the purpose set forth.



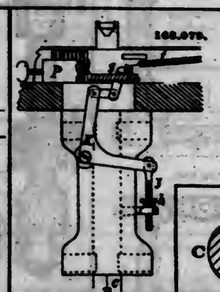
168,077. BOILER-FURNACE. V. D. Anderson, Springfield, Ohio. [Filed Sept. 4, 1875.]

The herein described boiler-feeder, consisting of the water-tank B, connected to the mud-drum C by a pipe, *c*, and the steam-pipe F, connected with the mud-drum and the boiler, with the check-valve *d*, constituting the tank B with the steam-space I at the volume of the boiler, the whole being arranged to operate substantially as described.

168,078. HORSE-HAY. Geo. Armstrong, Rhodes, Ill. [Filed July 28, 1875.]

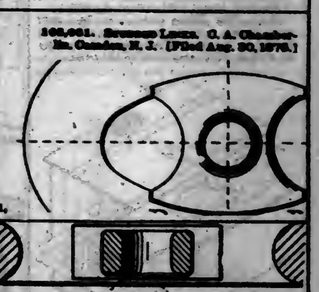
Brief.—The strap is connected, on adjustment, at any desired point by means of a clamping-screw on the head of the pin.

1. The combination, with the hooking-pin and loop-strap, of a screw device at the heel for hooking the strap by pressure of the screw against it, substantially as specified.



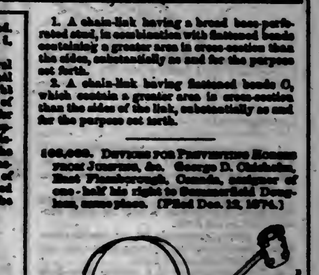
2. The combination, with the pin A and loop-strap B, of the screw-ferrule or nut C, substantially as specified.

168,079. ADJUSTABLE-MACHINES. Albert Baker, Westfield, Pa. [Filed May 25, 1875.]



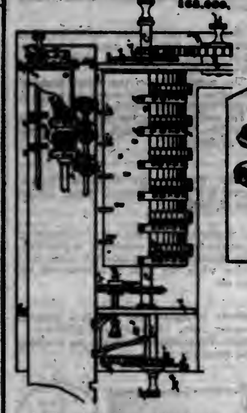
Brief.—The sliding gulley is moved by a slotted bar, which changes and moves it forward when actuated by a bell-crank lever.

1. The rib O on the side of the gulley P, in combination with the notched plate *g* and spring *f*.



2. In combination with the rib O on the side of the gulley P, the notched plate *g*, and spring *f*, the arm I, rod J, adjustable rod L, and lever K, when arranged as described, to produce the results substantially as specified.

168,079.



168,081.

168,080. CALCULATING-MACHINE. Edmund D. Barbour, Boston, Mass. [Filed Feb. 6, 1875.]

Brief.—A cylinder is provided with several series of sliding teeth set in longitudinal grooves, and so arranged as to be brought into position to operate the gear-wheels of the register. A special provision is made for the decimal transfers; and the results of operations are transmitted to the series of registering-wheels, which are all arranged on the same shaft. By means of a sliding and transfer paper pressed upon the raised figures of the said registering wheels or disks, a printed impression of the numerical results may be made, when desired.

168,080.

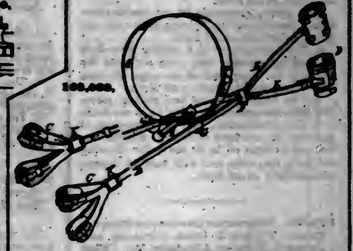
1. The calculating-machine, having a single revolving cylinder, with sets of separate teeth sliding in grooves, separately or together, into a position to operate upon a register, substantially as described.

2. The handle H, gear-wheels F' and E', and worm-gear E'', for imparting a feed motion to a register.

3. The detaching-wheel K, handle K', pinion K'', and pinion K''', for the purposes described.

4. The wheels V and V', and handle V'', for registering the quotient upon the common dials of a calculating-machine.

5. The hollow spindle E, having pinions E, with beveled hubs *r* and *r'*, and the studs *t* and *t'* and *v* and *v'* attached to the cylinder, for effecting the carrying of the tens.

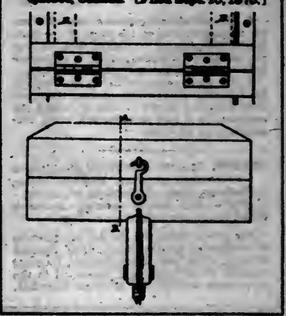


6. In combination, with the spindle E and pinion E, with beveled hubs, the pinion *n*, dial *n'*, and projection *p*, or their equivalents, substantially as described.

7. The carrying-wheels E, with beveled hubs, substantially as described.

1. A chain-link having a broad base perforated steel, in combination with fastened beads centrically a greater area in cross-section than the sides, substantially as and for the purpose set forth.

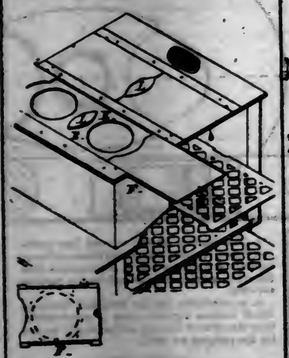
2. A chain-link having fastened beads C, which contain a greater area in cross-section than the sides of the link, substantially as and for the purpose set forth.



168,082. DEVICE FOR PREVENTING HORSES FROM JUMPING, &c. George D. Chisholm, East Farnsborough, Canada, assignor of one-half his right to Summerfield Douglass, same place. [Filed Dec. 22, 1874.]

168,083.

The combination of the girt A, having the rings C C, the longitudinal straps B B, passing through the rings C C, and having at the ends the rings E E, and liberated or split straps O O and the straps D, connected with the straps B B, and provided at its ends with the tapering elongated leggings D, the whole being constructed and arranged substantially as and for the purpose described.



168,084. KNIFE-SCOURER. J. H. Clapham, Quebec, Canada. [Filed Sept. 10, 1875.]

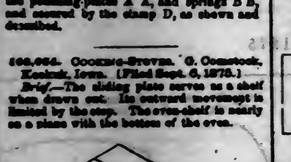
The covered hinged case C C, open at each end and provided with dovetailed recesses for the polishing-plates A A, and springs B B, and secured by the clamp D, as shown and described.

168,664. COOKING-STOVE. G. Comstock, Keokuk, Iowa. [Filed Sept. 6, 1875.]

Brief.—The sliding plate serves as a shelf when drawn out. Its outward movement is limited by the stop. The oven-shelf is nearly on a plane with the bottom of the oven.

1. The combination of a sliding stove-rest-hole lid, with a channel thereafter on the stove-top, and between two elevated portions thereof, substantially as set forth.

2. A sliding stove-hole lid, in combination with holding projection B over its edge, substantially as set forth.



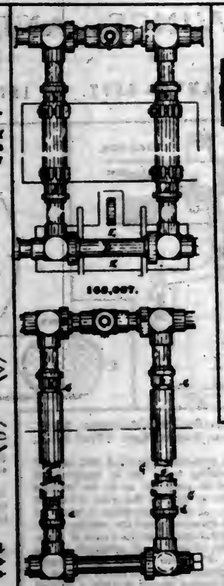
3. A sliding stove-hole lid, in combination with a stop to prevent its being drawn out too far, substantially as set forth.

4. The combination of a sliding stove-hole lid, having concave end, with a device for holding the inner end of its edge F when drawn out, substantially as set forth.

5. The combination of two sliding stove-lids with the central division I, as set forth.

6. The combination, with the stove-oven, of the shelf M, arranged to slide in and out under and in front of it, to serve for drawing out pans, &c., cake, and with holding device, substantially as set forth.

168,665. EXTENSIBLE BRACES FOR HEDGE-FRAMES. William T. Dunn, Pittsburg, and James F. Hillman, Allegheny, Pa. [Filed Sept. 1, 1875.]



1. The self-adjusting shoes e, capable of automatic adjustment to the slope of the construction, permanently connected with, to, and in combination with, the parts a d, extensible by a screw-joint, substantially as set forth.

2. The shoes e attached to the outer ends of the extensible parts a a by means of U-shaped clips d playing loosely in shoes or bosses b, the combination of said parts named being substantially as set forth.

168,666. FLAMED COMPOSITION FOR MAKING ORNAMENTAL ARTICLES. Frank B. Dudley, Hastings, Mich. [Filed Aug. 24, 1875.]

Brief.—Any desired coloring matter is added to the composition.

The plastic compound for the manufacture of ornamental articles, consisting of Spanish whiting, white lead, crude varnish, Dammar varnish, Japan drier, and linseed-oil in the proportions substantially as herein described.

168,667. VULCANIZING HOSE OR TUBING. James B. Forsyth, Boston, Mass. [Filed Jan. 2, 1875.]

1. The improved process above described for vulcanizing tubing by means of heat applied internally, as described, while the tubing is covered, as set forth.

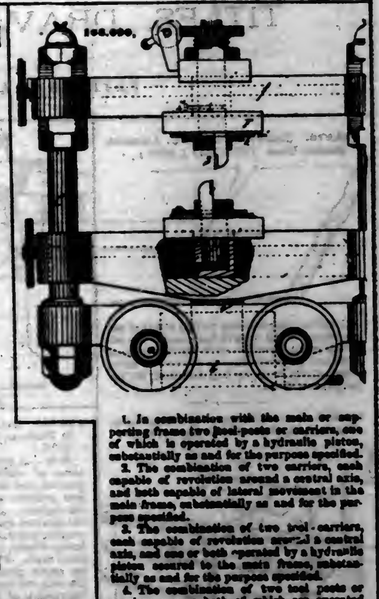
2. The combination of the hollow mandrel G, the pipes B and D, and couplings b and d, arranged together as described.

3. The combination of the pipe B, couplings b and d, pipe D, and carriage E, arranged together as described.

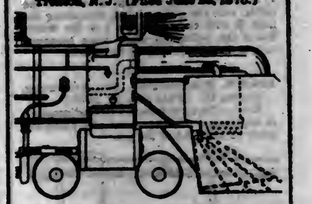
168,668. VULCANIZING HOSE OR TUBING. James B. Forsyth, Boston, Mass. [Filed May 22, 1875.]

The improvement in the art of vulcanizing hose, above described, consisting in introducing the heating medium through pipes into the hose while the hose is surrounded by heated air.

168,669. BAKING-PAN. Lydia A. Friend, Denver, Colo. [Filed June 8, 1875.]



Brief.—Upon withdrawing the pin the hoop can be removed.



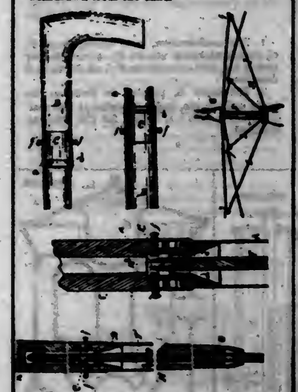
The combination of the hoop I, provided with the clasp, pin, and groove, as specified, and the bottom K, as shown and described.

168,670. MACHINES FOR THRASHING METAL. Stanislaus Hahn, Pittsburg, Pa. [Filed Apr. 24, 1875.]

Brief.—Two cross-beams—the one adjustable vertically and the other movable vertically by a hydraulic ram—support, respectively, the two shear-blade holders, and these holders are free to rotate, and also free to be moved laterally upon the beams, the screws being used for the latter purposes. The whole machine is mounted on two pairs of wheels.

168,671. STEAM-ANNEALING. W. Halsted, Trenton, N. J. [Filed June 28, 1875.]

1. In combination with a locomotive, a smoke-stack or chimney projecting from the engine directly forward horizontally over the cow-catcher, and having its forward end turned downward, and entering a box which covers the cow-catcher, substantially as and for the purpose set forth.



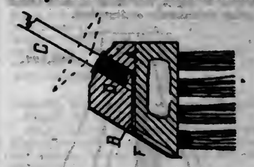
2. In combination with a smoke-stack or chimney projecting horizontally from the locomotive, a triangular box or covering over the cow-catcher, the combination serving to convey the sparks and ignecus matter directly forward from the smoke-stack, and then down upon the trunk forward of the locomotive.

3. In combination with the box which covers the cow-catcher, a tank or water-compartment located in the top of such box, and provided with perforations or water-outlets in its bottom, to permit the water to drip through the same, substantially as and for the purpose set forth.

4. In combination with the box that covers the cow-catcher, and with a water-dripping apparatus, the corrugated or grooved plate beneath the cow-catcher, and inclining backward, and serving to receive the falling water and the embers or sparks, and to extinguish them, all substantially as set forth.

168,672. CANES AND UMBRELLAS. Cornelius Theodore Harris and August Klindworth, Cleveland, Ohio. [Filed Aug. 4, 1875.]

Brief.—The plates press against the spring-cushion, whereby the umbrella-rod may be withdrawn from the cane.



1. The handle B of the cane, herein described, provided with a slotted ferrule, C, and D, having a slot, *c d d*, therein, with a ball-mouth opening, in combination with section A thereof and pin *e*, substantially as set forth, and for the purpose specified.

2. In combination with the cane constructed as herein described, the umbrella consisting of the tubular handle F, rod F', rest ((and rib G, brace *f*, band G', and collar H, in the manner substantially as described, and for the purpose set forth.

3. The plates *f' f'*, in combination with the rod F and cushion *x x*, in the manner substantially as described, and for the purpose specified.

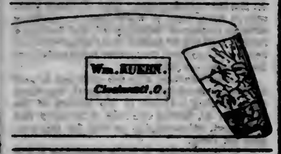
168,673. WATER-SPRINKLER. H. T. Hollenbeck, Philadelphia, Pa. [Filed July 15, 1875.]

Brief.—The water passes to the blocks through a hollow handle, and thence through the head, where it strikes a metal deflector, which spreads the water in front of the brushes.

In a water-brush, the combination of the block A, brushes B, spray-chamber E, pipe C, and the spray-deflector F, as shown and described.

168,674. COMBINATION-LOCKS. Charles D. Judd, East Haven, Conn. [Filed Apr. 26, 1875.]

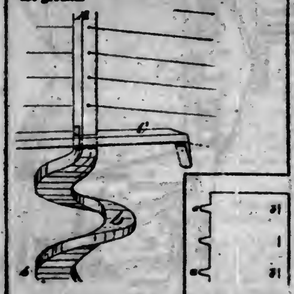
1. The circular plate *d*, attached to the cone-spindle, and provided with curved slots for engaging the pins *a*, attached to the bolt B, and moving the bolt B back and forth, in the manner described, substantially as and for the purpose set forth.



2. The spindle made in two pieces and connected by pins, in the manner described, allowing the outer part to be turned nearly a revolution before the pins again engage each other to move the inner part of the spindle, substantially as set forth.

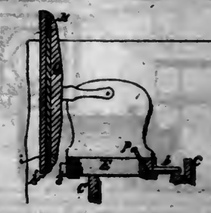
168,675. DEVICES FOR SECURING THE RODS IN HEDDLE-FRAMES. Lemuel J. Knowles, Worcester, Mass. [Filed Aug. 20, 1875.]

The combination, with the end pieces B B, of the harness-frame and heddle-bars provided with end slots *b b* of the holding and supporting pieces *a a*, provided with bands *b*, hooks *b*, bearing-surfaces adjoining the hooks for steadying the heddle-bars, and screws and nuts *b*, substantially as and for the purpose set forth.



168,676. MANUFACTURE OF OIL-PICTURES FOR TRANSFERRING. William Keehn, Cincinnati, Ohio. [Filed June 21, 1875.]

The process of producing transferable pictures in opposite colors, consisting in the use of two sets of sheets, A and B, one side of each of which sheet A has its sized surface marked or imprinted with the light-outline or border, the sheet with a transparent oil-color, on which the picture is subsequently painted, the sheet sized bordered and painted surface of sheet A being then pasted face downward upon the sized surface of sheet B, from which sheet A when pasted, so as to leave the picture proper adhering face downward to sheet B, and ready for the final transfer to the object to be decorated, substantially as set forth.

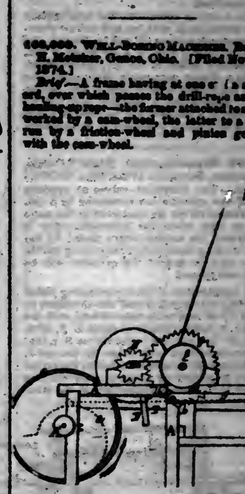


168,677. PRESS-FORM. John W. Letcher and T. J. Smith, Johnstown, N. Y. [Filed May 17, 1875.]

Brief.—A post in one solid piece of metal, its lower end flat and spiral, and perforations for wires through its upper part, enters the earth through a metal sill held to the surface of the ground by a leg which is stricken into the ground.

168,678. SEWING-GAGE. Christian B. Lenox, Atlanta, Ga., assignor of one-half his right to John F. Divine, Wilmington, Del. [Filed July 24, 1875.]

Brief.—Cushions hinged together, and all contained in dovetailed recess of bank. Gage adjustable forward and back on fixed frame.

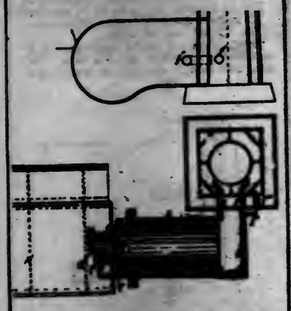


1. The combination of the bottom frame C, cast-frame E, bands *b c*, and steps *c c*, all constructed and arranged in the manner and for the purpose set forth.

2. The combination, with the bank F, provided with the dovetail bands *d*, of the jointed cushion G H H', constructed as described, for the purpose stated.

168,679. WELL-BORING MACHINE. Reuben H. Webster, Genoa, Ohio. [Filed Nov. 28, 1874.]

Brief.—A frame having at one end (a standard, over which passes the drill-rope and the hoisting-up rope—the former attached to a lever vertical by a cam-wheel, the latter to a drum run by a friction-wheel and pinion gearing with the cam-wheel.



In a well-boring machine, the combination of the cam D, lever or walking beam I, rope O, sheave F, standard E, and drill H, with a windlass, consisting of the pinion N, cog-wheel O, shafts M P, and brake, comprising a wheel, G, band R, and lever S, all as herein before set forth.

168,680. SHEET-METAL TUBES. John C. Milligan, South Orange, N. J. [Filed July 8, 1875.]

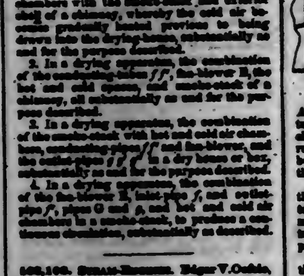
As a new article of manufacture, a sheet-metal tube the longitudinal seam of which is formed by a series of tongues projecting from one edge of the sheet, which pass through slits near the opposite edge of the sheet, and are bent backward upon the surface of the inner lap of the tube so formed, substantially as herein described and set forth.

168,101. GRAIN-DRIERS. Adolphe Mack, Logansport, Ind. [Filed Aug. 10, 1875.]

Brief.—The air, which is introduced through a pipe, either passing through the connected chambers which surround the chimney, is discharged, in a heated condition, into the drying-chamber through a conical pipe.

1. The combination of the hot and cold air chambers with the smoke-stack and exterior shell of a chimney, whereby the cold air becomes moderately heated previous to being drawn into the drying-frame, substantially as and for the purpose described.

2. In a drying apparatus, the combination of the condensing-tubes *f f*, fan-blower B, the hot and cold spaces, and smoke-stack of a chimney, all substantially as and for the purpose described.

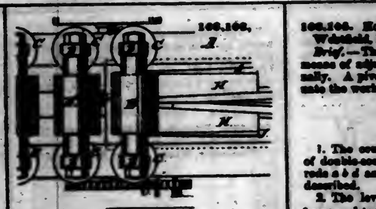


3. In a drying apparatus, the combination of the smoke-stack with hot and cold air chambers, condensing-pipes *f f* and fan-blower, and the outlet-pipes *f' f'* in a dry house or box, substantially as and for the purpose described.

4. In a drying apparatus, the combination of the fan-blower B, inlet-pipe *f*, and outlet-pipe *f'*, pipes G and *g*, and hot and cold air chambers in a smoke-stack, to produce a continuous circulation, substantially as described.

168,102. STEAM-ENGINES. Edgar V. Cobbin, Mannheim, Germany. [Filed Sept. 7, 1875.]

Brief.—The induction-valves at opposite ends of the cylinder are connected by a rod. The exhaust-valves are connected in the same way, so that when the induction-valve is opened and the exhaust-valve closed by the piston striking them, the corresponding valves at the opposite end of the cylinder will be closed and opened.



The combination of the reciprocating piston B, having the rods C D and the shoulders or collars *f g* on said rods, respectively, with the cylinder A, having the inlet-pipes E F, inlet-valves E' F', and the outlet-valves H I, that are connected with each other by the rod J, all substantially as specified, so that the valves shall all be moved by direct contact with the body of the piston, substantially in the manner described.

168,103.

168,104. MILK-COOLERS. Leroy C. Palmer, Charlotte, Vt. [Filed Mar. 18, 1875.]

Brief.—A vertically-adjustable and laterally-compressed regulator of the height of water in the cooling-pan. A double-shouldered pipe between the pans, receiving a dependent and sloped tube attached to the milk-pan.

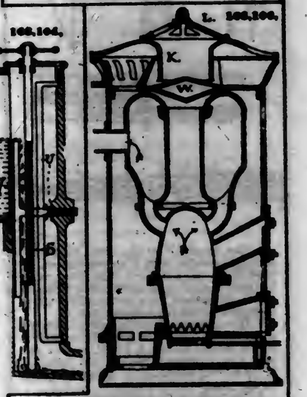
168,104.

1. In combination with the pan A' and tank A, the double-shouldered pipe G, being a fixture in the bottom of water-tank A, reaching close to bottom of milk-pan A', and having a rubber packing or gasket on its upper end, all being arranged and to operate substantially in the manner set forth.

2. In combination with the milk-pan A' and the double-shouldered fixed pipe G, the short tube V, being a fixture in the bottom of the milk-pan A', having one side of its lower end truncated, substantially as and for the purpose set forth.

3. In combination with the water-pan A and the milk-pan A' the water-regulator R, composed of a suitable shell of one or more pieces, having at its upper part the inlet O, over which inlet slides an adjustable gate, F, properly packed, kept in position laterally by means of guides E R, controlled in height by screw S and wheel T, and made water-tight by screw-pressure bar U and wheel F, the lower part of the regulator having an outlet to which may be connected a pipe or drain, operating in the manner and for the purpose as set forth.

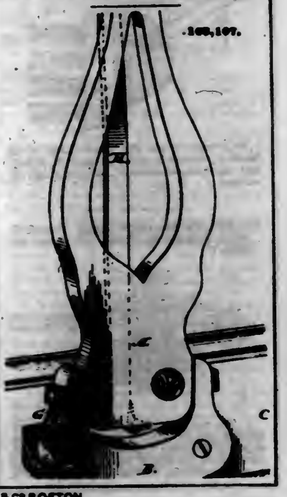
168,105. SCHOOL-ROOM FURNITURE. James M. Reddy, Milwaukee, Wis. [Filed Mar. 17, 1875.]



Brief.—The bottom of the pan is made double to obviate excessive heating from the first impact of the hot air.

1. The combination, with spring-bent F, of double-contacted stocks F', adjustable by rods *a b d* and slide-pieces *f' f*, as shown and described.

2. The lever B, pivoted in front to the frame and tongue, and adjustable at the rear in slotted guides *b b*, as and for the purpose specified.

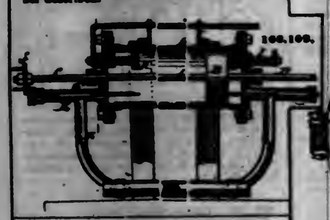


168,106. SCHOOL-ROOM FURNITURE. James M. Reddy, Milwaukee, Wis. [Filed Mar. 17, 1875.]

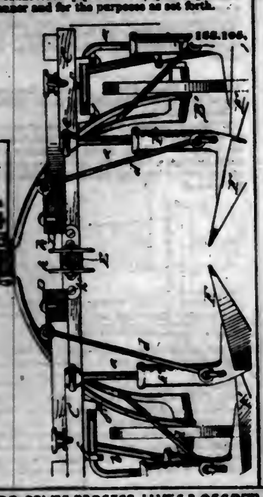
Brief.—The form of standards and their means of adjustment laterally and longitudinally. A pivoted lever or gage-bar to graduate the working depth.

168,106.

168,107.



168,107.



168,108. MACHINES FOR WELDING RAILWAY-FROGS. Arthur J. O'Leary and Jno. Turner, Chicago, Ill. [Filed July 12, 1875.]

Brief.—Dies pivoted upon a plate adapted to slide between pulleys and under rolls, by which the welding operation is performed.

The combination of the pivoted dies H, the sliding bed-plate F, and the pressure-rollers E, wheels C, and frame A, as described.

168,108.

168,108.

168,107. BOOT-JACKS. Milo A. Richardson, Bridgeport, Conn., assignor to R. Bixby, Sherman, N. Y. [Filed June 17, 1875.]

The spring C, in combination with the footboard A, provided with the slot E, the bracket B, provided with the slot G, and the bolt D, substantially as and for the purposes herein set forth.

168,109. COMPOUNDS RESEMBLING LINSEED-OIL. Albert Bleiler, Allegheny City, Pa. [Filed July 29, 1875.]

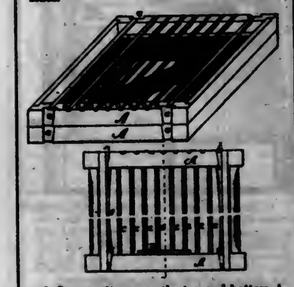
1. A compound oil resembling linseed-oil, composed of linseed oil, crude petroleum oils, tropical as described, litharge, and gum-shellac, together with bichromate of potash and rosin for giving the proper color and gravity to the oil.

2. The method herein described of disguising or removing the petroleum odor, consisting in secreting fixatives in the oil or its admixtures.

168,110. LUBRICATIVE DEVICES. George A. Sawyer, Augusta, Me. [Filed July 6, 1875.]

1. A lubricating device having the metallic plate or rod C, with one or more vertical or one or more spiral grooves, B, formed upon or within it, substantially as described.

2. In a lubricating device, the combination of the stopper A with the metallic plate or rod C, having formed upon or within it one or more longitudinal or spiral grooves, B, substantially in the manner and for the purpose herein set forth.



168,111. RAISED-STOOLS. Edwd. I. Savoy, Rossville, N. H. [Filed Apr. 20, 1875.]

The seat A, provided with the pins D, having in it a tapering center, *c*, in combination with the screw B, provided not only with the tapering projection or head *b* to closely fit the said center, but with the transverse notch *c*, arranged with the head, as and for the purpose as represented.

168,112. POULTRY-COOPS. James Shepard, Bristol, Conn. [Filed Mar. 11, 1875.]

Brief.—A coop with removable posts and cloth sides inside of the posts, the framed top and bottom determining the form of the cloth sides.

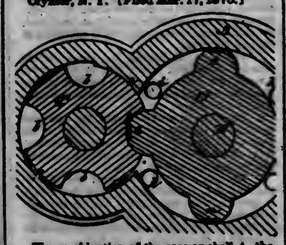
1. In a poultry-coop, the top and bottom A A, in combination with the removable posts and flexible cloth sides, all operating together so as to expand or collapse the coop, substantially as described.

2. In a poultry-coop, the combination of the top and bottom A A, having dovetailed recesses *a a a a*, with the removable and reversed posts *b b b b* and wedges *b' b' b' b'*, all substantially as and for the purposes described.

3. In a poultry-coop, the two framed sides, in combination with the removable posts placed at the outer edges of said framed sides, and three or more cloth sides placed inside of said posts, the form of the cloth walls being imparted by means of the two framed sides, all substantially as described, and for the purpose set forth.

168,113. LOCKS FOR CIGAR-BOXES. Henry Silberman, New York, N. Y. [Filed Sept. 13, 1875.]

Brief.—The front of the box carries a right angle or hook, which takes into a recess in a plate secured to the lid. The hook can only be freed by pushing in the front of the box. The recessed plate is of sheet metal, and carries prongs, by which it is secured to the wood.



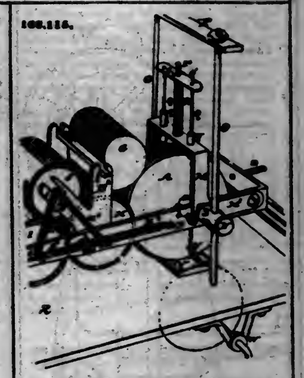
In combination with the cigar-box front *a* and hook *b*, projecting therefrom, the perforated plate *c*, having the prongs *d*, and the box-cover B, having the recess *e*, all arranged so that the box can only be unlocked by springing the front *a* inward, substantially as described.

168,114. PICTURE-HANGERS. C. M. Smith, Boston, Mass. [Filed Aug. 10, 1875.]

A picture-hanger composed of the depicted-hooked screw C and a T-headed screw, D, all constructed substantially in the manner and for the use as specified.

168,115. ROTARY ENGINES. John C. Titus, Marion, Ohio, assignor to William Haven, Clymer, N. Y. [Filed Mar. 27, 1875.]

The combination of the case or shell A, the wheels or cylinders C and C' C', with their respective lugs *a* and recesses *b*, steam-spaces *f*, bearings *e*, inlets *h h*, and outlets *i i*, all constructed substantially as and for the purpose herein set forth.



168,116. ORNAMENTING AND MARKING WHEELS. Frank Tuckhorter, Cincinnati, Ohio. [Filed June 30, 1875.]

Brief.—The wheel is adjustable on its standards, and can be held to register by a spring-pawl, which falls through a hole in a pin projecting from the wheel. The wheel may be taken from its frame and used with a handle.

168,117. PORTABLE ENGINES. John Ulr, Erie, Pa. [Filed June 28, 1875.]

In a road-locomotive, the frictions *a* and *d*, in combination with wheels *c*, axle B, rod *g*, lever G, crank-shaft D, and engines O, all constructed substantially as described, and for the purpose set forth.

168,118.

1. In a head ornamenting-press, the combination of roller A, with device for taking it, arranged substantially as described, roller V, plate 2, and registering apparatus Q, for the purposes set forth.

2. In a head ornamenting-press, the combination of roller A, with device for taking it, arranged substantially as described, roller V, plate 2, and adjustable uprights O, as and for the purposes set forth.

3. In a head ornamenting-press, the combination of roller A, with device for taking it, arranged substantially as described, roller V, plate 2, registering apparatus Q, and uprights O, for the purposes specified.

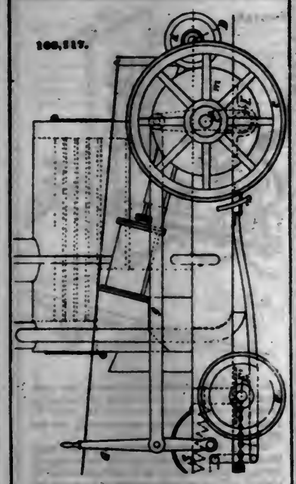
168,119. GOLD WASHERS AND SEPARATORS. Bryan Tyree, Washington, D. C. [Filed June 7, 1875.]

Brief.—The slats of the grate are made tapering on one side to allow the ready passage of gravel, dirt, &c. The box washing-table has openings, nearly square, protected on each side by projecting plates, by which construction the sand is prevented settling around and clogging the openings. The grate-bars are removable and adjustable.

1. The bars A', constructed as shown in Fig. 3, wide at the top and narrow at the bottom, with a straight perpendicular rear edge, *c*, front, inwardly-inclined edge *b*, extending about two-thirds of the height of the bar, and straight, perpendicular lower front edge *a*, substantially as and for the purposes described.

2. The grating A, composed of separate removable and adjustable bars A', intermediate plates A², and binding-rods E, all substantially as and for the purposes described.

3. In combination with grating A and box B, the partitioned box C D and perforated tank E, arranged in relation to each other, and the tank perforated in its bottom, so that the jets of water therefrom will strike just in front of each partition in the box C, as and for the purposes described.



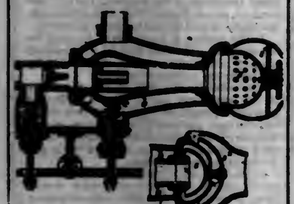
4. The platform F, perforated or pierced with nearly square or slightly-pyramidal shaped holes, provided on each side with deflecting-plates *f*, as and for the purposes described.

5. The gold precipitator and concentrator, consisting of grating A, box B, partitioned box C D, tank E, perforated platform F, and partitioned box G *g*, all constructed, arranged, and adapted to operate as and for the purposes described.

168,120. PORTABLE ENGINES. John Ulr, Erie, Pa. [Filed June 28, 1875.]

In a road-locomotive, the frictions *a* and *d*, in combination with wheels *c*, axle B, rod *g*, lever G, crank-shaft D, and engines O, all constructed substantially as described, and for the purpose set forth.

168,117.

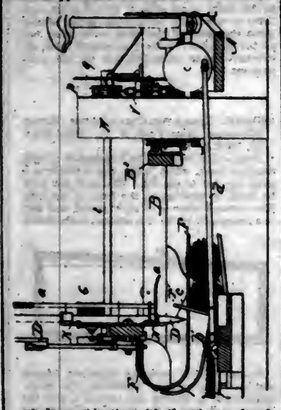


168,118. SAFE-DOORS. Elias E. Walton and Michael Hamler, Cincinnati, Ohio. [Filed Apr. 20, 1875.]

The sliding cap for the inside of safe-doors, in connection with the grooves on the inside edges of door for the cap to slide in.

168,119. EJECTOR ATTACHMENTS FOR VACUUM-BRAKES. Geo. Westinghouse, Jr., Pittsburg, Pa. [Filed Dec. 24, 1874.]

Brief.—Upon the discharge-nozzle of an ejector is arranged a case containing one or more discharges placed transversely to the outgoing column of steam and air, and other perforated or affording annular spaces for the escape of said column, all being to prevent the noise occasioned by said column discharging directly into the air.



1. A box or case, arranged on the discharge end of an ejector, and containing one or more diaphragms, with perforated or annular escape-parts, or both, the same being arranged across the direction of the escape of steam from the ejector, substantially as set forth.

2. In combination with an air-ejector, otherwise arranged to discharge freely into the open air, one or more perforated diaphragms, arranged in or across the discharge, substantially as and for the purposes set forth.

3. A dome-shaped discharge, *c*, arranged with reference to the discharge-opening of the ejector-head, and in combination therewith, substantially as set forth.

168,120. GRAIN-BINDERS. John H. Whitney, St. Louis, Mo., assignor to Seymour & Whitney Manufacturing Company, same place. [Filed Nov. 24, 1874.]

Brief.—The cut grain is delivered at the stubble-side of the platform, where it is bound and dropped from the machine.

1. In combination with the pitman *d* and the sickle-bar *b* the elongated wrist *o'*, having a bearing on *o* in a guide-plate, *w*, at its front end, substantially as shown and described.

2. The curved rods E, having their inner ends *r'* turned upward, said rods being arranged in relation to the rake and binding mechanism, substantially as described, for the purpose of forming the bundle, as set forth.

3. The combination of the wheel L, curved slotted lever I, and needle D, arranged to operate substantially as described, for imparting to the needle the required intermittent motions, as set forth.

4. In combination with the wire-carrying needle D and its reciprocating lever, the grooved cam-wheel L, pivoted lever H, and connecting-rod T, all constructed and arranged to operate substantially as described, whereby the intermittent movements are imparted to the wire carrier and twister at the required intervals, as set forth.

5. The clutch *j*, provided with its arm *n*, in combination with the rock-shaft S, provided with the arm *m*, having the inclined face and shoulder *n'* thereon, for automatically throwing the binding mechanism out of gear with the driving mechanism, substantially as described.

6. In combination with the automatic disconnecting-clutch and driving mechanism, the lever *q*, connected to the rock-shaft S, all constructed to operate substantially as described, for putting the binding devices in operation at will, as set forth.

7. The plate M, having its upper surface rounded or inclined in the line of the movement of the grain to assist in separating the grain for the passage of the needle, substantially as described.

8. The plate M provided with the enlarged opening for the passage of the needle, and the bearing-points *r* to prevent lateral displacement of the needle, constructed to operate as and for the purpose set forth.

9. The plate M provided with the slot *o'* and incline *t*, in combination with the needle D provided with the finger *u*, said parts being constructed to operate substantially as described, for the purpose of delivering the wire properly to the twister, as set forth.

10. The needle D provided with the lever *s* and rigid projections or guards *x* and finger *u*, all constructed to operate substantially as described.

11. The combination of friction-pulley *h*, spring *f'*, and the needle provided with the shoulder *g'*, arranged to operate as set forth, for the purpose of giving increased tension to the wire while the bundle is being formed, as set forth.

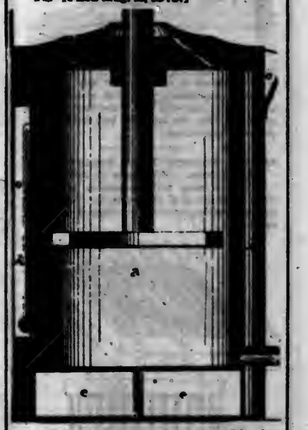
12. The lever I provided with the adjustable fulcrum *h'*, in combination with the needle D and wheel L, whereby the movements of the needle can be regulated to suit its adjustment on its supporting-bar B', as set forth.

13. The needle D provided with the finger *u*, and having its lower bearing N arranged substantially as described, whereby the needle is drawn up so as to bring the finger *v* within said bearing to insure its being cleared within the needle, as set forth.

14. The combination of the spring-rods F and the bent rods E, arranged to operate in connection with a grain-binding mechanism, substantially as described.

168,121. TRAPS AND BENDS. Frederick Adee and James Foley, Brooklyn, N. Y. [Filed Sept. 2, 1875.]

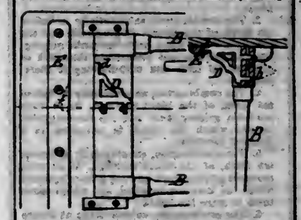
Brief.—The trap is made with a plain cylindrical thimble, which is fitted with a rubber plug that can be expanded to make a tight fit, thus dispensing with screw-threads in the thimble and the screw-plug commonly used.



The trap or bend made with the plain cylindrical thimble *b*, in combination with the rubber plug *d*, follower *c*, screw *f*, and head *f*, substantially as set forth.

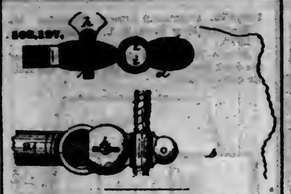
168,122. EYEGLASSES. James T. L. Anderson, Brooklyn, E. D., N. Y. [Filed Aug. 28, 1875.]

A pair of spring-connected eyeglasses, provided with clamps or nose-rests O O', movable on studs *o'* out of the plane of the glasses, as and for the purpose specified.



168,123. CHURNS. James C. Baker, Corry, Pa. [Filed Aug. 11, 1875.]

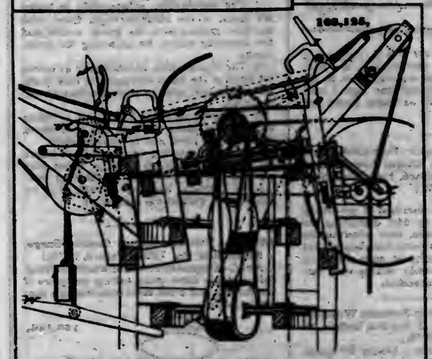
1. The chamber *a*, made wholly within the water-chamber *b*, and provided with the slide *g*, in combination with the thermometer *h* and dividing-strips of wood *i*, whereby the thermometer is protected both from the heat of the water in the chamber *b* and the outside air, substantially as shown and described.



2. The brace or supports *c*, placed radially under the bottom of the churn, and having spaces between them for the water to flow freely between, as set forth.

168,124. FOLDING TABLES. Hiram Baldwin, Nashua, N. H. [Filed Feb. 20, 1875.]

In a folding table, the brackets D, having a lip, *d*, and legs *e*, in combination with the rails *a b* of folding legs B B', and the recessed strips E, substantially as specified.



168,125. WHEELS-SPANNER. Wm. Brown, Milan, Ohio. [Filed June 17, 1875.]

The combination of the through-brace J, cross-bar I, side spar H, side spring G, attached to the cross-spring C, substantially in the manner as herein described, and for the purpose set forth.

168,126. MACHINES FOR JOINTING STAVES. Benjamin Barker, Ellsworth, Me. [Filed July 8, 1875.]

Brief.—The stave-carriage is carried upon a curved track, the curvature of which is proportioned to the bilge of the stave, the latter being held in position upon the carriage by automatically-operating dogs.

1. The feeding-strap J, adjustable and stationary feed-pulleys K K, and the foot-lever W and its connections, with the movable pulley, combined and arranged substantially as specified.

2. The feed-strap and the reversing-cord, connected to the dogs I in such manner that their tension holds the dogs in the staves, substantially as specified.

3. In combination with two adjustable inclined saws, the sliding carriage, automatically-acting dogs, and the inflexible vertically-curved rail, having its radius of curvature all on one side, as shown and described.

168,127. MEANS FOR ATTACHING MAST-HOOPS TO SAILS. Chas. S. Barnard, West Meriden, Conn. [Filed Aug. 26, 1875.]

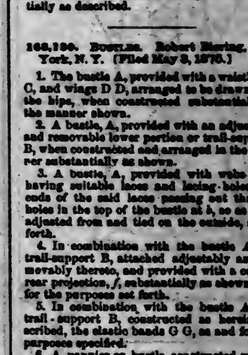
A clamp for fastening the hoop to the sail, consisting of the three parts *d a o* and screw A, as set forth.

168,128. PILLOWS. Gardner T. Barlow, Pittsfield, Mass. [Filed June 12, 1875.]

As an improved article of manufacture, the improved pillow for camp-beds having one permanently-closed pocket, A, stuffed with fine soft material, and another pocket, B, for the reception of coarse material, substantially as specified.

168,129. BUSTLES. Robert Haring, New York, N. Y. [Filed May 3, 1875.]

1. The bustle A, provided with a waistband, C, and wings D D, arranged to be drawn over the hips, when constructed substantially in the manner shown.



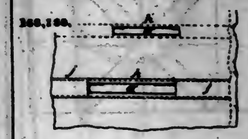
2. A bustle, A, provided with an adjustable and removable lower portion or trail-support, B, when constructed and arranged in the manner substantially as shown.

3. A bustle, A, provided with webs E E, having suitable laces and lacing-holes, the ends of the said laces passing out through holes in the top of the bustle at *b*, so as to be adjusted from and tied on the outside, as set forth.

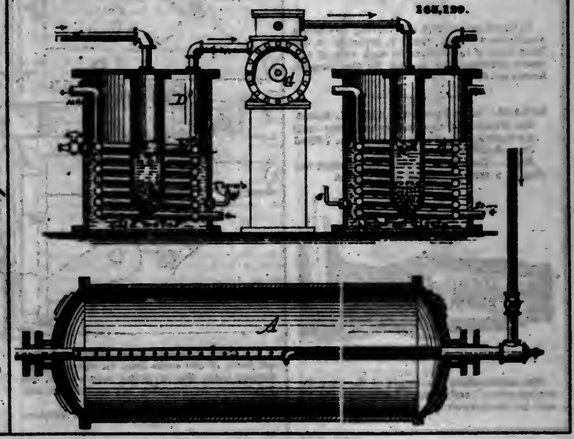
4. In combination with the bustle A, the trail-support B, attached adjustably and removably thereto, and provided with a curved rear projection, *f*, substantially as shown, and for the purposes set forth.

5. In combination with the bustle A and trail-support B, constructed as herein described, the elastic bands G G, as and for the purposes specified.

6. A pannier or bustle constructed with a series of concealed pockets, *j j*, having openings *h h*, in combination with springs *a a* detachably inserted in the pockets *j j*, substantially as and for the purpose set forth.

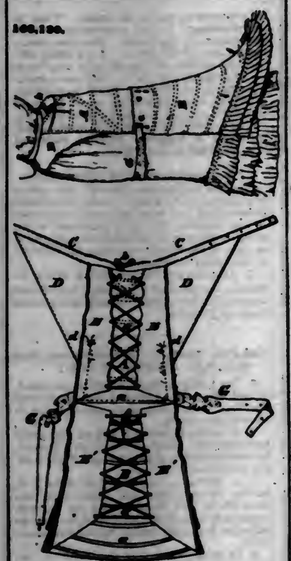


168,130. REPARATING RUBBER FROM WASTE. Marc W. Boyttey, Tenafly, N. J. [Filed Mar. 19, 1875.]

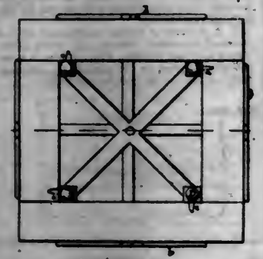


Brief.—Separates fiber by a centrifugal machine; dissolves waste by naphtha; creates a vacuum in the solidifier by action of the pump; admits the solution by air-pressure; closes the inlet; revolves the solidifier; operates the air-pump, whereupon air is forced through the heater and into solidifier, whence, with vapors, it is drawn into the condenser, whence the liquid rubber is drawn off. The air is taken onward, reheated, and sent repeatedly through the circuit. Sheet of rubber deposited on inside of solidifier is removed by withdrawing one of its heads. Water in the condenser. Liquid evaporable at a low temperature in the heater. May pass steam and air through the circuit. Mixes sticky rubber with sulphide of lime, or with hemp-bleach before treatment as above. May use a crushing-roller in solidifier. If fabric be valuable, it may be saved by soaking waste in crude turpentine, or gum and lard-oil and naphtha, heated to 250° Fahrenheit. Wash off rubber by steam of naphtha. Naphtha recovered from the wash by distillation.

1. The process of solidifying rubber solutions by surface evaporation, through the agency of a current of air which is made to circulate continuously and repeatedly over the surface of said solution, through a condenser to deposit the volatile solvent, and through a heater back to the vessel containing the solution, substantially as specified.

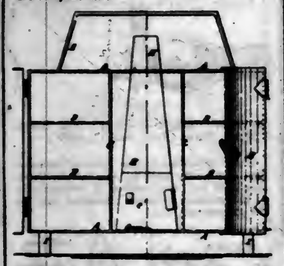


2. An apparatus for solidifying rubber solutions, composed of a solidifier, a condenser, and a calorifier, combined to operate substantially as described.



168,131.

166,120.

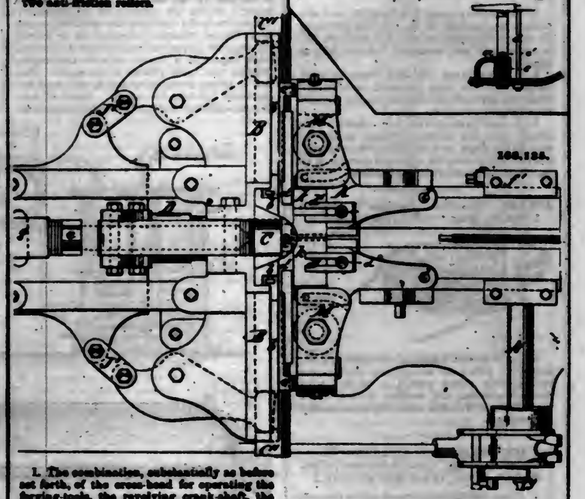


166,121. REVOLVING DRY-GOODS STANDS. Jos. J. Hoel, Lewisburg, Pa. [Filed Apr. 29, 1875.]

In combination with a revolving dry-goods stand, the wires or rods b b, attached to the front edge of the shelves on each side of the stand, substantially as and for the purpose herein set forth.

166,122. PORTABLE LOUNGE-HEATERS. M. Bradley, New York, N. Y. [Filed Sept. 4, 1875.]

Brief.—The lamp is placed in the bottom of the draft-flue, which is in the rear of the middle compartment.



The combination of the box A, the door or doors B, the vertical partitions C, the horizontal partitions D, the tapering tube E, the lamp F, the handle H, and the legs I with each other, substantially as herein shown and described.

166,124. PROCESSES OF PREPARING CARMINE PRINTING-INK. Caspar Joseph Friedbach and Carl Friedbach, New York, N. Y. [Filed Mar. 26, 1875.]

The process herein described of producing carmine printing-ink by first dissolving the carmine in aqua ammonia, then allowing the mixture to stand for twenty-four hours, next adding half the quantity of aqua ammonia originally used, and finally mixing with varnish, substantially as specified.

166,125. MACHINERY FOR FORMING WIRE-BAR HEADS. Orrin C. Burdict, Buffalo, N. Y. [Filed July 6, 1875.]

Brief.—This comprises a header for upsetting the end of the bar, and two pairs of dies or hammers moving laterally, for reducing the upset portion to the proper form. A feed-carriage operated automatically, and held by toggles, and gripping-dies attached to the outward ends of two swinging arms pivoted to the carriage, that grips the metal by the binding of that produced by threader; the arms between two anti-friction rollers.

1. The combination, substantially as before set forth, of the cross-head for operating the forging-tools, the revolving crank-shaft, the toggle-bar, the movable box for its butt, and the toggle-pivot.

2. The blank-carriage, constructed substantially as before set forth, with movable gripping-jaws, and an abutment for the butt of the blank.

3. The combination, substantially as before set forth, of the lateral forging-tools and the blank-carriage, fitted with movable gripping-jaws for griping and presenting the blank to said lateral tools and withdrawing it therefrom.

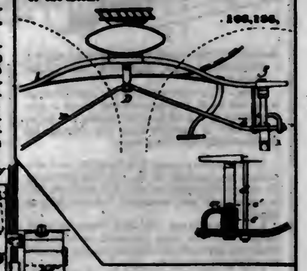
4. The combination, substantially as before set forth, of the blank-carriage, fitted with movable griping-jaws, and the heading-tool, toward which the blank is advanced in a grasped condition.

5. The combination, substantially as before set forth, of the blank-carriage, fitted with movable griping-jaws, and the guides between which the jaws are impelled, and which open them to gripe the blank.

6. The combination, substantially as before set forth, of the blank-carriage, fitted with movable griping-jaws, the jaw-pins, and the cam-grooves for opening said jaws when the carriage is drawn back.

7. The combination, substantially as before set forth, of the blank-carriage, fitted with movable griping-jaws, the guide, stocks, and the adjusting-screws for adjusting the guide-stocks.

8. The combination, substantially as before set forth, of the blank-carriage, the rock-shaft, the toggle-link, and the eccentric-twisted toggle-pivot.

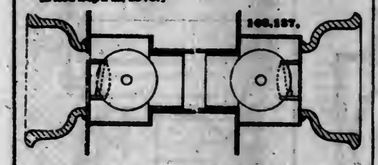


9. The combination, substantially as before set forth, of blank-carriage, the rock-shaft, the vibrating pawl, and the driving-shaft.

10. The combination, substantially as before set forth, of the blank-carriage, fitted with movable griping-jaws, the rock-shaft for moving the carriage, and the movable dog for limiting the withdrawal movement.

166,126. BUTTERED-CRACKER. Gottlieb Burger, Ellenville, Pa. [Filed June 9, 1875.]

Brief.—Dispenses with fish-wheel and ring-bolt, a single fixed plate taking the place of the former, and a pin solid with the pole that of the latter.

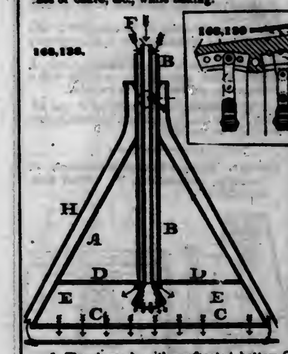


166,126.

166,124.

166,127. STRAINING-TUBES. Daniel B. Campbell and Jas. B. Creighton, Boston, Mass. [Filed Sept. 11, 1875.]

166,127.



1. The method of mounting and operating the whistle or other signal of a speaking-tube, substantially as herein shown, whereby the whistle is permitted to remain open until air is forced into the tube from the opposite end, when the whistle is closed and sounded, essentially as and for purposes stated.

2. The whistle or signal working on an axis or pivot placed obliquely to opposite vertical planes of the mouth-piece and whistle-chamber, whereby the whistle remains open until closed by air entering the tube from the opposite terminus, essentially as and for purposes stated.

166,128. STEAM-WASHERS FOR CAKES AND BISCUITS. David Carrick, Philadelphia, Pa. [Filed July 24, 1875.]

Brief.—To be used in moistening the surface of cakes, &c., while baking.

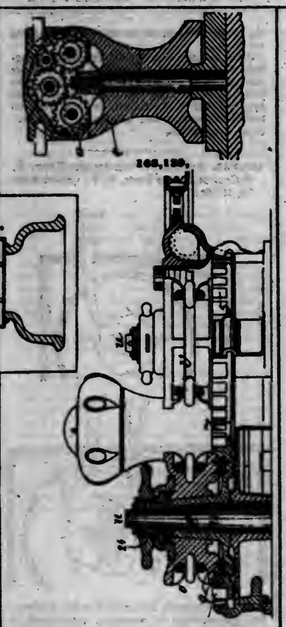
166,128.

1. The dome A, with perforated bottom C and steam-pipe B, combined and operating substantially as and for the purpose set forth.

2. The dome A, with perforated bottom C and steam-pipe B, in combination with the partition D to the dome, above said bottom, substantially as and for the purpose set forth.

3. The chamber E, in combination with the steam-pipe B and inclosed water-pipe F, substantially as and for the purpose set forth.

4. The steam-dome A, with perforated bottom C, in combination with the inclosing bonnet H, substantially as and for the purpose set forth.



166,129. WINDLASSES AND CAPSTANS. D. M. B. Coffin, Jr., Newton, Mass. [Filed Apr. 28, 1874.]

1. The combination of the internal worm-gear or nut-wheel a with the screw or screws b and barrel c of the capstan.

2. The combination of the two screws b, the two gears, and shaft f with the head of the capstan.

3. The pawl-holder h, hinged to the capstan, substantially as and for the purpose set forth.

166,129.

4. The combination of short lever-socket g', its cam hinged to the screw-rod q, made to turn in the deck, and nut r, attached to the friction-brake or strap of a windlass, substantially as shown and described.

5. The arrangement and combination of two sets of elastic cushions between and with the driving and driven parts of the nut-casing or impelling mechanism of a windlass, substantially as shown and described.

6. The center-bearing constructed with step and bars u for upright shaft, and the rest or bearing for the horizontal shaft, substantially as shown.

7. The combination of the two fixed non-rotating spindles s s with the chain-wheels or windlass-barrels v, the capstan, and suitable connecting-gears, substantially as shown.

8. The combination of the two fixed non-rotating spindles s s, the chain-wheels or windlass-barrels v, and the messenger-wheel 46 with suitable connecting-gears, substantially as shown.

9. The combination of the capstan x and the messenger-wheel 46 with suitable connecting-gear, substantially as shown.

10. The sleeve 8, in combination with its friction-grooved plate, the chain-wheel, and the friction-grooved plate connected thereto, and the nut-wheel 24, substantially as described.

11. Friction-rings or sections of rings 9, (see Fig. 12,) in combination with the grooved friction-plates.

12. In a windlass, the arrangement of an anchor-chain to engage with the chain-wheel at its lower forward side, extend around aft and upward, leaving the periphery on the upper forward side for the hawse-pipe and anchor, in combination with a turn around the forward side of the bit as it passes from the deck-pipe to the windlass.

13. The upright roller 26, in combination with the windlass-bit and the arrangement of the cable or anchor-chain, as shown and claimed above.

14. The combination of the pawl 30, located forward of the windlass, with the chain-wheel and its pawl-wheel or drum 43, substantially as shown.

15. The separate friction-wheel 38, in combination with the separate chain-wheel, when the two are automatically locked to each other, substantially as described.

16. The combination of the sliding lock-bolt 40, friction-wheel 38, and a ratchet-wheel and shaft, 36 and 46, substantially as described.

17. The construction of a windlass-beam with the T-section-shaped connection to the links, substantially as described.

18. The construction of a windlass-beam with through-open sockets for levers arranged obliquely to each other, substantially as described.

19. The internal ratchet-wheel 36, in combination with the pawl lever or wheel 34, 35 and the windlass-shaft, substantially as shown.

20. The double series or reversed pawls of wheel 34, in combination with the ratchet-wheel 36, substantially as shown.

21. The construction of the chain-guard and chain-guide in one article for the double use, substantially as described.

22. The chain-wheel or barrel 20 and pawl-wheel 43, constructed separately, and automatically clutched together by projections and recesses or shoulders, substantially as and for the purpose set forth.

166,140. ARTIFICIAL LEGS. Cornelius Collins and James H. McCalla, East Melrose, Iowa. [Filed July 17, 1875.]

Brief.—The iron side braces extend to the ankle, where they are curved and slotted, to serve, in connection with a pin on the foot, as a guide to the movement of the ankle.

1. The combination of steel bars D with the sockets A B, ankle F, and the foot E, substantially as specified.

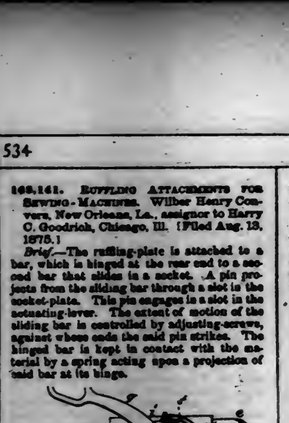
2. The heel connected to the steel bars by the pins H and curved slots G, in combination with the ankle-joint I K L, substantially as specified.

168,141. RUFFLING ATTACHMENTS FOR SEWING-MACHINES. Wilber Henry Conyers, New Orleans, La., assignor to Harry C. Goodrich, Chicago, Ill. [Filed Aug. 13, 1875.]

Brief.—The ruffling-plate is attached to a bar, which is hinged at the rear end to a second bar that slides in a socket. A pin projects from the sliding bar through a slot in the socket-plate. This pin engages in a slot in the actuating-lever. The extent of motion of the sliding bar is controlled by adjusting-screws, against whose ends the said pin strikes. The hinged bar is kept in contact with the material by a spring acting upon a projection of said bar at its hinge.

1. In a ruffler, the hinged bar *m*, provided with the plate *o*, in combination with the sliding bar *c* and spring *e*, substantially as described.

2. The combination of the socket *c*, sliding bar *c*, hinged bar *m*, operating-lever *g*, and presser-foot *a b*, substantially as and for the purpose specified.



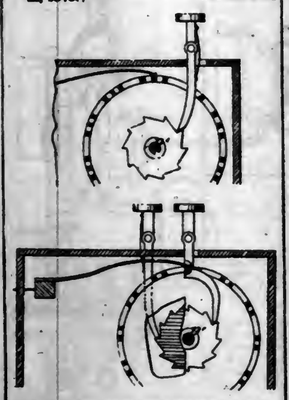
3. In a ruffler, the lever *g h*, screws *i i'*, socket *c*, sliding plate *o*, and pin *f*, all constructed and operating substantially as specified.

168,142. ROOFING COMPOUNDS. James A. Craig, Philadelphia, Pa. [Filed Aug. 26, 1875.]

Brief.—The roof-boards are covered with one or more layers of hot pitch, over which is spread a layer of broken or granulated soapstone in lieu of gravel, as ordinarily practiced.

A roofing compound consisting of comminuted soap-stone and hot pitch, applied substantially as and for the purpose specified.

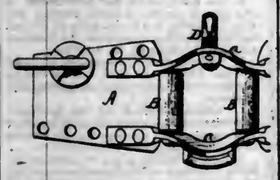
168,143. AUTOMATIC TELEGRAPH-KEYS. L. S. Crandall, New York, N. Y. [Filed Aug. 21, 1875.]



1. An automatic telegraph-key composed of a series of pivoted spring keys or levers, provided with cam or contact pieces of varying shape corresponding to the Morse character of their letters, in combination with projecting arms of a common transmitting-shaft, spring-pawl, ratchet-wheel, and insulated metal tongue, the keys, shaft, and ratchet being connected to one pole, the tongue to the other pole, of the battery, to transmit messages by mechanical means, substantially in the manner and for the purpose set forth.

2. The shaft provided with a series of cam-operated arms, D, and a single pawl-arm, having a spring-retractor, as and for the purpose set forth.

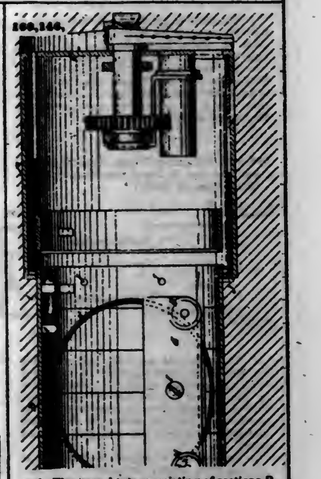
3. In automatic telegraph-keys, the spring-keys or finger-levers, provided with cam or contact pieces having step-shaped projections and intermediate extensions, for producing the required feed of the ratchet and the dwell at points of contact and non-contact, substantially as specified.



168,144. AUTOMATIC TELEGRAPH-KEYS. L. S. Crandall, New York, N. Y. [Filed Aug. 21, 1875.]

1. An automatic telegraph-key for mechanical transmission of messages, constructed of a series of sliding spring-keys, representing the letters of the alphabet, and connected, by spring-pawls and ratchet-wheels, with a corresponding number of revolving wheels, with partially-insulated circumferences, and with spring tongues or riders in contact therewith, said wheels being connected to one pole, while the tongue is connected to the other pole, substantially as and for the purpose specified.

2. The combination of two sliding spring-keys, having spring-pawls, with one transmitting-wheel, provided with ratchet-wheels placed in opposite direction to each other, for the purpose of coupling here having letters with reversed Morse characters, substantially as shown and described.



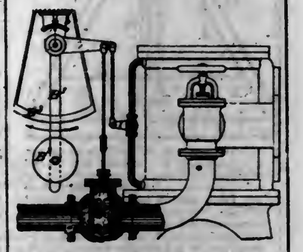
168,145. SADDLE-TREES. H. Gruhnhank, Coalton, Md. [Filed July 1, 1875.]

The metallic harness or jockey saddle tree composed of back-plates A A, sharply curved or arched bars a a, to which are secured the crupper-loop C, and cheek-hook D, and large friction-rollers B, all constructed and united as described, whereby a simple, strong, and durable ventilated tree is secured.

168,146. TUNNELS. Olney B. Dowd, New York, N. Y. [Filed Aug. 6, 1875.]

Brief.—The tunnel-tube consists of elliptical sections, with lugs and fastenings on their interior, to convey the sections through a completed portion of the tube. The shield is enlarged to introduce the sections and secure them against the completed section. Stop-pins pass through the sections to prevent the shield from being pressed back on the tunnel. Packing and a follower are arranged between the tunnel and shield to prevent leakage.

1. The tunnel-tube consisting of sections B, having an elliptical form and smooth exterior surface, and lugs and fastenings or connecting devices on the inner surface, as shown and described, whereby a section may be conveyed through a completed portion of the tube without impediment, as set forth.



2. The combination of the tunnel-sections B, of elliptical form, and the enlarged cam A, as shown and described, whereby the sections may be introduced through the portion of tunnel previously made, and fitted together in the case.

3. The combination of the stop-pins J with tunnel B and tunneling-case A, substantially as specified.

4. The trucks G H and clamping-bolt I, combined and arranged for coupling with a tube-section, substantially as specified.

5. The combination of packing D and follower E with the tunnel B and the case A, substantially as specified.

168,147. MARINE-ENGINE GOVERNORS. J. Everding, Philadelphia, Pa. [Filed Aug. 30, 1875.]

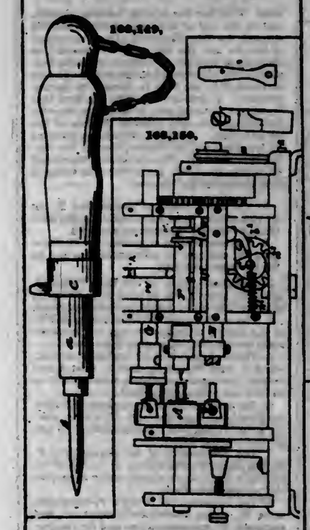
1. The combination, in a marine-engine governor, of a rock-shaft, a weighted arm attached thereto, and rock-arms, respectively, operating a regulating-valve in the steam supply-pipe, and an atmospheric cock or valve communicating with both ends of the engine-cylinder, substantially as set forth.

2. The combination, with a marine-engine governor, of a device for destroying the vacuum upon one side of the piston of the engine, and allowing the escape of steam from the other, substantially as set forth.

168,148. SPRING ROCKING-CHAIRS. S. Fallon, Brooklyn, N. Y. [Filed Nov. 14, 1874.]

Brief.—The tension of the spring is adjusted by the adjustment of the nuts on the screw-rods.

168,148.



The combination of cross-bar *c'*, the arm or bolt D, the pivoted or hinged bar or rod E and the hand-nuts F with the pedestal A, the cast-iron E, and the coiled springs C, substantially as herein shown and described.

168,149. IMPLEMENTS FOR MOLDING AND PERFORATING FAUCET-HOLES IN GLASS BOTTLES, &c. John Neil Fort, Philadelphia, Pa., assignor to Dempsey Wicker-Covered Glassware Company. [Filed July 13, 1875.]

Brief.—A tube projecting from and inside of a handle is lessened in diameter at its front end, to form a shoulder. A pointed loose rod lies within it, with a handle to protrude it to the necessary distance.

The implement consisting of the tubular mold *c*, gage *e*, and rod or plunger *a*, constructed and operating in the manner and for the purpose substantially as set forth.

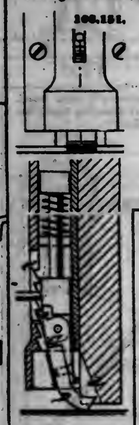
168,150. MACHINERY FOR MAKING METAL SCREWS. Albert W. Gilbert, Worcester, Mass. [Filed Sept. 9, 1875.]

1. The rotary head A, provided with sets of jaws, as described, in combination with a series of two or more screws, B F G, arranged to operate with such head, and furnished with tools, as described, to effect simultaneously the operations of milling or shanking a screw-blank, and pointing or cutting a thread on another, while an attendant may be in the act of removing a finished screw from one set of the jaws of the head and substituting a blank for such screw, the said screws being provided with mechanism for operating them, as specified.

2. The combination of the latch *b'* and the escapement *F*, as constructed and arranged in manner substantially as specified.

3. The combination of the latch *b'* and escapement *F*, as described, with the lever and the feeding mechanism, as described, of the arbor E, such feeding mechanism consisting of the pulleys *w y*, band *n*, shafts *s s'*, screw *s''*, worm-gear *b'*, gear *S*, and rack *r'*, all being arranged as shown and explained.

4. The combination of the sleeve *m'* and the studs *p q r s* with the two pulleys *n o*, and the threading-arbor G, all being applied and to operate as specified.



168,151. DOOR-CHECKS. Edwin S. Granel, Dayton, Ohio. [Filed Sept. 11, 1875.]

Brief.—A suitable case carries a sliding spring-acted plunger, which terminates in a hinged head-piece having curved rubber extension, that is thrown by a projecting pin into contact with the floor, and retained by the ends of the head-piece locking into notched teeth upon inside of the case, the reverse movement of closing the door automatically detaching and withdrawing the rubber back again into the casing.

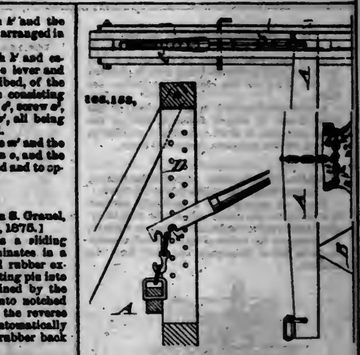
1. A door-check for holding the door open at any point, composed of a casing with front slot and interior ratchet-teeth, and of a sliding and spring-acted plunger with hinged head-piece, having end projections, and rubber extension-block, for retaining the rubber firmly in contact with the floor, substantially in the manner and for the purpose set forth.

2. The plunger-guiding casing and door, provided with recesses at the lower part for giving play to the carving of the rubber when sliding on the floor, substantially as specified.

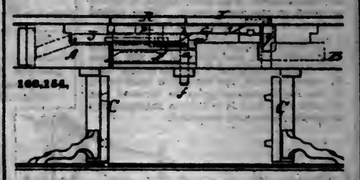
168,151.

168,152. COOKING-RANGES. Thrustavus Greene, Guelph, Canada. [Filed Nov. 12, 1874.]

Brief.—The independent front grate-bars are removable. The smoke-dispenser or hood is adjustable.



1. The grate-bars I, in combination with the grate-bar holders I' and I'', provided with slots *i* and holes *i'*, arranged substantially as described, and for the purpose specified.

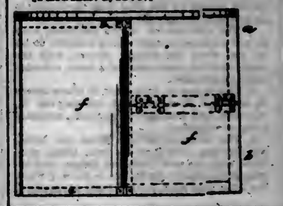


2. In combination with the vertical rear portion or wall of the range, the sliding smoke-dispenser H, with sliding door *h* and rack *h'*, substantially as described, for the purpose set forth.

168,153. PORTABLE LEVER-POWERS. Wm. P. Hale, Florence, N. Y. [Filed July 31, 1875.]

The combination of lever A, working on a fulcrum, B, and a lever, C, fulcrumed at right angles thereto, the said levers being flexibly connected, as and for the purpose specified.

168,154.



1. In an extension-table for automatically storing away and raising the intermediate leaves, the combination of the self-raising platform G, having the inclined steps *g h*, and bearing on inclined legs *i*, that are attached to the slides *d* of the end frame A, with the downwardly-projecting pins *f*, that extend through the middle frame F, and with the end frame B of the table, all arranged so that the platform G will be raised by the act of extending and lowered by the act of contracting the table, substantially as specified.

2. In combination with the middle frame F of an extension-table, having self-storing leaves, the lock composed of the forked lever *j*, and of the lever I and bolt *m*, said lock being applied to the rail *e* of the frame F, substantially as and for the purpose specified.

3. The combination of the end frames A B of a self-storing extension-table with the intermediate leaf H, having the lugs *p*, that join it to the link J of the frame A, and with the intermediate leaf I, having cams *q*, that connect it with the frame B, substantially as herein shown and described.

168,155. SOFA-BEDS. Joseph B. Harlow, Portland, Me., assignor of one-half his right to William A. Jackman, same place. [Filed Mar. 3, 1875.]

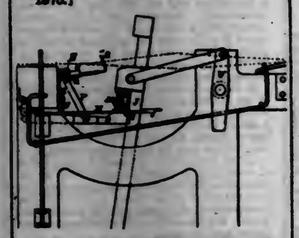
1. In a sole-bed, constructed substantially as herein described, the convex or cutting-*f*, with its head-rest formed by the arms *e* and bar *g*, the said head-rest being held in position by the draw of the convex, as herein set forth.

2. The combination, in a sole-bed, of the fixed frame *a*, hinged frame *b*, having the rigid arm-rest *d*, arms *e*, convex *f*, and bar *g*, as and for the purposes herein set forth.

168,166.—NUT-LOCKS. Alfred Hills Harris, London, England. [Filed May 10, 1875.]

Brief.—A spring-pawl is centrally pivoted in a cavity in the under side of the nut, to engage with ratchet-teeth on the bar or washer, and released for removal by means of a screw made to tilt or disengage the pawl from the ratchet.

The nut-screw or pin B, in combination with the spring-pawl C, nut A, and ratchet-teeth G, substantially as and for the purposes set forth.

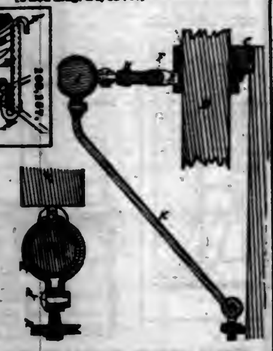


168,167.—REVERSIBLE PLOWS. Myron B. Hatfield, Walcott, Va. [Filed Aug. 31, 1875.]

Brief.—The turning of the mold-board automatically turns the shovs from side to side. The draft-rod extends under the entire beam, having a hooked rod secured to its rear end at right angles. The latter slides in a tube attached to the mold-board. When turned the hook drops into place and locks it.

The combination of the draft-rod G, running lengthwise with, and swiveled to, the beam A, with the hooked rod F and the slotted tube E, connected with the reversible mold-board D, the rod G connecting at its forward end with the draft-hook H or a clevis, substantially as herein shown and described.

168,168.—WEFT-STOP MECHANISM. Thos. Isherwood, Westerly, R. I. [Filed Mar. 6, 1875.]

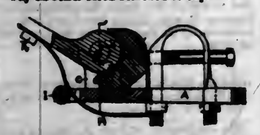


1. In combination with the stopping mechanism of a loom, the feeler C, arranged upon a rock-shaft upon the breast-beam, and adapted to be presented to the weft-thread and withdrawn during the back movement of the lathe, and to be actuated by the tension of the weft-thread caused by the drag from the shuttle in its passage through the shed.

2. The combination of the secondary stop E, and a retracting contrivance adapted to be left free when the shipper thrown, with the crank and the crank-shaft of a loom, substantially as specified.

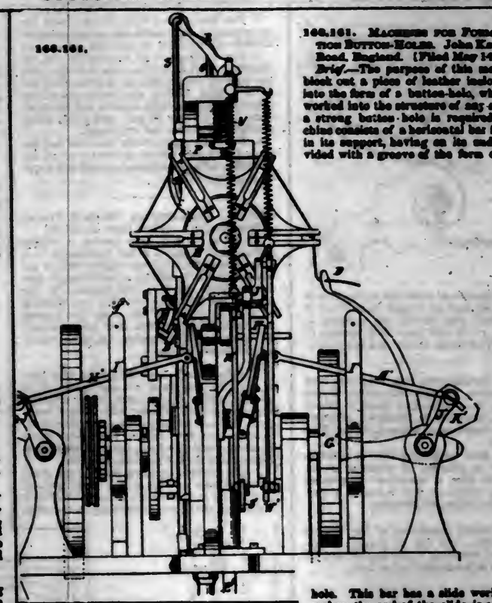
3. The fulcrum A, rock-shaft B, elbow-lever E, hand rod F, and hooked tripping-rod H, combined and arranged in the loom, substantially as specified.

4. The sliding roller-cam M on the lathe, and the cam-lever O on the front beam, combined with the rock-shaft and fulcrum, and arranged to present the feeler to the weft when the lathe goes back, substantially as specified.



168,169.—TENONING FOR SHIPS' YARDS. Saml. S. Jordan and John C. Stevens, Bath, Me. [Filed Aug. 24, 1875.]

The combination of the clasp C and its cylindrical bearing-tube D with the shaft E, arranged to rotate on said tube, the swivel G, truss H, brace K, and yard J, for joint operation, as shown and set forth.



168,170.—THILL-COUPLERS. Walter Kelton, North Attleborough, Mass. [Filed Apr. 6, 1875.]

Brief.—Spring-support for thill resting midway on roller-block attached to clip.

The spring-bar H, in combination with the block I, plate A G, and thill-plate D, substantially as and for the purposes set forth.

168,161.

168,161.—MACHINES FOR FORMING BUTTON-HOLES. John Kenny, Dover Road, England. [Filed May 14, 1875.]

Brief.—The purpose of this machine is to block out a piece of leather bordering a card into the form of a button-hole, which may be worked into the structure of any article when a strong button-hole is required. The machine consists of a horizontal bar free to move in its support, having on its end a die provided with a groove of the form of a button-hole. This bar has a slide working therein, and on the end of the slide is a core passing through the die. The outer edge or periphery of the die and the bed-plate are beveled, so that when brought in contact with the bed-plate a groove is formed by the bevels. The die and bed-plate are held in contact by spring-pressure. A feed-lever holding the card lays it onto the material, and, by its action, draws it into the groove, and between the face of the die and plate. A cam or crank-lever, pressing on the other end of the bar, stamps the button-hole into form. The operation is completed by cutting the card; the button-hole frame is then automatically removed.

1. The combination of presser-foot B, bar S', elbow-lever K, and the cam L on the main shaft, as and for the purpose set forth.

2. The combination of presser-foot B, elbow-lever M, and cam N, substantially as and for the purpose described.

3. The combination of the knife O, bar Q, spring Q, lever R, rod S, lever T, and cam U, substantially as and for the purpose described.

4. The combination, with feed card-wheel E, of the double clamping-springs *a a*, substantially as and for the purpose described.

5. The combination of card-wheel E, ratchet-wheel V, pawl W, sliding shaft X, lever X, and disk A', having a cam-groove, substantially as and for the purpose described.

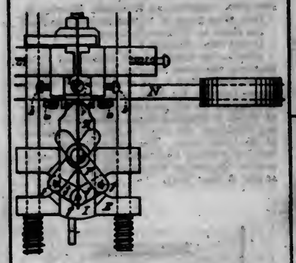
6. The combination of the card-wheel E, having double springs, the knife P, sliding shaft O', lever P', and cam L, substantially as and for the purpose described.

7. The combination of the gripping-jaws F, sliding shaft F', elbow-lever F'', and disk G', having a cam-groove, substantially as and for the purpose described.

8. The combination of jaws F, horizontal cross H', spring guide-bars I', crank J', and segment K', substantially as and for the purpose described.

9. The combination of bed-plate G, die B, sliding shaft L', spring M', elbow-lever N', slide P, spring Q', and cam U', substantially as and for the purpose described.

10. The combination of the bed-plate G and the picker-bar I, forming the eye of the button-hole, substantially as and for the purpose described.



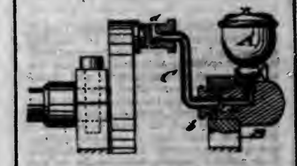
11. The combination of picker-bar I, bar S', lever T', spring U', and cam X', substantially as and for the purpose described.

12. The combination of the picker-bar I and the forked lift J, for the purpose described.

13. The combination of the lift J, spring Y', bar V', lever W', and cam X', substantially as and for the purpose set forth.

168,160.—SAW GUMMING AND SETTING MACHINES. Hiram A. Kimball, Philadelphia, Pa. [Filed Sept. 9, 1875.]

Brief.—The pivoted lever, carrying the gumming-tool and the cam-plate, is oscillated by hand or otherwise. The saw is fed forward by the clamp, which is moved and clamped by the cams, and thrown back on the saw loosely, to take a new hold, by the springs.



1. The single male cutting-die M, having two cutting-edges at opposite sides to each other, in combination with duplicate dies B B, having each two cutting-edges and cutting-bevel b through which the single die passes in an oscillating or other alternating movement, substantially as set forth.

2. The oscillating cutter-head E, provided with the adjustable plate O, having double cams *f g*, substantially as and for the purpose set forth.

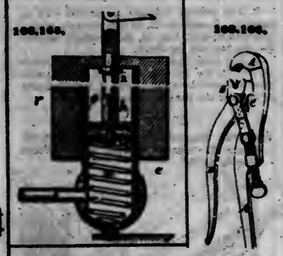
3. The reciprocating slide H, in combination with the double cross-clamps F F, plate I, having a tongue, *r*, and vibrating plate O, having double cams *f g*, substantially as and for the purpose set forth.

168,162.—OILERS FOR CRANK-WRISTS. C. Kurth, Chattanooga, Tenn. [Filed Aug. 28, 1875.]

The combination of oiler A, bed-plate B, having channel *a*, the journal *b*, the bent pipe C, the wrist-pin having angle-hole *d*, as and for the purpose specified.

168,164.—PROCESSES OF TREATING OLEAGINOUS SEEDS. Alfred B. Lowther, Chicago, Ill. [Filed Mar. 6, 1875.]

Brief.—The seeds are fed under pressure to suitable rollers; the cake is then steamed and the oil expressed.



The process of crushing oleaginous seeds and extracting the oil therefrom, consisting of the following successive steps, viz: the crushing of the seeds under pressure, the maintenance of the seeds by direct subjection to steam, and, finally, the expression of the oil from the seed by suitable pressure, as and for the purpose set forth.

168,165.—GOVERNORS FOR ENGINES. James W. Mathieson, Brooklyn, N. Y., assignor to Sarah Hardick, executrix, and John Styer and Abraham H. Van Nesson, executors of Charles B. Hardick, deceased. [Filed Aug. 30, 1875.]

Brief.—The piston is operated by the water-pressure from the pump, to regulate the opening of the throttle-valve.

The hollow weight C, resting upon a collar upon the piston-rod *f*, in combination with the piston A, cylinder *e*, throttle-valve *d*, pump *b*, and steam-engine *c*, for regulating the speed of the engine according to the pressure in the pump, substantially as set forth.

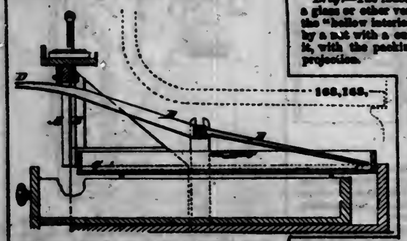
168,163. 168,166.

168,166.—FIRE-TONGS. Alex. McDonald, Kaltfax, Canada. [Filed Aug. 28, 1875.]

Brief.—The bars are connected together by a pivoted link, one end of which is adjusted in a slot by means of a screw.

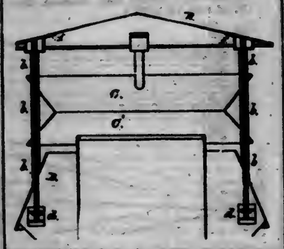
1. The combination of the pivoted bars A with the hooked lever B and the notched lever C, substantially as herein shown and described.

2. The combination of the set-screw D with the bars A, the hooked lever B, and the notched lever C, substantially as herein shown and described.



168,167.—WRISTLETS. Patrick McGlew, Des Moines, Iowa. [Filed July 31, 1875.]

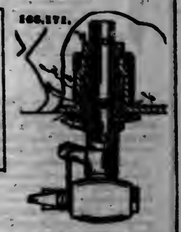
Brief.—The loop yields sufficient, to allow the vines to be attached without violent twisting.



The loop D and elastic strap C, in combination with the whiffletree A, as and for the purpose specified.

168,163.—AXE-PAINS. James M. McHaim, Carlisle, Ky. [Filed May 26, 1875.]

The combination, with slotted front of a pan, D, having a fingered cross-bar pivoted in open bearings between ash-pan sheet and supported grate, as shown and described, to make said pans readily detachable.

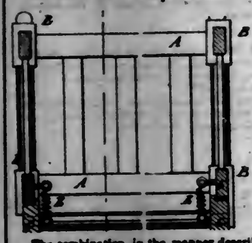


168,169.—VENTILATORS FOR CESSPOOLS. F. Milan, Cumberlandport, Mass. [Filed July 3, 1875.]

168,171.—DEVICES FOR ATTACHING FAUCETS. Jas. S. Morton, Philadelphia, Pa., assignor to Dempsey Wicker-Covered Glassware Company. [Filed July 12, 1875.]

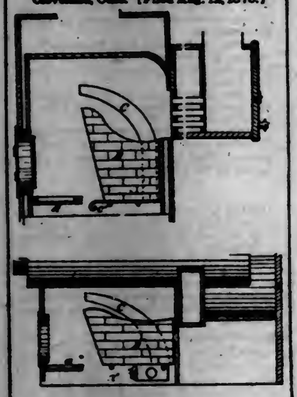
Brief.—The faucet is attached to the side of a glass or other vessel by being inserted into the "hollow interior projection," and secured by a nut with a cup attachment, which binds it, with the packing beneath, to the interior projection.

168,171.



The combination of the hollow interior projection *b*, the tube *c*, provided with exterior screw-threads, the nut *d*, with its cup *e*, and the base *f*, forming means for securely attaching faucets to glass vessels, such as bottles and demijohns, substantially as set forth.

168,172.—CAR-STARTERS. Thomas Murgatroyd, St. Joseph, Mo., assignor to himself and Ferdinand Schoen, same place. [Filed Aug. 31, 1875.]



The combination of the pair of pivoted levers A B, provided, respectively, with a hooked end and a claw, D, as and for the purpose set forth.

168,175. CRADLES. Jos. B. Neibach, Utica, N. Y. [Filed Mar. 7, 1874.]

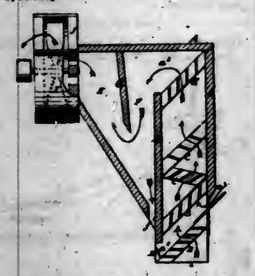
The combination, in the manner described, of side frames A A, end frames B B, having recesses *b' b'*, and the flanged head-frames C C, with the springs D D, all arranged as described, to form a rocking spring-held cradle.

168,176. FURNACES. Nathan L. Newcomb, Cleveland, Ohio. [Filed Aug. 12, 1875.]

1. The combination, with a furnace, of one or more fans, C, adapted to receive air from under the grate, and to discharge it within the furnace above the grate-bars, substantially as and for the purpose shown.

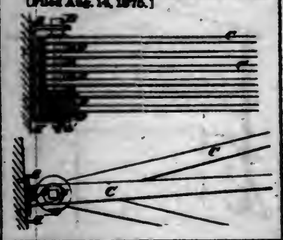
2. The combination, with the furnace of the fire-wall B, placed immediately behind the grate-bars, and extending well up into said furnace, and one or more fans, C, receiving air from below, and discharging it at the upper portion of said fire-wall and over the grate-bars, substantially as and for the purpose described.

168,177. HAT-FORMING ROLLS. Jos. Watt, Danbury, Conn. [Filed Sept. 9, 1875.]



Brief.—The free or lateral edges of the forming cloth or paper are folded into the longitudinal opening, and are of sufficient length to enter the V-shaped groove. When the spindle is turned in either direction, the forming material is wedged between it and its seat. The spindle is held in its seat by a spring secured to the lower end of the roll.

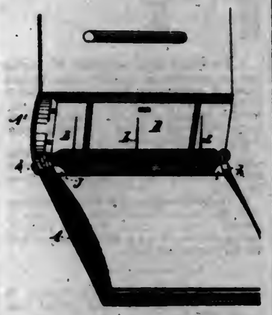
1. The combination, with the frame H, die B, slotted wedge A, oscillating lever *a*, sliding bar C, vertical levers D, E, and punch F, the several parts being constructed, arranged, and combined to operate substantially as and for the purpose set forth and described.



2. The combination and arrangement of the die B in three parts, substantially as shown and described, with the punch F, oscillating lever *a*, bar C, and lever D, the whole constructed and arranged to operate substantially as herein before specified.

168,177. MIDDLINGS-PURIFIERS. Alvin F. Ordway, Beaver Dam, Wis. [Filed July 3, 1876.]

An improved middlings-purifier, formed by the combination, with each other, of the air-trunk A, provided with the openings *a' a' a'*, the lower inclined rest B, the series of zigzag reeks C, the upper inclined rest E, the air-chambers F H, separated in their upper parts by the partition G, and provided with the opening *f*, and the fan-blower I J, substantially as herein shown and described.

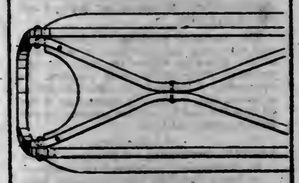


168,178. CLOTHES-DRYERS. Harrison V. Osborne and Robert Hay, Trenton, Mo. [Filed Aug. 14, 1875.]

The combination of the breakst A, made with a square hole in its upper end, and a longitudinal groove or slot in its body, the bolt B, made with a long square head, the pivoted arms C, the washers D, provided with pins F, and the washer E, with each other, substantially as herein shown and described.

168,179. TEMPORARY BINDERS. Newton S. Otis, New York, N. Y., assignor of one-half his right to William B. Gray, same place. [Filed Sept. 6, 1875.]

Brief.—The binding-bond is held at right angles to the lower cover or base A by means of the hook clasp K, the short arm of which passes beneath the base, while the long arm is being forced into sockets *g* and *i*, the former of which is attached to the base of the binding-bond, and the latter to the upper surface of the lower cover. The binding-bar is channeled or grooved longitudinally to receive the ends of the needles when struck down at right angles to their body.

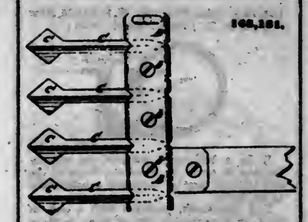


1. In combination with the covers O and O' and binding-strip K, to which are attached the needles L, the grooved or channeled binding-bar R operating to permanently bind letters or papers, substantially as and in the manner herein shown and set forth.

2. In combination, the sockets *g* and *i*, attached, respectively, to the base of the binding-machine B and the lower cover A, and the sliding metal clasp K, arranged, applied, and operating to retain the binding-machine in an upright position, substantially as and for the purposes as herein shown and set forth.

168,180. SLEIGHS. Robt. B. Parks, Princeton, Ill., assignor to himself and John R. Parks, same place. [Filed Aug. 26, 1875.]

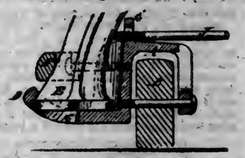
Brief.—Both runners are made of one continuous piece.



An improved sled, composed of a seat with supporting-frame attached thereto, and made of curved front part, side runners, and curved bottom braces, bent of one piece, substantially as specified.

168,181. COMBINED CULTIVATORS AND HARROWS. Isaac P. Fleharty, Table Grove, Ill. [Filed Aug. 14, 1875.]

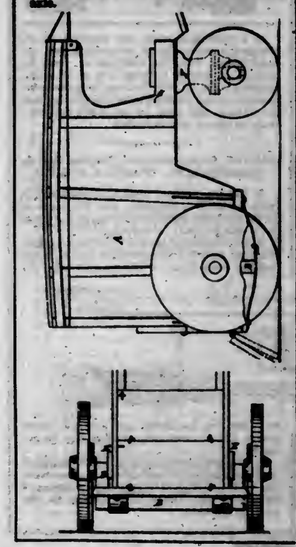
Brief.—The two-part beam is recessed to receive either the harrow or cultivator ends of the reversible teeth.



168,181.

The combination of the head B, made in two parts or halves bolted together, and provided with V-grooves and with recesses in their inner surfaces, and the reversible square teeth C, made pointed at one end, and provided with shoulders *g'* at their other ends, with each other, substantially as herein shown and described.

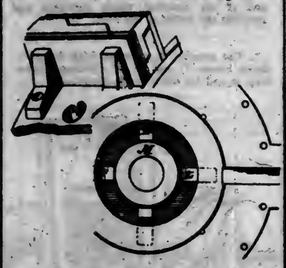
168,182. SEWING-MACHINE CASTERS. B. P. Pratt, Chicago, Ill. [Filed May 26, 1875.]



Brief.—A tension-rod, screw-threaded right and left at either end, passes through suitable leg-nuts on top of the caster-frame. A foot or shoe piece of ordinary construction is held in place by a suitable clamp, and the right and left action of the end-threaded tension-rod serves to draw the shoe-pieces tightly onto the legs or feet of the sewing-machine stand, and secure them in position.

The combination of the end-threaded tension-rod J, the caster-frame, having leg-nut G' and foot C D, the leg E, having toe or point *e*, and the clamp F, all constructed and arranged substantially as and for the purpose specified.

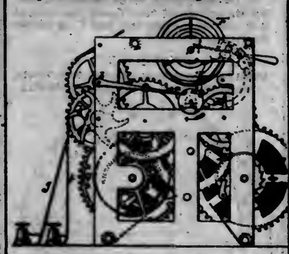
168,183. ICE-WAGONS. Charles Rauch, Cleveland, Ohio. [Filed July 6, 1875.]



Brief.—Blocks on body limit its movement by striking against vertical portion of cranked axle.

The combination of body A, having limiting-blocks E, high forward part, and low rear part with the pivotal standard, the cranked axle B, and springs D, all substantially as and for the purpose set forth.

168,184. ROTARY ENGINES. Henry Reily, Petrolia, and Phineas C. Walsh, Tidioute, Pa. [Filed Aug. 6, 1874.]



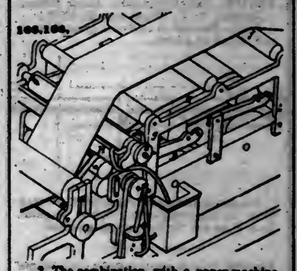
Brief.—A revolving crank-pin engages in the cam-grooves of two plates, which are connected to the slide-abutments, to operate them. Each abutment is held down by a rim on a revolving disk while the other is being raised.

The combination, with the valves F G, of the arms C C, plates E E, with grooves *e*, sliding rollers *g*, and springs h, the flanged disk S, and arm T, with revolving wrist *d*, all substantially as and for the purposes herein set forth.

168,185. ELECTRIC CIRCUIT-BREAKING CLOCK-WORK. David Rossman, New York, N. Y., assignor, by mesne assignments, to Wm. F. Smith and S. Samuels, same place. [Filed Aug. 12, 1875.]

Brief.—The circuit-breaking train of wheels acts only at the time when in the course of the revolution of a pin-wheel in the time-keeping train, the pins have advanced sufficiently to allow the escape of an arm projecting from a spindle of the circuit-breaking train.

1. The arm *a*, combined with the rotary wheel *d* and intermittently-rotating wheel h, to constitute a circuit-breaker, substantially as herein shown and described.

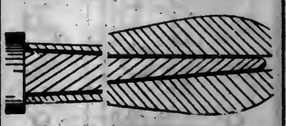


2. The combination of the mainspring B, which rotates the wheel *d*, with the mainspring C, arm *a*, and circuit-breaking wheel h, substantially as herein shown and described.

168,186. MANUFACTURE OF PASTEBOARD. Geo. W. Russell, Lawrence, Mass. [Filed Feb. 28, 1875.]

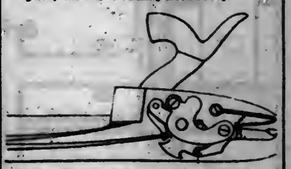
Brief.—The web from one cylinder is pasted while soft, and united with that from another cylinder before reaching the press-rolls.

1. The described improvement in the manufacture of thick paper from two or more webs of pulp, which consists in the application of paste to said webs at the time and in the manner set forth—that is to say, while said webs are yet in a plastic, semi-pulpy, and incomplete condition, and in transit to the press-rolls, by which the several pasted webs are united and joined in a single homogeneous sheet, as described.



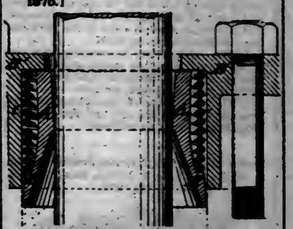
168,188.

2. The combination, with a paper-machine, of a trough for receiving a limited quantity of paste, a roll wallowing in such paste, and transmitting the latter to one or more webs of pulp, and finally of a cistern for containing a considerable quantity of paste, and a pump connected with such cistern, for delivering such paste to the trough, an overflow-pipe extending from the trough to the cistern, and the whole being substantially as and for the purposes stated.



168,187. PAINT-BRUSH HANDLES. George W. Schermerhorn, East Livingston, Me. [Filed Aug. 6, 1875.]

Brief.—A convenient supplemental handle is placed upon the ordinary brush-handle, whereby the brush can be used with greater ease.



In combination with an ordinary paint-brush having the tapering stock or handle b, the perforated removable handle *a*, applied as and for the purposes set forth.

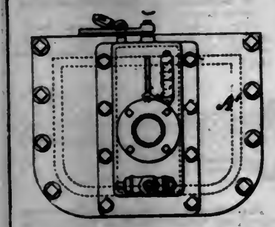
168,189. GUN-LOCKS. John O. Scott, Wenpace, Wis. [Filed May 26, 1875.]

In a gun-lock, the combination of a cear, provided with a friction-roller, a tumbler, provided with notches, such as shown, and a sear-lever, the combination being and operating substantially as shown and described.

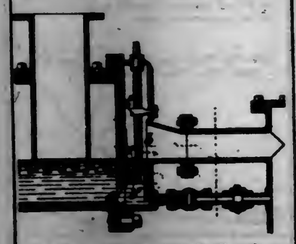
168,190. PISTON-ROD STUFFING-BOXES. J. M. Searle, Stanhope, N. J. [Filed July 31, 1875.]

The arrangement of the spring-controlled cup A, with its conical recessed end toward the cylinder-head, whereby it is adapted to set on the interposed packing, as shown and described.

168,190. CAR-COUPLERS. Lewis Sibley, Ramapo, N. Y. [Filed Aug. 31, 1875.]



Brief.—The link is held on a pivoted block and moved by a lever.



The combination of curved link C, pivoted block D, supporting-spring E, and weighted lever F, as and for the purpose specified.

168,191. TAR-GATES FOR HYDRAULIC MAINS OR GAS-WORKS. John M. Shaney, Camden, N. J., assignor to James W. Starr and James W. Starr, Jr., same place. [Filed Sept. 9, 1875.]

Brief.—To the end of the hydraulic main is affixed a valve-chest, with a tar-outlet on a level with the mouth of the dip-pipes. Outlets governed by vertically-sliding gate. Outside indicator and scale show height of gate. Wrench on gate-screw is locked against a stop to prevent meddling. A direct-supplying outlet from main to tar-pipe.

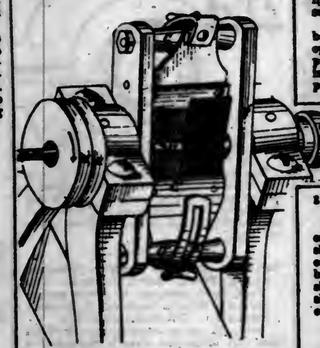
1. The combination of a hydraulic main, an end plate closing the same, and having an opening in its bottom, a valve-casing on the end plate having an opening in its face at the level of the bottoms of the dip-pipes, and a vertically-moving valve closing the opening in the casing and operated from the outside thereof, substantially as set forth.

2. The combination, in a tar-gate, of a vertically-moving valve and its operating-screw and a pointer connected to a nut on said screw and projecting through a slot in the valve-casing, substantially as set forth.

3. The combination, in a tar-gate, of a vertically-moving valve, an operating-screw journaled in the valve-casing, and a locking-wrench or lever, substantially as set forth.

4. The combination of the valve-casing, the draw-off pipe, the tar-pipe, and the cleaning-plug, substantially as set forth.

168,192. AIR-VALVES FOR PUMPS. Simon Smith and Isaac B. Collins, Mount Ohnit, Pa. [Filed Aug. 31, 1875.]

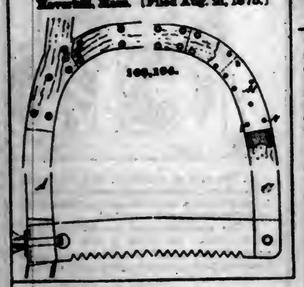


The combination, with steam-grooved valve O o' o', seated in a perforated plug, B, of the plug A, having longitudinal perforation larger at o', diminished at o', further contracted at o', and made still smaller at o', as and for the purpose specified.

168,193. PAPER-TUBE MACHINES. L. Smith, Lowell, Mass. [Filed Sept. 14, 1874.]

Brief.—The paper is wound upon the mandrel, the flocks revolving around it to press the layers together. It is then passed between the finishing-brushes, after which the tube is drawn over the enlarged head on the end of the mandrel, which stretches and smooths the inside of the tube.

1. The mandrel A, provided with the cylindrical bosses U and W, of differing diameters, as and for the purposes described.



168,193.

2. The combination of one or more flocks, O O', with the mandrel A, having the boss U, as and for the purposes described.

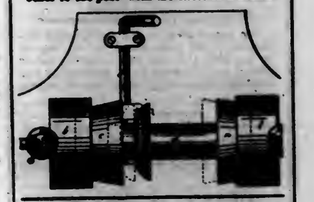
3. The combination of the mandrel A, having the cylindrical boss V, and the brushes Q Q', revolving about said boss V, as and for the purposes described.

168,194. BOOT-SAW FRAMES. P. B. Towle, Haverhill, Mass. [Filed Aug. 21, 1875.]

168,194.

168,195. BELL-PUNCHES. H. B. Towle, New York, N. Y. [Filed June 10, 1875.]

1. In a ball-punch machine, an adjustable stop or screw, by which the throw of the ball-hammer may be regulated substantially as set forth.



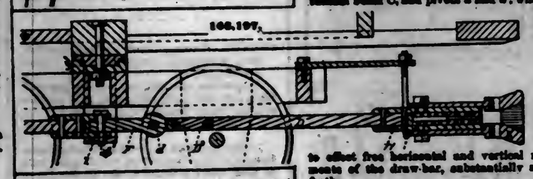
2. A ball-punch, provided with a pair of jaws, or a projecting pin or bars, to serve as a wrench or lever, in the manner and for the purpose substantially as set forth.

3. In a ticket-punch, a thumb-piece placed eccentrically to the axis of the sliding rod, to cause the engaging part thereof to escape from the lever, which it actuates with freedom, substantially as described and set forth.

4. As a new article of manufacture, a toy ball-punch, comprising a ball and hammer, operated by an actuating-piece to receive pressure direct from the operator without the intervention of a lever, and a perforator or punch, substantially as set forth.

168,196. HOISTING APPARATUS. W. Turner, Millerstown, Pa. [Filed Mar. 19, 1875.]

Brief.—A winding-drum, with a fixed conical clutch-piece at each end, is loose on a shaft, revolving in bits, on one of which a counter clutch-piece is stiached, a similar one being affixed to the shaft. The drum, when slid in one direction, locks clutched to the shaft, for the purpose of winding, and in the other to the post with the effect of a brake.



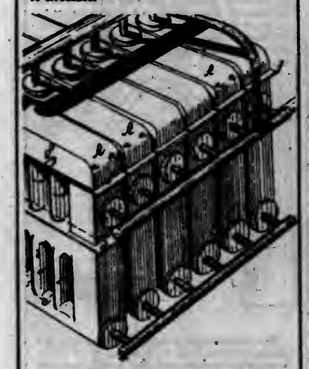
In a hoisting-machine the combination of the shaft a and pulley b attached thereto, in combination with the windlass or drum d, having the conical clutches c e on its ends, recessed block I rigidly fastened to a frame or upright, o, and shifting-lever f for moving the drum back and forth on the shaft, substantially as shown and described.

168,197. CAR-COUPLINGS. Stephen Uzlick, Philadelphia, Pa. [Filed Dec. 4, 1874.]

1. The longitudinal beam C, in combination with the studs b, hangers x, and the frame A of the car-body, for the connection of the draw-bars, substantially as described.

2. The combination of a draw-bar of a railroad-car with link F, bifurcated iron B, longitudinal beam C, and pivots d and d', whereby

168,197.



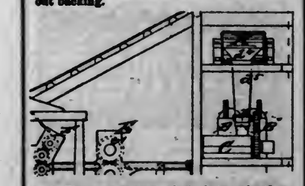
to offset fore horizontal and vertical movements of the draw-bar, substantially as set forth.

3. The combination of the middle section D and end sections D' and D² of the draw-bars, the sections being held together by means of bolts or rivets, substantially as and for the purpose set forth.

The combination of the wood pieces A, B, and C, and the metal corner-pieces M, when the wood pieces are slotted and notched, and the metal corner-pieces fitted in the slits, and the wood and metal pieces rivited, substantially as specified.

168,198. SECTIONAL STEAM-GENERATORS. Geo. W. Walker, Malden, and Miles Pratt, Watertown, Mass. [Filed Aug. 14, 1875.]

Brief.—The sections are connected near the water-level, so as to allow the hottest water to circulate.



1. The combination, with two or more sections of a steam-generator with tubes, of an inlet-pipe or water-receiving way and a water-circulating or connecting pipe or way, connected with the sections between the inlet-openings and the water-level, and below the steam-space, whereby the water in the sections circulates freely through the sections, substantially as described.

2. A steam-generator of two or more sections, in combination with an inlet-pipe or water-receiving way, a circulating pipe or way connected with the sections below the steam-space and water-level, and with a steam-pipe connecting the steam-spaces of the sections, all substantially as described.

168,199. MACHINES FOR MAKING PLASTIC FLOOR-CLOTH. Profit Walton, Staines, Great Britain, assignor to the American Linoleum Manufacturing Company, New York, N. Y. [Filed Aug. 21, 1875.]

Brief.—A plastic compound is forced into the mixer, which receives cork-dust or other similar material through a mixer. The whole is incorporated and forced out upon an endless belt, on which it is spread by rollers. It may then receive a canvas back, or be dried without backing.

1. The arrangement relatively to each other, substantially as before set forth, of the cement-pan, the receiver, and the mixer, whereby the cement is compounded and delivered to the mixer in regulated quantities.

2. The arrangement relatively to each other, substantially as before set forth, of the powder-meter, the receiver, and the mixer, whereby the cement and powder are mixed in definite proportions.

3. The arrangement relatively to each other, substantially as before set forth, of two receivers and one mixer, whereby a continuous supply of cement is fed and mixed.

4. The arrangement relatively to each other, substantially as before set forth, of two cement-pans, two receivers, and one mixer, whereby a continuous supply of cement can be compounded and fed to the mixer.

5. The arrangement relatively to each other, substantially as before set forth, of the receiver, the powder-meter, the mixer, and the calender, whereby the materials are mixed in definite proportions and delivered in a thin sheet.

6. The arrangement relatively to each other, substantially as before set forth, of the cement-pan, the receiver, the powder-meter, the mixer, and the breaker, whereby the materials of the composition are compounded, mixed in definite proportions, and formed into a slab.

7. The arrangement relatively to each other, substantially as before set forth, of the cement-pan, the receiver, the mixer, the powder-meter, the breaker, and the calender, whereby the materials are mixed in definite proportions, and the composition thereby produced is delivered in a thin sheet.

168,200. COMBINED BURGLAR-ALARMS AND DOOR-FASTENERS. William S. Watkins, St. Louis, Mo. [Filed Sept. 20, 1875.]

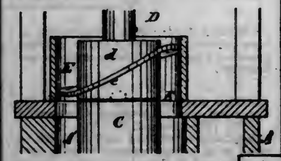
1. The combination of the screw a and head b, provided with the nipples c, substantially as shown, whereby a burglar-alarm and door-fastener is formed, as described.

2. The combination of the screw a, head b, nipples c, and casing d, whereby a combined burglar-alarm and door fastener is formed, substantially as described.

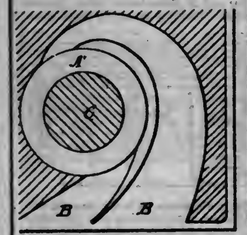
168,200.

168,201.

168,201. DRAFT-TUBES FOR SODA-WATER. John C. Wharton, Nashville, Tenn. [Filed July 12, 1875.]



Brief.—The nozzle is provided with a shield, by sliding which up and down on the tube the gaseous liquid may be caused to foam or be prevented from foaming, as may be desired

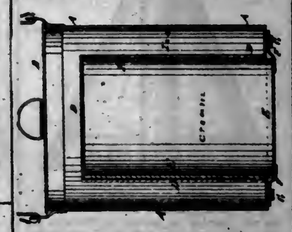


1. In combination with the shield B, with or without projections d, the pipe A and nozzle E, forming a shoulder, the nozzle also having radial or tangential holes, substantially as and for the purpose set forth.

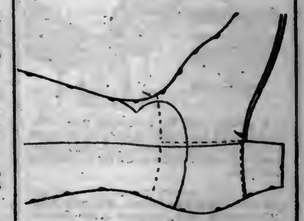
2. The movable shield B, with projections d d, &c., as and for the purposes described.

168,202. WATER-WHEELS. Robt. Wilson, McLeansville, N. C. [Filed July 26, 1875.]

Brief.—The water-chest receives and feeds the water to the bottom of the wheel through wedge-shaped channels. The water passes up through the wheel, and is discharged at the top.



1. The water-chest A, provided with central circular opening A', solid head-block C, and wide mouth, gradually-converging curved channels B B', discharging into the space A' at opposite sides thereof, as and for the purposes described.

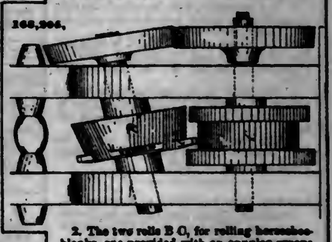


2. In combination with the chest A, constructed with the central circular opening A', solid head-block C, and wide-mouthed, gradually-curved, converging or wedge-shaped channels B B', the top-discharge inclosed wheel D d e, substantially as and for the purposes described.

168,203. ICE-CREAM CANNISTERS. Henry W. Wyman, New York, N. Y. [Filed Sept. 11, 1875.]

The combination of the vessel A, provided with a cover, B, and bail C, the inner vessel D, made with an open bottom and a closed top, the detachable vessel E, and the legs and open keepers F G, with each other, substantially as herein shown and described.

168,204. STONE. David D. Young, Indianapolis, Ind. [Filed June 14, 1875.]

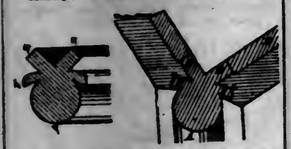


A sign boot or shoe consisting of two or more pieces of sheet metal, stamped or swaged into shape and soldered together, substantially as and in the manner specified, for the purpose set forth.

168,205. MACHINES FOR ROLLING HORSESHOE-BLANKS. William D. Young, Pittsburg, Pa., assignor to Shoenberger & Co., same place. [Filed Mar. 20, 1875.]

1. The rolls B C, for rolling horseshoe-blanks, one provided with an annular groove, and the other provided with crescors, the axes of the rolls crossing each other while the faces of the rolls are parallel.

168,205.



2. The two rolls B C, for rolling horseshoe-blanks, one provided with an annular groove and the other provided with crescors, said crescors being placed at right angles to the axis of the roll, the axes of the rolls crossing each other substantially as and for the purpose specified.

168,906. CLOTHES-POUNDERS. S. M. Allen, Dillsburg, Pa. [Filed July 17, 1875.]

In a clothes-pounder, the combination of the air-chamber A, having perforations B, with the concentric downward-projecting flanges or beaters D, substantially as and for the purpose herein before set forth.

168,907. CORNER-BEADS FOR PLASTERING. Galen P. Atherton, Worcester, Mass., assignor of one-half his right to S. Fletcher, same place. [Filed Jan. 19, 1875.]

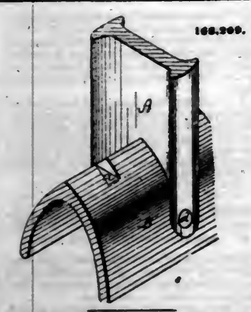
A corner-bead for plastering, when constructed with the projecting side ribs or flanges F, combined with the main body A and angle-flanges B, substantially as and for the purpose described.

168,908. VEHICLE-AXLES. Ephraim Ball, Clarksville, Tenn., assignor to the Clarksville Iron Wagon Manufacturing Company, same place. [Filed Mar. 6, 1875.]

1. The axle A, formed with top and bottom flanges *a b*, and having its ends hammered down in tapering form, with the top flange *a* rounding to spindle shape, substantially as set forth.

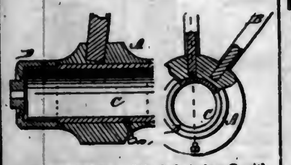
2. In combination with the axle A, the end plate B, welded to the end of the axle and drawn out to form the screw *d*, substantially as set forth.

3. In combination with the axle A, the side pieces D D, riveted or bolted to the axle, for the purposes set forth.



4. The bottom pieces C and E, in combination with axle A and the pieces B and D D, substantially as and for the purposes set forth.

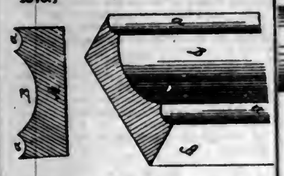
5. The band G, in combination with the axle A, side pieces D D, and bottom piece E, substantially as and for the purposes set forth.



6. The reversed ring-bolt H, having its head fastened by rivets or bolts to the axle, substantially as set forth.

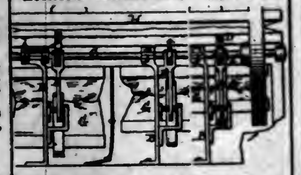
168,909. VEHICLE-WHEELS. Ephraim Ball, Clarksville, Tenn., assignor to the Clarksville Iron Wagon Manufacturing Company, same place. [Filed Mar. 6, 1875.]

The combination of the L-shaped metallic spoke A, with forked end and square part *b*, and the metallic felly B, having notches *c*, the parts being united by the rivets *d*, all substantially as set forth.



168,910. VEHICLE-HUBS. Ephraim Ball, Clarksville, Tenn., assignor to the Clarksville Iron Wagon Manufacturing Company, same place. [Filed Mar. 6, 1875.]

The combination of the hub A, box C, with wrought-iron bands D D, and the metallic spokes B, cast solid in the hub, substantially as set forth.

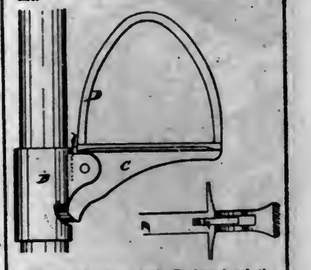


168,911. VEHICLE-WHEEL TIRES. Ephraim Ball, Clarksville, Tenn., assignor to the Clarksville Iron Wagon Manufacturing Company, same place. [Filed Mar. 6, 1875.]

The tire A, having an outer flat surface, an inner hollowed-out center, B, and longitudinal grooves *a a* each side thereof, as shown and described.

168,912. APPARATUS FOR OPERATING ORGAN-BELLOWS. Giles Beach, Gloversville, N. Y. [Filed June 11, 1875.]

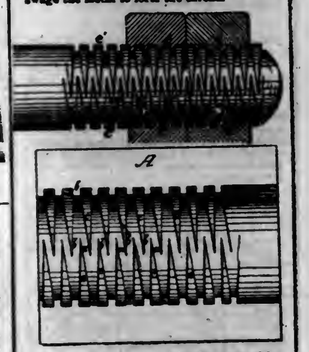
Brief.—To a revolving shaft cams are secured, so as to have consecutive action upon the rocker ends of elbow-levers which operate the feeders. Intended mainly for pipe-organs.



1. The combination, with the reservoir and feeders of an organ-bellows, and the levers for operating said feeders, of the shaft and a series of cams, substantially as shown and described.

2. The elbow levers B, provided with friction-rollers *c*, and arc-faced fillers *f*, in combination with the cams D and feeders G, substantially as shown and described.

168,913. STILTS. Franklin Beaumont, Jr., Dallas, Tex., assignor to himself and Wm. H. Beaumont, same place. [Filed July 26, 1875.]

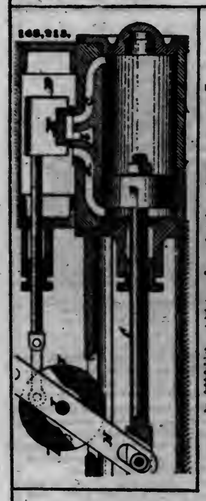


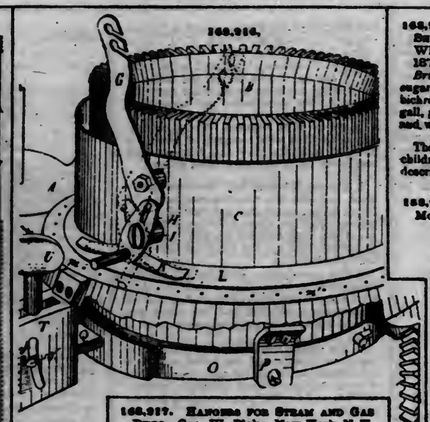
Brief.—The foot-plate is hinged to the sleeve which slides upon the staff, for adjustment to any desired point at which a spring serves to press the foot-lever. The lever engages with the wood of the staff, the weight of the walker also preventing disengagement while it is in use.

The combination of tube B, slotted at *b*, the thereto pivoted lever C, attached to or made in one with the foot-plate, and having serrated end *c*, and the stirrup D, all constructed and arranged substantially as and for the purpose specified.

168,914. DIES FOR SWAGING RIGHT-AND-LEFT INTERSECTING SCREW-THREADS. T. Beddow and A. T. Jackson, New Albany, Ind., assignors to T. Beddow, same place. [Filed Sept. 11, 1875.]

Brief.—The dies are counterparts of a right-and-left-screw-threaded bolt, the grooves or depressions corresponding with the threads, and the ridges with the base of the thread on the bolt. The dies are used in a press, and swage the metal to form the thread.





Dies A A, having semicircular concavities in them, which present right-and-left intersecting threads *a b* and intermediate double V-shaped spaces *c'*, as and for the purposes set forth.

168,915. VALVE-GEARS. Henry J. Behrens, New York, N. Y. [Filed June 16, 1875.]

1. The combination, with the steam cylinder and piston in communication with the valve-chest, of an independent plunger, exposed on one side to the pressure of the propelling fluid from the valve-chest, and actuated by the engine-piston against said pressure, but released or tripped at the end of the piston's stroke to reverse the valve, substantially as described, and for the object herein set forth.

2. The combination, with the engine-piston B, its valve E, and the resistance-plunger F, of the following devices, constituting a trip mechanism having lost motion—namely, the lever H, the rock-shaft I, the crank K, and the disks J M, substantially as and for the purposes herein set forth.

168,916. KNITTING-MACHINES. D. Bickford, New York, N. Y. [Filed Dec. 10, 1874.]

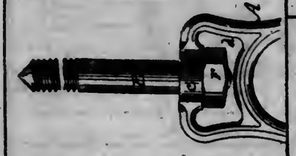
Brief.—The cams which raise the needles are arranged relatively to each other, so that a single switch, operated from the outside of the cam-cylinder, serves to deflect the needles downward in whichever direction the machine is revolved, and this switch is connected to a swinging thread-carrier in such a manner that, upon a reversal of the machine, these devices change in unison. The needle-cylinder is provided on its opposite sides with journals, which have bearings in a lever that is fulcrumed to the bed of the machine, so that by operating a screw connected with the long arm of the said lever, the needle-cylinder is raised or lowered, as may be desired.

1. In combination with a knitting-machine cam-cylinder or cam-plate, provided with devices for raising and depressing the needles, a swing-lever adapted to operate as described, whereby it serves to deflect the needles downward in whichever direction the machine may be revolved.

2. In combination with the cam-cylinder of a knitting-machine, the automatic swing-lever F, swing yarn-carrier G, and connecting mechanism, as described, whereby both the lever and carrier shall be shifted in unison, substantially as and for the purpose set forth.

3. In a rotary reversible knitting-machine, the combination, with the bed and with the cam-cylinder, of a pivoted yarn-carrier, mounted on the cam-cylinder, located, with reference to the cams, or cams and switch, substantially as described, and connecting mechanism, whereby said yarn-carrier is automatically operated as the machine is reversed, substantially as set forth.

4. The combination, with the stationary needle-cylinder and with a revolving cam-cylinder, of the pivoted thread-carrier and lever H, both mounted on the cylinder and pin m, substantially as shown and described.

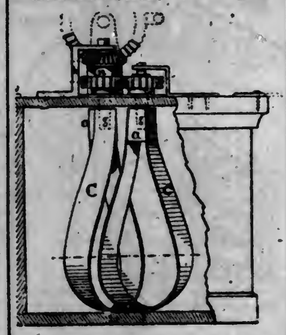


5. The combination, with the cam-cylinder, of a pivoted yarn-carrier, G, pivoted arm H, provided with projection m, and frictional piece or spring K, substantially as and for the purpose set forth.

6. The combination, with the needle-cylinder and with the bed of the machine, of an adjusting yoke-lever hung from and fulcrumed on the bed and pivoted to the needle-cylinder, and an adjusting device, substantially as and for the purpose described.

7. The combination, with the needle-cylinder, provided with journals and with the bed of the machine, of an adjustable lever, whereby the cylinder may be at will raised and lowered, substantially as described.

8. The combination of the yoke O, hangers F, arm Q, bar T, and adjusting-screw U, substantially as and for the purpose set forth.



168,917. HANGERS FOR STEAM AND GAS PIPES. Geo. W. Blake, New York, N. Y. [Filed June 11, 1875.]

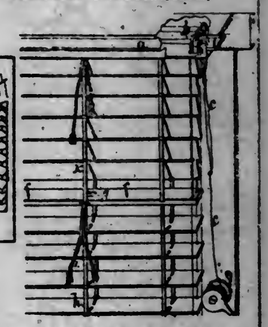
1. The stirrup A, in combination with the screw or bolt E, and nut F, substantially as herein set forth.

2. The combination, with a stirrup, A, screw or bolt B, thread *f*, and nut F, of the extension-piece G and coupling H, substantially as and for the purpose herein described.

168,918. CHURNS. Francis H. Boggs, Montgomery Township, Woodford County, Ill. [Filed June 20, 1875.]

The elliptical dasher-blades O O, attached to rhomboidal blocks *a*, the ends of the blades being secured to the parallel faces of the blocks, the edges of the blades coinciding with the vertical edges of the blocks, causing the blades to take a twisted form, in combination with a rotating shaft, substantially as specified.

168,919. DISINFECTING, DEODORIZING, AND ANTISEPTIC COMPOSITIONS. G. H. Bowen, Washington, D. C. [Filed Aug. 24, 1875.]



A new composition of matter for disinfecting and deodorizing purposes, consisting of permanganate of potash, boracic acid, and thymol or thymic acid, as herein described.

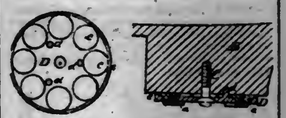
168,920. COMPOSITION DRESSING FOR SHOES, &c. John H. Brown and Joel G. Whiteside, St. Louis, Mo. [Filed July 12, 1875.]

Brief.—Composition composed of glue, soap, sugar, sal-soda, nut-galls, prussiate of potash, bichromate of potash, borax, gum-shellac, oxgall, gum-copal, extract of logwood, glycerine, and water.

The composition for dressing ladies' and children's shoes, compounded substantially as described, in about the proportions specified.

168,921. INSIDE BLINDS. John Bryan, Des Moines, Iowa. [Filed Oct. 1, 1874.]

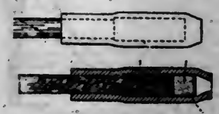
In a window-blind, the suspended division-board *f f*, independent slat-operating tapes *h* and *k*, and double set of elevating-cords *e e*, substantially as and for the purposes shown and described.



168,922. ANTI-INCRUSTATING COMPOUNDS. Hugh Burgess, Boyer's Ford, Pa. [Filed Sept. 1, 1875.]

An anti-incrustating composition consisting of pinate or sylvate of soda, as set forth.

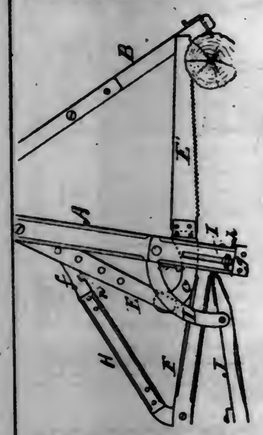
168,923. BLEACHING-SOAP. Peter Burns, San Francisco, Cal. [Filed Dec. 10, 1874.]



A soap compound consisting of the ingredients tallow, cocoa-nut oil, rosin, caustic soda, alcohol, borax, benzole, and ammonia, in about the proportions specified.

168,924. HEEL-PROTECTORS FOR BOOTS AND SHOES. Levi W. Buxton, Nashua, N. H. [Filed June 19, 1875.]

The adjustable heel-plate D, having the raised rim *e* and spurs *d*, in combination with the flanged rubber-studs *b*, substantially as and for the purpose set forth.



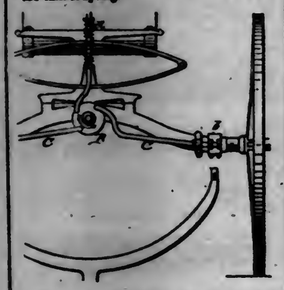
168,925. PROTECTORS FOR EXPLOSIVE CAPS. Frederick A. Caudell, Dover, N. J. [Filed July 2, 1875.]

An exploder for miners, arranged with an elastic inclosing covering, *d*, for the purpose of embracing and holding firmly the entering fuse, substantially as described.

166,226. SAWING-MACHINE. F. M. Carnahan, Adrian, Mich. [Filed Aug. 21, 1875.]

Brief.—A curvilinear reciprocating movement is given the saw by means of a vertically-vibrating operating-lever and a connecting-rod, one end of which is pivoted in a slot in the lever, and the other end is adjustably attached to a pendent rod vibrating between the main beams of the frame, and provided with a thwarted lever end, in which the curved shank of the saw is pivoted. The frame can be adjusted to the inequalities of soil by means of equalizing-blocks, and held in position by flat-headed blocks, adapted to be driven into the ground.

1. The gin A B, vibrating supporting-rod E, connecting-rod H, and vertically-vibrating operating-lever F, in combination with a crescent-saw, E', substantially as specified.



2. The combination, with the saw E' and operating-lever F, of the connecting-rod H, having notched prolongation f, and the slotted supporting-rod E, having upward rods 4, substantially as specified.

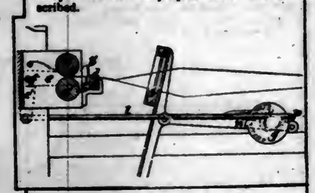
3. The vibrating and adjustable treadle J, having notched vibrating arms I, in combination with the saw-supporting frame A, substantially as specified.

4. The frame A and equalizing-blocks I, in combination with the holding-bolts h, adapted to be driven into the ground, substantially as specified.

166,227. DEVICES FOR DETACHING HORSES. James Carpenter, Sheridan, Mich., assignor of one-fourth his right to Jos. W. Marsh. [Filed Aug. 14, 1875.]

Brief.—Pressing on the upright rod releases the thill-coupling.

The combination, in a vehicle, of the pivoted wheel B, horizontal rods C C, thill-clips b b, perpendicular rod D, and spring 4, substantially as and for the purposes set forth.



166,228. TAKE-UP MECHANISMS FOR LOOMS. Hugo Carstaedt, New York, N. Y. [Filed Apr. 2, 1875.]

Brief.—The take-up is adapted to the weaving of cornets, and to insure the action of the holding needle-bar, a lifter-bar and a depressor-bar are so arranged and operated as to press the fabric upon the needles, and lift it above them, as required. The operating-cam is provided with a segmental guard, by means of which the lifter and depressor bars are thrown out of operation when desired.

1. The combination, with the take-up of a loom, and with the retaining-needles d, of a lifting device, constructed substantially in the manner described, whereby the fabric is raised out of the needles during the time the filling-thread is beaten up, and while the take-up is acting on it.

2. The combination, with the take-up of a loom, with the retaining-needles d and lifter b, of a depresser, b', both the lifter and depresser being actuated by a cam which acts independently of the reed, substantially as set forth.

3. The combination of the cam-disk g and segmental guard r with the forked rod f, bell-crank levers e e', blades b b', and take-up rollers a a', all constructed and operating substantially as and for the purpose shown and described.

166,229. TOY BUILDING-BLOCKS. George H. Chinnock, Brooklyn, N. Y. [Filed Mar. 6, 1875.]

1. A cubical or other shaped block, provided with grooves c on one or more of its faces, in combination with the ornamenting paper or material, the edges of which are turned down into and confined by the grooves, substantially as described.

2. As a new article of manufacture, a toy block, constructed of a cubical piece of wood or other material, having two lettered faces opposite each other, and having its four remaining sides or faces provided with a continuous slot or depression, in which the ornamenting material is secured, substantially as described, and for the purposes specified.

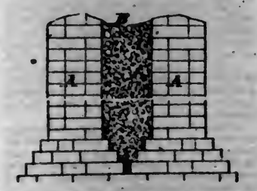
166,230. ARTICULATED TOY FIGURES. Geo. H. Chinnock, Brooklyn, N. Y. [Filed Sept. 2, 1875.]

166,230.

1. An articulated or jointed toy figure, the adjoining members or portions of which are made, respectively, concave and convex, and united by a metallic link swiveled to one part, and loosely attached and secured to the other by means of a slot in said link, arranged to engage a pin secured to the other part, for the purpose of allowing freedom of motion to the members, and the ready disengagement of said parts, substantially as described.

2. The metallic slotted link, pivoted to one member of an articulated toy figure, and adapted to be secured to the adjoining portion of the adjacent member, for the purpose of connecting said parts, substantially as described.

166,231. EAVES-TROUGH. C. A. Codding, Dowagiac, Mich. [Filed Sept. 7, 1875.]



Brief.—A strip of metal is soldered on the outside of the trough at the lap-seams, one end being fastened at the head, and the other end bent over the edge of the trough. A brace-bar is also bent over the head at one end, and over the edge of the trough at the other end. In each instance the strip and brace-bar are securely soldered to impart stiffness to the trough.

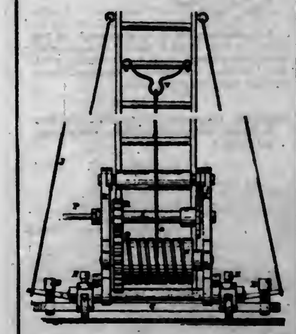
1. The combination, with the sections of metal forming the trough, of the bands D, soldered upon the lap-seams and fastened at one end beneath the tube or head, and bent at the other over the side of the trough, as and for the purpose described.

2. The combination, with the sides of the trough, of the brace C, bent over and soldered to the side of the trough at one end, and bent around and soldered to the tube or head at the other, for the purpose described.

166,232. CONSTRUCTION OF FENCES. Jas. B. Cook and James W. Heath, Memphis, Tenn. [Filed Apr. 28, 1875.]

Brief.—The escape of prisoners is prevented by a loose or mobile filling of sand or similar material between hollow walls or linings. The hollow or double walls are supported by doubly-flanged pillars, and a supply-receptacle is provided on top to replenish the material.

1. The method of preventing the puncturing of walls by the employment of a loose or mobile filling of sand, gravel, or other material within or between hollow walls or wall-linings or floors or ceilings.



2. The combination of a hollow or double wall or wall-lining or floor or ceiling, a mobile filling, and a supply-receptacle above, from which the space may be kept constantly filled.

3. The combination of the doubly flanged or grooved pillars, the double plates of the hollow wall or wall-lining, and a suitable mobile material filling the space between them, substantially as set forth.

4. The construction of the frame-standards of the hollow walls or wall-linings, with latticed or other openings, substantially as and for the purpose set forth.

166,233. FIREMEN'S LADDERS. M. Cronin, Washington, D. C. [Filed Sept. 16, 1875.]

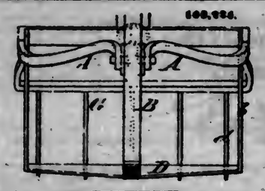
Brief.—A rectangular platform or frame-work, for raising and supporting ladders, is provided with adjustable caster-wheels and screws, to adjust the platform to uneven surfaces; or, on icy or smooth streets pins are used instead of the screws for securing the platform in position. To the front of the platform is pivoted a folding and adjustable derrick, provided with a drum, on which the hoisting-rope is wound. Folding arms are secured to the sides of the platform, to which guy-ropes are attached for holding the ladder steady when elevated. A stop-rope is secured at one end to the rear end of the platform, and at the other end to one of the ladder-rounds, which prevents the ladder from being raised too far.

1. A portable platform for supporting ladders, with adjustable caster-wheels and screw-bolts, or iron pins, substantially as herein set forth, and for the purpose specified.

2. In combination with the portable ladder-platform B, the folding and adjustable derrick K, substantially as set forth, and for the purpose specified.

3. The combination of the portable platform B, derrick K, drum N, crank P, rope O, double hook V, folding arms I, and guy-rod J with the ladder A, all substantially as shown, and for the purpose set forth.

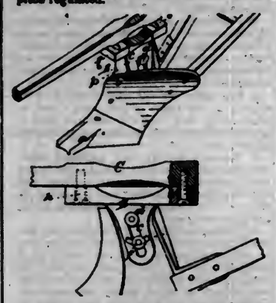
4. The combination of the portable platform B, derrick K, drum N, crank P, rubber-wheel T, pawl U, rope O, double hook V, folding arm I, guy-rod J, stop-rope W, adjustable caster-wheels F, and adjusting screws or pins D with the ladder A, all substantially as shown and described, and for the purpose set forth.



5. The combination of the caster-wheels F and pivoted supporting-bar G with the adjusting-screws E, substantially as shown and described, and for the purpose set forth.

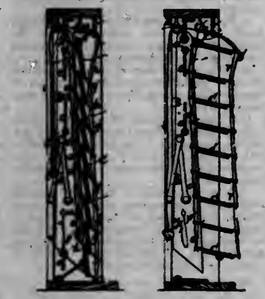
166,234. GARDEN IMPLEMENTS. Jno. Christy, Clyde, Ohio, assignor of one-half his right to Milo Hunter and Byron C. Brigham, same place. [Filed July 10, 1875.]

Brief.—A horizontal cutter is mounted upon a single wheel, like a wheelbarrow. Immediately in front of the blade is pivoted a rake-head, whose teeth extend a little distance below the cutting-blade. When the machine is pushed with the wheel forward, the teeth drag loosely upon the ground, but when drawn forward the teeth penetrate the soil.



In combination, with the double-edged hoe D, secured rigidly to the frame A, the pivoted rake G, the tines of which are extended below the horizontal portion of the hoe, substantially in the manner and for the purpose described.

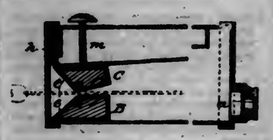
166,235.



166,235. PLOWS. Wm. H. Daniels, Montpelier, Ohio. [Filed Feb. 2, 1875.]

Brief.—A standard in two parts, to allow the beam to be elevated, moved laterally, or its pitch regulated.

The T-shaped stand or bar B, with the vertical and curvilinear slots s s and transverse slots p p, in combination with the plow with the set-screws d f, and the plow-beam with the set-screws h h, substantially as and for the purpose set forth.



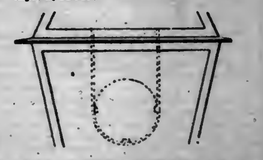
166,236. BLIND-AWNINGS. Jacob David, Brooklyn, N. Y. [Filed Aug. 26, 1875.]

In a blind-awning, the combination of the swinging side pieces, double-jointed braces, ventilating front slats, and folding side slats, substantially as shown and described.

166,237. KNIFE-POLISHERS. A. M. De Hart, Reading, Pa. [Filed Aug. 12, 1875.]

Brief.—The rear edges of the rubbing-pads open at intervals by means of springs, for the purpose of admitting polishing material between them.

1. The combination of the upper tilting jaw C, plate D, spring 4, and knob D', with stem s, all constructed substantially as and for the purposes herein set forth.



2. The combination of the box A, stationary jaw B, tilting jaw C, plate D, spring 4, and knob D', with stem s, all constructed and arranged to operate substantially as and for the purposes herein set forth.

166,238. BUCKLES. William C. Downs, Bristol, R. I. [Filed Sept. 16, 1875.]

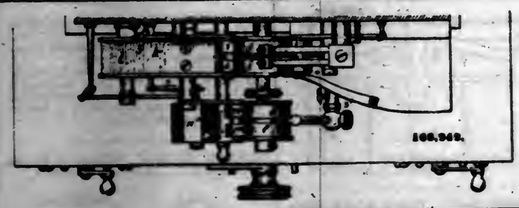
A buckle composed of malleable cast-iron, having a solid frame with a full pintle-eye at each end and a pintle-tongue, substantially as described.

166,239. STREET-LAMP SIGNALS FOR LOCATING FIRE-PLUGS. Geo. H. Dougherty, Jersey City, N. J., assignor of one-half his right to O. F. Marquard, same place. [Filed Apr. 3, 1875.]

In combination with a street-lamp, signals of different colors arranged therein in relation to each other and to the adjacent fire-plug, so as to indicate upon which side of the lamp said fire-plug is located, substantially as set forth.

166,240. MANUFACTURE OF PILLS. Jacob Dunton, Philadelphia, Pa. [Filed Sept. 4, 1875.]

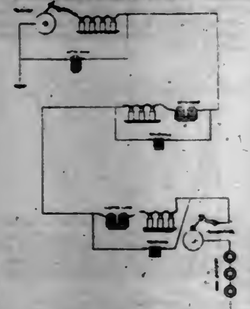
In manufacturing pills by compression, the herein-described method of drying the powders, before compression, at a temperature of about 90° Fahrenheit, with 20° absolute dryness, (Mason's hygrometer,) to prevent reaction upon the mold, and insure stability of cohesion, and lubricating the mold to prevent adhesion, and insure the removal of the pill integrally and perfect.



166,241. WINKER-STRAPS FOR BRIDLE-BLINDS. Edgar Beaton and James Scott, Jacksonville, Ill. [Filed Aug. 16, 1875.]

The bifurcated or forked winker-strap A for bridle-blinds, re-enforced with wire B, having the plate b, substantially as and for the purpose set forth.

166,242. TRANSMITTERS AND RECEIVERS FOR AUTOMATIC TELEGRAPHS. Thomas A. Edison, Newark, N. J., assignor to himself and Geo. Harrington, Washington, D. C. [Filed Jan. 26, 1875.]



1. The transmitting-drum f and receiving-drum e upon the same shaft, in combination with the receiving and transmitting styles or rollers a a and a cloth, b', for connecting either one drum or the other to the shaft h, as set forth.

2. The two contact-rollers *i* and *i'*, applied to the transmitting-drum, one at each side of the roller *a* or styles, in combination with the wire *d*, to guide the advancing end of the strip of paper, as set forth.

3. The roller *a'*, removable from the shaft *a*, and received by friction, and containing points, in combination with the receiving drum *a* and yielding roller *a'*, substantially as set forth.

168,943. AUTOMATIC TELEGRAPH. Thomas A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. [Filed Jan. 26, 1876.]

1. The secondary battery, with poles of similar materials, applied in the main circuit, containing the receiving-instrument, in combination with a shunt around the receiving-instrument, containing a resistance or electro-magnet, for the purposes set forth.

2. The combination, with the signaling electro magnet, placed in the line, of a secondary battery, also in the line, and a shunt around such instrument, containing a resistance, substantially as set forth.

168,944. AUTOMATIC TELEGRAPH. Thomas A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. [Filed Jan. 26, 1876.]

1. The secondary battery, with poles of similar materials, applied in the main circuit, containing the receiving-instrument, in combination with a shunt around the receiving-instrument, containing a resistance or electro-magnet, for the purposes set forth.

2. The combination, with the signaling electro magnet, placed in the line, of a secondary battery, also in the line, and a shunt around such instrument, containing a resistance, substantially as set forth.

168,945. NUT-SCRAPER. Thomas A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. [Filed Jan. 26, 1876.]

Brief.—Two direct-acting horizontally-moving dies, to forge the sides of the blank, and a vertically-moving flat-faced anvil, upon which the nut is drawn out by a roller attached to a carriage reciprocating in the ways of a yoke-piece (which is given a vertical movement at the proper intervals by cams upon a rock-shaft) after the completion of the side dies. A bracket, upon which the devices for feeding the heated rod are arranged, can be swung around horizontally on its vertical pivot, when it is desirable to expose the faces of the dies. A griping-slide is reciprocated in ways of the bracket by a rock-shaft and lever, to feed the rod forward, and is retracted by a spring, the bite of the plunger that forces the rod against the griping-jaws being automatically released during the backward movement of the slide. The rod is fed against a gage. Two cutters—one for severing the nut from the rod, and the other for shearing the superfluous metal from the point—are carried by the swinging bracket.

1. The combination of a roller, 32, a flat or nearly flat opposing die or anvil, 17, and a pair of side dies or hammers, 18, retracted during the effective movements of the roller, substantially as herein described.

2. The combination of carriage 34, sliding in bearing-ways 33, and yoke-arm 36 40, for guiding and reciprocating the roller 32, in the manner set forth.

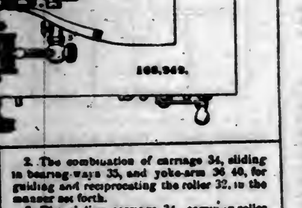
3. The sliding carriage 34, carrying roller 32, side dies 18 18, and bottom die or anvil 17, and cranks or their equivalent, in combination with the shaft 2, having cams 10 39, for operating the shaping mechanism, in the manner set forth.

4. The main driving-shaft 2, mounted in arms 4 4, fulcrumed to the main frame, in combination with cranks 6, eccentric shaft 7, and treadle 8, for opening and closing the dies, as set forth.

5. The main driving shaft, arranged below the side dies or hammers, and about on a line with the end dies, substantially as shown and described, in combination with the roller 32, dies 18 18 17, set-screws 20, bell-cranks 22, and connecting-rods 24.

6. The combination in a horseshoe-nail machine, of continuously actuated moving dies or hammers, and a roller, a driving shaft adapted to rise and fall, to open and close the dies, and a feed mechanism, actuated by hand, substantially as herein shown and described, to provide for subjecting the nail to any required number of blows, and for withdrawing the same at any time, as set forth.

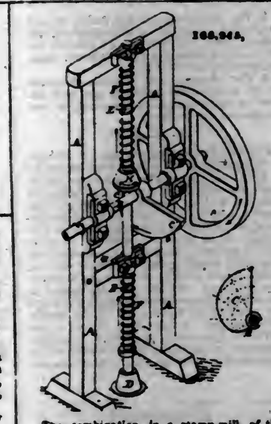
7. The supplemental frame, supporting the feed, gage, and cutting mechanism, and attached to the main frame by a vertical pivot, so as to swing laterally to expose the die-ways, as set forth.



8. The sliding feed-table, projected by a rock-shaft and lever, and retracted by a spring, in combination with the adjustable stops 66 69, substantially as described, for the purpose specified.

9. The grooved arm 68, and toggle 72, combined and operating, substantially as described, for locking and unlocking the griping mechanism, in the manner set forth.

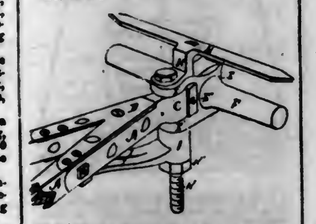
10. The combination of the tripping-cam 79, pawl 80, lever 81, and lifting-spring, for operating the cutting arm or slide, in the manner set forth.



11. The sliding gage 86, adjustable longitudinally, and projected and retracted laterally by the cam 92, or its mechanical equivalent, in combination with rock-shaft 61, and hand-lever 93, in the manner specified, for the purpose set forth.

12. The combination of the hand lever 93, rock-shaft 61, crank-lever 62, grooved cams 92, and tripping-cam 79, with their appurtenances, substantially as shown and described, for operating the feeding-slide, griping-jaw, sliding gage, and cutting arm or slide, in unison, by hand, in the manner set forth.

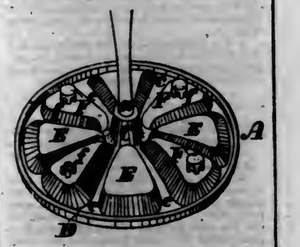
168,946. ORE-STAMPS. Wm. C. Ferguson and John S. Jones, St. Louis, Mo., assignors of one-third their right to John L. Ferguson, same place. [Filed Apr. 28, 1875.]



Brief.—The stamp-shaft is lifted by means of a cam which has a descending pitch, in order that, as the force required to compress the springs increases, the amount of compression is proportionately diminished, and the power required to revolve the cam remains constant.

168,946.

The combination, in a stamp-mill, of the stamp D, with shaft E, spring or springs F, with lifting-cam C, having a decreasing pitch from its point *c* to point *c'*, substantially as and for the purpose set forth.

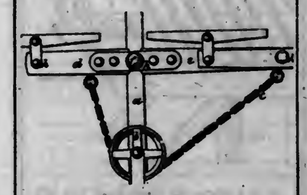


168,946. CARRIAGE-COUPLINGS. Stephen B. Foster, Minneapolis, Minn. [Filed Aug. 20, 1875.]

1. The combination, with the reach A, of a coupler E, and bolt K, of the double brace I I, and rubber pad G, substantially as and for the purpose set forth.

2. The combination, with a bowed axle F, having a coupler E, welded thereon, of the reach A, pad G, rubber pad G, plate D, double brace I I, and bolt K, constructed to operate substantially as shown and described.

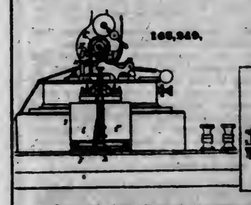
168,947. CLOTHES-POUNCERS. Andrew French and John S. Lash, Philadelphia, Pa. [Filed Aug. 24, 1875.]



1. The metallic disk A, cast in one piece, having a central depressed hub, C, from which proceed radial ribs *e e*, flaring upwardly toward the rim D, the space between said ribs being cast to form chambers E, substantially as shown and described.

2. In combination with the conical disk, having chambers E, the arbors F, and globes *f*, substantially as set forth and shown.

168,948. DRAFT-EQUALIZERS. Ezra Graham, Manchester, Iowa, assignor to himself and Enos Hamblin, same place. [Filed Aug. 23, 1875.]



Brief.—The unequal levers are pivoted upon the same bolt.

The combination, with pole *a*, of unequal levers *d e*, jointed on the same pole-pin, and connected by a chain, *c*, passing over a rear pole-pulley, *b*, to turn the three-horse equalizer specified.

168,949. PRINTING-TELEGRAPHS. Elisha Gray, Chicago, Ill. [Filed June 1, 1874.]

Brief.—Improvements on Gray's former Patent No. 152,907.

168,949.

1. In a printing-telegraph instrument, the separable and yielding points *h* and *h'*, one in constant electrical connection with the press-magnets and one pole of the battery, and the other in like connection with the other pole and the type-wheel magnets, in combination with a yielding separator or circuit-breaker, controlled substantially as specified, for the purposes set forth.

2. The combination of the polarized relay I, having its helices in the main circuit, the points *w* and *w'* on opposite sides of corresponding points on the polarized armature, the Morse armature l', and its lever, provided with the points or pin *h*, and actuated by the relay-magnet, and the points *l* and *n* on opposite sides of the pin *h*, the several parts being arranged in the circuit of the local battery, substantially as and for the purposes specified.

3. In combination, substantially as described, the separable points *h* and *h'*, arranged in the circuit of the type-wheel magnets, an automatic circuit-breaker operating in connection with the said points, the separable points *h* and *n* arranged in the circuit of the printing-magnets, and controlled by the main current, all operating together in a printing-telegraph instrument for the purpose of leaving the local circuits broken when the instrument is at rest.

4. The main-battery circuit or wire carried to the diagonal insulated points of the pole-changer, in combination with the insulated tongues attached to the type-wheel lever, one of the said tongues being electrically connected to the sendlever of the primary instrument, and the other to the sendlever of the secondary instrument, substantially as specified, and for the purposes set forth.

5. The pole-changer A, consisting of the insulated points *d' e'*, *e*, and *d*, in combination with the type-wheel lever provided with the insulated springs *c* and *c'*, all arranged substantially as specified, with relation to each other and the circuits, for the purposes set forth.

6. The sliding, yielding, and vibrating arm H, provided with a wedge-shaped insulation-block on one end, and engaging at the other end a screw or worm on the type-wheel shaft, in combination with the yielding points *h* and *h'*, arranged in the type-wheel circuit, and with a releasing-arm carried by the printing mechanism, substantially as and for the purposes set forth.

7. The combination of the polarized relay and the Morse armature, in connection with the points *l* and *n* arranged in the local circuit, substantially as and for the purposes specified.

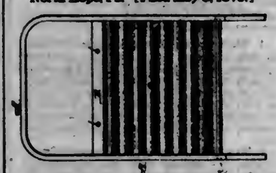
168,950. COFFINS. Francis B. Haden, Chelsea, Great Britain. [Filed Sept. 13, 1875.]

Brief.—A composition of glue and other matter is used for constructing coffins, the material rapidly decomposing, and allowing the body to come in contact with the earth, for more speedy dissolution.

As a new article of manufacture, a perishable coffin composed wholly or in part of the materials herein described, or of the substantial equivalent thereof, being of such a nature that, by the action upon it of the moisture of the earth in which the coffin is buried, it shall be disintegrated and decomposed before the dead body which it has inclosed becomes decomposed, so as to leave said body exposed to the resolvent action of the earth.

168,951. VALVES FOR PUMPING-ENGINES. Wm. H. Harrison, Bethlehem, Pa. [Filed Nov. 3, 1876.]

Brief.—The valve which admits steam to the chest to operate the main valve also controls the quantity of steam, and the time when it is to be admitted to the cylinder.



168,951.

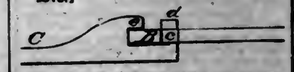
1. The combination, in a direct-action pumping-engine, of the regulating-valve K, operated by and moving simultaneously and in unison with the engine, the main valve operated by the pressure of steam, the partition in the chest of the main valve, and a partition having ports adapted to the regulating-valve, substantially as described, so that the admission of steam to the chest of the main valve shall be graduated by the regulating-valve, in the manner set forth, as the piston is concluding and commencing each stroke, for the purpose specified.

2. The combination of the small cylinder *h*, its piston *f*, connected to the two parts of the main valve, and the cones *e e*, adapted to openings in the cylinder-heads, all as set forth.

168,952. WASH-BOARDS. Edwin S. Heath, North Hope, Pa. [Filed May 8, 1876.]

The screw-rod C and corrugated zinc plates, connected therewith by a lap-joint, as specified, in combination with the grooved flexible frame-piece A and cross-bars B B, as and for the purpose specified.

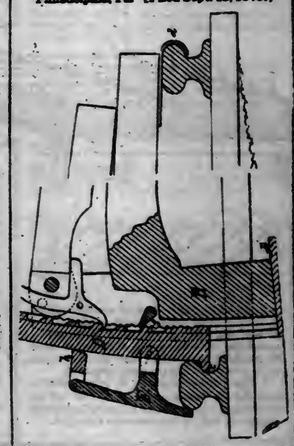
168,953. ATTACHMENTS TO COFFEE-POTS. Samuel S. Hoover, Aldersons, W. Va., assignor to Andrew J. Jones, same place. [Filed Aug. 27, 1875.]



1. In a condensing attachment for coffee-pots, the combination of a vessel adapted to hold water, having an open top, sides tapering downwardly and inwardly in a straight line, and a top flanged rim, the said vessel being adapted to fit coffee-pots of various sizes, with a coil of pipe whose upper open end is secured near the top of said vessel, substantially as described and shown.

2. In a condensing attachment for coffee-pots, the combination of a vessel adapted to hold water, having an open top, sides tapering downwardly and inwardly in a straight line, and a top-flanged rim, with a cone composing the entire bottom of the vessel, and a coil of pipe whose upper open end is secured near the top of said vessel, substantially as described and shown.

3. In a condensing attachment for coffee-pots, the combination of a vessel having an open top, tapering sides A, and top-flanged rim *a* with the coil of pipe D, pipe C, cone B cap *c'*, and handle E, substantially as described and shown.



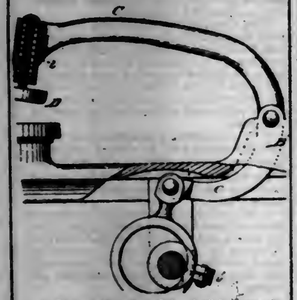
4. The condensing attachment for coffee-pots described, consisting of a vessel having tapering sides A, top rim *a*, and handle E, the cone B, having the cap *c'*, the pipe C, having the cap *d*, and the coil of pipe D, all constructed and arranged substantially as described and shown.

168,954. PITMAN-CONNECTIONS. Sylvester B. Howard, Gilman, Ill. [Filed July 31, 1876.]

The sickle-bar A, having the segment B, notch *c*, and stop *a*, in combination with the pitman C, provided with the recessed head, pintle *d*, and hook *e*, substantially as described, and for the purpose set forth.

168,955. TRACK-LIFTERS. Geo. W. Hunter, Philadelphia, Pa. [Filed Sept. 13, 1876.]

1. In a lifting jack, a standard whose front face is made on the arc of a circle, having combined therewith a hook adapted to move in the curve of such arc, substantially as described.

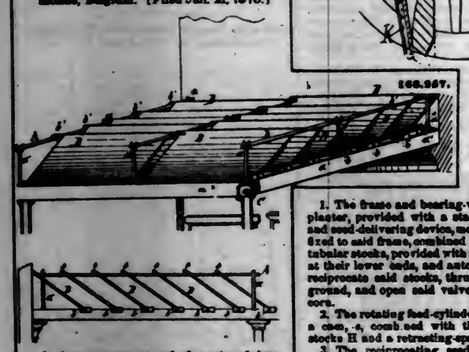


2. In a lifting-jack, the combination of an upright, an extending lateral arm and a hook or means of connection with the rail farthest from the pedestal, substantially as described.

3. In a lifting-jack, the combination, with the movable hook or elevating device, of an adjustable clamp or stay, substantially as and for the purposes set forth.

4. In a lifting jack, a clamp or stay consisting of the combination of the lever F and movable strut A, substantially as shown.

166,866. MACHINES FOR BEATING LEATHER. John H. Hussey, Baltimore, Md., assignor to Abraham S. Adler, Lewis P. Uriel, Jas. Clement, and John H. Hussey, same place. [Filed Sept. 11, 1875.]



Brief.—A power-hammer is attached to a rocking lever adapted to give a yielding blow in hammering leather seams.

1. The combination of the shaft A, eccentric d, sleeve b, rocking lever C, working in a slotted boss, yielding hammer D, and anvil H, all constructed and arranged substantially as and for the purpose described.

2. In a machine for hammering leather, the combination of the rocking lever C, provided with a vertical tube extending through its front, with the spring i, yielding hammer D, and anvil H, all constructed substantially as and for the purpose specified.

166,867. AWNINGS. Alphonse Ingbels Termonde, Belgium. [Filed Jan. 21, 1875.]

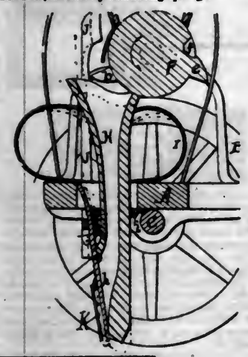
1. An awning composed of a series of slats, B, having their lower rods b^1 pivoted as described, and their upper rods b supported by transverse rods A, so that the slats B lie at an angle to and overlap each other, substantially as and for the purposes specified.

2. The frames or wings B, in combination with the gutters or spouts a^1 a^2 b^2 c^2, and the hollow supporting-columns C, substantially as described, and for the purposes specified.

3. The frames or wings B, in combination with the rods A, gutters or spouts a^1 a^2 b^2 c^2, the vertical rods or standards a, the supporting-columns C, and a water spout or conduit, substantially as set forth, and for the purposes described

---

166,868. KEY-RINGS. George W. Jopson, Waterbury, Conn. [Filed Sept. 9, 1875.]

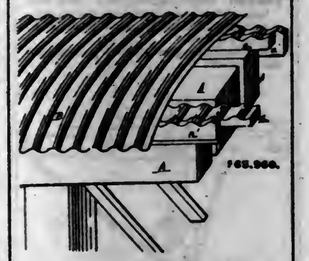


The combination of the divided ring a and collar c, the two ends of the ring constructed to receive and hold the said collar, and allow the collar to rotate thereon, the said collar constructed with an opening, f, substantially as and for the purpose specified

---

166,869. SEED-PLANTERS. A. M. Kaboose, Sun Prairie, Wis. [Filed Aug 12, 1875.]

Brief.—Mounted in bearings, to revolve in the bottom of the hopper, is a cylinder having seed-cells, beneath which are secured adjustable stocks for receiving the seed and depositing it in the earth. Upon the cylinder are cams, the central one of which strikes, in its revolution, rollers upon arms that secure the stocks together, and thus force them down into the earth. While thus depressed the two outside cams come into action, and strike the vertically pivoted arms, the lower ends of which are attached to a cross-bar, that presses against the upper ends of pivoted valves, to discharge the seed. The cams having acted, the stocks and valves are restored to their normal position by retracting-springs.



1. The frame and bearing-wheels of a corn-planter, provided with a stationary seed-box and seed-delivering device, moving in bearings fixed to said frame, combined with one or more tubular stocks, provided with automatic valves at their lower ends, and automatic devices to reciprocate said stocks, thrust them into the ground, and open said valves to deposit the corn.

2. The rotating feed-cylinder, provided with a cam, e, combined with the reciprocating stocks H and a retracting-spring, as set forth.

3. The reciprocating seed-stocks H and valves h, which are automatically closed by springs S, combined with the tripper-levers J and rotating tappets or cams h.

4. Combined with the reciprocating seed-stocks H, the covering-hoes K connected therewith, as set forth.

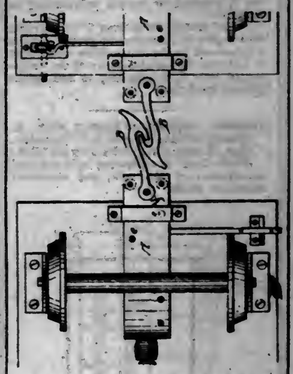
166,870. COVERS FOR THE UPPER ORIFICE OF BEEHIVES. Moritz Lassig, Chicago, Ill. [Filed Oct. 19, 1874.]

1. In a bridge, the combination, with the top chord A, of a corrugated sheet-metal covering, B, projecting on each side of said chord, arched and secured at an elevation above the timbers composing said chord, so as to leave a free open space between said covering and chord, substantially as described and shown.

2. In a bridge, the combination, with the top chord A, of the corrugated arched covering B and the strips a a', all constructed and arranged substantially as described and shown.

166,871. BEE-HIVES. David Latchaw, Barleyville, Pa. [Filed Mar. 24, 1875.]

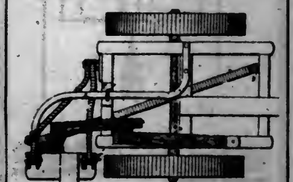
Brief.—An improvement on Patent No. 141,443, August 5, 1873, to same inventor. A moth-trap is fixed in the lower part of one of the frames, which frame may take any place in the series. The several frames are tongued and grooved, so as to present a close exterior, however they may be arranged together. Each end has an inner rank, an outer shutter, a space between, and, laterally, tongues to join in one with the frames.



1. The wire trap D, the frame C, provided with the wire tubes g g', constructed and arranged as and for the purpose specified.

2. The comb-frames, tongued and grooved, as shown and described, so that the frames of themselves form a perfectly close hive, as and for the purpose herein set forth.

3. The rank H provided with the grooves, as shown, and the glass I, in connection with the end board G and frames C, substantially as and for the purpose described.

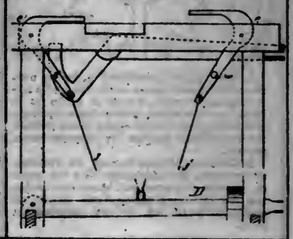


4. The case A, combined with the detachable bars B B and frames C, so arranged as to provide a summer and winter hive, substantially as and for the purpose herein described.

166,872. CAR-COUPLINGS. Charles Mace, Danville, Pa. [Filed July 24, 1876.]

In combination with the draw-heads A A, provided with springs D, and stops, as described, the coupling-latches B B provided with ears e e, and levers C, and detachably connected to the draw-heads by the bolts Y, substantially as and for the purposes described.

166,873. HARVESTERS. R. H. McCormick, Chicago, Ill. [Filed Apr. 6, 1874.]



1. The suspension-bar, constructed substantially as hereinbefore set forth, secured centrally upon the main frame, and having its rear end carved inward, so as to form a point of support for the rear coupling-arm, and afford room for the rake-post.

2. The combination of the shoe, the independent coupling-arms pivoted thereto, and to a common stud on the main frame, and the drag-bar pivoted to the main frame near its outer front corner, extending diagonally backward between the wheels and pivoted to the rear coupling-arm, these members being constructed and operating in combination substantially as set forth.

166,874. MACHINES FOR STRETCHING HAT-BODIES. John G. Meeker, Danbury, Conn., assignor of one-half his right to D. W. Meeker, same place. [Filed July 21, 1875.]

Brief.—Flattens a cone-shaped hat-body, and places it upon a segment-shaped table-top, provided with compound lever-arms, carrying clamps. These clamps hold the body upon the lever-arms, while the latter are caused to diverge from the edges of the table by the interposition of a wedge-shaped lever.

166,875. VALVE-GEARING. Llewellyn F. Law, Chicago, Ill. [Filed Aug. 24, 1875.]

Brief.—The hollowed clamp, with arms and rods, adjusted by thumb-screws, together with a screw having a center-point, has a clamping-screw on one arm, and attaching-bolt with extension-blocks on the other.

1. The clamp A, having the clamping-screw e, adjustable arm C, rods D and E, adapted to be placed and secured as described, and screw f, having a center point, all combined substantially as and for the purpose specified.

2. In combination with the clamp A, one or more extension-blocks, B, and attaching-bolt b, substantially as and for the purpose named.

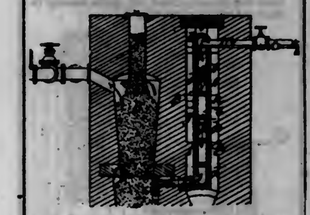
166,876. MANUFACTURE OF IRON. Albert G. Lewis, Brooklyn, N. Y. [Filed May 27, 1876.]

Brief.—Uses a mixture of infusorial earth, found in Nevada, wolfram, and manganese, as a "physic" in puddling.

The method herein specified of removing foreign substances from iron by a mixture composed of the above-described silica, wolfram, and manganese introduced into the melted metal, substantially as and for the purposes set forth.

166,877. TRUSSES. Leon T. Lubin, Boston, Mass. [Filed Aug. 24, 1875.]

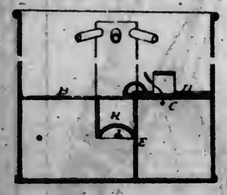
Brief.—A small pad passes through an opening in a large abdominal plate, and is given a yielding rocking motion by means of a straight steel bar, which is attached to it upon its outer side, and by an elastic cord, which loops over alternate hooks placed upon the plate and pad.



1. The hernia-pad A and holder-pad or plate B, the two applied and connected together by an elastic cord, b, substantially as described, for the purpose specified.

2. The hernia-pad A, arranged to move in and out of its holder-pad or plate B, the spring-band G, and the elastic straps D D, and a non-elastic band, E, all connected together and arranged substantially as herein described, and for the inward movement or pressure of the hernia-pad A in the outward movement of the holder-pad B, substantially as specified.

3. The non-elastic band E, with its loops b^1, in combination with the elastic strap or straps D, substantially as and for the purpose described.



166,878. GAS-APPARATUS. Philip W. Mechanic, Elsewelville, N. Y. [Filed Nov. 7, 1874.]

Brief.—Air to incite combustion is admitted at the top of the steam-superheater. Subsequently shows all air-inlets, and supports combustion by the oxygen of the steam. Gas-retort has side grate. Steam enters it through an annular space between coal and coke at the gratebars bottom.

1. The sectionally-constructed retort A, encompassed by a flue, f, and composed of compartments d, mounted one upon the other, in combination with the contracted apertures e, connecting said compartments, a steam-inlet, h, in communication with the upper one of said compartments, and a steam-outlet, c, below, connecting said retort with the decomposing-chamber of the apparatus, substantially as and for the purposes herein set forth.

166,879. WASH-BOILERS. Frank Mackil, Richmond, Tex. [Filed May 22, 1876.]

The wash-boiler, having the rigid horizontal partition B, with slide-closed opening C, the vertical supporting partition E, having the end passages a in the water-chamber, and the horizontal arched steam-tube H, having the central entrance d and the upright end chutes communicating therewith, constructed and arranged as shown and described.

166,880. TAG-FASTENERS. T. F. Marston, New York, N. Y., assignor to Philip Hake, Hoboken, N. J. [Filed June 2, 1875.]

The fastener for tags herein shown and described, made from a piece of wire, constructed with the circular loop A to receive and seat the tag, and with the inwardly-bent sides C C for stiffening the fastener, and with the point F and the loop-guard E, as and for the purpose described, the outer end of said loop-guard being turned up to form a guide for passing the material onto the piercing-pin.

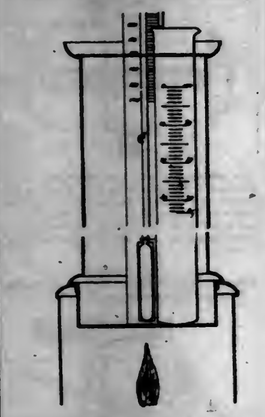
166,881. MANUFACTURE OF BEER AND ALE. John Matthews, New York, N. Y. [Filed Aug. 6, 1875.]

Brief.—Makes beer and ale by using malt extract, hop extract, grape-sugar, and pure alcohol, in accordance with certain specified formulæ.

1. The improved material herein described for producing beer and ale, called beer extract, and consisting of malt extract, hop extract, sugar, and alcohol, with or without flavoring and coloring materials such as named, the whole combined and put up for use substantially as specified.

2. The improved beverage herein described, consisting of beer extract, as described, water and carbonic-acid gas, substantially as set forth.

166,882. AERATED SEA-WATER. John Matthews, New York, N. Y. [Filed Aug. 6, 1875.]



The new manufacture herein described—sea-water charged with carbonic-acid gas and inclosed in bottles or other air-tight vessels, substantially as specified.

1. The pivoted lever-arms C C', with fingers f f', in combination with the wedge-shaped lever F, arranged to operate substantially as specified.

2. The pivoted lever-arms C C', provided with fingers f f', carrying the pivoted clamps e e', operated by the intermediate connections j j, and lever D, in combination with the wedge-shaped lever E, substantially as and for the purpose set forth.

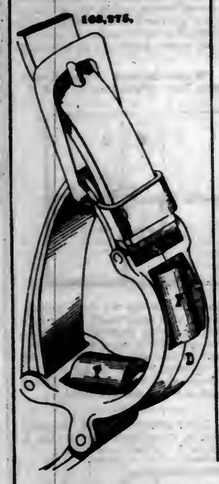
166,275. MEASURE OF TESTING MILK. A. Mouzed, Clifton, assignor to G. Tagliabue, East Chester, N. Y. [Filed July 28, 1875.]

Brief.—Tests by separating solid and fluid constituents of the milk, and measuring amount of solids.

1. The above-described process of testing milk, by mixing the same with any suitable alkaline and cold solutions and subjecting the mixture to heat.

2. The compounds or their equivalents, called in this specification solutions Nos. 1 and 2, substantially as and for the purpose described.

3. The test-tube F, marked off, as described, into three equal divisions, the upper division being being marked off into thirty-three and one-third parts, substantially as described.



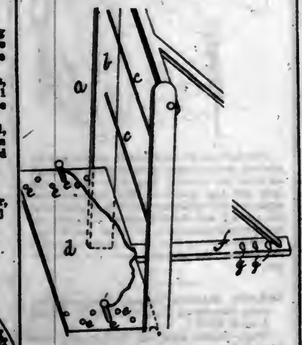
166,276. GAME APPARATUS. Andrew Miller, Guntersville, Ala. [Filed Aug. 5, 1875.]

1. The rotating game-board A, having a series of numbered spaces on its face, and a corresponding number of pins or hooks on its back, in combination with a frame having a projecting arm, C, with spring d and index i, substantially as and for the purposes herein set forth.

2. The cards D, each having six numbers, as described, in combination with the board A, provided with numbered spaces and hooks, and frame C, having spring d and index i, all substantially as and for the purposes set forth.

166,275.

166,277.

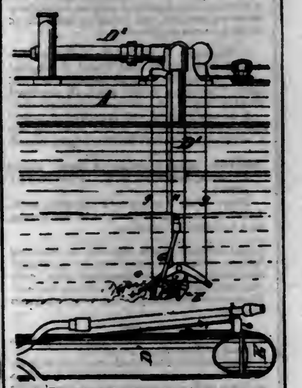


166,275. SHAFT-TUGS. Albert F. Morse, Sharon, Mass. [Filed Apr. 2, 1875.]

1. A shaft-tug provided with removable friction-rolls, substantially as described.

2. The friction-rolls F F' and pins s, in combination with the metallic shaft-tug D, having recess b, substantially as described.

166,276. BOOK-HOLDERS. L. A. Moulton, Old Town, Me. [Filed Aug. 23, 1875.]



In a book-rest, the combination of the frame a, shelf and arm d f, and cross-bar and arm h i, said shelf and cross-bar being pivoted at opposite edges of the uprights b b, substantially as and for the described purposes.

166,277. FIRE-PROOF ROOFS. A. B. Mullett, Washington, D. C. [Filed Apr. 2, 1875.]

1. A coating or layer of fire and water proof cement, having hooks or cleats embedded therein, and secured by the setting or hardening of the cement, for attaching or anchoring a sheathing of sheet metal, and forming a supplemental protection, in the manner herein set forth.

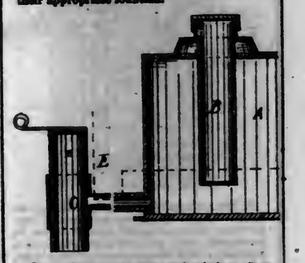
2. The combination of a foundation, A, of concrete, a coating or layer, B, of cement, anchoring hooks or cleats h, embedded in the cement, and supported thereby, and copper or other sheet-metal sheathing, C, attached to the hooks or cleats, substantially as herein specified, to constitute an improved wind-proof and fire and water proof roof.

166,278. DREDGING APPARATUS. William H. Newton, Madison, Wis. [Filed Sept. 4, 1875.]

1. The pivoted adjustable head or mouth-piece E, combined with the swinging pipe D', substantially as described.

2. The adjustable nozzles G G, combined with the adjustable hood E and swinging pipe D', substantially as described.

166,279. STEAMER IRON-BOTTOMS. Josiah Orthwalt, S. M. P. Hasbrouck, and Eli M. Sweet, Minneapolis, Minn. [Filed June 1, 1875.]



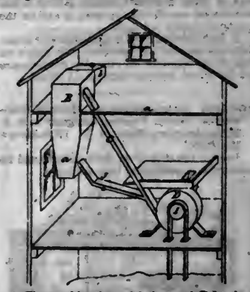
1. The combination, in a bed-bottom, with the slats B E, head-rail D, and foot-rail D', of the stays O O, secured to the head-rail, and sliding under the foot-rail, and the springs G G and G', arranged substantially as herein set forth.

2. In a bed-bottom, the slats B E, fastened to the head-rail and sliding on the foot-rail, except the outer slat on each side, which is fastened to the foot-rail, substantially as herein set forth.

166,280. SODA-FOUNTAINS WITH DOUBLE FAUCETS. Frederick T. Paine, Ishua, Miss. [Filed July 23, 1875.]

Brief.—Each of the two receptacles shown has a cooler depending from the neck. The necessary ingredients mix as the fluid flows from the faucet joining the pipes leading to their appropriate fountains.

In a soda-water apparatus, two independent vessels, A A', provided with covers a a', having separate cooling vessels, and both vessels provided with pipes C C', having a mixing faucet, E, substantially as herein specified.



166,281. SPIKE AND NAIL EXTRACTORS. J. Pascoe, Georgetown, D. C. [Filed Aug. 28, 1875.]

The combination of the lever-shoe B, provided with the notches b b, with the shackle-bar C, adapted to be adjusted in said notches, and the spring D, as shown and described.

166,282. COTTON-CLEANERS. A. C. Pearce, Milan, Tenn. [Filed July 8, 1875.]

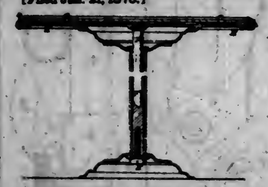
Brief.—The cotton to be cleaned is placed on a table, from which it is delivered into an inclined chute, and blown by a rotary fan upwardly against a screen in one side of a trunk. As the cotton falls out of the trunk, it is subjected to a milder blast from a secondary air-tube provided with a regulating-valve.

1. The combination, with the trunk B, having discharge-chute a, of the primary blast-pipe C and secondary pipe J, the latter provided with regulating-valve V, substantially as specified.

2. The combination, with a receiving-trunk, B, a primary blast-pipe, C, a secondary air-conduit, J, and screen d, of a regulating-valve, V, and a blowing-fan, F, substantially as specified.

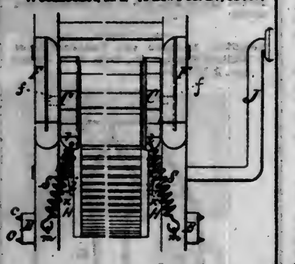
3. The combination, with a primary blast-pipe, C, and a secondary conduit, J, of the reticulated screen d and valve v, substantially as specified.

166,283. BEE-HIVES. John Peter Peaker, Booneville, Miss. [Filed July 31, 1875.]



Brief.—A supplementary bottom is attached, which carries a drawer with a feed-cup, also moth-decoys.

1. The combination, with a bee-hive having in its bottom sliding communicating doors b', of a supplementary detachable bottom, B, supporting a feed-cup, J, and dripping-pan r, substantially as and for the purpose set forth.

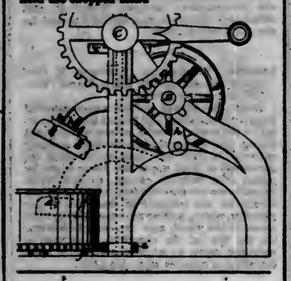


2. The combination, with a bee-hive having a lighted bottom, of the supplementary bottom B having moth feed-pan m, the drawer I having moth-decoy cup g, and the moth-openings f and m, substantially as described.

166,284. ADVERTISING-TABLES. Johann Maximilian Flemmer, London, England. [Filed Jan. 21, 1875.]

As a new article of manufacture, a table having a suitable transparent top, with spaces for the display of advertisements, photographs, or other similar devices, and a base, E, having recesses formed therein to contain said advertisements, photographs, or other similar devices, arranged with capability of being rotated by means of the tubular portion G, and so constructed that the top piece may be removed with facility for changing the advertisements, &c., substantially as shown and described.

166,285. WASHING-MACHINES. D. B. Pond, Woonsocket, R. I. [Filed Feb. 27, 1875.]



1. The cylinder G, composed of detachable spaced cylindrical rods g, socketed into metallic end disks H, in combination with rubber or rubber-covered rollers D' and intermediate wooden rollers D, detachably secured to segmental end plates C, substantially as specified.

2. The locking-pin j, in combination with continuous shaft I, end disks H, having a diametrically-notched flange, i, and detachable cylindrical rods g, substantially as specified.

3. The open-ended vertically-arranged guide-plates F, in combination with the journals f of end plates C of the yielding and detachable pressure-rollers D D', substantially as specified.

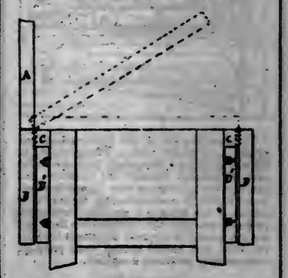
166,286. CHOPPING-BLOCKS FOR MEAT-CUTTERS. Hugh P. Rankin, Allegheny, Pa. [Filed Jan. 29, 1875.]

Brief.—Consisting of sections held together by a clamping-band, which extends above the top surface of the sections, forming a guard to hold the chopped meat.

The combination, with sectional block, of the band F, passed around and extending above the edge of block, as shown and described, to serve both as a clamp for sections, and guard against the escape of chopped meat.

166,287. MACHINES FOR PURIFYING CREAM OF TARTAR. Anton Reinert, New York, N. Y. [Filed Aug. 6, 1875.]

Brief.—The cream of tartar is ground between crushing-rollers, and falls to an inclined cylinder, through which it is driven by a perforated spiral conveyer against a stream of water.

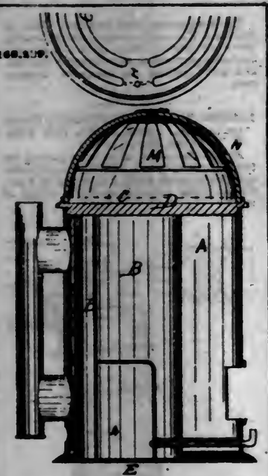


1. In a machine for purifying cream of tartar, the combination, with an inclined revolving cylinder having interior spiral perforated conveyers, of a suitable feeder of water, arranged for directing the water against the upper side of the interior of the cylinder.

2. The hollow perforated shaft, in combination with the cylinder having spiral perforated conveyers.

3. The combination, with cylinder and spiral perforated conveyers and a water-feeder, of a suitable crusher having a channel leading to the cylinder, for crushing and cleansing the cream of tartar at one continuous operation.

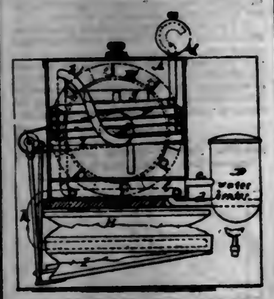
166,288. KITCHEN-TABLES. J. C. Nichols, Denver, Colo. [Filed July 9, 1875.]



The combination of the blocks C, arranged longitudinally beneath the top, and rigidly attached to the sides of the table, the levers D, hinged to the blocks C, the hinged brackets D', and the cover A, hinged to the blocks C, as and for the purposes described.

166,289. HEATING-STOVES. Malcom Roberts, North Madison, Ohio. [Filed Mar. 10, 1875.]

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.

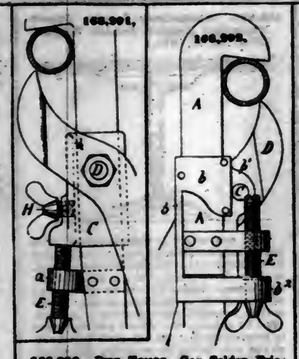


168,889.

The combination of the following elements, when relatively arranged, as and for the purposes described: The casing A, curvilinear passages B, top plate D, provided with elongated curvilinear openings C, bottom plate, provided with curvilinear openings E, damper H, opening K, dome M, provided with a damper, and spans N.

168,890. HYDROCARBON-GAS APPARATUS. Carl F. Schneider, Hamburg, Germany. [Filed Aug. 2, 1875.]

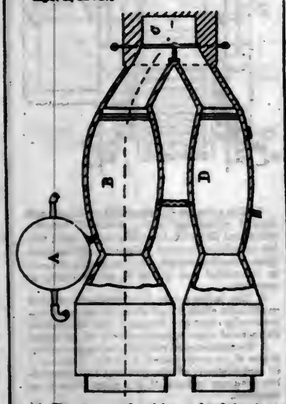
Brief.—A foot-wheel provided with buckets raises the hydrocarbon fluid, and empties it into the upper part of a coil of pipe, through which it descends, while a blast of warm air is forced through the pipe in the opposite direction. A water-heater and a blast apparatus are connected with the carburetor.



The combination of the hydrocarbon-reservoir A, provided with a lifting-wheel, B, for elevating the hydrocarbon fluid, the coiled tube F passing through the reservoir and through the heating-chamber G, and the feed-water heater D communicating therewith by means of the pipes c d, and the blast apparatus H, whereby the hydrocarbon fluid and air are passed in opposite directions through the tube, and heated during their passage, substantially as herein described.

168,891. PIPE-TONGS. Geo. Seldon, Erie, Pa. [Filed July 24, 1875.]

The combination, in the pipe-wrench herein described, of the hooked jaw lever A, lug c, and thumb-screw E with the sleeve C, fulcrum-pin D, and lever B, all constructed substantially as described, and for the purpose set forth.

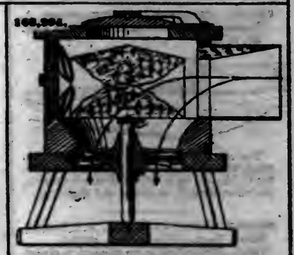


168,892.

168,892. PIPE-TONGS. Geo. Seldon, Erie, Pa. [Filed July 24, 1875.]

In pipe-wrenches the lever B, provided with sleeve b, lugs b^1 b^2, fulcrum-pin C, and thumb-screw E, in combination with the adjustable hooked jaw A and jaw D, as described and shown.

168,893. MELTING AND TREATING IRON. William Sletcher, Jr., Troy, N. Y. [Filed Apr. 2, 1875.]



1. The process of melting and refining iron by adding to the cupola a fuel of about two-thirds coke and about one-third charcoal, and running the molten metal from the cupola to a reverberatory furnace, and also from said furnace to a second independent reverberatory furnace, from which the metal is ultimately tapped for foundry uses, substantially as herein specified.

2. The cupola A, first and second independent reverberatory furnaces B and D, and chimney C, combined substantially as and for the purposes set forth.

168,894. WINDMILL. Lawrence B. Stephens and Samuel F. Shay, Terrell, Tex. [Filed Aug. 14, 1875.]

Brief.—A series of inclined vanes mounted upon a vertical shaft, and set in a circular opening in the lower side of a square or polygonal casing, provided with sliding doors opening outward on each side, one of which are connected at their upper and lower edges by means of a strip of canvas, so that when opened outward they will form a funnel-shaped mouth for the entrance of the wind to the chamber, which, leading to escape through the vanes of the wheel, puts the same in motion. On the top of the chamber is secured a weighted valve, by which the pressure upon the wheel is relieved when too great.

168,895.

1. The windmill, consisting of a wheel composed of inclined vanes mounted on a vertical shaft and set in an opening in the lower part of a square or polygonal chamber provided with sliding doors opening outward, and having their lower edges connected by canvas, or other flexible material, to form a funnel-shaped mouth when opened, as and for the purposes herein set forth.

2. In combination with the wheel and chamber, constructed as described, the valve on top of the chamber for relieving the pressure on the wheel, substantially as set forth.

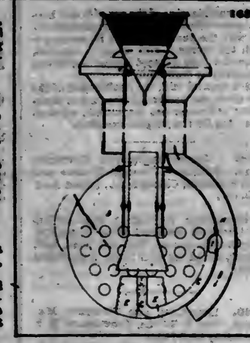
168,896. LAMP-BURNER. Gustav Siebenmann, Berlin, Prussia, assignor to B. B. Schneider, New York, N. Y. [Filed Sept. 15, 1875.]

Brief.—The drip from both outside and inside taken is conducted into the lamp.

1. The ring or collar H, arranged below and independent of the chimney-holder, in combination with the wick-raising wheels G, substantially as herein described and shown.

2. The combination, with the wick-tube C, air-tube D, and inlet B, of the external concentric chamber B, the internal chamber L, and openings f l m, substantially as shown and described.

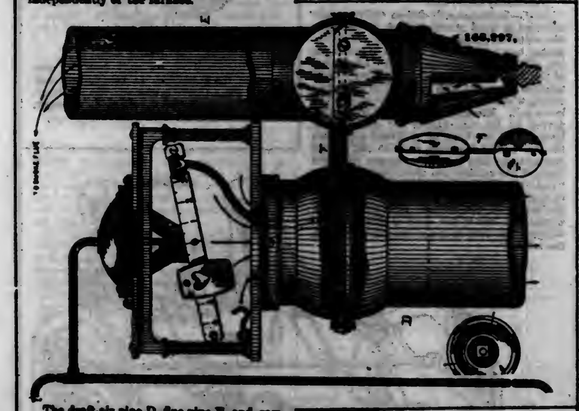
168,897.



168,898. CULTIVATOR. J. A. Thompson, Bennington, N. J. [Filed Aug. 20, 1875.]

Brief.—Devices for securing and adjusting the plow-beams upon the runners, and for adjustably holding the shovel-standards.

1. The combination, with the runner-frame A B C, having the slotted wings H, of the adjustable plow-beams G G, provided with the spring-straps a a and the bolts b b, all substantially as and for the purposes herein set forth.

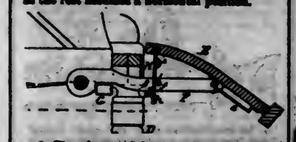


2. In combination with a plow, I, having a round shank, A, the slotted beam G, slotted plate a, with parallel flanges a a, set-screw f, and break-pin i, all constructed substantially as and for the purposes herein set forth.

168,899.

168,897. HEAT-REGULATORS FOR HOT-AIR FURNACES. Alfd. H. Tingley, Providence, R. I. [Filed May 13, 1875.]

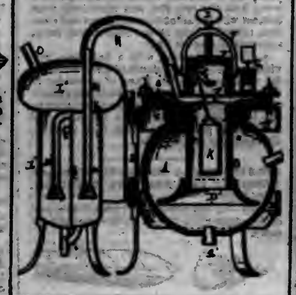
Brief.—The compound damper is operated by expansion and contraction of the diaphragm. When the draft-pipe of the furnace is closed, the flue-pipe is opened to allow draft independently of the furnace.



168,897.

The draft-air pipe D, flue-pipe E, and compound damper F, operating in combination with the hot and cold air vessels A B, and communicating pipes, diaphragm, and lever, substantially as and for the purposes set forth.

168,898. FOOT-REST FOR CHAIRS. Joseph H. Travis, Boston, Mass. [Filed Oct. 30, 1874.]



Brief.—The elongated loops give the foot-rest a more extended outward movement on the carrying-frame, and thereby permit the weight of the outer end to automatically swing the inner end up into its proper position. The hooks catch on the staples and limit the upward movement of the inner end, and the stems of the hooks and the staples guide it as the rest assumes a horizontal position.

1. The elongated loops e, in combination with the leg-rest E and its carrying-frame F, substantially as and for the purpose described.

2. The hooks f and staples g, in combination with the leg-rest E and its carrying-frame F, all arranged together upon a chair, for operation as described, for the purposes specified.

168,899. SPARK-ARRESTERS FOR LOCOMOTIVES. William G. Van Rensselaer, Fishkill Landing, N. Y., assignor of one-half his right to Charles L. Kimball, same place. [Filed Apr. 30, 1875.]

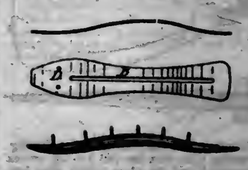
1. A locomotive smoke-stack in which the sparks and cinders are arrested and removed through the influence of a counter-current or downward draft created therein by means of a pipe terminating at or near the mouth of the exhaust-pipe, and connected with a discharge-pipe leading from the bottom or the smoke-stack, substantially as shown and described.

2. The construction and arrangement of the pipe G with the exhaust-tubes D E and pipe H, in combination with the smoke-stack A and smoke-box B of a locomotive, substantially as and for the purpose shown and described.

168,900. APPARATUS FOR GENERATING AND WARMING CARBONIC-ACID GAS. Hermann Voigt, Milwaukee, Wis. [Filed Feb. 20, 1875.]

Brief.—The gas-generator has an air-tight joint formed by the rubber washers between the flanged ring and the cover. The perforated vessel in the cylinder is raised and lowered by the crank-shaft of the cover, the position being maintained by the pin entering perforations in the cranknut. The superfluous gas is prevented from rising through the acid by the bell mouth. The washer is provided with partitions and pipes, as set forth.

1. The construction of the rubber washers C E, flanged ring F, and cover F' with the generating vessel A and cylinder D, for forming a gas-tight joint between them, substantially as described.

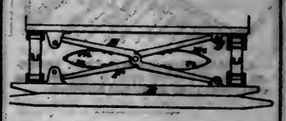


2. The bell-mouth D' at the lower end of the cylinder D, as and for the purpose set forth.

3. The combination of the crank-shaft c, chain f, and perforated vessel K with the chamber F', whereby the said vessel may be raised and lowered in the cylinder D, substantially as described.

4. The combined gas-washing and gas-holding vessel, consisting of the vessel L L', provided with the partitions h h' and pipes M M', substantially as shown and set forth.

168,901. BOOT-SHANK STIFFENER. Thomas C. Walker, Morristown, Ohio. [Filed Mar. 23, 1875.]



Brief.—The central longitudinal slot is intended to admit a line of pegs or stitches, uniting the portions of the sole and holding the spring in place.

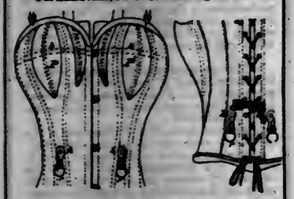
As a new article of manufacture, a sheet-metal boot-shank stiffener, having holes D D, and a slot or opening, B, with parallel sides formed through the same, and extending from front to rear in the center of the said shank, in the manner and for the purpose shown and described.

168,902. VEHICLE-SPRINGS. Robt. Walker, Oakland, assignor of one-half his right to George W. Henshaw, Gridley, Cal. [Filed Apr. 27, 1875.]

Brief.—Owing to the equalizing-bars the bed descends parallel to the bolster.

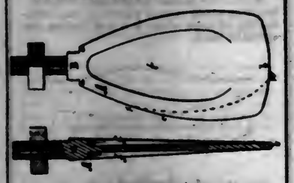
The levers E and F, united at their center, in combination with the springs n n of a vehicle, for the purpose of equalizing the pressure, all substantially as set forth.

168,903. TRUSS-COUPLINGS. R. C. Walter, Kirkwood, Mo. [Filed Aug. 28, 1875.]



Brief.—Bolt has spring provided with locking-leg, which engages with slot in clip-arm.

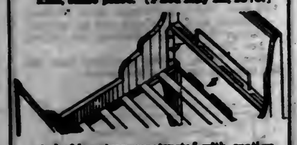
HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON.



The combination of ear D, having a slot, *d*, and pin E, provided with spring *e* and lug *e*, substantially as and for the purposes set forth.

168,864. CORSETS. Ira De Ver Warner, Cortlandville, N. Y. [Filed Aug. 27, 1875.]

As a new article of manufacture, a corset provided with the bones-forms P P, expanded by the cross-stays *b b*, the shoulder-straps S S', and the pivoted hooks *h h* in front and rear, the whole being combined and arranged substantially as and for the purposes set forth.



168,865. THIMBLES FOR THRASHING-MACHINES. Jonathan W. Waberman, Oregon, Wis. [Filed July 16, 1875.]

The thrashing and hulling teeth A, having tapering sides from the pall *a* to the convex bit-edge *b*, and the edges of said sides between convex and tapering back again to said pall, and furthermore provided with the double concaves or re-entrant planes *f*, all substantially as and for the purposes specified.

In testimony that I claim the above I have

168,866. REE-BOX TRAPS. R. G. Watkins, Georgetown, Col., assignor to J. R. Watkins, same place. [Filed May 22, 1875.]

A bed-bag loop constructed with contiguous coils B F G and hitch H, and having a slide-cover, D, as shown and described.

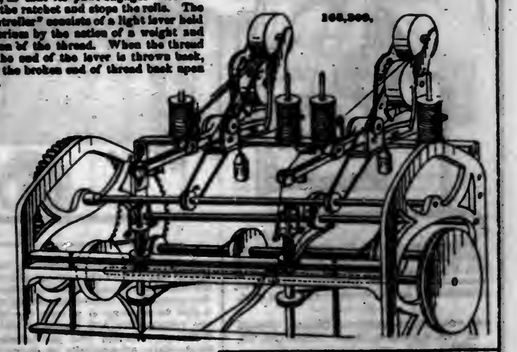
168,867. CUTTER-HEAD. Rudolphus L. Webb, New Britain, Conn., assignor to Landers, Frary & Clarke, same place. [Filed July 6, 1875.]

Brief.—The cutters having notches of different depths, by turning it either way, one of these notches is made to set upon the projection upon the saddle, thus effecting the desired adjustment.

1. A box-nail cam, consisting of the bar A, the cover B, and the hopper C, the bar constructed with the headed bars *a*, and the cover with corresponding slots, whereby the two parts are secured together, substantially as set forth.

2. The combination of the cover B and hopper C, constructed with the intermediate recess *f*, with the runner-cylinder H, constructed with the flange *h*, and so as to interlock between and with the said hopper and cover, substantially as described.

3. In a vertical mill, the combination of the runner-shaft, the notched sleeve L, and corresponding projection *l* on the saddle, substantially as and for the purpose specified.



168,868. COMPOSITIONS FOR COVERING STEAM-BOILERS. Thomas Webber and Chas. Stedman, Chicago, Ill. [Filed Aug. 23, 1875.]

The composition for coating steam-boilers herein described, composed of soot-ashes, rye-flour, hydraulic cement, flax-seed meal, hair, and water, mixed together in the proportions set forth.

168,869. DOUBLING AND TWISTING MACHINES. Jos. F. Wicks, Providence, R. I. [Filed July 12, 1875.]

Brief.—Independently-driven delivery-rolls mounted in fixed standards not in combination with a stopping mechanism. A vertically-sliding bar is free to rise and fall in guides on one of the fixed standards. The upper end of the bar is bent over, so as to form a pawl adapted to engage with the teeth of a ratchet-wheel, which is mounted upon the axis of the lower roll. The lower end of the bar is supported by the rear end of the stop-motion lever. The breaking of a thread depresses the rear end of the lever, and the sliding bar descends, so that its pawl engages with the teeth of the ratchet and stops the rolls. The "end-controller" consists of a light lever held in equilibrium by the action of a weight and the tension of the thread. When the thread breaks, the end of the lever is thrown back, carrying the broken end of thread back upon the rolls.

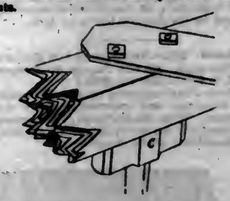
168,869.

1. In a doubling and twisting machine, the combination, with each spindle, of independently-driven delivery-rolls, mounted in stationary standards, and a stopping mechanism, substantially as described, whereby, on the breakage of the yarns of any spindle, its delivery-rolls will be prevented from revolving, substantially as set forth.

2. The combination, with each spindle in a doubling and twisting machine, of a stop-motion lever and an end-controller, substantially as described, whereby, on the breakage of the yarn, the broken end will be carried backward away from the spindle, and prevented from contact with adjacent running yarns and spindles, independently of the stop-motion lever, substantially as set forth.

3. The combination, with a bed-plate, provided with stationary standards, and arranged for attachment to the frame of a doubler, of delivery-rolls, mounted on the stationary standards, and a stopping mechanism, mounted on the bed-plate, connected with the rolls, and arranged to permit or prevent their rotation, substantially as described.

168,870. CIGARS. Stephen S. Wilson and Charles F. Carr, Adel, Iowa. [Filed Mar. 16, 1875.]

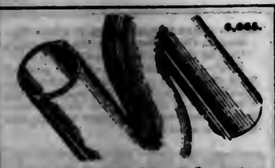


Brief.—A cap permanently placed as a part of the cigar upon its end by adhesive attachment.

As a new article of manufacture, a cigar, B, provided at its small end with an inclosing permanently-attached mouth-piece, A *a c*, substantially as and for the purpose specified.

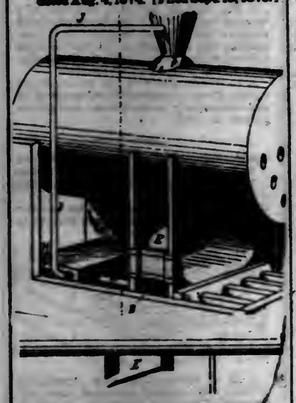
168,871. HARROWS. John C. Williams, Olin, Iowa. [Filed Aug. 30, 1875.]

Brief.—A block of iron, called a head-block, has a square hole in its center, a little larger on the upper side, into which the tooth accurately fits. A thin plate covers the head of the tooth, and both are secured to the under side of the harrow-beam by two bolts and nuts.



The improved harrow-tooth fastener, composed of the head-block C, having the mortise C', plate D, and retaining-bolts E, all constructed and arranged substantially as shown and for the purpose described.

168,872. GRAIN-BINDERS. Jacob C. Dewey, Fairfield, Iowa. [Filed Aug. 30, 1875.]



Brief.—The arm *a* is pivoted to the frame, and has a pawl, *b*, which engages with the ratchet-wheel *c*, which is secured to the shaft *d*, which has a pinion, *e*, which meshes with the gear-wheel *f*, which is secured to the shaft *g*, which has a pinion, *h*, which meshes with the gear-wheel *i*, which is secured to the shaft *j*, which has a pinion, *k*, which meshes with the gear-wheel *l*, which is secured to the shaft *m*, which has a pinion, *n*, which meshes with the gear-wheel *o*, which is secured to the shaft *p*, which has a pinion, *q*, which meshes with the gear-wheel *r*, which is secured to the shaft *s*, which has a pinion, *t*, which meshes with the gear-wheel *u*, which is secured to the shaft *v*, which has a pinion, *w*, which meshes with the gear-wheel *x*, which is secured to the shaft *y*, which has a pinion, *z*, which meshes with the gear-wheel *a'*, which is secured to the shaft *b'*, which has a pinion, *c'*, which meshes with the gear-wheel *d'*, which is secured to the shaft *e'*, which has a pinion, *f'*, which meshes with the gear-wheel *g'*, which is secured to the shaft *h'*, which has a pinion, *i'*, which meshes with the gear-wheel *j'*, which is secured to the shaft *k'*, which has a pinion, *l'*, which meshes with the gear-wheel *m'*, which is secured to the shaft *n'*, which has a pinion, *o'*, which meshes with the gear-wheel *p'*, which is secured to the shaft *q'*, which has a pinion, *r'*, which meshes with the gear-wheel *s'*, which is secured to the shaft *t'*, which has a pinion, *u'*, which meshes with the gear-wheel *v'*, which is secured to the shaft *w'*, which has a pinion, *x'*, which meshes with the gear-wheel *y'*, which is secured to the shaft *z'*, which has a pinion, *a''*, which meshes with the gear-wheel *b''*, which is secured to the shaft *c''*, which has a pinion, *d''*, which meshes with the gear-wheel *e''*, which is secured to the shaft *f''*, which has a pinion, *g''*, which meshes with the gear-wheel *h''*, which is secured to the shaft *i''*, which has a pinion, *j''*, which meshes with the gear-wheel *k''*, which is secured to the shaft *l''*, which has a pinion, *m''*, which meshes with the gear-wheel *n''*, which is secured to the shaft *o''*, which has a pinion, *p''*, which meshes with the gear-wheel *q''*, which is secured to the shaft *r''*, which has a pinion, *s''*, which meshes with the gear-wheel *t''*, which is secured to the shaft *u''*, which has a pinion, *v''*, which meshes with the gear-wheel *w''*, which is secured to the shaft *x''*, which has a pinion, *y''*, which meshes with the gear-wheel *z''*, which is secured to the shaft *a'''*, which has a pinion, *b'''*, which meshes with the gear-wheel *c'''*, which is secured to the shaft *d'''*, which has a pinion, *e'''*, which meshes with the gear-wheel *f'''*, which is secured to the shaft *g'''*, which has a pinion, *h'''*, which meshes with the gear-wheel *i'''*, which is secured to the shaft *j'''*, which has a pinion, *k'''*, which meshes with the gear-wheel *l'''*, which is secured to the shaft *m'''*, which has a pinion, *n'''*, which meshes with the gear-wheel *o'''*, which is secured to the shaft *p'''*, which has a pinion, *q'''*, which meshes with the gear-wheel *r'''*, which is secured to the shaft *s'''*, which has a pinion, *t'''*, which meshes with the gear-wheel *u'''*, which is secured to the shaft *v'''*, which has a pinion, *w'''*, which meshes with the gear-wheel *x'''*, which is secured to the shaft *y'''*, which has a pinion, *z'''*, which meshes with the gear-wheel *a''''*, which is secured to the shaft *b''''*, which has a pinion, *c''''*, which meshes with the gear-wheel *d''''*, which is secured to the shaft *e''''*, which has a pinion, *f''''*, which meshes with the gear-wheel *g''''*, which is secured to the shaft *h''''*, which has a pinion, *i''''*, which meshes with the gear-wheel *j''''*, which is secured to the shaft *k''''*, which has a pinion, *l''''*, which meshes with the gear-wheel *m''''*, which is secured to the shaft *n''''*, which has a pinion, *o''''*, which meshes with the gear-wheel *p''''*, which is secured to the shaft *q''''*, which has a pinion, *r''''*, which meshes with the gear-wheel *s''''*, which is secured to the shaft *t''''*, which has a pinion, *u''''*, which meshes with the gear-wheel *v''''*, which is secured to the shaft *w''''*, which has a pinion, *x''''*, which meshes with the gear-wheel *y''''*, which is secured to the shaft *z''''*, which has a pinion, *a'''''*, which meshes with the gear-wheel *b'''''*, which is secured to the shaft *c'''''*, which has a pinion, *d'''''*, which meshes with the gear-wheel *e'''''*, which is secured to the shaft *f'''''*, which has a pinion, *g'''''*, which meshes with the gear-wheel *h'''''*, which is secured to the shaft *i'''''*, which has a pinion, *j'''''*, which meshes with the gear-wheel *k'''''*, which is secured to the shaft *l'''''*, which has a pinion, *m'''''*, which meshes with the gear-wheel *n'''''*, which is secured to the shaft *o'''''*, which has a pinion, *p'''''*, which meshes with the gear-wheel *q'''''*, which is secured to the shaft *r'''''*, which has a pinion, *s'''''*, which meshes with the gear-wheel *t'''''*, which is secured to the shaft *u'''''*, which has a pinion, *v'''''*, which meshes with the gear-wheel *w'''''*, which is secured to the shaft *x'''''*, which has a pinion, *y'''''*, which meshes with the gear-wheel *z'''''*, which is secured to the shaft *a''''''*, which has a pinion, *b''''''*, which meshes with the gear-wheel *c''''''*, which is secured to the shaft *d''''''*, which has a pinion, *e''''''*, which meshes with the gear-wheel *f''''''*, which is secured to the shaft *g''''''*, which has a pinion, *h''''''*, which meshes with the gear-wheel *i''''''*, which is secured to the shaft *j''''''*, which has a pinion, *k''''''*, which meshes with the gear-wheel *l''''''*, which is secured to the shaft *m''''''*, which has a pinion, *n''''''*, which meshes with the gear-wheel *o''''''*, which is secured to the shaft *p''''''*, which has a pinion, *q''''''*, which meshes with the gear-wheel *r''''''*, which is secured to the shaft *s''''''*, which has a pinion, *t''''''*, which meshes with the gear-wheel *u''''''*, which is secured to the shaft *v''''''*, which has a pinion, *w''''''*, which meshes with the gear-wheel *x''''''*, which is secured to the shaft *y''''''*, which has a pinion, *z''''''*, which meshes with the gear-wheel *a'''''''*, which is secured to the shaft *b'''''''*, which has a pinion, *c'''''''*, which meshes with the gear-wheel *d'''''''*, which is secured to the shaft *e'''''''*, which has a pinion, *f'''''''*, which meshes with the gear-wheel *g'''''''*, which is secured to the shaft *h'''''''*, which has a pinion, *i'''''''*, which meshes with the gear-wheel *j'''''''*, which is secured to the shaft *k'''''''*, which has a pinion, *l'''''''*, which meshes with the gear-wheel *m'''''''*, which is secured to the shaft *n'''''''*, which has a pinion, *o'''''''*, which meshes with the gear-wheel *p'''''''*, which is secured to the shaft *q'''''''*, which has a pinion, *r'''''''*, which meshes with the gear-wheel *s'''''''*, which is secured to the shaft *t'''''''*, which has a pinion, *u'''''''*, which meshes with the gear-wheel *v'''''''*, which is secured to the shaft *w'''''''*, which has a pinion, *x'''''''*, which meshes with the gear-wheel *y'''''''*, which is secured to the shaft *z'''''''*, which has a pinion, *a''''''''*, which meshes with the gear-wheel *b''''''''*, which is secured to the shaft *c''''''''*, which has a pinion, *d''''''''*, which meshes with the gear-wheel *e''''''''*, which is secured to the shaft *f''''''''*, which has a pinion, *g''''''''*, which meshes with the gear-wheel *h''''''''*, which is secured to the shaft *i''''''''*, which has a pinion, *j''''''''*, which meshes with the gear-wheel *k''''''''*, which is secured to the shaft *l''''''''*, which has a pinion, *m''''''''*, which meshes with the gear-wheel *n''''''''*, which is secured to the shaft *o''''''''*, which has a pinion, *p''''''''*, which meshes with the gear-wheel *q''''''''*, which is secured to the shaft *r''''''''*, which has a pinion, *s''''''''*, which meshes with the gear-wheel *t''''''''*, which is secured to the shaft *u''''''''*, which has a pinion, *v''''''''*, which meshes with the gear-wheel *w''''''''*, which is secured to the shaft *x''''''''*, which has a pinion, *y''''''''*, which meshes with the gear-wheel *z''''''''*, which is secured to the shaft *a'''''''''*, which has a pinion, *b'''''''''*, which meshes with the gear-wheel *c'''''''''*, which is secured to the shaft *d'''''''''*, which has a pinion, *e'''''''''*, which meshes with the gear-wheel *f'''''''''*, which is secured to the shaft *g'''''''''*, which has a pinion, *h'''''''''*, which meshes with the gear-wheel *i'''''''''*, which is secured to the shaft *j'''''''''*, which has a pinion, *k'''''''''*, which meshes with the gear-wheel *l'''''''''*, which is secured to the shaft *m'''''''''*, which has a pinion, *n'''''''''*, which meshes with the gear-wheel *o'''''''''*, which is secured to the shaft *p'''''''''*, which has a pinion, *q'''''''''*, which meshes with the gear-wheel *r'''''''''*, which is secured to the shaft *s'''''''''*, which has a pinion, *t'''''''''*, which meshes with the gear-wheel *u'''''''''*, which is secured to the shaft *v'''''''''*, which has a pinion, *w'''''''''*, which meshes with the gear-wheel *x'''''''''*, which is secured to the shaft *y'''''''''*, which has a pinion, *z'''''''''*, which meshes with the gear-wheel *a''''''''''*, which is secured to the shaft *b''''''''''*, which has a pinion, *c''''''''''*, which meshes with the gear-wheel *d''''''''''*, which is secured to the shaft *e''''''''''*, which has a pinion, *f''''''''''*, which meshes with the gear-wheel *g''''''''''*, which is secured to the shaft *h''''''''''*, which has a pinion, *i''''''''''*, which meshes with the gear-wheel *j''''''''''*, which is secured to the shaft *k''''''''''*, which has a pinion, *l''''''''''*, which meshes with the gear-wheel *m''''''''''*, which is secured to the shaft *n''''''''''*, which has a pinion, *o''''''''''*, which meshes with the gear-wheel *p''''''''''*, which is secured to the shaft *q''''''''''*, which has a pinion, *r''''''''''*, which meshes with the gear-wheel *s''''''''''*, which is secured to the shaft *t''''''''''*, which has a pinion, *u''''''''''*, which meshes with the gear-wheel *v''''''''''*, which is secured to the shaft *w''''''''''*, which has a pinion, *x''''''''''*, which meshes with the gear-wheel *y''''''''''*, which is secured to the shaft *z''''''''''*, which has a pinion, *a'''''''''''*, which meshes with the gear-wheel *b'''''''''''*, which is secured to the shaft *c'''''''''''*, which has a pinion, *d'''''''''''*, which meshes with the gear-wheel *e'''''''''''*, which is secured to the shaft *f'''''''''''*, which has a pinion, *g'''''''''''*, which meshes with the gear-wheel *h'''''''''''*, which is secured to the shaft *i'''''''''''*, which has a pinion, *j'''''''''''*, which meshes with the gear-wheel *k'''''''''''*, which is secured to the shaft *l'''''''''''*, which has a pinion, *m'''''''''''*, which meshes with the gear-wheel *n'''''''''''*, which is secured to the shaft *o'''''''''''*, which has a pinion, *p'''''''''''*, which meshes with the gear-wheel *q'''''''''''*, which is secured to the shaft *r'''''''''''*, which has a pinion, *s'''''''''''*, which meshes with the gear-wheel *t'''''''''''*, which is secured to the shaft *u'''''''''''*, which has a pinion, *v'''''''''''*, which meshes with the gear-wheel *w'''''''''''*, which is secured to the shaft *x'''''''''''*, which has a pinion, *y'''''''''''*, which meshes with the gear-wheel *z'''''''''''*, which is secured to the shaft *a''''''''''''*, which has a pinion, *b''''''''''''*, which meshes with the gear-wheel *c''''''''''''*, which is secured to the shaft *d''''''''''''*, which has a pinion, *e''''''''''''*, which meshes with the gear-wheel *f''''''''''''*, which is secured to the shaft *g''''''''''''*, which has a pinion, *h''''''''''''*, which meshes with the gear-wheel *i''''''''''''*, which is secured to the shaft *j''''''''''''*, which has a pinion, *k''''''''''''*, which meshes with the gear-wheel *l''''''''''''*, which is secured to the shaft *m''''''''''''*, which has a pinion, *n''''''''''''*, which meshes with the gear-wheel *o''''''''''''*, which is secured to the shaft *p''''''''''''*, which has a pinion, *q''''''''''''*, which meshes with the gear-wheel *r''''''''''''*, which is secured to the shaft *s''''''''''''*, which has a pinion, *t''''''''''''*, which meshes with the gear-wheel *u''''''''''''*, which is secured to the shaft *v''''''''''''*, which has a pinion, *w''''''''''''*, which meshes with the gear-wheel *x''''''''''''*, which is secured to the shaft *y''''''''''''*, which has a pinion, *z''''''''''''*, which meshes with the gear-wheel *a'''''''''''''*, which is secured to the shaft *b'''''''''''''*, which has a pinion, *c'''''''''''''*, which meshes with the gear-wheel *d'''''''''''''*, which is secured to the shaft *e'''''''''''''*, which has a pinion, *f'''''''''''''*, which meshes with the gear-wheel *g'''''''''''''*, which is secured to the shaft *h'''''''''''''*, which has a pinion, *i'''''''''''''*, which meshes with the gear-wheel *j'''''''''''''*, which is secured to the shaft *k'''''''''''''*, which has a pinion, *l'''''''''''''*, which meshes with the gear-wheel *m'''''''''''''*, which is secured to the shaft *n'''''''''''''*, which has a pinion, *o'''''''''''''*, which meshes with the gear-wheel *p'''''''''''''*, which is secured to the shaft *q'''''''''''''*, which has a pinion, *r'''''''''''''*, which meshes with the gear-wheel *s'''''''''''''*, which is secured to the shaft *t'''''''''''''*, which has a pinion, *u'''''''''''''*, which meshes with the gear-wheel *v'''''''''''''*, which is secured to the shaft *w'''''''''''''*, which has a pinion, *x'''''''''''''*, which meshes with the gear-wheel *y'''''''''''''*, which is secured to the shaft *z'''''''''''''*, which has a pinion, *a''''''''''''''*, which meshes with the gear-wheel *b''''''''''''''*, which is secured to the shaft *c''''''''''''''*, which has a pinion, *d''''''''''''''*, which meshes with the gear-wheel *e''''''''''''''*, which is secured to the shaft *f''''''''''''''*, which has a pinion, *g''''''''''''''*, which meshes with the gear-wheel *h''''''''''''''*, which is secured to the shaft *i''''''''''''''*, which has a pinion, *j''''''''''''''*, which meshes with the gear-wheel *k''''''''''''''*, which is secured to the shaft *l''''''''''''''*, which has a pinion, *m''''''''''''''*, which meshes with the gear-wheel *n''''''''''''''*, which is secured to the shaft *o''''''''''''''*, which has a pinion, *p''''''''''''''*, which meshes with the gear-wheel *q''''''''''''''*, which is secured to the shaft *r''''''''''''''*, which has a pinion, *s''''''''''''''*, which meshes with the gear-wheel *t''''''''''''''*, which is secured to the shaft *u''''''''''''''*, which has a pinion, *v''''''''''''''*, which meshes with the gear-wheel *w''''''''''''''*, which is secured to the shaft *x''''''''''''''*, which has a pinion, *y''''''''''''''*, which meshes with the gear-wheel *z''''''''''''''*, which is secured to the shaft *a'''''''''''''''*, which has a pinion, *b'''''''''''''''*, which meshes with the gear-wheel *c'''''''''''''''*, which is secured to the shaft *d'''''''''''''''*, which has a pinion, *e'''''''''''''''*, which meshes with the gear-wheel *f'''''''''''''''*, which is secured to the shaft *g'''''''''''''''*, which has a pinion, *h'''''''''''''''*, which meshes with the gear-wheel *i'''''''''''''''*, which is secured to the shaft *j'''''''''''''''*, which has a pinion, *k'''''''''''''''*, which meshes with the gear-wheel *l'''''''''''''''*, which is secured to the shaft *m'''''''''''''''*, which has a pinion, *n'''''''''''''''*, which meshes with the gear-wheel *o'''''''''''''''*, which is secured to the shaft *p'''''''''''''''*, which has a pinion, *q'''''''''''''''*, which meshes with the gear-wheel *r'''''''''''''''*, which is secured to the shaft *s'''''''''''''''*, which has a pinion, *t'''''''''''''''*, which meshes with the gear-wheel *u'''''''''''''''*, which is secured to the shaft *v'''''''''''''''*, which has a pinion, *w'''''''''''''''*, which meshes with the gear-wheel *x'''''''''''''''*, which is secured to the shaft *y'''''''''''''''*, which has a pinion, *z'''''''''''''''*, which meshes with the gear-wheel *a''''''''''''''''*, which is secured to the shaft *b''''''''''''''''*, which has a pinion, *c''''''''''''''''*, which meshes with the gear-wheel *d''''''''''''''''*, which is secured to the shaft *e''''''''''''''''*, which has a pinion, *f''''''''''''''''*, which meshes with the gear-wheel *g''''''''''''''''*, which is secured to the shaft *h''''''''''''''''*, which has a pinion, *i''''''''''''''''*, which meshes with the gear-wheel *j''''''''''''''''*, which is secured to the shaft *k''''''''''''''''*, which has a pinion, *l''''''''''''''''*, which meshes with the gear-wheel *m''''''''''''''''*, which is secured to the shaft *n''''''''''''''''*, which has a pinion, *o''''''''''''''''*, which meshes with the gear-wheel *p''''''''''''''''*, which is secured to the shaft *q''''''''''''''''*, which has a pinion, *r''''''''''''''''*, which meshes with the gear-wheel *s''''''''''''''''*, which is secured to the shaft *t''''''''''''''''*, which has a pinion, *u''''''''''''''''*, which meshes with the gear-wheel *v''''''''''''''''*, which is secured to the shaft *w''''''''''''''''*, which has a pinion, *x''''''''''''''''*, which meshes with the gear-wheel *y''''''''''''''''*, which is secured to the shaft *z''''''''''''''''*, which has a pinion, *a'''''''''''''''''*, which meshes with the gear-wheel *b'''''''''''''''''*, which is secured to the shaft *c'''''''''''''''''*, which has a pinion, *d'''''''''''''''''*, which meshes with the gear-wheel *e'''''''''''''''''*, which is secured to the shaft *f'''''''''''''''''*, which has a pinion, *g'''''''''''''''''*, which meshes with the gear-wheel *h'''''''''''''''''*, which is secured to the shaft *i'''''''''''''''''*, which has a pinion, *j'''''''''''''''''*, which meshes with the gear-wheel *k'''''''''''''''''*, which is secured to the shaft *l'''''''''''''''''*, which has a pinion, *m'''''''''''''''''*, which meshes with the gear-wheel *n'''''''''''''''''*, which is secured to the shaft *o'''''''''''''''''*, which has a pinion, *p'''''''''''''''''*, which meshes with the gear-wheel *q'''''''''''''''''*, which is secured to the shaft *r'''''''''''''''''*, which has a pinion, *s'''''''''''''''''*, which meshes with the gear-wheel *t'''''''''''''''''*, which is secured to the shaft *u'''''''''''''''''*, which has a pinion, *v'''''''''''''''''*, which meshes with the gear-wheel *w'''''''''''''''''*, which is secured to the shaft *x'''''''''''''''''*, which has a pinion, *y'''''''''''''''''*, which meshes with the gear-wheel *z'''''''''''''''''*, which is secured to the shaft *a''''''''''''''''''*, which has a pinion, *b''''''''''''''''''*, which meshes with the gear-wheel *c''''''''''''''''''*, which is secured to the shaft *d''''''''''''''''''*, which has a pinion, *e''''''''''''''''''*, which meshes with the gear-wheel *f''''''''''''''''''*, which is secured to the shaft *g''''''''''''''''''*, which has a pinion, *h''''''''''''''''''*, which meshes with the gear-wheel *i''''''''''''''''''*, which is secured to the shaft *j''''''''''''''''''*, which has a pinion, *k''''''''''''''''''*, which meshes with the gear-wheel *l''''''''''''''''''*, which is secured to the shaft *m''''''''''''''''''*, which has a pinion, *n''''''''''''''''''*, which meshes with the gear-wheel *o''''''''''''''''''*, which is secured to the shaft *p''''''''''''''''''*, which has a pinion, *q''''''''''''''''''*, which meshes with the gear-wheel *r''''''''''''''''''*, which is secured to the shaft *s''''''''''''''''''*, which has a pinion, *t''''''''''''''''''*, which meshes with the gear-wheel *u''''''''''''''''''*, which is secured to the shaft *v''''''''''''''''''*, which has a pinion, *w''''''''''''''''''*, which meshes with the gear-wheel *x''''''''''''''''''*, which is secured to the shaft *y''''''''''''''''''*, which has a pinion, *z''''''''''''''''''*, which meshes with the gear-wheel *a'''''''''''''''''''*, which is secured to the shaft *b'''''''''''''''''''*, which has a pinion, *c'''''''''''''''''''*, which meshes with the gear-wheel *d'''''''''''''''''''*, which is secured to the shaft *e'''''''''''''''''''*, which has a pinion, *f'''''''''''''''''''*, which meshes with the gear-wheel *g'''''''''''''''''''*, which is secured to the shaft *h'''''''''''''''''''*, which has a pinion, *i'''''''''''''''''''*, which meshes with the gear-wheel *j'''''''''''''''''''*, which is secured to the shaft *k'''''''''''''''''''*, which has a pinion, *l'''''''''''''''''''*, which meshes with the gear-wheel *m'''''''''''''''''''*, which is secured to the shaft *n'''''''''''''''''''*, which has a pinion, *o'''''''''''''''''''*, which meshes with the gear-wheel *p'''''''''''''''''''*, which is secured to the shaft *q'''''''''''''''''''*, which has a pinion, *r'''''''''''''''''''*, which meshes with the gear-wheel *s'''''''''''''''''''*, which is secured to the shaft *t'''''''''''''''''''*, which has a pinion, *u'''''''''''''''''''*, which meshes with the gear-wheel *v'''''''''''''''''''*, which is secured to the shaft *w'''''''''''''''''''*, which has a pinion, *x'''''''''''''''''''*, which meshes with the gear-wheel *y'''''''''''''''''''*, which is secured to the shaft *z'''''''''''''''''''*, which has a pinion, *a''''''''''''''''''''*, which meshes with the gear-wheel *b''''''''''''''''''''*, which is secured to the shaft *c''''''''''''''''''''*, which has a pinion, *d''''''''''''''''''''*, which meshes with the gear-wheel *e''''''''''''''''''''*, which is secured to the shaft *f''''''''''''''''''''*, which has a pinion, *g''''''''''''''''''''*, which meshes with the gear-wheel *h''''''''''''''''''''*, which is secured to the shaft *i''''''''''''''''''''*, which has a pinion, *j''''''''''''''''''''*, which meshes with the gear-wheel *k''''''''''''''''''''*, which is secured to the shaft *l''''''''''''''''''''*, which has a pinion, *m''''''''''''''''''''*, which meshes with the gear-wheel *n''''''''''''''''''''*, which is secured to the shaft *o''''''''''''''''''''*, which has a pinion, *p''''''''''''''''''''*, which meshes with the gear-wheel *q''''''''''''''''''''*, which is secured to the shaft *r''''''''''''''''''''*, which has a pinion, *s''''''''''''''''''''*, which meshes with the gear-wheel *t''''''''''''''''''''*, which is secured to the shaft *u''''''''''''''''''''*, which has a pinion, *v''''''''''''''''''''*, which meshes with the gear-wheel *w''''''''''''''''''''*, which is secured to the shaft *x''''''''''''''''''''*, which has a pinion, *y''''''''''''''''''''*, which meshes with the gear-wheel *z''''''''''''''''''''*, which is secured to the shaft *a'''''''''''''''''''''*, which has a pinion, *b'''''''''''''''''''''*, which meshes with the gear-wheel *c'''''''''''''''''''''*, which is secured to the shaft *d'''''''''''''''''''''*, which has a pinion, *e'''''''''''''''''''''*, which meshes with the gear-wheel *f'''''''''''''''''''''*, which is secured to the shaft *g'''''''''''''''''''''*, which has a pinion, *h'''''''''''''''''''''*, which meshes with the gear-wheel *i'''''''''''''''''''''*, which is secured to the shaft *j'''''''''''''''''''''*, which has a pinion, *k'''''''''''''''''''''*, which meshes with the gear-wheel *l'''''''''''''''''''''*, which is secured to the shaft *m'''''''''''''''''''''*, which has a pinion, *n'''''''''''''''''''''*, which meshes with the gear-wheel *o'''''''''''''''''''''*, which is secured to the shaft *p'''''''''''''''''''''*, which has a pinion, *q'''''''''''''''''''''*, which meshes with the gear-wheel *r'''''''''''''''''''''*, which is secured to the shaft *s'''''''''''''''''''''*, which has a pinion, *t'''''''''''''''''''''*, which meshes with the gear-wheel *u'''''''''''''''''''''*, which is secured to the shaft *v'''''''''''''''''''''*, which has a pinion, *w'''''''''''''''''''''*, which meshes with the gear-wheel *x'''''''''''''''''''''*, which is secured to the shaft *y'''''''''''''''''''''*, which has a pinion, *z'''''''''''''''''''''*, which meshes with the gear-wheel *a''''''''''''''''''''''*, which is secured to the shaft *b''''''''''''''''''''''*, which has a pinion, *c''''''''''''''''''''''*, which meshes with the gear-wheel *d''''''''''''''''''''''*, which is secured to the shaft *e''''''''''''''''''''''*, which has a pinion, *f''''''''''''''''''''''*, which meshes with the gear-wheel *g''''''''''''''''''''''*, which is secured to the shaft 6,668.

A water-trap made of two similar portions or longitudinal half-trap sections of sheet metal, with corresponding external flanges running lengthwise of the trap, and which are united by soldering or burning them together, substantially as specified.

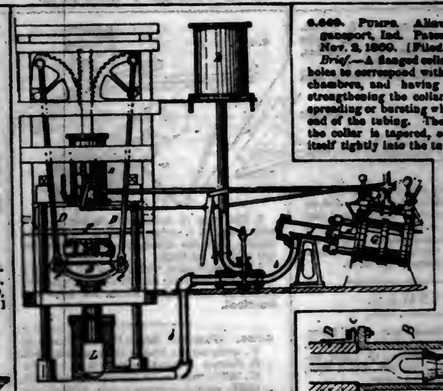
6,669. SMOKE-BURNING FURNACES. Saml. A. Ford, Chicago, Ill. Patent No. 149,004, dated Sept. 22, 1873; reissue No. 5,909, dated Aug. 4, 1874. [Filed Sept. 15, 1875.]

1. The combination of the primary air-heating chamber or reservoir H and air-distributing chamber D with connecting-pipes, substantially as shown and described.

2. The combination of the air-chambers H and D with connecting-pipes, and the steam-pipe J, substantially as shown and described.

3. The combination of the air-chambers H and D, their connecting-pipes, and the upper air-chamber H, substantially as shown and described.

4. The combination of the air-chambers H and D, their connecting-pipes, the air-chamber H, and the steam-pipe J, substantially as shown and described.



5. The tapering air-chamber H, forming a flaring-shaped passage, the lower and back wall of said chamber being perforated, in combination with a furnace, constructed substantially as described, and in the manner specified.

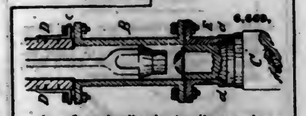
6,670. HYDRAULIC ATTACHMENTS FOR COTTON-PRESSES. Saml. Hughes, Charleston, S. C., assignor to himself and Michl. Kelly, same place. Patent No. 150,044, dated Apr. 21, 1874. [Filed Aug. 26, 1875.]

Brief.—A steam-cylinder actuating progressive levers, and by them the movable platen, is combined with a hydraulic-pressure apparatus, the former to furnish the first and the latter the finishing pressure.

1. The combination, in a lever power-press, of a steam-actuated piston, for giving a part of the pressure to the platen, and a hydraulic-actuated piston or plunger, for giving a part of the pressure to the platen, substantially as and for the purpose described.

2. The combination, in a progressive-lever power-press, wherein the compression is partly effected by the direct pressure of steam, of an independent hydraulic-pressure apparatus with the platen of the press, the said hydraulic apparatus arranged relatively to the platen, substantially as described, whereby, as the pressure is released from the platen, the liquid will be returned to the primary forcing apparatus.

3. In a progressive-lever power-press, the combination, with the piston and steam-cylinder A, of the auxiliary hydraulic cylinder or chamber L and ram M, arranged in relation with the piston E, substantially as and for the purpose described.



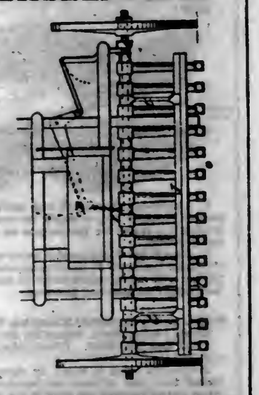
4. In a progressive-lever power-press, the rods D D, provided with elongated eyes *c c*, in combination with the piston E and hydraulic jack or ram M, substantially as and for the purpose described.

5. In a progressive-lever power-press, the combination of the steam-piston G' and its cylinder with the plunger I, the cylinder J, the cylinder or chamber L of the ram M, the pipe *b b'*, the piston E, and the steam-cylinder A and its mechanical connections, substantially as and for the purpose described.

6. In a progressive-lever power-press, the reservoir N and pipe *b'*, in combination with the check-valve K and pipes *b b'*, connecting the hydraulic cylinder J with the chamber L of the ram, all arranged for operation in relation with each other, substantially as and for the purpose described.

6,666. PUMPS. Alleus M Parthurst, Logansport, Ind. Patent No. 96,476, dated Nov. 2, 1869. [Filed Aug. 10, 1875.]

Brief.—A flanged collar provided with bolt-holes to correspond with those in the flange of chamber, and having an enlargement for strengthening the collar, so as to prevent its spreading or bursting when it is driven on the end of the tubing. The lower inner edge of the collar is tapered, so that it will wedge itself tightly into the tubing.



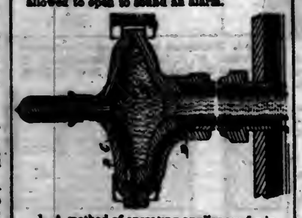
6,666.

1. A flanged collar, having its inner lower end tapered or rounded off, and its outer side strengthened by an enlargement, in combination with the tubing and piston-chamber of the pump, substantially as and for the purpose set forth.

2. The combination of clamps D, provided with claws *b* and jaws *c c*, stock A, chamber B, flanged collar E, having an annulet, *d*, and its inner lower edge tapered, and tubing C, constructed substantially as described.

6,670. HORSE-RAKES. John J. Squire, St. Louis, Mo., assignor to Adam E. Rosa. Patent No. 16,816, dated Dec. 23, 1856; reissue No. 2,903, dated Feb. 16, 1869; extended seven years. [Filed Apr. 24, 1875.]

Brief.—The driver, in his seat, causes a sliding clutch to engage with a second clutch on one of the wheels, when the rake is raised by the traction of the machine. The disengagement of the clutches is automatically effected by an arm on the axle.



1. In combination with a clutch mechanism adapting the rake-teeth to be raised by the traction of the machine, a lever arranged within reach of the driver in his seat on the machine, for throwing said clutch mechanism into gear.

2. In a two-wheel rake, in which the teeth are raised by the traction of the machine, a clutch mechanism, controlled by the driver in his seat on the machine, for causing the teeth to be raised, in combination with an arm on the rake-head, for automatically releasing the rake-teeth after the load has been discharged.

3. A sliding clutch on the head that supports the rake-teeth, in combination with the clutch face or pins on the carrying or driving wheel, for the purpose set forth.

6,667. HIGH AND LOW WATER INDICATORS. Frank Millward, Cincinnati, Ohio, assignor, by mesne assignments, to R. Boyd, trustee, same place. Patent No. 110,501, dated May 30, 1871. [Filed May 11, 1874.]

Brief.—The steam-pressure is greatest above the diaphragm, for the reason that the weight of the column of water is supported by the steam-pressure on the lower side. When the level falls below the end of the pipe the water in it flows out, the pressure is equalized on both sides of the diaphragm, and the valve allowed to open to sound an alarm.

1. A method of operating appliances for indicating a water-level, by combining a flexible diaphragm with two compartments separated by the diaphragm, both of which communicate openly with the same pressure apparatus, the pressure in one of them being varied by the intermittent support of a hydrostatic column in the tube leading thereto.

2. In combination with the separate compartments C E, inclosing the flexible diaphragm B, operated by the intermittent action of a hydrostatic column, the pipes D and F, arranged one within the other, substantially as and for the purpose specified.

3. In combination with the compartments C and E, communicating separately with a pressure apparatus, in the manner stated, a compressing diaphragm, B, made of metal, substantially as and for the purpose specified.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.

OFFICIAL NOTICE.

Commissioner J. M. THACHER having resigned his official position, Judge R. H. DUELL, of New York, has been appointed Commissioner of Patents.

NOTICE TO MANUFACTURERS AND OTHERS.

UNITED STATES PATENT OFFICE,
Washington, D. C., October 5, 1875.

The COMMISSIONER OF PATENTS respectfully requests manufacturers of and dealers in engines, machines, apparatus, tools, and appliances of whatever kind, to send to this Office duplicate copies of all catalogues and circulars which they have issued or may issue from time to time.

R. H. DUELL, *Commissioner.*

COMMISSIONER'S DECISIONS.

MASSEY *vs.* SAWYER.—*Interference; appeal.*

[*Appeal from the Examiner of Interferences in the matter of the application of Orren W. Massey and the patent of Peter O. Sawyer, for* "IMPROVEMENT IN COTTON-GINS."—*Decided September* 7, 1875.]

Abandonment of an invention by sale for more than two years prior to the filing of an application for a patent not established by inferences or presumptions arising on the testimony in the absence of clear and explicit proof as to dates.

SPEAR, *Acting Commissioner:*

On the recommendation of the Examiner of Interferences, and in accordance with official rule No. 59, this case was remanded to the Principal Examiner for his action on the question of sale, by the applicant of the device in dispute, for more than two years prior to the filing of his application.

A review of the action of the Principal Examiner is now asked by the patentee, against whom the Examiner of Interferences had awarded priority.

Although the question of abandonment by the first and original inventor is an *ex parte* one, and, therefore, no appeal lies by a party opposing his application, yet under the general power to superintend and perform all duties connected with the issuing of patents, I have consented to the request of the opposing party in this case to review the action of the Principal Examiner, inasmuch as it is opposed to the views expressed by the Examiner of Interferences in his decision on the question of priority.

The Principal Examiner states that he has looked in vain in the testimony for positive proof of public use, exhibition on sale, or other statutory bar to the allowance of a patent to the applicant.

Massey's application was filed June 21, 1873. In order, therefore, to defeat his application on the ground that his invention was on sale for more than two years prior to his application, it should be established beyond doubt that the placing of the invention on sale actually took place prior to June 21, 1871. On this point the Examiner of Interferences says:

It seems that the gin, in a complete and salable condition, was put with the other gins on hand the first part of 1871, or in December, 1870, and was kept there in stock; it was sold and went out as other stock, (M. X 22.)

The cross-question and answer here referred to are as follows, commencing with question 21:

Question. Was this gin of which you speak in December, 1870, the roll-box of which, as shown in Exhibit A in section, placed upon public sale and publicly sold?

Answer. I was selling what I called the "Griswold Gin." This gin was not known to the public, and when sold was sent out just as all stock in my shop was sold.

Q. 22. Then it was publicly sold, was it?

A. I do not know whether you call it public or private; it was sold and went out as my other stock.

No date is given in these answers, or in any others, by this or the other witnesses, when the device in question was sold, or when it was put with other stock to be sold; nor is it stated definitely whether it was put with other stock at all. Further, Massey was not questioned directly on any of these points. It is true that he was asked what he did with the gin he completed in December, 1870, (the device in dispute,) and to this he replied simply that he sold it. He was then asked to whom he sold, and answered that he kept no record and could not say; but he was not asked *when* or about what time he sold it, nor *when* or about when he put it with his other stock. He says the gin was up stairs where his gin and lint room was, but there is

nothing to show when it was put there or whether other gins were there.

There is no question that he completed the invention in December, 1870, and that in that and the following month it was used in ginning cotton; but these trials were the first ones made, and were entirely experimental.

Two months afterward he says he added his "patent rib" to the machine, and tried it in that way; found it a perfect success, and determined to patent it. This would bring the date down to April, 1870. There is absolute silence in the testimony as to dates after the one last mentioned, affecting the disposition of the particular device in question. I cannot agree, therefore, that the testimony justifies the inference placed upon it by the Examiner of Interferences.

The report of the Principal Examiner is affirmed, and the case is now ready for further disposition, if required, of the question of priority.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF NEW YORK.

H. D. STOVER AND J. A. FAY & CO. *vs.* E. S. HALSTED AND G. W. MERRITT.

[*In equity.—Before* SHIPMAN, *J.—Decided August*, 1875.]

The third claim of the patent of H. D. Stover—Improvement in Planing-Machines, July 23, 1861—viz, "The arrangement of matching-cutters to be adjusted both laterally with each other and vertically upon the bed-piece, essentially as described, in combination with the platen, so that the planing and matching of the piece may both proceed at the same time, or either the planing or matching may be done separately, whether the platen be made movable with the piece secured thereupon or the platen be fixed and the piece be made to move thereon," held valid.

The claim, though not expressed with accuracy, should be construed *ut res magis valeat quam pereat*.

The inventor intended to claim a surfacing and matching machine, in which the matching-cutters were adjusted laterally and vertically, in combination with the platen, and were so adjustable vertically that the matching mechanism could be mechanically dropped below the platen when surfacing alone was to be done.

The movable or fixed character of the platen is not a necessary part of the improvement to which the third claim relates, and might have been omitted therefrom.

The term "matching-cutters" in the claim signifies "matching mechanism;" and the claim is infringed by the Merriam machine in which the matching-*spindles* alone are dropped below the bed, the heads with the cutting-blades having been first removed.

The corporate character of a corporation complainant being averred under oath in the bill of complaint, and the same not being denied in the answer, but simply proof thereof being called for: *Held*, that the fact of incorporation was in effect admitted by the pleadings.

[*S. A. Duncan* and *George Gifford*, for complainants.
W. J. A. Fuller, for defendants.]

SHIPMAN, *J.*:

This is a bill in equity praying for an injunction and an account, and is founded upon letters patent of the United States for an Improvement in Planing-Machines, which patent was issued to Henry D. Stover, one of the complainants, on July 23, 1861. The other complainants, J. A. Fay & Co., are a corporation and the assignees and owners of an undivided half interest in so much of the patent and of the invention covered thereby as is embodied in the third claim of said patent. The assignment was executed September 14, 1868.

The answer admits that said patent was issued to said Stover, and puts the complainants to proof of their present title thereto, and alleges that the patent is void for want of novelty. The defendants deny that they have infringed by averring that the only machines which they use or have used for planing or matching lumber are machines made under letters patent which were granted to Rufus N. Merriam on November 5, 1867, and which patent is alleged to have been for a "different invention from that claimed by said Stover in his patent." The answer also avers that the complainants are equitably estopped by their own acts from any recovery in this suit.

The fact that J. A. Fay & Co. are a corporation is in effect admitted by the pleadings.

The machines to which the alleged improvements in each of the patents relate is a machine for planing and matching lumber. Machines for planing the surface of boards, and at the same time for planing or grooving and matching the edges of boards, have been long in use, and were well known prior to the date of the Stover patent. In these machines the boards were planed by means of a cylinder which occupied a horizontal and transverse position above the bed or platen upon which the boards were placed, and the edges of the boards were at the same time grooved and matched by means of matching-cutters. These cutters were attached to spindles which were supported in a vertical position, so as to project through and above the bed, and thus enable the knives to operate upon the edges of the lumber as it passed between the knives after leaving the planing-cylinder. The machines were also provided with mechanism, by means of which the space between the matching-cutters could be increased laterally, so that stuff of different widths could be matched upon the same machine.

Although in the machines which were in use prior to the Stover patent there were devices which caused a slight vertical adjustment of the matching-cutters upon their spindles, so that lumber of different thickness could be matched, yet there was no machine in which the matching apparatus could be entirely removed, by mechanical means, below the surface of the platen when the surfacing of wide boards only was desired. Oftentimes there was a necessity for planing without matching boards of greater width than would pass between the matcher-heads, and in such case it was necessary to detach and remove by hand the spindles from the machines. It was thus impossible to surface wide boards upon a machine of ordinary dimensions without incurring the labor and delay which were incident to a removal of the matching mechanism by hand. One object of the machines of Stover and of Merriam was to obviate this difficulty, and each patentee adopted the same general mode of accomplishing the desired result. The matching-spindles are so attached to each machine that they can, at the pleasure of the operator, be simultaneously dropped below the surface of the platen.

In the Stover machine the platen is movable or stationary. When boards are to be both planed and matched the platen is stationary, and the lumber is passed under the cutting-cylinder, by feed-rolls, to be planed, and thence through the matching-cutters to be matched. When boards are to be planed without being matched, they can be placed and secured upon a movable platen, which, with the lumber upon it, is passed under the cutting-cylinder. But the platen cannot be moved without previously removing the matching-spindles, which, if not removed, prevent the progress of the platen.

The object of the Merriam machine is described by the patentee in his specification as follows:

In that variety of planing-machines designed not only for planing the surface of lumber, but also for matching the edges thereof, much inconvenience has resulted from the necessity of lowering that portion of the bed of the machine which supports the upper ends of the vertical shafts, which carry the matching-cutters whenever it is required to adjust the said cutters for matching lumber of different thicknesses, or to move the said shaft out of the way in using the planer for surface-planing only. The object of the invention is to remedy this defect.

One result which was intended to be accomplished by each machine was the lowering of the shafts beneath the surface of the bed, when it was desired to use the machine for surfacing and not matching.

The defendants place their defense upon three grounds: first, that the third claim of the Stover patent, which claim alone the defendants are charged with infringing, describes a mechanical impossibility, and a machine destitute of utility; second, that the Stover patent is void for want of novelty; third, that the Merriam machine is not an infringement of the Stover patent.

1. Is the third claim of the plaintiffs' patent valid? The claim is as follows:

I also claim the arrangement of matching-cutters to be adjusted both laterally with each other and vertically upon the bed-piece, essentially as described, in combination with the platen, so that the planing and matching of the piece may both proceed at the same time, or either the planing or matching may be done separately, whether the platen be made movable with the piece secured thereupon, or the platen be fixed and the piece be made to move thereon.

The defendants contend that the patentee is confined by this language to a mechanism whereby the lumber may be both planed and matched at the same time, or planing and matching may be done separately either upon a movable or a fixed platen. It is obvious that the lumber cannot be matched upon a movable platen by the Stover machine, because the matching-spindles project through apertures in the platen, and the spindles, when in a position for matching, would prevent a forward movement of the platen; and it is also obvious, from the description of the machine, that no such mechanical impossibility was contemplated.

The specification reads as follows:

To the platen A′ is secured a guide, D′, which may be removed at pleasure. This correctly guides the board in connection with the spring E^1, to be matched by cutters which may be raised up through holes V^2 and W^2, formed through the platen for that purpose, and adjusted at the desired elevation, they being driven by pulley S from pulley Q′ on a drive-shaft, L′. The platen may thus be used stationary, and over which the boards may be moved by feed-rolls, to be both planed and matched on both edges at the same time, or either may in the same manner be done separately; or the platen may be moved by any means, (not necessary to be shown,) and the lumber secured thereupon while lying perfectly natural by jaws F^1 operated by right and left hand screws G′ to pinch and hold the piece by turning the lever H′, * * * * In order to dress dimension lumber the platen is moved in bed along with the piece secured upon it to be dressed; and, when boards are to be dressed by passing them under the cutting-cylinder, requires that a set of feed-rolls shall be combined with the other portions of my machine to feed the boards or piece over the platen A′ and under the cutters to be dressed, the platen being fixed during such operation.

The intention of the patentee was to state in the third claim the improvements which he had described, and which consisted in part of devices for the removal by mechanical means of the matching apparatus when "dimension" lumber was to be dressed—that is, planed and not matched. The third claim is not expressed with accuracy, but should be construed "*ut res magis valeat quam pereat*," and in connection with the specification, so that "the inventor shall have the benefit of what he has actually invented." (*Woodman* vs. *Stimpson*, 3 Fish., 98.)

If the court can clearly see what is the nature and extent of the claim, by a reasonable use of the means of interpretation of the language used, then the plaintiff is entitled to the benefit of it, however imperfectly and inartificially he may have expressed himself. (*Ames* vs. *Howard*, 1 Sumn., 485.)

The inventor intended to claim a surfacing and matching machine in which the matching-cutters were adjusted laterally and vertically, in combination with the platen, and were so adjustable vertically that the matching mechanism could be mechanically dropped below the platen when surfacing alone was to be done. By such a machine the matching and planing could be done at the same time, or the planing could be done separately with the matcher-cutters removed, or the matching could be done separately when the cutters were raised above the surface of the platen. He had previously claimed the movable platen which he supposed to be an improvement upon other planing-machines. The movable or fixed character of the platen is not a necessary part of the improvement to which the third claim relates, and might have been omitted from the statement of that claim. A construction which should compel the patentee to the declaration that his machine could either match or plane boards when placed upon a fixed [*movable?*] platen, the matching-cutters being upon stationary arbors projecting through the platen, would be a construction of the utmost rigor, and in violation of the liberal rules in regard to the interpretation of patents which have prevailed in the courts of this country. It is a just and reasonable construction to hold that the concluding clauses of the claim were introduced parenthetically, and related to the platen which the patentee had previously claimed, and had no reference to the planing or matching which are mentioned in the clause which immediately precedes those now under discussion. Thus construed the claim would read as follows: I also claim the arrangement of matching-cutters, to be adjusted both laterally with each other and vertically upon the bed-piece, essentially as described in combination with the platen, (whether the platen be made movable with the piece secured thereupon or the platen be fixed and the piece be made to move thereon,) so that the planing and matching of the piece may both proceed at the same time, or either the planing or matching may be done separately.

2. Does the Merriam machine infringe the complainants' patent?

The object of the Merriam machine has already been given in the language of the patentee. One object was to "move the shafts out of the way in using the planer for surface-planing only." He also states that "by this arrangement they" (i. e., the vertical spindles) "can be lowered beneath the surface of the bed, for surface-planing only, without removing any portion of the bed, and in a moment of time."

In the Stover patent the device by which the matching-cutters are dropped below the surface of the platen is thus described:

The matching-cutters and bar X^2 are made vertically movable and adjustable by sliding in grooves N, which are formed in central portion of bed-piece A, by means of screw O′, threaded and fitted to stand P′ on bar X^2, and turned by wheel N′.

By this single screw the two spindles are simultaneously moved above and below the surface of the platen.

The same simultaneous movement is effected by double racks instead of a single screw in the model which was used upon the trial. The same movement is effected in the Merriam machine by racks, pinions, and a weighted lever. The mechanism is thus described by one of the defendants' witnesses:

This is accomplished by two separate sliding steps having their motion vertically, each step being provided with a rack in which mesh two pinions connected together by a longitudinal shaft. By rotating this shaft it gives to the sliding steps, which carry the matcher-spindles, a vertical motion sufficient to raise them to their places when performing their work, or depress them entirely out of the way.

The elevation and depression of the matcher-spindles in the two machines are performed by substantially the same means and in substantially the same way. It is true that the Merriam machine is probably an improvement upon the Stover machine, but the principle and essential elements of the two machines are the same.

It is claimed that the Merriam machine does not infringe the plaintiffs' patent, because the specification of the Stover patent describes no method by which a lateral movement of the matcher-spindles can be produced. A lateral movement of the matching mechanism was well known prior to the date of the Stover patent, which was not granted for an improved lateral adjustment. The third claim was for the arrangement of matching-cutters to be adjusted both laterally and vertically, as described, in combination with the platen. The method of vertical adjustment is described and claimed: any appropriate and customary method of lateral adjustment could be used, and one method was indicated in the drawings; but as the patentee claimed no improvement in mechanism by which lateral motion was obtained, it was not important to give a description of any particular method of accomplishing this result when the methods already in use were well understood.

The third claim of the Stover patent is for "an arrangement of matching-cutters." In the Merriam machine the cutting-blades are placed upon "heads" of larger diameter than that of the spindles to which the heads are attached. The heads are removed from the spindles by hand, and the spindles are then dropped below the surface of the platen. In the machine which was shown in the Stover patent, the cutting-blades are inserted in slots in the ends of the spindles, and are raised and depressed with the spindles. It is contended that the Stover patent is limited to an arrangement of cutters or knives, which must be lowered by mechanical means, and that the patent is not infringed by reason of the fact that in the Merriam machine the matching-spindles only are carried below the platen. The object of the Stover invention was to enable wide surfacing to be done upon a planing and matching machine of ordinary width. To accomplish this object the entire matching apparatus must be removed below the surface of the platen. In the Stover machine, as shown in the drawings, the spindles and cutters are simultaneously dropped. The cutters cannot be lowered unless the spindles are lowered also, and unless the spindles are lowered the machine cannot plane wide boards. The invention was for an arrangement of the cutting mechanism; and it would have been a more accurate use of language had the word "mechanism" or an equivalent term been used instead of the word "cutters;" but, by a common form of expression, in the language which was employed a part of the mechanism was substituted for the whole.

But in case a limited signification is given to the word "cutters," the conclusion for which the defendants contend is not reached. The cutters or knives must be placed upon spindles, and the "arrangement of matching-cutters" is an arrangement upon spindles which are so vertically adjusted that the whole can be dropped below the surface of the platen. The matching-spindles of the Merriam machine are so vertically adjusted that they can be lowered below the surface of the bed, and in the mechanism by which the dropping of the spindles is effected the Stover patent is infringed. The Merriam machine "incorporates in its structure and operation the substance" of the Stover invention. (*Carter vs. Baker*, 4 Fish., 404.)

3. The novelty of the Stover machine.

It has already been remarked that machines which were in use prior to the Stover patent contained devices for a slight vertical adjustment of the matcher-cutters, so that boards of different thicknesses could be accurately matched. This vertical adjustment was sometimes effected by a thread at the upper end of the spindles, and sometimes by loosening a set-screw, which secured the cutter-head to the spindle. These machines did not contain any device by which the spindles could be simultaneously dropped below the surface of the platen at the will of the operator, so that boards could be planed which were wide enough to pass over the top of the spindles thus lowered. Upon the entire proofs, it does not appear that any machine existed prior to the date of the Stover patent which had the principle of the Stover machine.

4. As to equitable estoppel.

The testimony in regard to Stover's propositions to a witness and one of the manufacturers of the Merriam machine, is, if true, not sufficient to justify a court in dismissing the bill.

Let a decree be passed for an injunction and account.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date October 5, 1875.]

8,673.—Lamp Shade and Chimney.—THOMAS B. ATTERBURY, Pittsburg, Pa., assignor to himself and JAMES S. ATTERBURY, same place. Application filed September 20, 1875. Term of patent 14 years.

8,674.—Floor Oil-Cloths.—JOSEPH BARRETT, New York, N. Y., assignor to RICHARD H. REEVE and BENJAMIN C. REEVE, Camden, N. J. Application filed September 22, 1875. Term of patent 3½ years.

8,675 and 8,676.—Fancy Cassimeres.—FREDERICK S. BOSWORTH, Providence, R. I., assignor to THE WEYBOSSET MILLS, same place. Applications filed September 18, 1875. Term of patents 7 years.

8,677 to 8,679, inclusive.—Carpets.—OTTO HEINICKE, New Utrecht, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Applications filed September 24, 1875. Term of patents 3½ years.

8,680 to 8,684, inclusive.—Carpets.—HENRY HORAN East Orange, N. J., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Applications filed September 24, 1875. Term of patents 3½ years.

8,685.—Cooking-Stoves.—WILLIAM J. KEEP, Troy, N. Y. Application filed September 20, 1873. Term of patent 7 years.

8,686.—Dress-Trimming.—SALLIE MCLAUGHLIN, Philadelphia, Pa., assignor to EDWARD H. GODSHALK, same place. Application filed September 13, 1875. Term of patent 3½ years.

8,687.—Carpets.—ELEMIR J. NEY, Dracut, Mass., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed September 24, 1875. Term of patent 3½ years.

8,688.—Bust, (Shakespeare.)—WILLIAM PAGE, New York, N. Y. Application filed September 6, 1875. Term of patent 7 years.

8,689.—Floor Oil-Cloth.—FRANK. H. RANDALL, Camden, N. J., assignor to RICHARD H. REEVE and BENJAMIN C. REEVE, same place. Application filed September 22, 1875. Term of patent 3½ years.

8,690.—Coffin-Screws.—CEPHAS B. ROGERS, West Meriden, Conn., assignor to C. ROGERS & BROTHERS, same place. Application filed September 21, 1875. Term of patent 7 years.

8,691.—Carpets.—THOMAS J. STEARNS, Boston, Mass., assignor to ROXBURY CARPET COMPANY, same place. Application filed September 23, 1875. Term of patent 3½ years.

8,692.—Fancy Cassimeres.—WILLIAM A. WALTON, of Providence, R. I., assignor to THE WEYBOSSET MILLS, same place. Application filed September 18, 1875. Term of patent 7 years.

8,693.—Border of a Pictorial Card.—MAHLON BOLTON, Jr., Philadelphia, Pa., assignor to WILLIAM H. LEHMAN and MAHLON BOLTON, Jr., same place. Application filed August 24, 1875. Term of patent 3½ years.

8,694 and 8,695.—Bracket.—CHRISTIAN HERTER, New York, N. Y. Applications filed August 27, 1875. Term of patents 3½ years.

8,696 to 8,698, inclusive.—Gasalier.—CHRISTIAN HERTER, New York, N. Y. Applications filed August 27, 1875. Term of patents 3½ years.

8,699.—Chandelier.—CHRISTIAN HERTER, New York, N. Y. Application filed August 27, 1875. Term of patent 3½ years.

8,700.—Newell Light.—CHRISTIAN HERTER, New York, N. Y. Application filed September 27, 1875. Term of patent 3½ years.

8,701.—Lamp.—CHRISTIAN HERTER, New York, N. Y. Application filed August 27, 1875. Term of patent 3½ years.

8,702.—Wall-Pockets.—JENNIE C. LAMM, Hopedale, Ill. Application filed September 9, 1875. Term of patent 3½ years.

8,703.—Advertising-Desk.—JOSEPH S. MORGAN, Brooklyn, N. Y. Application filed September 4, 1875. Term of patent 7 years.

8,704.—Provision-Safe.—FRANK NORTHRUP, Detroit, Mich., assignor to himself and ROBERT A. LITTLE, same place. Application filed June 3, 1875. Term of patent 7 years.

8,705.—Embroidery-Patterns.—EMIL CRISAND, New Haven, Conn., assignor to HENRY ST. JOHN, same place.—Case II. Application filed September 21, 1875. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK,

[Each certificate bearing date October 5, 1875.]

2,998.—Steam-Pumps and other Steam and Hydraulic Apparatus.—AQUOMETER STEAM-PUMP COMPANY, Philadelphia, Pa. Application filed July 3, 1875.
"word 'AQUOMETER.'"

2,999.—Leather-Board.—EDWIN F. BAILEY, Ashland, N. H. Application filed August 25, 1875.
"letters 'A L B.'"

3,000.—Castor-Oil.—ROBERT B. BROWN, St. Louis, Mo. Application filed August 28, 1875.
"words 'BRILLIANT CASTOR-OIL.'"

3,001.—Medicine.—JOHN CARNRICK, Bayonne, N. J. Application filed August 25, 1875.
"word 'MALTINE.'"

3,002.—Metallic Alloys and Articles of Use or Ornament made therefrom.—CHARLES J. A. DICK, Philadelphia, Pa. Application filed August 7, 1875.
"representation of the figure of an elephant."

3,003.—Medical Preparation.—LEWIS M. GREEN, Woodbury, N. J. Application filed September 18, 1875.
"words 'AUGUST FLOWER.'"

3,004.—Medical Preparations.—LEWIS M. GREEN, Woodbury, N. J. Application filed September 18, 1875.
"words 'GERMAN SYRUP.'"

3,005.—Coolers and Refrigerators.—EDWARD K. HOWES, San Francisco, Cal. Application filed August 21, 1875.
"words 'EUREKA REFRIGERATOR.'"

3,006.—Coffee and Tea making Utensils.—N. S. MCFARLAND, New York, N. Y. Application filed August 12, 1875.
"word 'CENTENNIAL.'"

3,007.—Tobacco and Cigars.—THE CONSOLIDATED TOBACCO COMPANY, San Francisco and Gilroy, Cal. Application filed July 3, 1875.
"words and letters 'Pride of Alameda,' C. T. C. Gilroy."

3,008.—Tobacco and Cigars.—THE CONSOLIDATED TOBACCO COMPANY, San Francisco and Gilroy, Cal. Application filed July 3, 1875.
"words and figures 'Bouquet of California,' with a bouquet of flowers placed after the word 'Bouquet,' between it and the words 'of California.'"

3,009.—Champagne Wine.—ANDREW J. COHEN, Philadelphia, Pa. Application filed August 19, 1875.
"a symbol representing the obverse and reverse of the Centennial medal issued by authority of the Government of the United States, having printed across its face the words 'Vin Centennial.'"

3,010.—Overcoats.—DEVLIN & Co., New York, N. Y. Application filed September 25, 1875.
"word 'CREEDMOOR.'"

3,011.—Overcoats.—DEVLIN & Co., New York, N. Y. Application filed September 25, 1875.
"word 'DOLLYMOUNT.'"

3,012.—Overcoats.—DEVLIN & Co., New York, N. Y. Application filed September 25, 1875.
"word 'WIMBLEDON.'"

3,013.—Wines and Spirits.—FRANK, BOEHM & Co., New York, N. Y. Application filed March 23, 1875.
"word 'CENTENNIAL.'"

3,014.—Butter.—WILLIAM JEX & Co., New York, N. Y. Application filed September 8, 1875.
"Gilt-Edge."

3,015.—Table-Sauce.—JAMES MEEHAN, Washington, D. C. Application filed September 23, 1875.
"words 'CENTENNIAL SAUCE.'"

3,016.—Watches.—J. H. MCMILLAN & Co., Chicago, Ill. Application filed September 29, 1875.
"the device or representation of a watch-balance of peculiar configuration."

3,017.—Fine Shirtings.—WILLIAM S. SLATER, North Smithfield, R. I. Application filed June 24, 1875.
"the head of an Indian warrior printed in colors."

3,018.—Dry-Goods.—WECHSLER, ABRAHAM & Co., Brooklyn, N. Y. Application filed March 13, 1875.
"a Maltese cross, with the letters 'W., A. & Co.'"

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date October 5, 1875.]

333.—Title: **"Dr. A. Boschee's German Syrup of Tar, Wild Cherry, &c."**—LEWIS M. GREEN, Woodbury, N. J. Application filed September 18, 1875.

334.—Title: **"Barber's Indian Vegetable Jaundice Bitters."**—OLIVER JOHNSON & Co., Providence, R. I. Application filed September 25, 1875.

335.—Title: **"Hurd's Magical Mixture for Washing Clothes."**—MARSH, HURD & Co., New York, N. Y. Application filed September 24, 1875.

336.—Title: **"Geo. A. Magee, Manufacturer of Awnings, Banners, Tents, and Flags."**—GEO. A. MAGEE, Paterson, N. J. Application filed September 24, 1875.

337.—Title: **"Mansfield Iron Paints."**—JOHN H. PUTNAM, Mansfield, Pa. Application filed September 23, 1875.

338.—Title: **"Fahnestock, Haslett & Schwartz."**—JAMES E. SCHWARTZ, Pittsburg, Pa. Application filed September 23, 1875.

INDEX OF INVENTIONS PATENTED OCT. 5, 1875.

	Class No.	No. of Patent.
Alarm, burglar, A. Gregory	24	168,391
Alarms, circuit closer for electrical burglar, L. Finch	50	168,470
Annealing box, C. H. Onions	85	168,408
Annunciator, electric, S. H. Beckwith	50	168,364
Artist's shading stump, L. F. Bruce	146	168,316
Auger, earth, W. E. Coman	51	168,454
Axle clip tie and loop, Clapp and Van Patten	31	168,320
Axle clip tie for carriages, Clapp and Van Patten	31	168,321
Bag and chair, combined traveling, C. Laumonier	102	168,402
Bale tie, T. H. Murphy	7	168,518
Balloons, car or boat attachment for, J. Hartness	143	168,466
Barrels, skid for oil, D. M. Haight	40	168,393
Bedstead, Ogborn and Kendrick	62	168,342
Bedstead, invalid, A. Kaufman	62	168,503
Beef shaver, smoked, C. R. Turner	25	168,433
Bell ringing, G. H. Collins	24	168,453
Bending metal bars, machine for, A. H. Campbell	125	168,450
Blind stiles, machine for boring, J. M. Seymour	30	168,532
Boilers, feed water apparatus for steam, W. H. Jenkins	148	168,398
Bolt and lath machine, combined, Gaither and Hill	174	168,474
Books, binding, G. K. Snow	15	168,535
Boot and shoe heel, T. C. Musgrove	16	168,341
Boot and shoe heels and soles, screw for, J. Uster	16	168,357
Boot and shoe soles and uppers, uniting, G. V. Sheffield	16	168,420
Boots and shoes, machine for notching and flanging counter blanks for, N. Harwood	16	168,329
Bottling apparatus, L. B. Wilson	1	168,547
Brakes, air valve for power, G. Westinghouse, Jr	122	168,359
Brush, hair, C. E. Teets	101	168,429
Brush, paint, C. R. Baker	22	168,363
Buildings, bird guard for, H. T. Blodget	4	168,466
Buildings, machine for making wooden gutters for, A. K. P. Buffum, (reissue)	174	6,675
Burner, candle G. Hollister	90	168,333
Burners, sheet metal attach. for gas, M. B. Dyott	64	168,463
Butter worker, J. Rooney	45	168,418
Buttons to wearing apparel, metallic fastener for attaching, D. Heaton	23	168,331
Canning meats, &c., apparatus for, W. Leland	56	168,508
Car coupling, J. H. Johnson	122	168,399
Car coupling, E. L. Sanford	122	168,345
Car coupling, O. C. Smith	122	168,423
Cars, apparatus for warming and ventilating railroad, J. Story	154	168,426
Cars, side bearing for railroad, G. Galloway	122	168,476
Carpet lining, G. W. Chipman	95	168,373
Carpet lining, G. W. Chipman	95	168,374
Carriage, C. Thomas	31	168,430
Carriage, child's, J. A. Crandall	31	168,458
Carriage, child's, L. B. Harrington, Jr	31	168,394
Carriage, child's, S. Oppenheimer	31	168,523
Carriage jack, A. W. Richards	79	168,530
Carriages, axle clip tie for, Clapp and Van Patten	31	168,321
Carriages, die for making body loop blanks for, Clapp and Van Patten	31	168,322
Carriages, top prop for, Clapp and Van Patten	31	168,319
Cart, dead, T. F. White	31	168,438
Caskets and coffins, construction of, J. M. Hutton	39	168,499
Catamenial sack, G. Mescom	156	168,515
Cement, tank for asphaltic, T. New, (reissue)	126	6,683
Cement, tank for asphaltic, T. New, (reissue)	126	6,684
Chair, opera, W. A. Slaymaker	62	168,351
Chair, tilting, H. S. Hale	62	168,462
Chairs, base for revolving, W. T. Doremus	62	168 363
Cheese protector, D. A. Wells	88	168,437
Chimney stack, T. C. Nativel	4	168,520
Chisel, mortising, A. B. Watterson	29	168,358
Chuck for turning whip stocks, C. S. Hartwell	172	168,467
Churn, A. D. Greee	45	168,392
Churn, I. E. Smith	45	168 333
Churn, rotary, W. B. Lampton	45	168,506
Cistern cut off, automatic, H. L. Wells	126	168,361
Clothes pin, H. C. Hill	91	168,332
Confectionery, E. Hawker	155	168,488
Copying press, Hoffman and Hoyt	117	168,494
Corpse lifter, J. J. Flannery	39	168,471
Cotton opener, J. E. Crane	28	168,324
Cracker machine, J. W. Eager	6	168,531
Crane, Caswell and Worth	79	168 372
Crane, F. A. Pratt	79	168,412
Crimping pin, hair, M. Gardner	161	168,388
Croquet apparatus, J. A. Crandall	143	168,323
Crozing staves, J. Pennie, Jr	40	168,410
Cultivator, sulky, J. Spain	43	168,537
Curtain fixture, G. W. Corey	62	168,456
Dental engine, W. W. Evans, (reissue)	46	6,677
Desk, office, F. H. Cutler	62	168,459
Distilling oils, Van Devort and Van Fleet	47	168,542
Drag, D. Miller	73	168,516
Dredgers, diking attachment for, G. W. Parsons	82	168,409
Drill, seed, B. Regan, (reissue)	133	6,679
Dumping attachment for offal presses, T. Webber	26	168,545
Egg beater, M. Loso	88	168,510
Electroplated figure, &c., Worthen and Gillespie	113	168,442
Engine governor, electrical marine, C. C. Wolcott	69	168,548
Equalizer, draft, J. M. Buckner	31	168,370
Ethylene, package for, J. P. Moore	156	168,340
Fastener for attaching buttons to wearing apparel, metallic, D. Heaton	23	168,331
Fence, iron, J. B. Wickersham, (reissue)	32	6,685
Fire arm, breech loading, W. W. Greener	18	168,328
Fire arms, sight for, D. M. Martines	55	168,404
Fish spear, M. Jinoks	143	168,335
Flood way for warehouses, J. H. Morrell	4	168,517
Flour sack packer, Fuller and Parkerson	57	168,387
Furnace, annealing, W. S. McKenna	85	168,513
Furnace for smelting lead, J. V. Woodhouse	99	168,440
Furnace, steam boiler, E. Kaselowsky	148	168,502
Furniture caster, W. Gould	24	168,479
Gas apparatus, H. J. Sarmon	66	168,539
Gas as a motive power, using carbonic acid, J. Westcott	2	168,546
Gas machine, A. Glachet	66	168,390
Gas regulator, J. H. Bean	64	168,444
Gate, automatic, N. H. Long	58	168,509
Glass tool, T. Carr	68	168,371
Globe, terrestrial, M. McVicar	146	168,514
Grate, J. E. Cree	149	168,325
Grinding and fitting pearl veneers, machine for, J. and G. Hoffmann	70	168,493
Hammer, steam, S. D. Wilson	60	168,439
Harness pad press, W. Dippert	72	168,381
Harvester, C. Denton	74	168,326
Harvester rake, M. Ray	74	168,526
Harvesters, pitman connection for, A. Rea	74	168,415
Hay, mechanism for unloading, W. H. Haynes	79	168,330
Hay tedder, E. M. Stockel	77	168,424
Head light for vessels, signal, W. M. and J. J. Walton	138	168,434
Heel trimming machine, I. Van Nouhuys	16	168,540
Hinge, L. E. Bolton	24	168,369
Horse power, A. B. Farquhar	159	168,469
Horseshoe, E. L. Brown	60	168,369
Horseshoe machine, W. W. Lewis	60	168,336
Hub, L. N. Bewley	31	168,445
Hydrant, C. F. Rapp	167	168,413
Hydrant, anti-freezing, R. Smeaton	167	168,422
Ice breaking vessel, E. J. Weedermann	137	168,436
Ice machine, A. Jas	83	168,500
Ice machines, condenser for, A. Jas	83	168,501
Indexes, machine for cutting and printing, H. H. Edwards	15	168,468
Indicator, W. L. Gallaudet	146	168,475
Induction coil, J. R. Chislett	50	168,451
Key hole guard for locks, H. Cochems	93	168,375
Kitchen cabinet, G. Holt	88	168,397
Ladder, extension, W. T. Core	30	168,378
Lap robe, F. L. Blakely	144	168,315
Latch and lock, combined knob, J. F. Cooper	93	168,377
Latch, gate, J. Peterman	93	168,525
Leather, machine for rounding, J. Lewis	92	168,403
Leather, machinery for graining, pebbling, and softening, H. Howson	92	168,497
Leather, manufacture of artificial, J. Harrington	56	168,485
Life preserving stool, H. H. Nash	138	168,519
Machinery, device for preventing backlash of, J. A. Hafner	67	168,481
Mail bags, manufacture of, H. Stephens	102	168,425
Marking implement, J. O'Kane	146	168,407
Marking wheel, S. E. Worrell	146	168,362
Mechanical movement, J. McCloskey	67	168,337
Metal bars, machine for bending, A. H. Campbell	125	168,450
Mill, rolling, King and Scott	125	168,504
Millstone staff, J. See	57	168,419
Millstone staff, P. Sellers	57	168,348
Motion, device for converting, W. F. Barnes, (reissue)	67	6,674
Motion from a treadle to a revolving shaft, mechanism for transmitting, J. Sigwalt, Jr	67	168,350
Multiplier, pattern, O. W. Richardson	157	168,343
Night soil and sewage apparatus, C. E. Frazier	8	168,473
Night soil apparatus, R. S. Gillespie	8	168,477
Nut lock, F. C. Hamilton	14	168,483
Nut lock, C. Henderson	14	168,489
Oils, distilling, Van Devort and Van Fleet	47	168,542
Ordnance, breech loading, E. Schultz	103	168,346
Ordnance, projectile for, J. G. Butler	103	168,447
Packing for stuffing boxes, metallic, P. Sage	151	168,344
Page indicator for books, E. Harris	15	168,395
Paper bag, A. S. Dennison	109	168,461
Paper box, E. D. F. Shelton, (reissue)	109	6,680
Paper fastener and card suspender, G. K. Snow	23	166,536
Paper hanging machine, R. H. Miner	107	168,339
Paper pulp, apparatus for the manufacture of, J. W. Dixon	108	168,382
Papec tube machine, H. M. Boies	109	168,366
Paper tubing, compound flexible, H. M. Boies	109	168,367
Paper tubing, manufacturing, H. M. Boies	109	168,365
Pearl veneers, machine for grinding and fitting, J. and G. Hofmann	70	168,493
Pencil case and calendar, combined, R. Howland	146	168,496
Photograph burnisher, J. Coumbe	111	168,457
Piano forte damper attachment, M. W. Hanchett	112	168,484
Pipes, apparatus for thawing frozen water, T. J. Sloan	167	168,352
Pipes, implement for thawing frozen water, T. J. Sloan	167	168,353
Plane, bench, Traut and Richards	29	168,431
Planing machine, Rice and Markland	173	168,529
Planter, corn, A. Hodgson	137	168,396
Planter, hand corn, O. C. Gilmore	133	168,389
Pocket, safety, J. Colton	38	168,376
Pot, coffee, M. J. Dewald	136	168,327
Pot lid, L. W. Turner	154	168,356

	Class No.	No. of Patent.
Press, lever, A. Cameron	7	168,449
Presses, dumping attachment for offal, T. Webber	26	168,545
Printing press, MacDonald and Calverley	117	168,511
Prisons, construction of, Cook and Heath	4	168,455
Projectiles, sabot for, J. G. Butler	105	168,318
Propellers, means for raising and lowering, J. W. Dilks	139	168,380
Psychrometer, W. Klinkerfues	101	168,505
Pump for deep wells, J. H. Duck	118	168,462
Pump for raising heavy liquids, E. L. Perry	96	168,411
Railroad rail joint, S. W. Griffith	120	168,480
Railroad signals, circuit closer for, L. B. Dennis	50	168,379
Rake, horse, S. R. Nye, (reissue)	77	6,678
Rake, horse, S. R. Nye, (reissue)	77	6,679
Rake, horse, H. C. Velie	77	168,543
Refrigerator, L. B. Woolfolk	56	168,441
Riveting machine, J. F. Allen	119	168,314
Rolling mill, King and Scott	125	168,504
Ruffle, band, T. Robjohn, (reissue)	38	6,686
Ruffles, mach. for making band, T. Robjohn, (reissue)	38	6,687
Sails, means for reefing and furling, E. Rawley	132	168,414
Sample box, Butterfield and Holliday	54	168,448
Saw, W. P. Miller	131	168,338
Saw handle, crosscut, L. Shepard	29	168,421
Scaffold, window, H. Krtiger, Jr	30	168,401
Scraper, earth, D. Irwin	51	168,334
Screw cutting die, J. C. Sherman	100	168,349
Seed drill, B. Reagan, (reissue)	133	6,672
Seedlings puller, J. S. Swaney	73	168,427
Separator, ore, C. W. Reiley	3	168,416
Sewing case, J. B. Stearns, Jr	38	168,538
Sewing machine, wax thread, J. M. Nichols	134	168,521
Shading stump, artist's, L. F. Bruce	146	168,316
Shaft, mechanism for transmitting motion from a treadle to a revolving, J. Sigwalt, Jr	67	168,350
Shingle machine, W. F. Valentine	174	168,541
Shingling bracket, T. Talbott, Jr	30	168,355
Ship's log, S. D. Trenchard	138	168,432
Skate, O. Edwards, (reissue)	143	6,676
Sluice gate, T. Parker	82	168,524
Snatch block, A. Hunt	67	168,498
Soles, hand tool for channeling, L. Goddu	16	168,478
Spinning machinery, wool, C. Martin	142	168,512
Spool exhibiting case, J. D. Cutter	54	168,460
Stencil plate, W. M. Kellie	146	168,400
Stove, B. Claflin	154	168,452
Stove, heating, E. Smith	154	168,534
Tank for asphaltic cement, T. New, (reissue)	126	6,683
Tank for asphaltic cement, T. New, (reissue)	126	6,684
Telegraph, duplex, T. A. Edison	50	168,385
Telegraphs, recording point for chemical, T. A. Edison	50	168,467
Telegraphs, solution for chemical, T. A. Edison	50	168,465
Telegraphs, solution for chemical, T. A. Edison	50	168,466
Thill coupling, S. L. Hill	31	168,491
Tobacco bucket lid, I. N. Reynolds	160	168,417
Tobacco drier, O. Duwel	160	168,384
Toy table, G. H. Burke	143	168,317
Toy watches and chains, manufacture of sugar, G. Arend	155	168,443
Tramways, clip for rope, E. Olsen	120	168,522
Trunk, H. Vogler	162	168,544
Truss, S. L. Hockert	156	168,492
Tube rolling machine, J. Hoskin	163	168,495
Valve for power brakes, air, G. Westinghouse, Jr	122	168,359
Vault light, J. F. Foley	4	168,472
Vehicle seat, D. Ford	31	168,386
Vehicles, pole and shaft for, G. W. Eddy	31	168,464
Vessel, ice breaking, J. J. Weedermann	137	168,436
Vessels, signal head light for, W. M., and J. J. Walton	138	168,434
Wagon gearing, J. C. Seamens	31	168,347
Wagon seat, Hern and Richards	31	168,490
Warehouses, floodway for, J. H. Morrell	4	168,517
Wash board, W. Todd, (reissue)	91	6,673
Washing machine, J. R. Barnes, (reissue)	91	6,671
Watch key, G. P. Reed	36	168,527
Watch regulator, C. Teske	36	168,429
Water meter, Rhodes and Swarts	167	168,528
Water meter, A. Swasey	167	168,354
Water trap supply and connection, J. H. Morrell	167	168,405
Water wheel gate, combined, J. W. Larmon	168	168,507
Wedges, machine for making, Morgan and Foster, (reissue)	174	6,682
Windmill, J. Hall, (reissue)	118	6,681
Wrench, E. Wiard	100	168,360
Wrench, ratchet, F. S. Ober	100	168,406
Yarn, composition for sizing, J. W. Wattles	17	168,435

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED OCTOBER 5, 1875.

	Patent No.
Adriance, W., assignee	168,543
Allen, J. F., Riveting machine	168,314
American Cable Screw Wire Company, assignee	168,478
Arend, G., Manufacture of sugar toy watches and chains	168,443
Avery, B. F., assignee	168,360
Baker, C. R., Paint brush	168,363
Barnard, A. B., assignee, (reissue)	6,679
Barnes, J. R., Washing machine, (reissue)	6,671
Barnes, W. F., Device for converting motion, (reissue)	6,674
Bean, J. H., Gas regulator	168,444
Beckwith, S. H., Electric annunciator	168,364
Bennett, M., assignee	168,490
Bewley, L. N., Hub	168,445
Blakely, F. L., Lap robe	168,315
Blodget, H. T., Bird guard for buildings	168,466
Boies, H. M., Manufacturing paper tubing	168,365
Boies, H. M., Paper tube machine	168,366
Boies, H. M., Compound flexible paper tubing	168,367
Bolton, L. E., Hinge	168,368
Bowden, J. H., assignee	168,507
Bradley, J. A., assignee	168,437
Brooks, E. J., assignee	168,483
Brown, E. L., Horseshoe	168,369
Bruce, L. F., Artist's shading stump	168,316
Buckner, J. M., Draft equalizer	168,370
Buffum, A. K. P., Machine for making wooden gutters for buildings, (reissue)	6,675
Burke, G. H., Toy table	168,317
Butler, J. G., Sabot for projectiles	168,318
Butler, J. G., Projectile for ordnance	168,447
Butterfield, M. K., and A. D. Holliday, Sample box	168,448
Calverley and MacDonald	168,511
Cameron, A., Lever press	168,449
Campbell, A. H., Machine for bending bars of metal	168,450
Capewell, G. J., assignee	168,356
Carr, T., Glass tool	168,371
Caswell, J. M., and A. E. Worth, Crane	168,372
Chipman, G. W., Carpet lining	168,373
Chipman, G. W., Carpet lining	168,374
Chislett, J. R., Induction coil	168,451
Claflin, B., Stove	168,452
Clapp, E. D., and F. Van Patten, Top prop for carriages	168,319
Clapp, E. D., and F. Van Patten, Axle clip tie and loop	168,320
Clapp, E. D., and F. Van Patten, Axle clip tie for carriages	168,321
Clapp, E. D., and F. Van Patten, Die for making body loop blanks for carriages	168,322
Cochems, H., Key hole guard for locks	168,375
Collins, G. H., Bell ringing	168,453
Colton, J., Safety pocket	168,376
Coman, W. E., Earth auger	168,454
Cook, J. B., and J. W. Heath, Construction of prisons	168,455
Cooper, J. F., Combined knob latch and lock	168,377
Core, W. T., Extension ladder	168,378
Corey, G. W., Curtain fixture	168,456
Coumbe, J., Photograph burnisher	168,457
Crandall, J. A., Croquet apparatus	168,323
Crandall, J. A., Child's carriage	168,458
Crane, J. E., Cotton opener	168,324
Cree, J. E., Grate	168,325
Cutler, F. H., Office desk	168,459
Cutter, J. D., Spool exhibiting case	168,460
Dennis, L. B., Circuit closer for railroad signals	168,379
Dennison, A. S., Paper bag	168,461
Denton, C., Harvester	168,326
Dewald, M. J., Coffee pot	168,327
Dilks, J. W., Means for raising and lowering propellers	168,380
Dippert, W., Harness pad press	168,381
Dixon, J. W., Apparatus for the manufacture of paper pulp	168,382
Doremus, W. T., Base for revolving chairs	168,363
Duck, J. H., Pump for deep wells	168,462
Duff, P. and R. P., assignees, (reissue)	6,673
Duwel, C., Tobacco drier	168,384
Dyott, M. B., Sheet metal attachment for gas burners	168,463
Eddy, G. W., Pole and shaft for vehicles	168,464
Edison, T. A., Duplex telegraph	168,385
Edison, T. A., Solution for chemical telegraphs	168,465
Edison, T. A., Solution for chemical telegraphs	168,466
Edison, T. A., Recording point for chemical telegraphs	168,467
Edwards, H. H., Machine for cutting and printing indexes	168,468
Edwards, O., Skate, (reissue)	6,676
Evans, W. W., Dental engine, (reissue)	6,677
Farquhar, A. B., Horse power	168,469
Finch, L., Circuit closer for electrical burglar alarms	168,470
Flannery, J. J., Corpse lifter	168,471
Foley, J. F., Vault light	168,472
Ford, D., Vehicle seat	168,386
Foster and Morgan, (reissue)	6,682
Frazier, C. E., Night soil and and sewage apparatus	168,473
Fuller, C. M., and R. M. Parkerson, Flour sack packer	168,387
Gaither, J. C., and J. T. Hill, Combined bolt and lath machine	168,474
Gallaudet, W. L., Indicator	168,475
Galloway, G., Side bearing for railroad cars	168,476
Gardner, M., Hair crimping pin	168,388
Gillespie and Worthen	168,442
Gillespie, R. S., Night soil apparatus	168,477
Gilmore, O. C., Hand corn planter	168,389
Glachet, A., Gas machine	168,390
Goddu, L., Hand tool for channeling soles	168,478
Gould, W., Furniture caster	168,479
Grant, F., assignee	168,487
Greener, W. W., Breech loading fire arm	168,328
Gregory, A., Burglar alarm	168,391
Griffith, S. W., Railroad rail joint	168,480
Gross, A. D., Churn	168,392
Hafner, J. A., Device for preventing backlash of machinery	168,481
Haight, D. M., Skid for oil barrels	168,393
Hale, H. S., Tilting chair	168,462
Hall, J., Windmill, (reissue)	6,681
Hamilton, F. C., Nut lock	168,483
Hanbury, C., assignee	168,488
Hanchet, M. W., Piano forte damper attachment	168,484

	Patent No.
Harrington, G., assignee	168,465, 168,466, 168,467
Harrington, J., Manufacture of artificial leather	168,485
Harrington, L. B., Jr., Child's carriage	168,394
Harris, E., Page indicator for books	168,395
Hartness, J., Car or boat attachment for balloons	168,486
Hartwell, C. S., Chuck for turning whip stocks	168,487
Harwood, N., Machine for notching and flanging boot and shoe counter blanks	168,329
Hawker, E., Confectionery	168,488
Haynes, W. H., Mechanism for unloading hay	168,330
Heath and Cook	168,455
Heaton, D., Metallic fastening for attaching buttons to wearing apparel	168,331
Henderson, C., Nut lock	168,489
Herckelrath, H., assignee	168,492
Hern, D. W., and P. Richards, Wagon seat	168,490
Hill and Gaither	168,474
Hill, H. C., Clothes pin	168,332
Hill, S. L., Thill coupling	168,491
Hockert, S. L., Truss	168,492
Hodges, A. J., assignee	168,326
Hodgson, A., Corn planter	168,396
Hoffman, W. H., and B. St. J. Hoyt, Copying press	168,494
Hoffmann, J. and G., Machine for grinding and fitting pearl veneers	168,493
Holden, C. W., assignee	168,446
Holliday and Butterfield	168,448
Hollister, G., Candle burner	168,333
Holt, G., Kitchen cabinet	168,397
Heskin, J., Tube rolling machines	168,495
Howland, R., Combined pencil case and calendar	168,496
Howson, H., Machinery for graining, pebbling, and softening leather	168,497
Hoyt and Hoffman	168,494
Hunt, A., Snatch block	168,498
Huntington, J. D., assignee	168,461
Hutton, J. M., Construction of caskets and coffins	168,499
Irwin, D., Earth scraper	168,334
Janin, A. C., assignee	168,500
Jas, A., Ice machine	168,500
Jas, A., Condenser for ice machines	168,501
Jenkins, W. H., Feed water apparatus for steam boilers	168,398
Jewett, H. W., assignee, (reissue)	6,675
Jincks, M., Fish spear	168,335
Johnson, J. H., Car coupling	168,399
Kaselowsky, E., Steam boiler furnace	168,502
Kauffman, A., Invalid bedstead	168,503
Kellie, W. M., Stencil plate	168,400
Kendrick and Ogborn	168,342
Kennedy, D. W., assignee	168,421
King, N., and W. Scott, Rolling mill	168,504
King, T. P., assignee	168,540
Kitzmiller, E. A., assignee, (reissue)	6,673
Klinkerfües, W., Psychrometer	168,505
Krüger, H., Jr., Window scaffold	168,401
Kuhns, B., assignee, (reissue)	6,672
Lampton, W. K., Rotary churn	168,506
Larmon, Y. W., Combined water wheel gate	168,507
Laumonier, C., Combined traveling bag or chair	168,402
Leckrone, E. K., assignee	168,533
Leland, W., Apparatus for canning meats, &c	168,508
Lewis, J., Machine for rounding leather	168,403
Lewis, W. W., Horseshoe machine	168,336
Long, N. H., Automatic gate	168,509
Lozé, M., Egg beater	168,510
MacDonald, J. C., and J. Calverley, printing press	168,511
Martin, C., Wool spinning machinery	168,512
Martinez, D. M., Sight for fire arms	168,404
Maxcy, S. N., assignee, (reissue)	6,675
McCloskey, J., Mechanical movement	168,337
McKenna, W. S., Annealing furnace	168,513
McVicar, M., Terrestrial globe	168,514
Meacom, G., Catamenial sack	168,515
Miller, D., Drag	168,516
Miller, W., assignee	168,476
Miller, W. P., Saw	168,338
Miner, R. H., Paper hanging machine	168,339
Moore, J. F., Package for ethylene	168,340
Moore, S. P., assignee	168,345
Morgan, G., and J. R. Foster, Machine for making wedges, (reissue)	6,682
Morrell, J. H., Water trap supply and connection	168,405
Morrell, J. H., Floodway for warehouses	168,517
Murkland and Rice	168,529
Murphy, T. H., Bale tie	168,518
Musgrove, T. C., Boot and shoe heel	168,341
Nash, H. H., Life preserving stool	168,519
Nativel, T. C., Chimney stack	168,520
New, T., Tank for asphaltic cement, (reissue)	6,683
New, T., Tank for asphaltic cement, (reissue)	6,684
Nichols, J. M., Wax thread sewing machine	168,521
Nye, S. R., Horse rake, (reissue)	6,678
Nye, S. R., Horse rake, (reissue)	6,679
Ober, F. S., Ratchet wrench	168,406
Ogborn, H., and T. T. Kendrick, Bedstead	168,342
O'Kane, J., Marking implement	168,407
Olsen, E., Clip for rope tramways	168,522
Onions, C. H., Annealing box	168,408
Oppenheimer, S., Child's carriage	168,523
Parker, T., Sluice gate	168,524
Parkerson and Fuller	168,387
Parsons, G. W., Diking attachment for dredgers	168,409
Peck, G. S., assignee	168,467
Pennie, J., Jr., Crozing stave	168,410
Perry, E. L., Pump for raising heavy liquids	168,411
Peterman, J., Gate latch	168,525
Pratt and Whitney Company, assignee	168,412
Pratt, F. A., Crane	168,412
Rapp, C. F., Hydrant	168,413
Rawley, E., Means for roofing and furling sails	168,414
Ray, M., Harvester rake	168,526
Rea, A., Harvester pitman connection	168,415
Reed, G. P., Watch key	168,527
Regan, B., Seed drill, (reissue)	6,672
Reily, C. W., Ore separator	168,416
Reynolds, I. N., Tobacco bucket lid	168,417
Rhodes, W. P., and J. H. Schwartz, Water meter	168,528
Rice, D. H., and J. W. Murkland, Planing machine	168,529
Richards and Hern	168,490
Richards and Trant	168,431
Richards, A. W., Carriage jack	168,530
Richardson, O. W., Pattern multiplier	168,343
Robjohn, T., Band ruffle, (reissue)	6,686
Roljohn, T., Machine for making band ruffles, (reissue)	6,687
Rooney, J., Butter worker	168,418
Roger, J. W., Cracker machine	168,531
Sage, P., Metallic packing for stuffing boxes	168,344
Samuels, S., assignee	168,477
Sanford, E. L., Car coupling	168,345
Schultz, E., Breech loading ordnance	168,346
Scott and King	168,504
Seameans, J. C., Wagon gearing	168,347
See, J., Millstone staff	168,419
Sellers, P., Millstone staff	168,348
Seymour, J. M., Machine for boring blind stiles	168,532
Sheffield, G. V., Uniting the soles and uppers of boots and shoes	168,420
Shelton, E. D. F., Paper box, (reissue)	6,680
Shepard, L., Crescent saw handle	168,421
Sherman, J. C., Screw cutting die	168,349
Sigwalt, J., Jr., Mechanism for transmitting motion from a treadle to a revolving shaft	168,350
Slaymaker, W. A., Opera chair	168,351
Sloan, T. J., Apparatus for thawing frozen water pipes	168,352
Sloan, T. J., Implement for thawing frozen water pipes	168,353
Smeaton, R., Anti-freezing hydrant	168,422
Smith, E., Heating stove	168,534
Smith, I. E., Churn	168,533
Smith, O. C., Car coupling	168,423
Snow, G. K., Binding books	168,535
Snow, G. K., Paper fastener and card suspender	168,536
Spain, J., Sulky cultivator	168,537
Stark, M. J., assignee	168,476
Stearns, J. B., Jr., Sewing case	168,538
Steckel, E. M., Hay tedder	168,424
Stein, W., assignee	168,439
Stellwagen, P., assignee	168,476
Stephens, H., Manufacture of mail bags	168,425
Story, J., Apparatus for warming and ventilating railroad cars	168,426
Sarmon, H. J., Gas apparatus	168,539
Swaney, J. S., Seedling puller	168,427
Swartz and Rhodes	168,528
Swasey, A., Water meter	168,354
Talbott, T., Jr., Shingling bracket	168,355
Taylor, D. C., assignee	168,528
Teets, C. E., Hair brush	168,428
Teske, C., Watch regulator	168,429
Thomas, C., Carriage	168,430
Todd, W., Wash board, (reissue)	6,673
Tompkins, H. B., assignee	168,477
Traut, J. A., and H. Richards, Bench plane	168,431
Trenchard, S. D., Ship's log	168,432
Turner, C. R., Smoked beef shaver	168,433
Turner, L. W., Pot lid	168,356
Uster, J., Screw for boot and shoe heels and soles	168,357
Valentine, W. P., Shingle machine	168,541
Van Devort, C., and C. Van Fleet, Distilling olls	168,542
Van Fleet and Van Devort	168,542
Van Nonhuys, I., Heel trimming machine	165,540
Van Patten and Clapp	168,319, 168,320, 168,321, 168,322
Velle, H. C., Horse rake	168,543
Vogler, H., Trunk	168,544
Walton Brothers, assignees	168,400, 168,432
Walton, W. M. and J. J., Signal head light for vessels	168,434
Warner, W. R., assignee	168,354
Warner, W. Y., assignee	168,497
Wattles, J. W., Composition for sizing yarn	168,435
Watterson, A. R., Mortising chisel	168,358
Webber, T., Dumping attachment for offal presses	168,545
Weedermann, E. J., Ice breaking vessel	168,436
Wells, D. A., Cheese protector	168,437
Wells, H. L., Automatic cistern cut off	168,361
Westcott, J., Using carbonic acid gas as a motive power	168,546
Westinghouse, G., Jr., Air valve for power brakes	168,359
White, S., assignee	168,323
White, S. S., assignee, (reissue)	6,677
White, T. F., Dead cart	168,438
Wiard, E., Wrench	168,360
Wickersham, J. B., Iron fence, (reissue)	6,685
Wilson, L. B., Bottling apparatus	168,547
Wilson, S. D., Steam hammer	168,439
Wolcott, C. C., Electrical marine engine governor	168,548

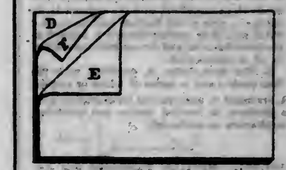
TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED OCT. 5, 1875.

168,214. RIVETING-MACHINE. J. F. Allen, New York, N. Y. [Filed Feb. 17, 1875.]

Brief.—The piston, at each end of its stroke, operates the valve by striking against the inclined face of plugs or bolts projecting, one near each end, through the sides and into the cylinder. The length of the stroke can be varied, so as to gradually reduce the end of the rivet, and form the head thereon, by turning the piston around, the under side of the piston being provided with an inclined face, that operates the valve sooner or later, in proportion as the face of the piston striking the valve varies in thickness. The hammer head, fastened to the piston-rod, works through a tubular guide, and moves therewith, as the latter is revolved, by means of a handle, thus effecting the adjustments of the piston.



1. An improved riveting machine, consisting of a cylinder, A, with suitable valves, in combination with the piston B, rod R, hammer P, guide-tube N, projecting guide-tube H, bracket J, steady-pin L, head bolt T, and the holding-bar W, the whole being arranged and operating together substantially as described.

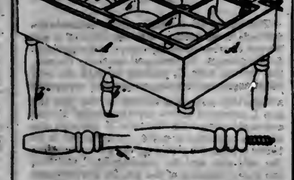
2. The combination of the cylinder A, plugs B B', lugs or horns C C', valve E, piston B, provided with an inclined surface, m, rod R, hammer P, and tube N, with projection or handle M, substantially in the manner and for the purpose set forth.

3. The piston B, with an inclined surface, m, on its under side, in combination with the plug B, piston-valve E, tube N, and projection or handle M, arranged and operating in the manner and for the purpose specified.

168,215. LAP-ROBE. Fredk. L. Blakely, Clinton, Iowa. [Filed Mar. 3, 1875.]

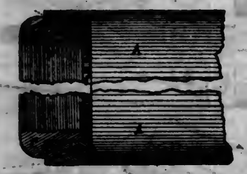
As a new article of manufacture, an improved lap-robe consisting of the coverings D E, of any suitable cloth, and the middle piece F, of oil-silk, or other fabrics impervious to air and water, all stitched together, and constructed substantially as described.

168,216. ARTISTS' SHADING-STUMPS. L. F. Bruce, Springfield, Mass. [Filed July 16, 1875.]



As a new article of manufacture, an artist's shading-stump, consisting of a thread of flexible material, a, made first in a strip, then rolled and firmly incased in a rigid covering, d, substantially as described.

168,217. TOY TABLES. George H. Burke, Springfield, Vt. [Filed July 16, 1875.]



Brief.—The body has compartments in which the removable legs, and others for the tablecut and cloth, all being covered by the hinged top or table.

1. A portable toy table, consisting of the box A, provided with the cover B, the pockets for packing the legs, and the legs b', arranged to be screwed into the bottom of the box, substantially as set forth.

2. The combination of the box A, provided with the cover B and pockets c, the removable tray b, and the legs b', arranged to be screwed into the bottom of the box, substantially as and for the purpose described.

168,218. SABOTS FOR PROFESSORS. John G. Butler, New York, N. Y. [Filed Sept. 20, 1875.]

1. The combination of a projectile having a double tapped ring, B, fitting over a polygonal or rounded shoulder, with a tongued and grooved auxiliary band, C, substantially as and for the purpose hereinbefore set forth.

2. The tongued and grooved band C, substantially as and for the purpose hereinbefore set forth.

168,219. TOP-PROPS FOR CARRIAGES. E. D. Clapp and Frederick Van Patten, Auburn, N. Y. [Filed Sept. 15, 1875.]

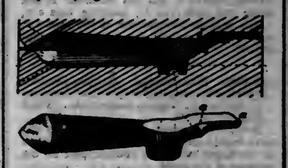
1. The combination of a hollow screw-threaded sleeve with a bolt and a prop-joint or prop-joints, substantially as described, and for the purposes set forth.

2. The combination of a hollow screw-threaded sleeve, a bolt, a prop-joint or prop-joints, and a cap, substantially as and for the purpose specified.

3. As a new article of manufacture, a top-prop for carriages, consisting of a bolt, B, having wings or pintles D, a cap, E, a hollow screw-threaded sleeve, F, and a prop-joint or prop-joints, G, substantially as shown and described.

168,220. AXLE-CLIP TIES AND LOOPS. E. D. Clapp and Frederick Van Patten, Auburn, N. Y. [Filed Sept. 15, 1875.]

As a new article of manufacture, an axle-clip tie and safety-loop, made of a single piece of metal, and having a recess, C, substantially as shown and described, and for the purpose set forth.



168,221. AXLE-CLIP TIES FOR CARRIAGES. E. D. Clapp and Frederick Van Patten, Auburn, N. Y. [Filed Sept. 15, 1875.]

As a new article of manufacture, an axle-clip tie for carriages provided with a recess, E, and shank D G, substantially as shown and described.

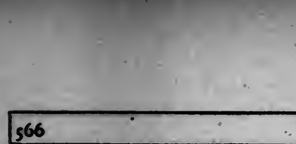
168,222. DIES FOR MAKING BODY-LOOP BLANKS FOR CARRIAGES. E. D. Clapp and Fredk. Van Patten, Auburn, N. Y. [Filed Sept. 15, 1875.]

Brief.—The new feature of the dies is the shape of b, Fig. 1.

1. The dies having the depressions and recesses of the form substantially as shown and described, and for the purpose set forth.

2. The body-loop-blank, made with a lip, c, of the form substantially as shown and described, and for the purpose set forth.

168,223. CROQUET APPARATUS. James A. Crundall, Brooklyn, N. Y., assignor to himself and Sylvanus White, same place. [Filed Sept. 4, 1875.]

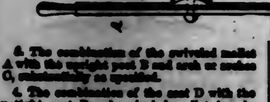


Brief.—A device embodying a rest, arch, and mallet, all in one.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON.

1. The compound mallet A, pivoted by a pin, a, to the post B, substantially as herein shown and described.

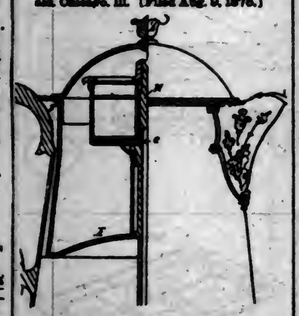
2. The post or handle B, combined with the brace or lunette C that project from its lower end, and constitutes the fork or yoke of the piano apparatus, substantially as herein shown and described.



160,893. GRAIN. Jos. H. Orr, Allentown, Pa. [Filed June 30, 1875.]

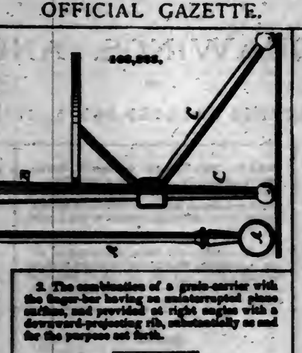
The combination of the grain-bars A A', having slots a b, and the guide-bar B and guide and rack-rod C, carrying lugs c c, which engage the pins d d on the jaws e e, substantially as and for the purposes described.

160,894. HASTENERS. Charles Deaton, Peoria, Ill., assignor of one-half his right to Andrew J. Rodgers, same place. [Filed Mar. 31, 1875.]



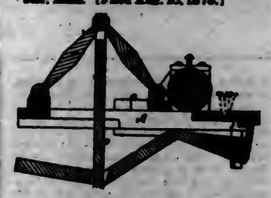
Brief.—By attaching the fingers to the convexedly-projecting rib the upper surface of the finger-bar is left unobstructed for the passage of the grain.

1. The finger-bar having an undercapped plane surface, and provided at right angles with a downward-projecting rib for supporting and attaching the fingers thereto, substantially as set forth.



2. The combination of a grain-carrier with the finger-bar having an uninterrupted plane surface, and provided at right angles with a downward-projecting rib, substantially as and for the purposes set forth.

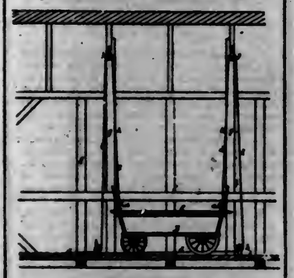
160,895. COFFEE-POT. Matthew J. Dowald, Chicago, Ill. [Filed Aug. 9, 1875.]



The combination, substantially as herein described, in connection with the body of a coffee-pot or other steeping-vessel, of the horizontal diaphragm B, arranged centrally therein, the vertical tube H, passing through the said diaphragm, and having an open end supported a little way above the bottom of the pot, the cup I, arranged above the diaphragm B, and communicating with the tube H through one or more openings or ports, c c, arranged to lie below a filter for retaining the grounds within the said cup, and the pouring-lip C, entering the upper chamber of the pot, for the purposes specified.

160,896. BURNER-LOADING FIRE-ARM. Wm. W. Greener, Birmingham, England. [Filed June 3, 1874.]

The combination of the lever D and shaft G, having arms E E, with the bolts O J, as described.



160,897. MACHINE FOR HOOPING AND FLANGING COOPERS'-BLANKS FOR BOGGS AND BINDS. Nelson Harwood, Leominster, Mass. [Filed Aug. 10, 1875.]

In a machine for hooping and forming coopers-stiffeners for boxes and chests, the combination of a carriage, G, and roller E with reciprocating jaws B C, provided with gages d d e, retaining-dies c f, and die-carrier E, all attached to a suitable bed-plate, A, and operated by toggles, pitmen, and weight-of lever, substantially as shown, and for the purposes described.

160,898. MECHANISM FOR UNLOADING HAY. Warren E. Haynes, North Sudbury, Mass. [Filed Sept. 9, 1875.]

Brief.—The wagon, having on it a platform loaded with hay, is drawn into the barn. Ropes attached to each corner of the platform load upward through pulleys, thence downward and to the horse-power. The load, when drawn up, is tilted by hooking one side to staples and hooking on the other.

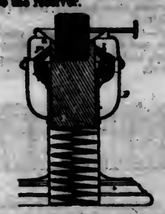
1. The combination of the hooking-chains f e and the branch chains r s, provided with hooks t t, as described, with the capstan D, its studs v, rope q, and the four hoisting-ropes d d d d, and their guide-pulleys f h, applied to the barn-frame A, and the car with a platform, C, all as represented.

2. The barn-frame A, provided with the four posts y and a series of hooks or staples, k, arranged in each, as and for operation with a platform, its hooked chains, and elevating mechanism as explained.

160,899. METALLIC FASTENERS FOR ATTACHING BUTTONS TO WEARING APPAREL. David Heaton, Providence, R. I. [Filed Jan. 28, 1875.]

The fastener having five prongs or spurs, three in front and two at the rear, constructed substantially as described, for the purpose specified.

160,900. CLOTHES-PIN. Homer C. Hill, Clinton, Ill. [Filed Apr. 12, 1875.]

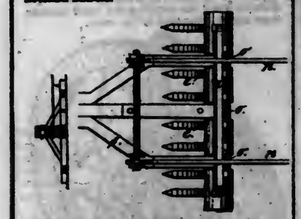


HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON.

A clothes-pin consisting of a piece of elastic metal, provided with an elongated notch or aperture, a, on end, b, having inclined sides, and of such tapering form that it may pass with facility through the said slit, and lap a, forming a part of the outwardly-curved end that resting against the prong d, all combined as described.

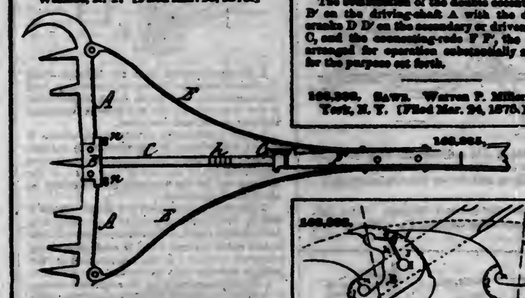
160,901. CANDLE-STICKING. Geo. Hollister, Quincy, Mass. [Filed Sept. 9, 1875.]

Brief.—The insulator is made of a non-heat-conducting substance. It guides the melted waste into the receiver.



1. In combination with the candle-burner provided with the waste-receiver D, surrounding its candle-tube, the insulator F, constructed to receive the waste of the candle and discharge it into the said receiver.

2. The candle-burner provided with the waste-receiver D, series of clasps E, and the insulator F, all being constructed and arranged substantially as, and to operate as, specified.



160,902. HARTH-SCRAPERS. David Irvin, Byron Centre, Mich. [Filed Mar. 6, 1875.]

Brief.—A series of hinged teeth arranged on a bar, and the angle regulated by a notched handle.

The above-described slicker and earth-remover, having, in combination with tongue r and head c, the hinged s, teeth q, bend t, and notched handles a, substantially as and for the purposes set forth.

160,903. FIRE-GRATE. Melvin Jinkins, Wallace, N. Y. [Filed Mar. 16, 1875.]

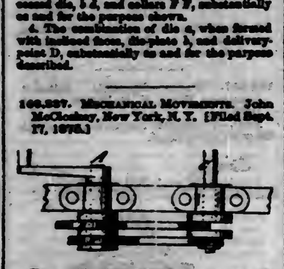
1. The combination, with the spring-jaws A A, of the central shaft C provided with the teeth h, and the spring P provided with the catch i, substantially as and for the purposes specified.

2. The combination, with the spring-catch F and sliding shaft G, of the cam G and pin h, as and for the purposes specified.

3. The combination, with the spring-jaws A A and head B, of the cut-corners a a, for adjusting the angle of the spring-jaws, as described.

160,904. HORSESHOE-MACHINES. William W. Lewis, Cincinnati, Ohio. [Filed May 20, 1875.]

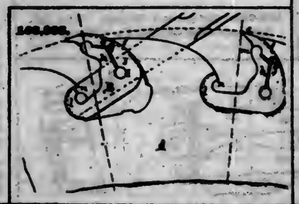
Brief.—Die-plates with faces shaped to produce the required form countersunk in the periphery; grooves at right angles to the inclined faces of the die-plates. The rail carrying the countersunk die-plates is provided with groove around it for the deliverer.



1. The grooves c c, in connection with the inclined faces on the opposite die a, for the purpose of producing an undercut crease, as described.

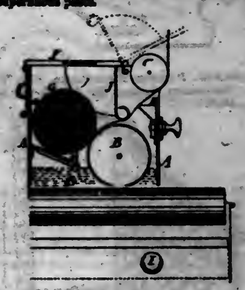
2. The combination of die a, formed with inclined faces, and countersunk die b d, substantially as and for the purposes specified.

3. The combination of roll A, having a die, a, with inclined faces, roll B, having a recessed die, b d, and cutters F F, substantially as and for the purposes shown.



4. The combination of die a, when formed with inclined faces, die-plate b, and delivery-point D, substantially as and for the purposes described.

160,905. MECHANICAL MOVEMENTS. John McCloskey, New York, N. Y. [Filed Sept. 17, 1875.]



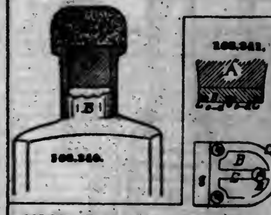
The combination of the double eccentrics B B' on the driving-shaft A with the double cranks D D' on the secondary or driven shaft C, and the connecting-rods F F', the whole arranged for operation substantially as and for the purposes set forth.

160,906. SAWS. Warren P. Miller, New York, N. Y. [Filed Mar. 24, 1875.]

160,907. PAPER-HANGERS' MACHINES. S. H. Miner, Cleveland, Ohio. [Filed Jan. 10, 1875.]

Brief.—A scraper is adjustably attached to the front side of the box, and is made to bear on the under side of the paper for removing superfluous paste.

1. The scraper and paste-regulator H, made with the inwardly-bent edges, in combination with adjusting-set-screws I, constructed and arranged substantially in the manner herein shown and described.



2. In a paper-hanging machine, substantially as described, the combination of the flanges J with the lid, as and for the purposes set forth.

3. A paper-hanging machine composed of the flanged lid F J, rolls B C, paste-receptacle, and adjustable scraper H, substantially as described.

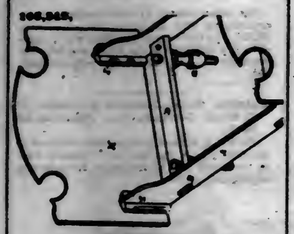
160,908. PACKAGES FOR BOTTLING. James P. Moore, Cleveland, Ohio. [Filed Mar. 8, 1875.]

Brief.—A package or bottle provided with a sponge, which is held in place by a capsule of the neck thereof, on the flange of the neck of the bottle, and of sufficient capacity for holding a sponge above the cork.

In combination with the neck b and cork C of the bottle A, the sponge E and capsule D, as and for the purposes set forth.

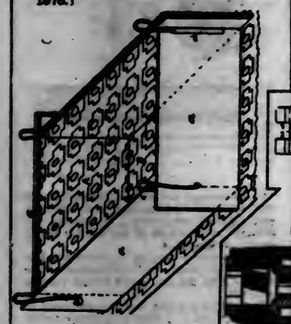
160,909. BOOT AND SHOE HEELS. Thos. C. Musgrove, Philadelphia, Pa. [Filed Apr. 12, 1875.]

The combination of the heel A, having an offset or shoulder, β, the recessed rubber B, and the yielding stainless-plate C, substantially as and for the purpose shown and described.



160,910. BEDSTEADS. Harrison Cotton, Richmond, Ind., and Tunis T. Kendrick, New York, N. Y. [Filed June 26, 1875.]

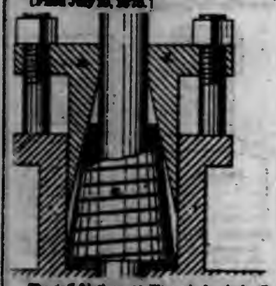
1. The head and foot boards H H, provided with the grooved cleats I I, in combination with the side rails A A, having the dovetailed tenons A A, constructed and operating substantially as and for the purposes set forth.



2. The legs c c, provided with tenons G G, in combination with the cross-bars D D, having the holes or mortises M M, substantially as and for the purposes hereinbefore set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & CO. BOSTON.

168,845.



168,845. PATTERN-MEASURE. Otis W. Richardson, Chicago, Ill. [Filed Aug. 19, 1875.]

1. A pattern-multiplier, consisting of three or more mirrors adjustably connected to each other, and having their reflecting-surfaces arranged, substantially as described, to produce, or partly produce, the patterns, for the purposes set forth.

2. The combination of three or more mirrors, *a b c*, with dotted charge or charge, substantially as and for the purposes specified.

168,844. METALLIC PACKING FOR STUFFING-BOXES. Philip Sage, Dubuque, Iowa. [Filed July 28, 1875.]

The self-fitting metallic conical split collar, in combination with the rod *b* and follower, when constructed substantially as and for the purpose herein specified.

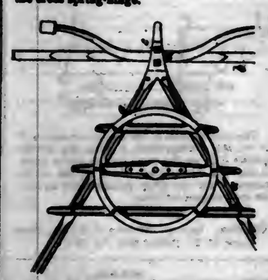
168,846. GAS-CONDENSER. Edwin L. Sanford, Pavilion, assignor of one-half his right to Sanford P. Hines, Middlebury, N. Y. [Filed May 19, 1875.]

1. The hooks A A, pivoted within the draw-head B, and having their angular rear ends *b b* passing through the bottom of the draw-head, in combination with the spring *b* arranged between said angular ends of the hooks, as and for the object specified.

2. The uncoupling-key D, formed with the two triangular prongs *m n* and head *o*, and in combination with the draw-bar C, with the corresponding openings *p p* therein, and the beveled catch *p*, all as and for the purpose herein before set forth.

168,847. BREECH-LOADING ORDNANCE. E. Schultze, Paris, France. [Filed July 31, 1874.]

1. The combination, in a piece of ordnance, substantially as described, of the channel D, and piece A, with notch *a*, to receive the end of the wire.



168,848.

2. The combination, in a piece of ordnance, substantially as described, of the cylinder C, ring G, and elastic bodies *p p* and E.

168,849. WAGON-GEARING. Julian C. Simmons, Virgil, N. Y. [Filed Aug. 11, 1875.]

Brief.—The splinter-bars are connected with the cross spring-hinge.

The hinge *c*, in combination with the splinter-bars *a a* and the cross-spring *b*, all substantially as and for the purposes set forth.

168,850. MILLSTONE-STAFFS. Peter Sellers, Lancaster County, Pa. [Filed July 1, 1875.]

168,846.

The circular marble slab A, dressed out of a single piece, with its central opening C and handles D, as and for the purposes specified.

168,847. SCREW-CUTTING DIES. Jireh C. Sherman, New Bedford, Mass. [Filed Aug. 4, 1875.]

Brief.—Chasers fit in radial grooves cut in the case, and are secured in position by clamping-rings, which are made to clamp them by set-screws.

The combination of the die-stock A, provided with the openings *a*, channels *b*, and rings B, and the cutters C, as described.

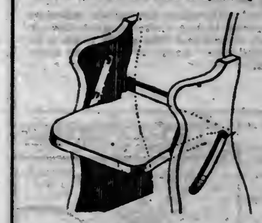
168,848. MECHANISM FOR TRANSMITTING MOTION FROM A TREADLE TO A REVOLVING SHAFT. John Shewalt, Jr., Chicago, Ill. [Filed Aug. 14, 1875.]

Brief.—A continuous forward motion is imparted to the balance-wheel by means of clutch-wheels arranged on each side of the same, and operated by a treadle and band. Said clutch-wheels are provided with locking-pieces, springs, and washers, the latter riding upon eccentrics on the inner hubs thereof. The balance-wheel is suspended in a frame made adjustable by means of a stud, and having a sheave-wheel for carrying the band passing from one clutch-wheel to the other.

1. In combination with the balance-wheel B, the adjustable frame A, inclosing said balance-wheel, said parts being constructed in the manner and for the purpose substantially as shown and described.

2. The combination of the clutch-wheels C and C, constructed as described, with the balance-wheel B, the former being arranged upon opposite sides of the hub of the latter, in the manner and for the purpose substantially as shown and described.

3. In combination with the clutch-wheels C and C, the eccentrics C' and C', provided with the washers *c* and *c*, the locking-pieces D and D, and spiral springs E and E, substantially being relatively arranged in the manner and for the purpose substantially as shown and described.

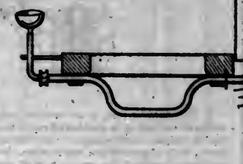


4. In combination with the adjustable hanger A and the balance-wheel B, the center pivotal bearings A' and A', said parts being relatively arranged in the manner and for the purpose substantially as shown and described.

5. In combination with the hanger A, the small sheave-wheel F, said parts being relatively arranged in the manner and for the purpose substantially as shown and described.

168,849.

168,850.

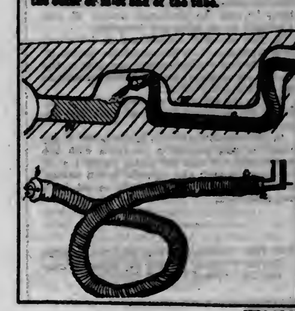


168,851. OPERA-CHAIRS. W. A. Shaymaker, Louisville, Ky. [Filed Dec. 4, 1874.]

The combination of the pivoted seat, side frames, intermediate links or bars, and the guiding pins and slots, substantially as described.

168,852. APPARATUS FOR THAWING FROZEN WATER-PIPES. Thos. J. Sloan, New York, N. Y. [Filed Mar. 17, 1875.]

Brief.—A flexible pipe constructed with a metallic head or nozzle and an external spiral wire or thread, whereby the pipe may be fed into the water-pipe to be thawed by means of a rotary movement from a tubular crank, working in suitable journals in a frame, the opposite end of said crank being connected, by a swiveled joint, with an upright tube, into which hot water may be poured by means of a funnel.

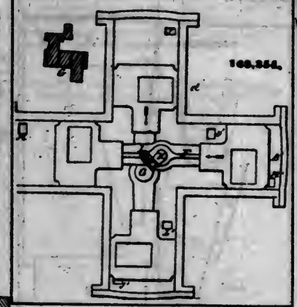


1. As a new article of manufacture, a flexible pipe, constructed with a metallic head or nozzle, and an external spiral wire or thread, whereby the pipe may be fed into the water-pipe to be thawed by means of a rotary movement, substantially as and for the purpose set forth.

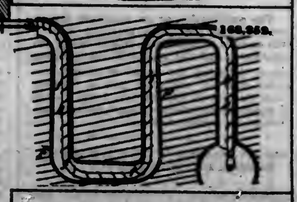
2. The combination of a crank with the externally spirally-threaded pipe, made of rubber or other flexible material, substantially as and for the purpose herein set forth.

3. The tubular segmental crank, arranged for adjustment along the length of the flexible externally spirally-threaded pipe, substantially as and for the purpose set forth.

168,853. IMPLEMENT FOR THAWING FROZEN WATER-PIPES. Thos. J. Sloan, New York, N. Y. [Filed Mar. 2, 1875.]



Brief.—A flexible tube of India-rubber or other flexible material, provided externally with a shield of closely-coiled wire, provided with a rounded nozzle, and having an internal draft-wire extending from the said nozzle to the outer or inlet end of the tube.

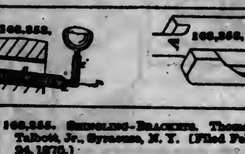


The combination of the flexible tube *a*, the coiled-wire shield *a*, the nozzle *b*, and draft-wire *c*, the whole combined and arranged for operation substantially as and for the purpose set forth.

168,854. WATER-MOTORS. A. Swasey, Hartford, Conn., assignor to W. E. Warner, same place. [Filed Aug. 13, 1875.]

Brief.—In four cylinders opening into each other at the center move four pistons, connected together in pairs by rigid connecting-rods. A connecting-link with pivots fits into sockets in the middle points of the rods. Each piston acts as a valve for the adjacent cylinder. The connection of the link with the piston-rods governs and regulates their motion, and causes them to have always the proper position and stroke.

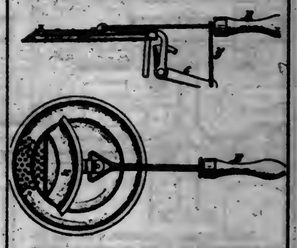
168,854.



1. The four cylinders, in combination with double pistons, connected and arranged as described, and with entrance and exit pipes communicating between the cylinders, substantially in the manner herein set forth, so that each pair of pistons act as valves for the other pair.

2. The link G, in combination with the two piston-rods, moving at right angles to each other and in straight lines, as a device for regulating and controlling their motion, substantially as described.

3. The combination of the link G, whose ends move in straight lines at right angles to each other with a reciprocating motion, and the crank and spindle I, connected with the middle point of said link, as a new mechanical movement for converting rectilinear into rotary motion, substantially in the manner described.



168,855. SHINGLING-BRACKETS. Thomas Talbott, Jr., Syracuse, N. Y. [Filed Feb. 24, 1875.]

A portable sliding bracket formed of a shoe, A, made to slide up over the roof, and suspended by a rope attached to the front end of the shoe, as described, on which is an abutment, *a*, and folding riser B and bar or tread C, constructed and combined as and for the purposes specified.

168,856. POT-LIDS. Lewis W. Turner, Wallingford, Conn. [Filed Aug. 12, 1875.]

Brief.—The pot can be tipped and the lid held in place by means of the handle, hook, and lever.

The pot-lid A, provided with the handle B, hinged to the lid, also provided with the hook *b*, passing through a slot in the edge of the lid, lever *c*, pivoted to the hook *b*, and connected to the handle B by the rod *g*, all the said parts constructed and arranged to operate as and for the purpose described.

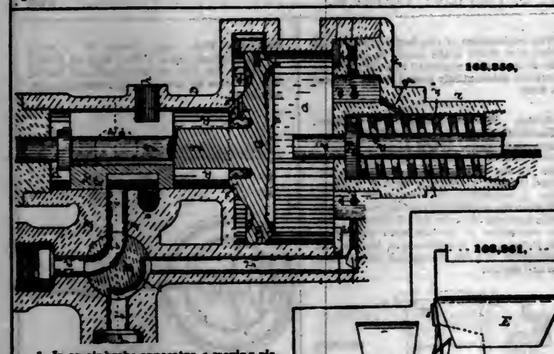
168,857. SCREWS FOR HEELS AND SOLES OF BOOTS AND SHOES. John Usher, Brooklyn, E. D., N. Y. [Filed Mar. 20, 1875.]

The screw for boot and shoe soles or heels, made with longitudinal slots or openings the entire length of the cylindrical portion for the reception of the screw-driver, as set forth.

168,858. MORTISING-CHISELS. Arthur B. Watterson, San Francisco, Cal. [Filed May 6, 1875.]

Brief.—The chisel is formed in two parts, united by a scarf-joint, for the purpose of removing the lower part for sharpening, or for substituting a different width of tool without removing the upper part. The main chisel is provided with two side plates having vertical slots, in which is fitted a supplementary chisel, secured in position by a key passing through the side plates, and a transverse slot in the back of the chisel.

The chisel A C, constructed as described, in two parts, with the mitring-joint B, in combination with the vertically-slotted sides D, the transversely-slotted chisel F, and key G, all arranged to operate substantially as and for the purpose set forth.



168,859. AIR-VALVES FOR POWER-BRAKES. George Westinghouse, Jr., Pittsburg, Pa. [Filed Aug. 10, 1875.]

Brief.—A slide-valve is attached to a piston, which is actuated by the varying pressure of air. When the piston is raised, air flows over the slide-valve into the port leading to the reservoir, while the slide-valve is in a position to allow air to exhaust from the brake-cylinder. Pressure being reduced, the piston falls and moves the slide-valve to uncover the cylinder-port, and allow air to flow from the reservoir to the cylinder and set the brakes.

168,858.

168,859.

1. In an air-brake apparatus, a moving piston arranged in the line of air communication, operated by air-pressure, and a slide-valve, H, connected therewith, in combination with suitable air ports and passages leading to an auxiliary reservoir and brake-cylinder, whereby such reservoir and cylinder will be charged with compressed air alternately and successively by the throw or motion of the piston and valve, substantially as set forth.

2. The port *a*, in combination with air-chamber *a*, piston G, slide-valve H, and auxiliary reservoir and brake-cylinder parts, arranged substantially as set forth.

3. The slide-valve H, in combination with an air-reservoir and brake-cylinder, arranged and operative substantially as set forth.

4. In combination with the piston G, a suitable line of ports and passages, *a a' b' b'' c'*, for supplying compressed air to the auxiliary reservoir while the piston is on its upper seat, substantially as set forth.

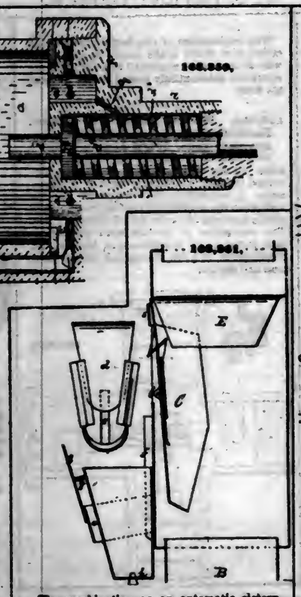
5. In combination with a piston, G, operated by air-pressure, a stem, *d'*, and spring *d''*, substantially as set forth.

6. The port *q* in an apparatus substantially such as described, for draining off the water of condensation from the air chambers or spaces to a drip-cup, *q'*.

7. A reversible four-way cock, in combination with a single line of charging-pipe and supply-port therefrom, a brake-cylinder part, and parts leading to and from suitable automatic devices, substantially as set forth, whereby either of the modes described of operating the brakes may be employed at pleasure without changing the port of supply.

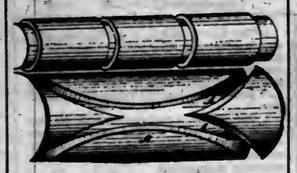
8. An arrangement of parts *l l'* in the seat D', parts *b'* and *c*, communicating with the automatic apparatus, and parts *b''* *c'*, communicating with the brake pipe and cylinder, substantially as set forth.

168,860. Whiffletree. Edwd. Wiard, Louisville, Ky., assignor to Benjamin F. Avery, same place. [Filed Jan. 26, 1875.]



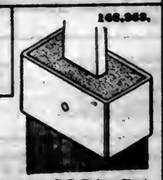
Brief.—The handles are held together by a sliding loop, capable of use when different-sized nuts are to be turned. A slot and projection prevent lateral play at the extremity of the handles

In a wrench with its sections A B and C D constructed and operating as described, the combination of the lug *f*, oblong slot *e*, shoulder *d*, stem *d'*, loop *g*, and sliding ring E, in the manner and for the purpose described.



168,862. Automatic Chinese Cut-Off. Harvey L. Wells, Burlington, Iowa. [Filed Aug. 9, 1875.]

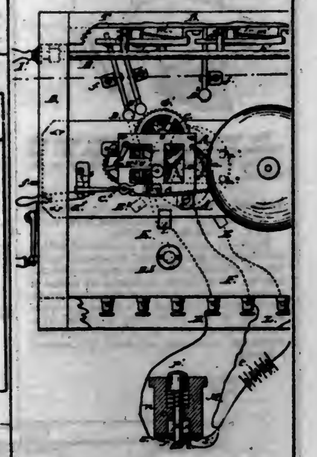
Brief.—The chute is held in horizontal position by the leaf-spring outside of the tank. As the water gradually weights the external tank it slides down the ways, and at the same time a projecting pin pulls out the spring, releasing the chute, which, by the weight of the water, removes a vertical position, discharging into the cistern.



The combination, as an automatic cistern cut-off, of the chamber A, arranged between the sections of leader-pipe B, and having the gateway *a* and the apron E, the swinging chute C, having the slotted opening *c*, provided with the adjustable gate *d*, together with the tank D, with its ways *f*, and the pin *g*, together with the leaf-spring S, as described, and for the purpose specified.

168,863. Marking-Wheels. S. H. Worrell, Hannibal, Mo. [Filed July 6, 1875.]

A marking-wheel having a groove to fit over the chine of a barrel or other similar article, so that the main surface or marking part of the wheel will touch all portions of the head of the barrel or other similar article, as shown.



168,865. Paint-Brushes. C. R. Baker, East Cambridge, Mass. [Filed Aug. 18, 1875.]

Brief.—The brush, being of even thickness, holds the same quantity of paint at the edges as at the center, and does not require frequent dipping.

A varnish or paint brush, in which the bottoms of the bristles are disposed in rectangular form within a rectangular socket or ferrule, substantially as and for the purpose described.

168,864. Electric Annunciators. Saml. H. Beckwith, Utica, N. Y. [Filed Apr. 1, 1875.]

Brief.—The alarm and all the indicators controlled by one electro-magnet, through which circuits pass from all the points to be signaled from. Magnet is revolved by clock-work.

1. The combination, in an annunciator, of a series of indicating or numbered cards or signs and a single electro-magnet controlling the same, with intermediate mechanism, for the purpose of causing the proper sign or number to appear on sounding an alarm or call, substantially as set forth and described.

2. The combination of a revolving electro-magnet, an armature-lever, a drag-spring, and a system of keys for the purpose of sounding an alarm or call by the appearance of annunciating-cards indicating the place from whence the alarm or call proceeds, substantially as set forth and described.

3. The revolving electro-magnet provided with the armature-lever O' and drag-spring G, in combination with the cut-off P, the automatic switch M, and the clock-work, whereby the breaking of the circuit at the switch causes the clock-work to move and revolve the magnet, and the circuit is automatically closed to stop the same, substantially as set forth and described.

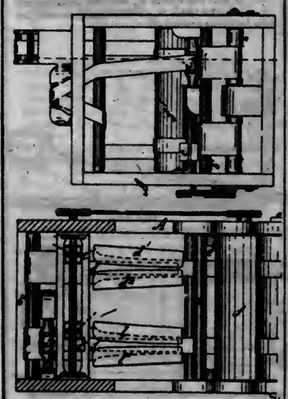
4. The keys D D', &c., in combination with the armature-lever O', the conducting-plates E E', &c., and the horizontal notched springs A', substantially as set forth and described.

5. The cams L, carrying the annunciating-cards M, in combination with the horizontal springs A', rods I and K, chains or cords *n'*, and keys D D', &c., substantially as set forth and described.

6. The conducting-plates E E', &c., in combination with the drag-spring G, the armature-lever O', and the automatic switch M, substantially as set forth and described.

7. The cut-off P, constructed as described, in combination with the automatic switch M, the revolving electro-magnet, the drag-spring G, and the armature-lever O', substantially as set forth and described.

8. The cut-off P, in combination with the crank P', substantially as set forth and described.

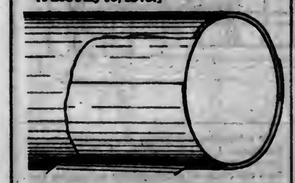


9. The automatic switch M, composed of the sheath *n* and plunger *p*, provided with the metal pins *r r* and the metal plates *s s'*, in combination with two circuits to the annunciating apparatus, substantially as set forth and described.

168,865. Processes for Manufacturing Paper Tubing. Henry M. Boies, Scranton, Pa. [Filed July 10, 1875.]

The process of manufacturing water-proof tubing of paper in one continuous operation, herein described, which consists in forming a tube by pasting and lapping the edges of a strip of paper of the required width, then drying the paste, and finally in coating the tube with a water-proof material, substantially as set forth.

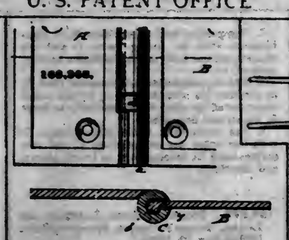
168,866. Paper-Tube Machine. Henry M. Boies, Scranton, Pa. [Filed July 10, 1875.]



Brief.—A strip of paper is pasted and folded into a tube, which passes over a yielding tension-roller, and under a guide, which directs it into another tube-forming apparatus, where a second strip of paper is pasted and folded over the first, forming a double tube.

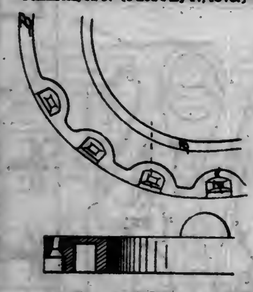
1. The combination of two sets of tube-forming apparatus, substantially such as described, with an intermediate roller having its bearings in a yielding bed, for the purpose of administering elastic tension to the tube as it is drawn off from the first set of tube-forming apparatus, and delivered to the second set of tube-forming apparatus, substantially as shown.

2. The combination of tube-forming apparatus, substantially such as described, provided with a reel for containing and delivering a strip of paper in suitable position to be formed into a tube, with a guide for delivering a tube already formed in suitable position to have the said strip of paper pasted and folded into a second tube outside of the tube so delivered, substantially as described.



168,867. Compound Flexible Paper Tubing. Henry M. Boies, Scranton, Pa. [Filed July 10, 1875.]

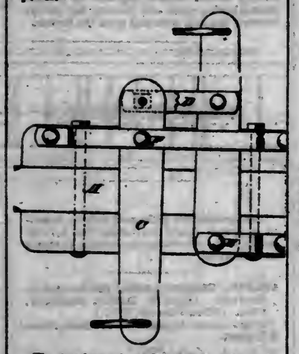
As a new article of manufacture, continuous flexible tubing composed of two or more single tubes of variable diameter, arranged loosely one within the other, each tube being made from a strip of flexible material, substantially as described.



168,868. Hinges. Lewis R. Bolton, Des Moines, Iowa. [Filed June 28, 1875.]

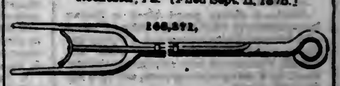
Brief.—The hinge is made reversible by the use of slotted end projections, combined with a detachable collar and a slotted sleeve, which fits upon a suitable rod formed on one of the leaves, the construction giving ready reversibility as a right-and-left hinge.

The within-described reversible right-and-left hinge, formed of the leaf A, having slotted tubular end projections *a a*, the leaf B, having pin *b* and web *y*, the slotted sleeve *c*, and collar *d*, all constructed substantially as and for the purposes herein set forth.



168,869. Horseshoes. Edward L. Brown, Plainfield, N. J. [Filed July 17, 1875.]

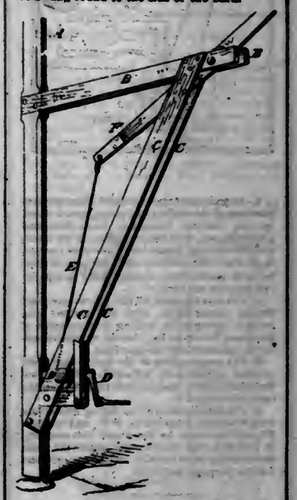
A horseshoe constructed with vertical flanges, forming an annular space, to be filled with elastic material, on its under side, and having its outer vertical flange extended to and made the full size of the outer boundary of the shoe, except at the nail-holes, where it is carried inside of, and partly around, said nail-holes, to admit the nails outside of said flange, substantially as hereinbefore set forth.



168,870. Draft-Equalizers. J. M. Bushnell, Salem, Mass. [Filed June 10, 1875.]

Brief.—The single-horse lever is coupled to the two-horse lever between the fulcrum and power.

The two-horse lever B, pivoted at its end, so that both horses will stand on the same side of pole, in combination with the one-horse lever C, pivoted at a point intermediate between its two ends, so that the third horse will stand on the other side of pole, and the strap D, connecting the end of the single-horse lever with a point on the two-horse lever intermediate between the fulcrum and power-end, all substantially as set forth.



168,871. Glass-Tools. Thomas Carr, Rochester, Pa. [Filed Sept. 11, 1875.]

The combination of a sliding pusher, *a*, with a glass paddle or fork, substantially as specified.

168,872. Cranes. Jesse M. Caswell and Addison R. Worth, De Soto, Wis. [Filed Aug. 6, 1875.]

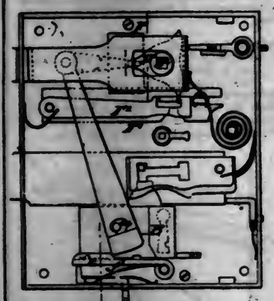
Brief.—An adjustable boom is centrally pivoted at the intersection of the jib and stay, from the inner end of which a winding-rope passes to the winch, the whole adapted to be swung round to the side of the barn.

The combination of the pivoted post A, the two parallel arms B, the two inclined braces C, the windlass D, the windlass rope or chain E, the pivoted lever F and the weight-rope or chain G, with each other in substantially the manner herein shown and described.

168,873. Carpet-Linings. G. W. Chipman, Boston, Mass. [Filed June 24, 1875.]

In a carpet-lining, the combination of the sheets of paper *a f* and the interior fibrous sheet *d*, with the folded edge-connecting strip pasted at its edges on the same side, and connecting the interior faces of the sheets *a b*, substantially as set forth.

168,874. Carpet-Linings. G. W. Chipman, Boston, Mass. [Filed June 24, 1875.]



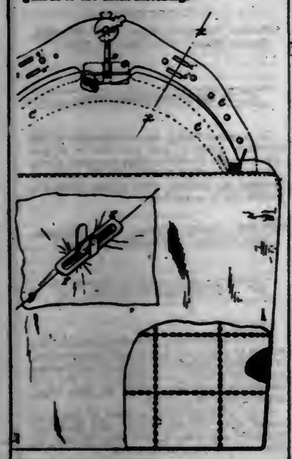
1. In a carpet-lining, the combination of two sheets of paper and an isolated fibrous sheet, with a connecting-strip, *c*, pasted at its edges on opposite sides, and applied to the two sheets, as described, to form an open edge, substantially as set forth.

2. In a carpet-lining, a sheet of paper, *b*, folded along its edge, as at *i*, and pasted or cemented to a sheet, *a*, back from its edge, to form an open edge, as set forth.

168,876. KEY-HOLE GUARDS FOR LOCKS. Henry Cochems, Easton, Pa. [Filed July 31, 1875.]

Brief.—A sliding guard-block is thrown into position to close the key-holes by means of a fulcrumed elbow-lever and a sliding and spring-acted knob-spindle and plate. The spindle is prevented from releasing the guard-block by a safety locking-plate, set by a key from the outside.

1. As an improvement in door-locks the combination of the sliding and spring-acted knob-spindle, having triangular knob-plate and projecting pin, with the fulcrumed elbow-lever, and the sliding guard-block pivoted thereto, to produce the closing and opening of key-holes by guard-block, substantially as and for the purpose set forth.



2. The combination of the elbow-lever and sliding guard-block, with the pivoted and flanged spring-pawl locking into recesses of the guard-block, to be released by the elbow-lever, substantially as described.

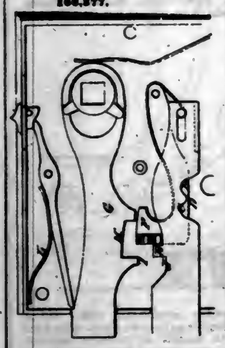
3. The combination of the guard-block and pivoted spring-pawl, with stop sliding below the same to lock guard-block rigidly from the inside, as set forth.

4. The combination of the sliding knob-plate with a sliding guard-plate, F F', and tumbler F', both operated by the armed knob and key, to lock the said guard-plate positively from the outside, substantially in the manner and for the purpose set forth.

168,876. SAFETY-POCKETS. Joseph Colton, New Orleans, La. [Filed July 10, 1875.]

Brief.—The pocket is attached to the garment by means of the plate, in connection with the slotted clasps. The rubber bloods are guards to the catch-fastening.

1. The pivoted and slotted disk B, in combination with the spring-catch D and the clasp C, substantially as herein shown and described.



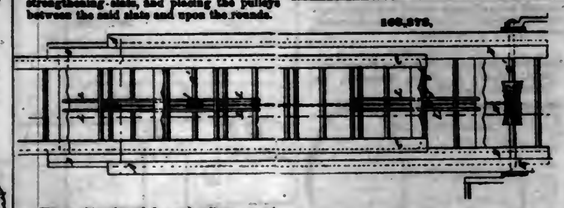
2. The hinged, slotted, and recessed plate F, in combination with the slots *c'*, formed in the outer bar of the clasp C, substantially as herein shown and described.

3. The combination of the rubber blocks G with the outer bar of the clasp C and the spring-catch D, substantially as herein shown and described.

168,877. COMBINED KNOB-LATCHES AND LOCKS. James F. Cooper, Syracuse, Ohio. [Filed Aug. 14, 1875.]

Brief.—A latch-bolt and a key-bolt and tumbler are so constructed and relatively arranged that the key-bolt is fastened by the latch-bolt and tumbler, while the entire withdrawal of the latch-bolt is prevented by the said tumbler.

168,877.



The combination of key-bolt A, having stud H and notch J, tumbler D, having projection F, and latch-bolt G, having notch H, all substantially as specified.

168,878. EXTENSION-LADDERS. William T. Core, Norfolk, Va. [Filed Aug. 6, 1875.]

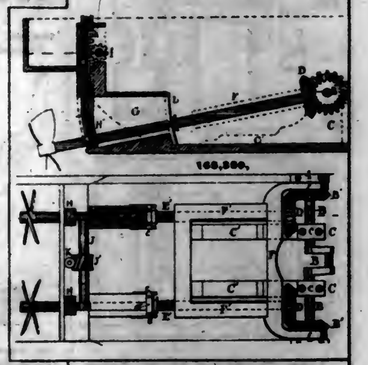
Brief.—The ordinary method of arranging the elevating-pulleys is improved upon by connecting several rounds together by parallel strengthening-slats, and placing the pulleys between the said slats and upon the rounds.

168,878.

The combination of the cord-pulleys, mounted on rounds *a'*, and the parallel bars L L, extended to the two contiguous rounds, as shown and described.

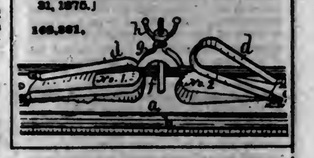
168,879. CIRCUIT-CLOSERS FOR RAILROAD-SIGNALS. Lloyd B. Dennis, Sandusky, Ohio. [Filed June 26, 1875.]

Brief.—Lever C, operated by train, forces B B apart.



The combination, with spring-clamp B B', holding together the ends of circuit-wires A A, of the lever C, adjacent spring D', rod D, and superposed spring E, all arranged substantially as and for the purpose specified.

168,880. MEANS FOR RAISING AND LOWERING PROPELLERS. Jos. W. Dilks, Washington, D. C. [Filed July 29, 1875.]



1. The combination of the vertical shaft I, endless screw-gear K J', shaft J, pinions I I, and jointed rack-bars H H', all substantially as described.

2. The combination of the frame E F F, the two propeller-shafts E' E', with their bevel-gear wheels D D pivoted to a line of the axis of striving-shafts B, and the bevel-gears B' B' on the shaft B, substantially as and for the purpose described.

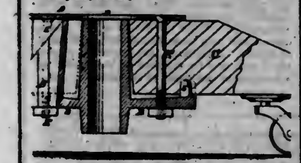
168,881. HARNESS-PAD PRESSES. William Dippert, Des Moines, Iowa. [Filed May 31, 1875.]

168,881.

In a harness-pad press, the combination of the forms 1 and 2, the hinged rims *d d*, and the screw-press *f f* A, adapted to depress and hold the rims, all substantially as and for the purpose described.

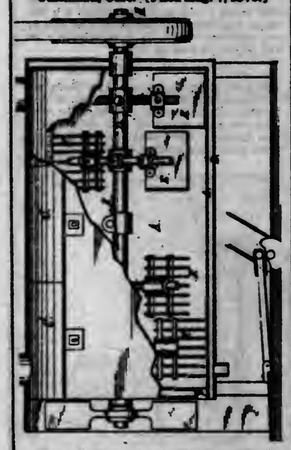
168,882. APPARATUS FOR THE MANUFACTURE OF PAPER-PULP. J. W. DEAN, West Manayunk, Pa. [Filed Aug. 26, 1875.]

Brief.—The material to be acted on is placed in a digester, through which the alkaline liquid percolates. After passing through the digester, the liquid is driven by a fan-pump through a chamber placed within a boiler, in which the liquid is heated by steam or hot water. The function of the fan-pump is simply to force the liquid which flows to it, and not to suck from the digester, thus avoiding the clogging of the filter.



168,883.

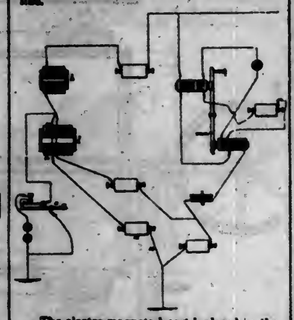
1. In combination with the digester A, the chamber B, and a coil or chamber within the same, whereby the alkaline solution, in its passage to the digester through said coil or chamber is heated by means of steam or hot water in said chamber, substantially as described.



2. The combination of the digester and the heating coil or chamber, with the intermediate fan-pump, whereby the alkaline solution is driven through the said coil or chamber without being sucked from the digester, substantially as described.

168,884. RAISES FOR REVOLVING CHAIRS. Wm. T. Devereux, New York, N. Y. [Filed July 10, 1875.]

The combination of the pivot or screw socket A, having flanged leg-sockets B, radial flanges *b'*, and studs *b'*, with the top plate D, fastening-bolts E, and legs C, substantially as and for the purpose set forth.



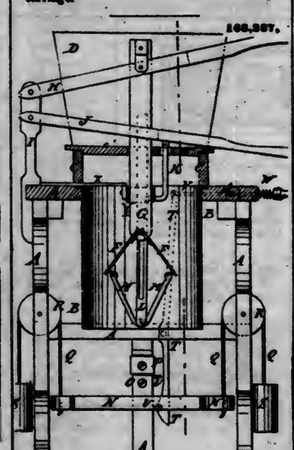
168,885. TOBACCO-DRIERS. Chas. Duval, Cincinnati, Ohio. [Filed Aug. 7, 1875.]

The cylinder A, in combination with the rotating shaft D, provided with the adjustable wings E and fork F, substantially as and for the purpose described.

168,886. DUPLEX TELEGRAPH. Thomas A. Edison, Newark, N. J. [Filed Jan. 26, 1875.]

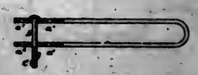
Brief.—In "bridge system" uses in the artificial line additional helix 14 and resistance 12, to more perfectly balance static discharge of line.

The electro-magnets *h* and *i*, placed in the bridge-circuit between the receiving-instrument and the line and artificial lines, respectively, in combination with the second artificial line 13 13 and the helices 14 around the cores of the electro magnet *i*, for the purposes set forth.



168,887. VEHICLE-SEATS. David Ford, Milwaukee, Wis. [Filed May 15, 1875.]

Brief.—Ends of seat hinged to fold inward, so that entire seat may be turned into body of vehicle.



A buggy-seat with hinged ends, latches I I, and pivoted supports K K, bent inward to allow the ends of the seat to swing under sufficiently to tip into the body of the buggy, and forward to permit of persons stepping into the carriage.

168,887.

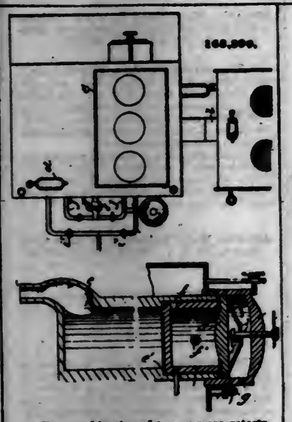
168,888. HAIR-CRIMPING PINS. M. Gardner, New York, N. Y. [Filed Mar. 20, 1875.]

A hair-crimping pin formed of the U-shaped pin A, having a number of holes, *a'*, formed in its arms, and the fastening-pin B, having a key, C, pivoted in its slotted forward end, substantially as herein shown and described.

168,889. HAND CORN PLANTERS. Orpheus C. Gilmore, Janesville, Wis. [Filed June 17, 1875.]

Brief.—The seed-cylinder is oscillated by arms connected to the vertical plungers.

The connecting-rods E E, in combination with the rods *f f* and cylinder C, for the purpose of operating the cylinder C, substantially as described, and for the purposes set forth.



168,890. GAS-MACHINES. Adonis Ginchet, Alexandria, Va. [Filed Sept. 15, 1875.]

Brief.—An ordinary stove heated by waste heat from the gas-generating stove. Under pressure in retort relieved automatically, and the escaping gas burned under retorts. Steam fed into a groove of a follower in the retorts. Double door-regulating valve over inlet of last partition. Removable support for the stove-grate. Gas-holder flexible and covered with metal, and metal with wood.

1. The combination of the main stove, having retorts, as described, with the auxiliary stove, having the flue F, as described.

2. The main stove, provided with its system of steam-pipes discharging into the groove of the retort.

3. The combination of the retort, the relief-pipe, and safety-valve with the fire-chamber, the relief-pipe being adapted to discharge into the fire-chamber when the valve is operated, as described.

168,890.

4. The combination of two or more retorts with independent relief-pipes with a main pipe and single safety-valve, substantially as described.

5. The combination of the retort, provided with a bearing-shoulder, loosened at a distance from the end of the retort, with a cylindrical follower having a solid end, adapted to slide in the mouth of the retort and bear against the shoulder, as described.

6. The combination of the retort, the follower, the cover, and the door, as described.

7. The combination of the cover, provided with the ears f', ring f'', the threaded and dished rod f', and door G, as described.

8. The combination of the cylindrical door, the loose hinges and fastening-keys, as described.

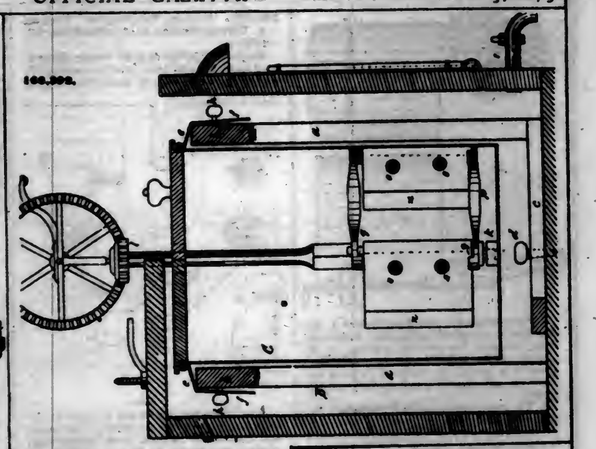
9. The entrance-pipe n of the purifier, cap n', and spring n'', in combination with the guide-rods, as shown.

10. The gasometer, consisting of a flexible bag, an intermediate metal inclosing-case, and an external protecting-case of wood, as described.

11. The threaded rod f', provided with the cross-bar, the square head for receiving a wrench, and square socket for holding a key, as described.

168,891. SUBMARINE-ALARUM. A. Gregory, Newark, N. J. [Filed Sept. 21, 1875.]

168,891.



1. A portable door-alarm, in which the following elements are combined, namely, a suspension strap or band by which the instrument may be suspended from, and operated by, the knob-knob of a door, and a bell actuated by said band, substantially as specified.

2. The combination, in a portable door-alarm, of operating mechanism with a suspension strap or band, by which the instrument is carried and operated, and a bell, actuated by said operating mechanism, essentially as described.

3. The combination, in a door-alarm, of a suspension strap or band, a drop-weight, tripped by said strap or band, and a bell, substantially as and for the purposes herein set forth.

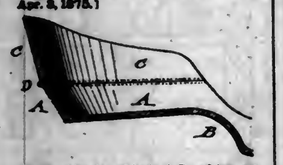
168,892. CHURNS. Asahel D. Green, Tilton, Ky. [Filed Aug. 24, 1875.]

1. The combination, with the cover casing A, of the removable choking-frame B, for supporting the box C by means of the plates c and hangers f, with shoes g, and the thumb-screws h, to admit of the ready removal of the box C, substantially as and for the purpose set forth.

168,892.

2. The damper consisting of the wings E, of unequal widths, and the arms p and shaft f, constructed to operate substantially as and for the purpose set forth.

3. The damper consisting of the wings E, and the arms p, with slots q, the upper series of arms being adjustable upon the cleats f, for the removal of the wings E, substantially as and for the purpose specified.

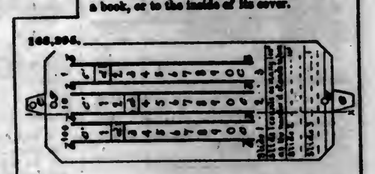


168,893. SKIDS FOR OIL-BARRELS. D. M. Haight, Oswego, Ill. [Filed May 15, 1875.]

168,893.

The oil-cask skid B, provided with a sheet-metal lining or pan, C, and a sheet-metal facing, D, upon the concaved and inclined upper edges of its end pieces, substantially as herein shown and described.

168,894. CHILDREN'S CARRIAGES. Leonard B. Harrington, Jr., Boston, Mass. [Filed Apr. 3, 1875.]

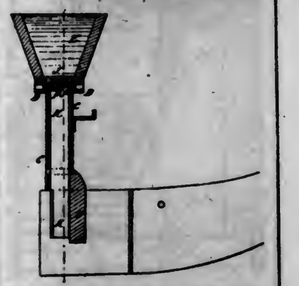


168,894.

The combination of body A B and top section C, the two secured together on their contiguous edges by an outside rib, D, as and for the purpose specified.

168,895. FARE-INDICATORS FOR ROOMS. Elbridge Harris, Boston, Mass. [Filed June 28, 1875.]

Brief.—The "number of the page" at which the reader left off is indicated by the slides in each of the three columns, by covering the numbers corresponding to those making up the page number. Thus page 231 is represented to the people at which the reader commenced. When the device is not in use, these slides may be moved above the columns of figures. By means of the projecting pieces, the device may be attached to the fly-leaf of a book, or to the inside of its cover.

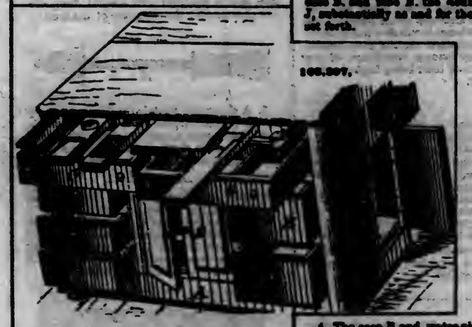


168,895.

In combination with the base a, provided with lining f and projecting pieces o o, the strips c, formed by means of parallel cuts b, and provided with slides d, substantially as and for the purpose set forth.

168,896. CORE-PLASTERS. Abia Hodgson, Humboldt, Kans. [Filed July 24, 1875.]

Brief.—The adjustable portions of the end-slide are made oval, with their ends next to the dropping-holes concaved and inclined. Over these fits a concave cut-off.



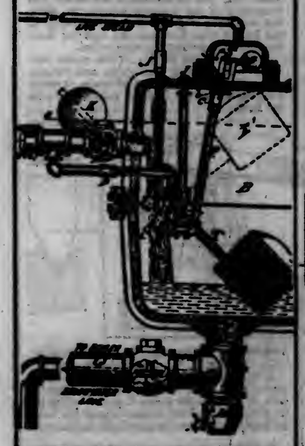
168,896.

1. The cut-off plate J, having its lower side concaved to fit upon the half-round or oval projections I of the slides F G, substantially as herein shown and described.

2. The half-round or oval projections I formed upon the upper side of the overlapping parts of the slides F G, and having their ends next the dropping-holes concaved, and their outer ends inclined, substantially as herein shown and described.

3. The four-ported valve-seat C, constructed substantially as described, in combination with the steam-outlet pipe D, inlet-pipe I, pipes H and F, and chamber S, with valve and lever O G, as and for the purposes specified.

4. In combination with the valve-seat C, case S, and pipe F, the double-seated valve J, substantially as and for the purpose herein set forth.



168,897.

168,897. KITCHEN-CABINETS. George Hoit, Minneapolis, Minn. [Filed Aug. 31, 1875.]

A combination kitchen-cabinet, constructed with a central cupboard, side and top drawers, sliding implements below the top or table, with supporting-pieces for an ironing-board, and longitudinal chambers and drawers back of the front shelves and drawers, all arranged substantially in the manner and for the purpose set forth.

168,898. FEED-WATER APPARATUS FOR STEAM-BOILERS. Wm. H. Jenkins, Philadelphia, Pa. [Filed Aug. 28, 1875.]

Brief.—When the cans is filled with steam, communication between it and the supply-pipe is opened, when the steam will be condensed in the latter and form a vacuum in both, which will raise water, open the check-valve, and fill the cans. The heat will then open the valve and admit live steam, until an equilibrium of pressure is established between the boiler and the cans. The pressure in the cans will close the check-valve in the supply-pipe, and the weight of the column of water will open the check-valve in the discharge-pipe, and the water by its own gravity flow into the boiler.

1. The combination, with the cans of the counterbalance-valve O and four-ported valve-seat C, of the pipe F, substantially as and for the purpose set forth.

2. The four-ported valve-seat C, constructed substantially as described, in combination with the steam-outlet pipe D, inlet-pipe I, pipes H and F, and chamber S, with valve and lever O G, as and for the purpose specified.

3. In combination with the valve-seat C, case S, and pipe F, the double-seated valve J, substantially as and for the purpose herein set forth.

4. The cans S and water-pipe Q, in combination with the valve I, pocket M, and valve R, constructed and arranged as and for the purpose set forth.

5. The counterbalance-valve O and ball Q, arranged on the upper part of the cans, in combination with pipe F and H, substantially as herein specified.

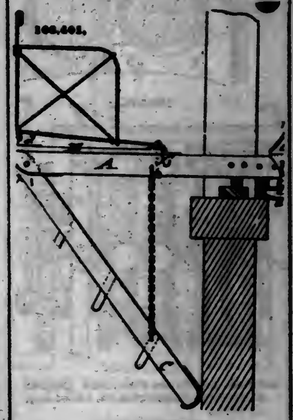
6. The four-port valve-seat C, the pipes D, F, I, H, P, check-valve A, and cans S, all combined and arranged as and for the purpose set forth.

168,899. GAS-GOVERNORS. J. H. Johnson, Brooklyn, Mich. [Filed Aug. 28, 1875.]

Brief.—The fulcrumed lever works the draw-head, and is fulcrumed by the post.

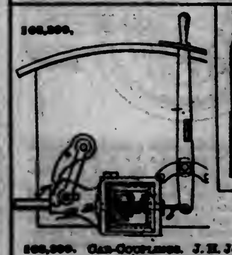
The combination, with the vertically-sweeping draw-head, of a fulcrumed slide lever actuated thereby, and hooked by a weighted post, the lever set and retained at any height for coupling, substantially as shown and specified.

168,900. SHINGLE-PLATES. Wm. M. Kelly, Nashville, Tenn. [Filed July 31, 1875.]



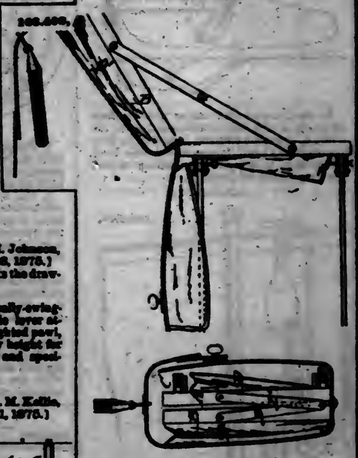
1. An adjustable shingle-plate, made of shingle lengths or dimensions, jointed by mixed overlapping edge-grooves, and held together by lengthwise covering-sleeve, lining sheets, substantially as described and shown, for the purpose set forth.

2. The locking spring-clasp, bent V shape, with turned-up end of lower part and beveled end of upper part, as and for the purpose described.



168,901. WINDOW-SCAFFOLDS. Rudolph Krueger, Jr., New York, N. Y. [Filed July 12, 1875.]

The shoe B, having bracket a and angular recess a', applied to window-frames in connection with supports A, as shown and described, to allow a lateral plane to be inserted across the window, as set forth.

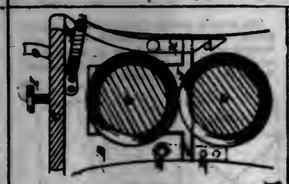


168,901.

168,902. CLOTHES-TRAVELING-RACKS AND CHAINS. Celine Lemonnier, New York, N. Y. [Filed Aug. 28, 1875.]

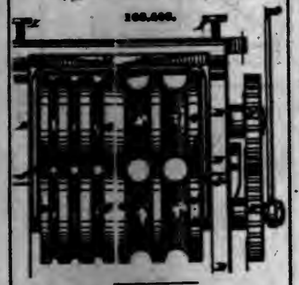
168,902.

168,902.



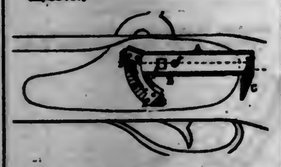
1. The hook and cord of a folding chair, being provided with a folding loop for closing same, substantially as specified.

2. The hinged hook combined with the locking-loop attached thereto for covering the folded up chair and carrying the device, substantially as specified.

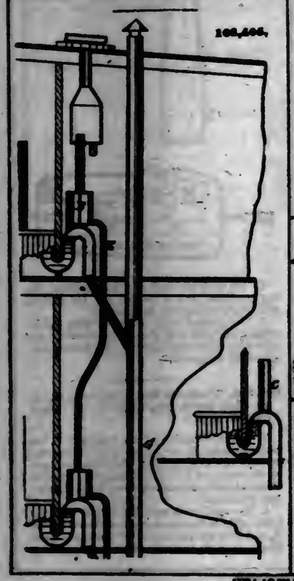


168,903. MACHINES FOR BOTTOMING LEATHER. Jos. Lewis, Prattsville, N. Y. [Filed July 31, 1875.]

1. The combination of the fingers P P, the heel stock-rod K, the eyelet-pins L, and the screws S with their heads out with the parts of the standard I to which the grooved rollers G are pivoted, substantially as herein shown and described.



2. The combination of the bars J with the lever ends of the upper parts of the standards I, and with the bearings F of the upper rollers G, substantially as herein shown and described.

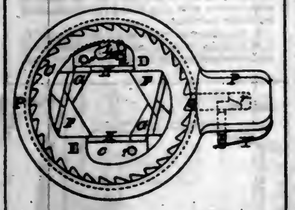


168,404.

168,404. Shuttle for Fire-Arms. Dimitrio M. Mortimer, Philadelphia, Pa. [Filed Aug. 12, 1875.]

In combination with side or vertical plane of the stock of a rifle or other small arms, the plate A, provided with the ledge D, bifurcated sights B C, and the graduated scale R, all constructed to operate substantially as and for the purpose set forth.

168,405.



168,406. Water-Trap Supplies and Connections. John H. Morrell, New York, N. Y. [Filed Sept. 22, 1875.]

Brief.—A reservoir divided by a partition, and connected by a pipe with the eave-trough or roof of the building, is located on the rise of each trap. A part of the water will flow directly into the first trap and a part into the reservoir, from whence it will flow into a reservoir similarly arranged on the trap below. The arrangement insures ventilation of the traps, and admits of their being kept charged with fresh water.

1. The combination, with the water-trap and a pipe receiving water from the roof, of a reservoir or chamber, having a partition, B, an opening, D, for the trap-supply, and a pipe, F, communicating with the lower traps, as and for the purposes described.

2. The combination, with a water-trap, of a pipe receiving water from the roof, and attached to the upper bend or rise of the trap in the middle, so as to deliver part of its water into the trap, and part into the outlet-pipe, and yet preserve a perfect ventilation, substantially as described.

168,406. Ratchet-Wrenches. Franklin S. Otey, Washington, D. C., assignor to Mussell and Walton Brothers, New York city. [Filed Aug. 4, 1875.]

1. The guiding-plates A and B, constructed with the projections *a b c d*, the parallel grooves *e e e e*, and the holes *n*, substantially as and for the purpose described.

2. The sliding jaws F and G, constructed substantially as described, and having dovetailed projections thereon, which engage with the dovetailed grooves formed in the projections of the guiding-plates, substantially as and for the purpose set forth.

3. The check-pawl I, constructed and arranged as described, in combination with the ratchet-wheel C, provided with teeth on a portion of its inner edge, substantially as and for the purpose described.

4. The readjusting-bars H and K, in combination with the floating-lugs D and E, and sliding jaws G G and F F, whereby the sliding jaws are restored to their normal positions when the movement of the ratchet-wheel is reversed, substantially as described.

168,406.

168,410.

5. In combination with the ratchet-wheel C, the pawl G, having a jog at its rear end, and the spring-catch X, substantially in the manner and for the purpose set forth.

6. The combination of the holder F, guiding-plates A and B, having the projections *a b c d*, ratchet-wheel C, having the floating-lugs D and E, and interior teeth, sliding jaws F F and G G, readjusting-bars H K, check-pawl I, operating-pawl G, and spring-stop X, the several parts being constructed and arranged substantially as described, and for the purpose set forth.

168,407. Marking Implements. J. O'Kane, New York, N. Y. [Filed July 26, 1875.]

Brief.—To the handle is attached a shank of iron or other metal, which is connected by a socket to the tip, which is of a flexible nature, and is provided with several deep, narrow channels for the reception of the fluid.

1. A channeled flexible tip, C, substantially as and for the purpose set forth.

2. The handle A, with its shank B, in combination with a channeled flexible tip, C, substantially as and for the purpose set forth.

168,408. Annealing-Boxes. G. H. Cuisine, Pittsburg, Pa. [Filed Jan. 13, 1875.]

Brief.—Longed rings of wrought metal embedded in the cast bottoms of the box, in order to strengthen the box against expansion and contraction under heat, and yet to permit it to be readily broken up for removing.

In annealing-boxes, the combination of the wrought-iron rings D D D with the cast bottom A, whereby the longitudinal and lateral strength of the bottom is materially increased and its vertical strength diminished, substantially as and for the purposes herein before set forth.

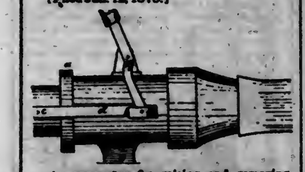
168,409. Dredge Attachments for Dredgers. George W. Parsons, Salisbury, Md. [Filed Aug. 21, 1875.]

Brief.—A dipping attachment consisting of an adjustable chute supported on cross-pieces having pivot-pins and rounded ends, with screw-bolts passing through guide-standards, to allow the chute to conform to the cutting of the lighter's upon which it is supported. The hopper is provided with a main water-pipe and branch-pipes, for discharging jets of water through perforations in the bottom, to facilitate the movement of the dredged mass.

1. The combination of the chute-supporting cross-pieces, having pivot-pins and rounded ends, with the adjustable screw-bolts and cross-pins of the guide-standards, to allow the oscillation of the chute on the setting of the lighter when dumping the material from the dipper, substantially as specified.

2. The inclined hopper of the chute, provided with a main water-pipe and branch pipes, for discharging jets of water through perforations of the bottom, substantially as set forth.

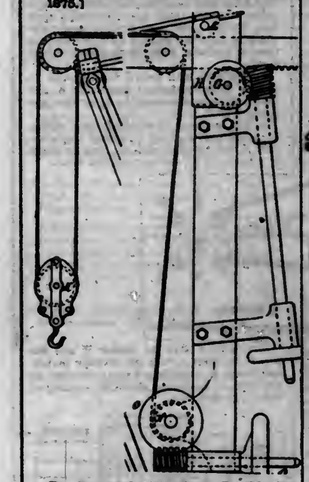
168,409.



168,410.

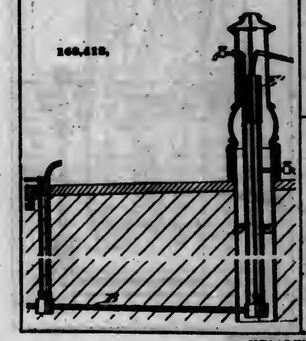
168,410. Chimney Stays. John Franck, Jr., Albany, N. Y. [Filed Mar. 2, 1875.]

Brief.—The cross-head of a barrel has two or more steps, channels, or grooves cut in each of its sides, for giving a greater width at its mouth, to receive a thicker edge of the barrel-head, and render the joint tight and strong.



In a barrel, the cross-headed B, having two or more steps, channels, or grooves, *a a*, or *c c*, and *c*, cut in each of its sides substantially as and for the purpose set forth.

168,411. Pumps for Raising Heavy Liquids. Edward L. Petty, Ridgewood, N. J. [Filed Jan. 12, 1875.]



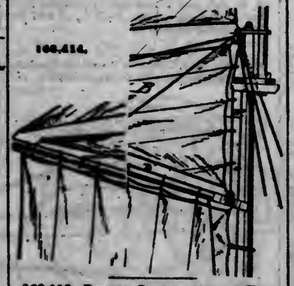
An apparatus for raising and removing heavy liquids, consisting of the pump constructed substantially as shown and described, and provided at its end with the externally-tapering supplemental cylinder H, for attaching the elastic tube L, and the charging-chamber J, having inlet-opening h, flange k, and inwardly-opening valve *j*, and outlet-opening *i*, the whole constructed to operate as specified.

168,412. Cranes. Francis A. Pratt, Hartford, Conn., assignor to the Pratt & Whitney Company, same place. [Filed Mar. 10, 1875.]

The horizontal sliding beam F, with the roller-bearings D and E, and a rack and pinion mechanism for moving it outward and inward beyond the fixed frame, in combination with the standing and fixed parts of a crane, substantially as herein described.

168,412.

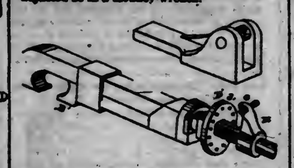
168,413. Hydrants. Christian F. Rapp, Cincinnati, Ohio. [Filed Aug. 28, 1875.]



Brief.—Combines a service-pipe and washpave pipe, and three-way cock at the junction of the same, and the same service-pipe extended, and two hydrant-pipes and three-way cock at the junction of the latter three, and a pump connected with one of the hydrant-pipes, in such a manner that by properly manipulating the cocks the standing water in the discharge-pipes may be forced out by the pump.

As an improvement in hydrants for preventing the freezing up in winter, the combination of supply-pipe B with a three-way cock, C, and exit-pipe B', and with a second three-way cock, D, and leasing-pipe B', pump connecting-pipe E, and pump E', the whole arranged to admit of the forcing out of the water from the pipes exposed to freezing, substantially as and for the purpose set forth.

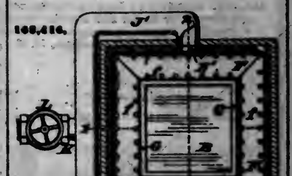
168,414. Means for Reefing and Furling Sails. Edward Rawley, North Union, Me. [Filed Aug. 21, 1875.]



The combination of rope E with mainsail-gaff D and triangular sail B, all arranged as shown and described, whereby it performs the function of a halyard and stay, as set forth.

168,414.

168,415. Pitman-Connections for Harvesting. Amor Rea, Bart Township, Lancaster County, Pa. [Filed June 10, 1875.]



Brief.—The bearing in which the shaft of the connecting-pitman is in work is formed of the semicircularly-recessed jaws of two bars, adjusted as in a monkey-wrench.

1. The combination of the hooked pitman A, provided with a grooved screw-thread, I, tapers *c*, and sliding jaw or counterpart B, flanged and grooved feed-nut D, and working device E, the whole constructed and operated substantially as and for the purpose specified.

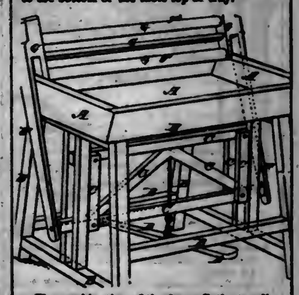
2. In combination with said pitman A and nut D, with its perforated flange *d*, the sliding nut-lock E, with its slotted projecting pin *e*, the whole substantially as and for the purpose described.

168,416.

168,416. Ore-Separator. C. W. Reilly, Cincinnati, Ohio. [Filed July 24, 1875.]

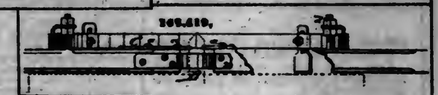
Brief.—Ore is fed into a receptacle through which flows an upward current of water. In the bottom of the receptacle is placed a movable screen provided with handles. When the charge of ore is sufficiently washed, it is removed by lifting out the screen with its superincumbent load.

168,417. Tobacco-Bucket Lids. Isaac M. Reynolds, Cincinnati, Ohio. [Filed Mar. 17, 1875.]



Brief.—The lid is made of tin, and is concave upon its under side, and even with its flanges is a removable screen for holding a wet sponge in the lid.

As a new article of manufacture, a bucket-lid having in its under side a chamber, B, situated above the plane of flange or lip *a*, and provided with the removable flat reticulated screen C, substantially as and for the purpose set forth.



168,418. Butter-Workers. P. Rooney, Fairfield, Vt. [Filed June 10, 1875.]

Brief.—A table with upward flanges. A traversing transverse bar to press the surface butter, carried by arms pivoted centrally to the ends of a sliding frame, moved downward by a treadle, and resting by a spring attached to the bottom of the table-top or tray.

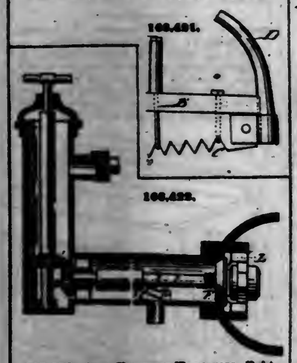
The combination of the frame C, the treadle D, the spring E, the pivoted bars F, and the frame G with the tray A and frame B, substantially as herein shown and described.

168,419.

168,419. Millstone-Seats. James Orr, St. Louis, Mo. [Filed July 31, 1875.]

The iron hoop provided with four adjustable cutting-points, arranged as shown and described, to support the traversing level when marking high places on surface of burr.

168,480. Method of Uniting the Soles and Uppers of Boots and Shoes. Geo. V. Sheffield, New York, assignor to himself and Martin Bennett, Brooklyn, N. Y. [Filed June 8, 1875.]



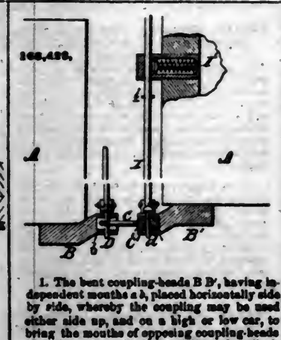
The improvement in the art of uniting the soles and uppers of boots and shoes, consisting in passing a doubled wire through the seam, inserting a thread through the loop of the wire on the under side of the sole, and drawing the thread through the leather by means of said wire, substantially as hereinbefore set forth.

168,481. Crosscut-Saw Handles. Lewis Shepard, Mace, Ind., assignor to himself and D. W. Kennedy, same place. [Filed July 24, 1875.]

Brief.—The saw is attached to a main handle, curved forwardly over it, and it is provided with a slotted stiffening back piece, secured to the blade by hooked rods and screw-nuts, and having an auxiliary handle in front of the main handle.

The combination, with crosscut-saw A, of back piece B C, and handles D E, arranged substantially as and for the purpose specified.

168,482. Anti-Friction Eyebolts. Robt. Smeaton, Milwaukee, Wis. [Filed July 15, 1875.]

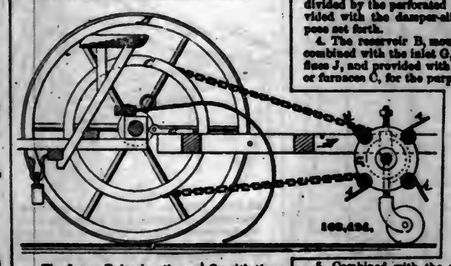


Brief.—The waste-valve is operated by a chain attached to the shaft of the main valve.

Valve H, operated by chain I, in combination with valve-shaft E and valve F, provided with stops L and caps G.

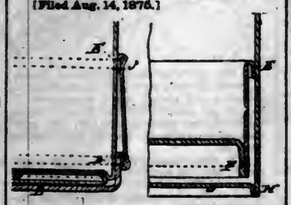
168,483. Car-Couplings. Oliver C. Smith, Rumsey, Ill. [Filed July 1, 1875.]

Brief.—The friction-rod guides the bolt which fastens the shanked link riding in the crushed draw-head.



1. The bent coupling-heads B B', having independent mouths *a b*, placed horizontally side by side, whereby the coupling may be used either side up, and on a high or low car, to bring the mouths of opposing coupling-heads on the same line, all substantially as described.

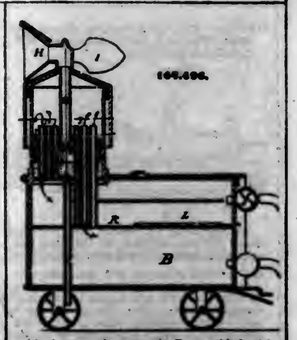
2. The car-coupler composed of bent heads B B', *a b*, shanked links O O', and four pins, D D' *d d*, all substantially as and for the purposes set forth.



3. In combination with the coupling-heads B B' and pins D, the rod I, provided with the stops *f* and friction-guide F, as and for the purposes described.

168,484. Hat-Tenders. Edwd. M. Stockal, Uniontown, Pa. [Filed Oct. 8, 1874.]

The frame E, having the rod G, with tines *h*, operated as described, said frame being made attachable at its forward end to the side of a horse-rake or other truck by means of the plates *e*, pivot-bolts *d*, and pin *o'*, so as to move freely in a vertical direction, and be readily detachable, substantially as set forth.

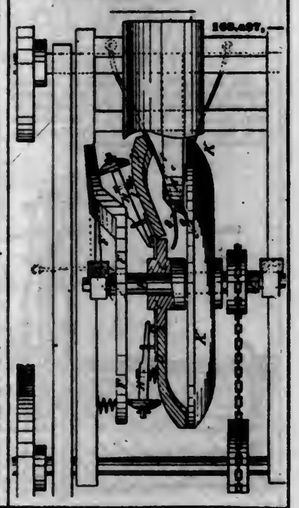


168,485. Manufacture of Mail-Bags. Henry Stephens, Brooklyn, E. D., N. Y. [Filed Aug. 14, 1876.]

The method of bottoming mail-bags, consisting in first sewing the shield C to the outside with a seam, E, next turning the bag inside out and folding the shield down, then sewing in the leather bottom with seam F, and finally sewing in the canvas bottom by a seam, H, as and for the purpose described.

168,486. Apparatus for Warming and Ventilating Railroad-Cars. Jas. Story, Washington, D. C. [Filed Sept. 17, 1875.]

Brief.—Air is admitted to the heating-chamber through the spray or washing chamber. It can be delivered to the cars from either or both of the compartments of the furnace-car. Each car is warmed or ventilated by independent pipes.



1. A warm-air reservoir, B, provided with several outlets, combined with the carriages of a railway-train, each provided with separate pipes for its own supply, and to convey air to the carriages in the rear.

2. Combined with the separate delivery-flues a warm-air reservoir, B, divided by a partition, in which there are controllable openings, for the purpose of simultaneously discharging air of the same or different temperatures or qualities from the separate compartments.

3. Combined with flues J the reservoir B, divided by the perforated diaphragm K, provided with the damper-slide L, for the purpose set forth.

4. The reservoir B, mounted upon wheels, combined with the inlet G, washer F, diving-flues J, and provided with the heating-stoves or furnaces C, for the purposes set forth.

5. Combined with the washer F and the pipe G the plate *g*, with its drooping peripheral flange to constitute a spray-chamber, as set forth, to insure the thorough washing of the air, as described.

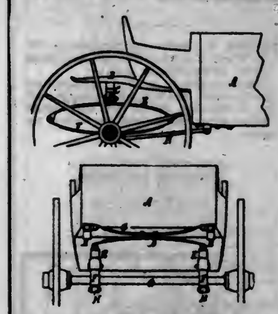
168,487. Seedlings-Pulleys. John S. Gramley, Marengo, Iowa. [Filed July 17, 1875.]

Brief.—A fixed wheel upon a revolving shaft forms a counterpart to a series of jaws, which are caused to open and close by cam-wheels, to seize and hold the seedlings, raise them from the earth, and deposit them in a receptacle.

The fixed wheel E, in combination with the shaft B, the polygonal hub C, and the hinged jaws D, substantially as herein shown and described.

168,488. Hair-Brushes. Chas. B. Tuttle, New York, N. Y. [Filed Aug. 24, 1875.]

Brief.—The back of the brush is hollow, and has a suitable cover; the handle is also hollow, and has at its end a removable cap. The brush is capable of holding a shaving set or other toilet article.

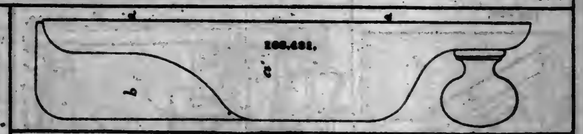


As a new article of manufacture, a hair-brush the back of which is constructed with the chambered recess B, provided with a detachable lid, A', and the mirror *a*, and with the hollow handle B, provided with a cap, *b*, as and for the purpose specified.

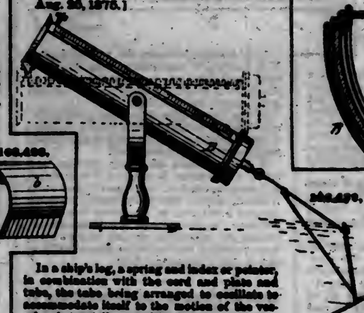
168,489. Watch-Regulators. Charles Tuska, Saratoga Springs, N. Y. [Filed Aug. 30, 1875.]

In combination with the regulator-arm and bended lever turning in fixed bearings, the traversing-cam C, connected with the latter by the elastic collar-shaped sleeve C', substantially as set forth.

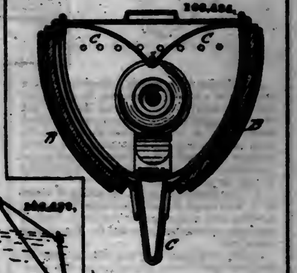
168,490. Carriages. Chauncey Thomas, Boston, Mass. [Filed May 11, 1875.]



1. The combination of the springs C D, arranged as described, with the hangers B B, applied to the carriage-body A, and also with the main springs E E F F, arranged together and with the axle, all substantially as specified.



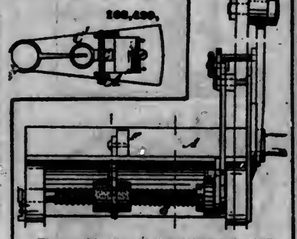
2. The connection-rods H H, pivoted to the body A, in combination therewith and with the axle C, and the longitudinal and transverse springs E E, F F, and D, applied to it, and the hangers, all substantially as specified.



168,491. Bench-Planes. Justus A. Trent and Henry Blakeslee, New Britain, Conn. [Filed June 15, 1876.]

The combination of the wrought-metal stock or shell *a*, having two broad and strong sides, *a' a'*, with a suitable filling, *b*, substantially in the manner and for the purposes set forth.

168,492. Sheep's Logs. Stephen D. Trenchard, New York, N. Y., assignor to himself and Walton Brothers, same place. [Filed Aug. 30, 1875.]



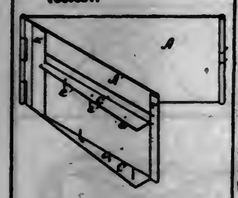
In a ship's log, a spring and index or pointer, in combination with the cord and plate and tube, the tube being arranged to oscillate to accommodate itself to the motion of the vessel, substantially as and for the purpose herein specified.

168,493. Shaving-Brush Shavers. Caleb B. Turner, Brooklyn, N. Y. [Filed Aug. 28, 1875.]

The combination of the swinging knife B, bar A, pusher F, feed-cover G, and the cam L and pawl mechanism for working the screw, substantially in the manner described.

168,494. Spiral Head-Linings for Vessels. Wm. M. Walton and J. J. Walton, New York, N. Y. [Filed Aug. 25, 1875.]

Brief.—A vessel approaching directly toward the point from which it is seen shows both lights; but when running in a direction to pass on either side, only one of the lights is visible, the other being hid by the projecting guard. Two colors are employed to indicate on which side the vessel will pass.



1. In a signal head-light for vessels, the combination of two differently-colored lenses, with a single lamp or light, and a central guard projecting from between the two lenses, substantially as and for the purposes herein set forth.

2. In a head-light for vessels, the double concave reflector C, forming a center point, *c*, in combination, with the two differently-colored lenses D E, for the purposes herein set forth.

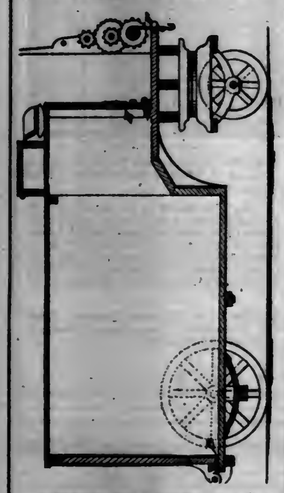
An ice-breaking vessel having a sharp cutting-prow, B, some distance back of the stem-post, and a front bow portion, having sharp upwardly-inclined bow D, as and for the purpose described.

168,497. Camera-Phototypes. D. A. Wells, Medina, Ohio, assignor to J. A. Bradley, same place. [Filed Mar. 15, 1875.]

No. 168,427.

1. A device for protecting the cut or broken surfaces of a cheese, consisting in an implement constructed to be inserted into the cut or broken opening of the cheese, and provided with wings A A', of a form to exclude air from said exposed cut or broken surfaces, and adapted to be held and retained in proper juxtaposition to said exposed surfaces, substantially as and for the purposes shown.

2. The cheese-protector, consisting of wings A A' and hinge B, and a suitable device for holding said wings against the cut or broken surfaces, substantially as and for the purpose described.



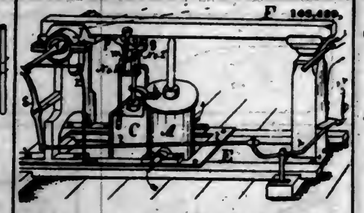
3. The combination of the wing A', having the fixed jaw C with points c, and the movable jaw C' with points c', the last-named jaw sliding in the ways d' formed on the wing A', substantially as and for the purpose described.

4. The combination, with the wing A', of the jaw C and points c, substantially as and for the purpose described.

5. The combination, with the wing A', of the jaw C and adjustable jaw C', substantially as and for the purpose described.

6. The combination, with the movable wing A, of a catch, e, whereby the said wing can be readily adjusted to a fresh cut surface, or readily detached to admit of cutting away more of the cheese, substantially as and for the purpose described.

No. 168,428. Dead-Cart. Thomas F. White, New York, N. Y. [Filed June 12, 1875.]

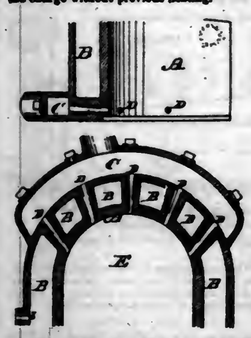


A dead-cart whose air-tight body is provided with front an wall an back door, as and for the purpose specified.

No. 168,429. Sugar-Harvester. Stephen D. Wilson, Des Moines, Iowa, assignor of one-half his right to William Seaks, same place. [Filed Mar. 6, 1875.]

Brief.—The throw of the valve is adjusted by a wedge, which is connected by rods through the hollow trunnion with the treadle.

No. 168,429.



1. In a steam-hammer, the pivoted L-shes Nos. 1 and 2, in combination with the valve-stem c and the hook m and cam g carried by the beam F, substantially as and for the purposes shown and described.

2. The combination of the cam g, rod p, pivoted lever n, spring r, crank-lever s, pitman t t, and treadle x x, substantially as and for the purposes shown and described.

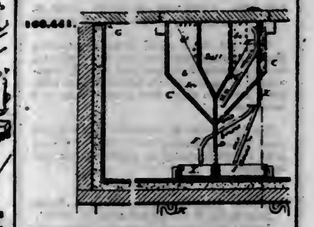
3. The combined oscillating cylinder and crank A C, having cross-ports Nos. 1 and 2, and carrying-latches Nos. 1' and 2', and valve D having slotted stem c, the beam F carrying the cam g and hook m, the hollow trunnions j inclosing the pivoted lever n, and the cam-adjusting and governing devices m p n o r t s, when arranged and combined substantially as and for the purposes set forth.

No. 168,430. Furnaces for Smelting Lead. J. V. Woodhouse, Bunker Hill, Ill. [Filed June 7, 1875.]

Brief.—The semicircular wall is hollow, to allow air to pass through and cool it. The blast passes from the blast-box, encircling the wall through tuyeres, the latter directly into the charge without previous heating.

1. The semicircular wall A, provided with the air-chamber B, the chamber C, tuyeres D D D D D, arranged as described, and hearth E, substantially as described.

2. The hearth E, provided with the semicircular wall A, as and for the purpose set forth.



3. The hearth E, provided with the semicircular wall and the tuyeres D D D D D, arranged as described, as and for the purpose set forth.

No. 168,431. Refrigerators. L. B. Woolfolk, Lexington, Ky. [Filed July 10, 1875.]

Brief.—Ice fed down through the recesses in the sides of the salt-holder. Partition at bottom of salt-holder keeps ice from passing from one side to the other, that the food-chambers may be kept at differing temperatures. Brine overflows through the air-inlet tubes. Air which has entered, on being warmed, rises and passes through outlets near the tops of the food-chambers. Doors shown on the top; they may be in the sides.

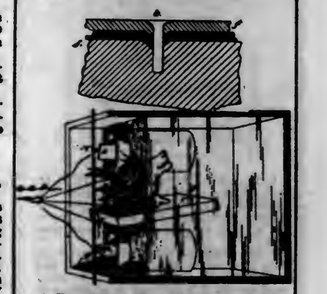
1. The combination of the refrigerator-box A, compartments 1 and 2, refrigerating-vessel C, salt-compartment a, ice-compartment b, recesses b', partition c, air-tube E, air-tubes F F', air-outlets G G, partition D, waste-pipe H, water-boxes I I', and escape-pipes K K', substantially as described.

No. 168,431.

2. The combination, with the refrigerator-box A, of the refrigerating vessel C, (containing salt-compartment a and ice-compartment b,) and having partition-flange D, and extending across the refrigerator-box at or near the center, for the purpose of dividing it into two compartments, 1 and 2, substantially as and for the purposes described.

3. The combination, with the refrigerating-vessel C, of the salt-compartment a, longitudinally in the middle, and extending from end to end of vessel C, for the purpose of exposing the largest refrigerating-surface of the ice-compartment, substantially as set forth.

4. The combination of the salt-compartment a, having recesses b' b', and ice-compartment b, for the purpose of supplying ice to the refrigerating-vessel, substantially as set forth.



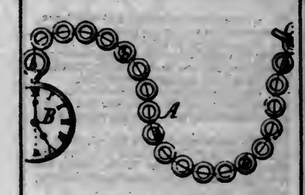
5. The partition c, in combination with the refrigerating-vessel C, having the salt-compartment a and the ice-compartment b, the refrigerator-box A having compartments 1 2, for the purpose of preventing the ice placed on one side of the salt-compartment from passing to the other, and thus securing a different temperature in the compartments 1 2, substantially as set forth.

6. The combination of the air-tube E, air-tubes F F', and air-outlets G G, with the refrigerating-vessel C, having salt-compartment a and ice-compartment b, and the refrigerator-box A, having compartments 1 and 2, in the manner and for the purpose set forth.

7. The combination, with the refrigerator-box A, refrigerating-vessel C, having salt-compartment a and ice-compartment b of the waste-pipe H, tube E, tubes F F', water-boxes I, and waste-pipes K, in the manner and for the purpose set forth.

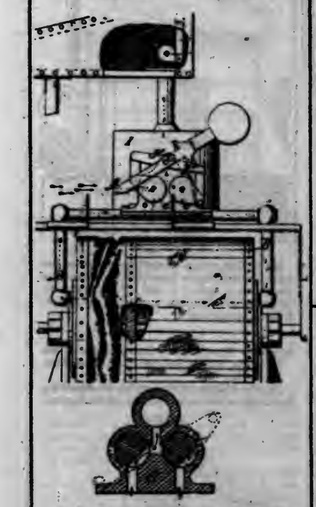
No. 168,432. Electroplated Figures, &c. W. B. Wortham and R. S. Gillespie, New York, N. Y. [Filed Feb. 19, 1875.]

Brief.—A piece of metal is driven into the figure to be covered with the electrotype-shell, and is afterward cut off close and riveted. Cathode-wires pass through the body of the figure.



1. The plugs or rivets b b, arrangement to secure an adhesion or soldering of the electroplating to the same, in combination with the electrotype-shell f and body A, as and for purposes specified.

2. The cathode-wires b b, extending through the body A, to both increase the conduction of electricity and strength of the figure, in combination with the electrotype-shell f and said body A, as specified.



No. 168,433. Manufacture of Sugar Toy Watches and Chains. George Arend, Brooklyn, N. Y. [Filed Sept. 17, 1875.]

Brief.—The parts are produced by means of roller-dies, and the cord or wire is fed in between these dies, together with the sugar, so that all the parts, on passing out of the dies, will be cemented by said cord or wire.

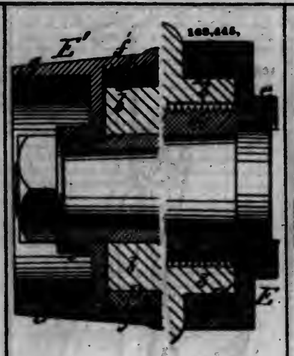
As a new article of manufacture, a sugar-toy composed of a watch, B, a chain, A, and a retaining-bar, C, all the parts being connected by a cord or wire, b, substantially as shown and described.

No. 168,434. Gas-Regulators. Jos. H. Bean, Cincinnati, Ohio. [Filed July 21, 1875.]

1. The combination of a pump, A, and governor, having the elastic top and rotary valve, controlling the inlet-opening, as described.

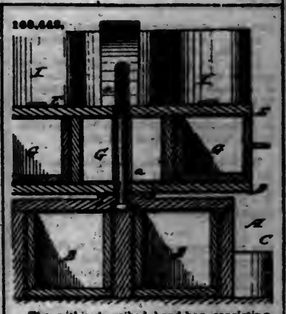
2. The combination of the pump, the valves, the compression-chamber, and the governor, as described.

3. The combination of the compression-chamber I and the valve J with its connections, adapted to control the movement of the motor, as described.



No. 168,435. Hubs. Levi N. Bowley, Corning, N. Y. [Filed July 8, 1875.]

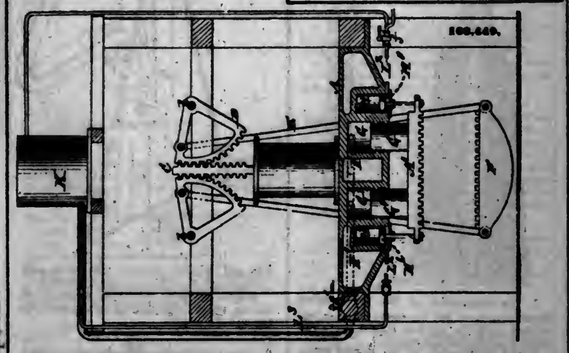
Brief.—There are two screw-threaded necks, one of which is on the head, to which the caps are fastened.



1. The cap E', having screw-threaded necks f f', in combination with the wooden hub C, having screw-threaded band D and the axle-box B, having screw-threaded end e, substantially as and for the purpose set forth.

2. The caps E E', having screw-threaded necks e f f f', the wooden hub C, having screw-threaded bands D D', and the axle-box B, having screw-threaded ends e e, substantially as and for the purpose set forth.

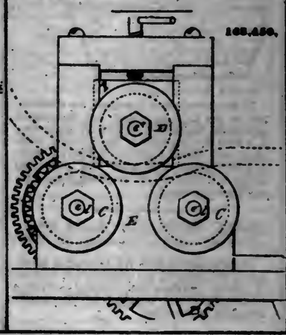
No. 168,435.



No. 168,436.

The within-described hand-box, consisting of the base A, with drawers B and side receptacles C, and the rotating top D E, with drawers G, corner receptacles H, and top boxes I, all substantially as and for the purposes herein set forth.

No. 168,439.

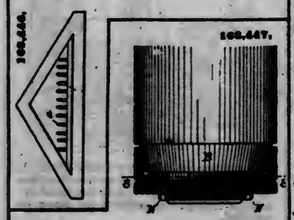


No. 168,439. Lever-Presses. A. Cameron, Charleston, S. C. [Filed July 24, 1875.]

Brief.—In a press in which is used a compound bed or platen made adjustable by hydraulic means, a combination of supplementary cylinders and pistons with the fixed bed-plate of the press, and a movable plate for operation in connection with the follower and working reservoir of the press.

1. The combination of the supplementary cylinders or chambers H H and their pistons H' H' with the fixed bed-plate A and the movable plate A', for operation in relation with the follower F and reservoir K, essentially as described.

2. The combination, with an adjustable pressing-plate, of one or more pistons, H', and cylinders H, for controlling said plate, substantially as specified.



No. 168,439.

No. 168,440. Reed-Guards for Buildings. H. T. Blodgett, Boston, Mass., assignor to himself and C. W. Holden, same place. [Filed July 14, 1875.]

Pins or projections a, located and applied to the façade of a building, all substantially as described, and for the purpose specified.

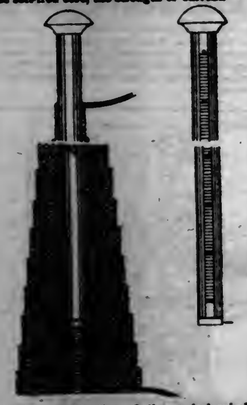
No. 168,440.

No. 168,447.

No. 168,447. Projectiles for Ordnance. J. G. Butler, New York, N. Y. [Filed Sept. 20, 1875.]

The combination of a projectile having a polygonal shoulder, O, at the base and a screw-thread extension, T, with a sabot, S, which is corresponding to fit the polygonal shoulder O, and retained in position by a nut, M, substantially as and for the purpose hereinbefore set forth.

No. 168,448. Sample-Boxes. Marshal K. Butterfield and Alfred D. Holliday, Redwood Falls, Minn. [Filed Aug. 16, 1875.]



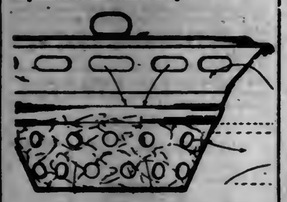
168,450. Machinery for Bending Bars of Metal. Andrew H. Campbell, Philadelphia, Pa. [Filed June 26, 1875.]

Brief.—The rolls are each formed of three eccentric disks, clamped together on the end of the shaft projecting outside the bearings by a nut, the upper one being adjustable vertically; and the system of gearing is such as to communicate a slow movement to the rolls from a rapidly-moving driving-pinion.

In a bending-machine, the combination, with the stationary flanged rolls C C, and the adjustable flanged roll D, of the gear-wheels E F *f f g* and pinions *f e*, constructed and arranged to operate substantially as specified.

168,451. Induction-Coils. J. B. Chidlett, Plymouth, England. [Filed July 14, 1875.]

Brief.—For regulating, in conjunction with the soft-iron core, the strength of current.

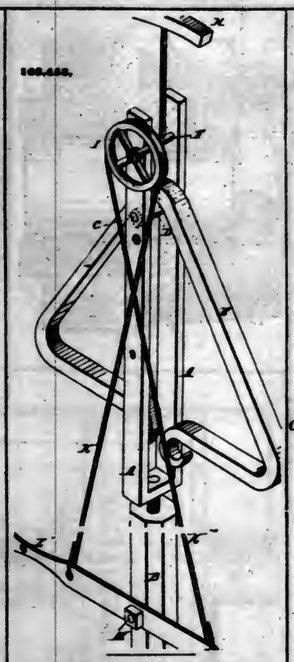


1. The combination of the central spiral electro-magnetic coil D, constructed as described, with the soft-iron core E, substantially as described and shown.

2. The combination of the central spiral electro-magnetic coil D, constructed as described, with the soft-iron core E and the graduated scale, substantially as described and shown.

168,452. Stoves. Rushmore Chubb, Galion, Ohio. [Filed May 3, 1875.]

Brief.—The rib rests upon the top plate of the stove. It prevents injury thereto by the expansion of the central fire-pot.



In the stove herein described, the combination of the tapering vessel and the central peripheral flange or shoulder, for supporting it within the pot-hole of an ordinary cook-stove, said vessel being provided with draft-openings above and below said peripheral flange, substantially as described, for the object herein specified.

168,453. Bell-Hangings. Giles H. Collins, Kalamazoo, Mich. [Filed Sept. 20, 1875.]

In combination with the bifurcated stand-ard A and gong B, the rock-shaft F, lever H, pulley I, cords or chains K, and oscillating lever L, the whole arranged to operate substantially as described.

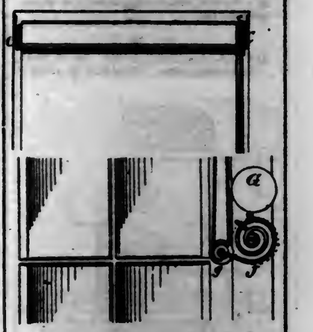
168,454. Earth-Augers. Wm. B. Coman, Oak Park, Ill. [Filed Aug. 26, 1875.]

Brief.—The loose point forms a valve to admit air, which is operated by a rod passing up through the shank.

In combination with the hollow shank A and loose point D, arranged as described, the spring G and adjusting-rod F, the latter extending through the cavity in the shank, as specified.

168,455. Compounding of Fabrics. Jas. B. Cook and James W. Heath, Memphis, Tenn. [Filed Sept. 14, 1875.]

Brief.—The coils are set on hollow columns, which inclose and conceal the gas, water, and drain pipes, and a secure basement for exercise in these offices. A hoisting-gearway supplies the communication with the structure of coils, which can be interrupted at pleasure. The coil-doors project diagonally from the walls, cutting off communication between the prisoners. The jamb also projects diagonally, and is perforated, and is closed at night by an outer door.



1. A structure of coils set on hollow columns, substantially as and for the purposes set forth.

2. The swinging or hinged gangway 10, employed in combination with an inner structure of coils and an outer main building, substantially as and for the purposes set forth.

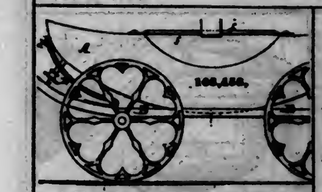
3. The construction of coil-doors with perforated jambs projecting from the face of the wall, substantially as and for the purposes set forth.

4. The combination, with the coil-door 15 and projecting perforated jamb 14, of the supplemental door or shutter 12, for closing the openings in the said perforated jamb when required.

168,456. Curtain-Fixtures. G. W. Covey, New York, N. Y. [Filed July 24, 1875.]

As a new article of manufacture, the certain fixture herein described, consisting of the pulley *g*, spring J, and pivoted guard C, provided with a flange on part of its circumference, as specified.

168,457. Photograph-Burnishers. John Ormsbee, Rhinebeck, N. Y. [Filed Aug. 14, 1875.]

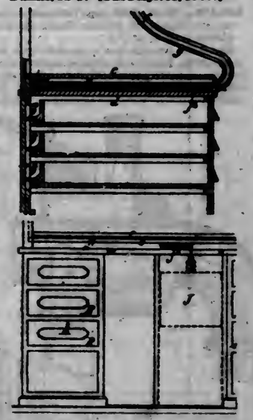


Brief.—Relates to the devices for adjusting the height of the lower roll and the heat-apron.

1. In combination with the lower roll of a photograph-burnisher, the adjustable flanged heat-apron and the adjusting-lever, substantially as specified.

2. A photograph-burnisher having the upper large roughened roll B, the lower adjustable and smaller, polished steel roll F, having, respectively, large and small gears engaged to rotate in the same direction, the flanged heat-apron H, the compressing-lever M, and its screw V, substantially as specified.

168,458. Children's Garments. James A. Grandall, Brooklyn, N. Y. [Filed May 31, 1875.]



1. The rod springs E E of a carriage-body, made each in form of an inverted letter V, both springs being applied to the supporting-frame, to straddle the carriage-body lengthwise, the arms of each spring converging at their upper ends to constitute lateral bosses, substantially as specified.

2. The combination of the A-shaped rod springs E E, with the pivoted carriage-body A, hanging on pins *f f* that extend from the springs into the carriage-body, and with the locking devices *e*, substantially as specified.

3. The carriage-body A, made with the rails *ff*, in the middle of its sides, to support the sliding carriage-top, substantially as herein shown and described.

168,459. Oyster-Dredge. Fredk. H. Outler, Buffalo, N. Y. [Filed Apr. 12, 1875.]

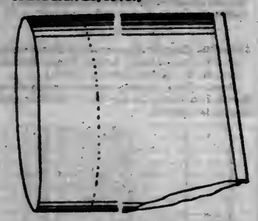
1. In combination with the transparent sides, back, and top, the flexible cover *e*, adapted to be withdrawn into a compartment, *d'*, under the bed *a*, whereby the top and back are left unobstructed, and a free access of light to the bed is permitted, substantially as and for the purposes described.

2. In combination with the drawers, provided with locks *m*, and the locking-bar *l'*, provided with clevis *n*, and a hooked hasp or eye, *o*, the flexible cover *e*, adapted to slide under the bed, or rest *a*, substantially as and for the purpose described.

3. The combination, with the sliding cover *e* and ways *f f*, of the weight J, cord and guide-pulleys *j j'*, for automatically closing the cover, substantially as hereinbefore set forth.

4. The flexible cover *e*, composed of the cloth or flexible sheet *f*, secured between slats or strips *g g*, substantially as and for the purpose hereinbefore set forth.

168,460. Spool-Holders for Gages. John D. Gates, New York, N. Y. [Filed July 1, 1875.]



1. In a spool-exhibiting case, the combination of fixed partitions in one direction and removable partitions in a direction transverse to the fixed partitions, substantially as and for the purposes herein described.

2. The combination of the drawer having the parallel fixed channels or recesses *c c*, and the rods F, arranged above and transverse to said channels or recesses.

3. The combination of the drawer having the channels or recesses *c*, the bars B, parallel therewith, and the transverse bars or rods F, the latter serving as transverse partitions, and, with the ribs *b*, forming compartments or pockets for the spools, substantially as shown and described.

4. The combination, with the drawer B, of the piano-convex or plano-prismatic glass-front H, substantially as and for the purpose shown and described.

168,461. Paper Bags. Albert H. Dunshee, Carthage, assignee of one-half his right to John D. Huntington, Watertown, N. Y. [Filed Mar. 26, 1875.]

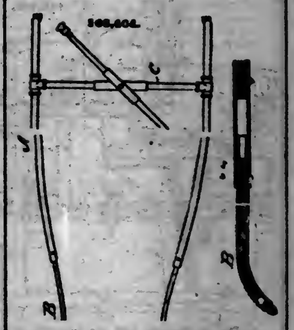
A paper parcel-bag for tradesmen's use, provided with a metallic re-enforcing strip for the bottom, as and for the purpose described.

168,462. Pumps for Deep Wells. John H. Dunk, Rapin, Ill. [Filed June 4, 1875.]

Brief.—In a short cylinder attached to the upper end of the suction-tube a flat valve with long upwardly-projecting stem works. Said stem passes through a loop in a trip-lever, which holds said stem upright, the cylinder acting also as a guide to the valve.

In combination, the cylinder D and valve S, with its stem S projecting upward through a loop in the trip-lever G, pivoted to said cylinder, whereby the lever acts as a guide for said stem, and the cylinder forms a guide for the valve S, as shown and described.

168,463. Paper-Metal Attachments for Gas-Burners. Michael R. Dyott, Philadelphia, Pa. [Filed Feb. 20, 1874.]



The within-described attachment for gas-burners, having a socket, *a*, formed within and of the same metal as the lower portion of the attachment, and presenting a flaring lower entrance for the admission of the burner, all as set forth.

168,464. Pulse and Shafts for Tympans. George W. Eddy, Waterford, N. Y., assignor to Lyman E. Bliss, Philadelphia, Pa. [Filed Sept. 4, 1875.]

Brief.—The parts are made tubular and adjustable.

1. A carriage pole or thills, made extensible by means of the sliding terminal B, substantially as described.

2. In combination with the tubular thills, the adjustable eye-plate E, substantially as set forth.

3. The cross-bar C, connected to the thills A, by a right and left hand screw on its ends, for adjusting them in width, as set forth.

4. The tubular terminals B, adapted to fit upon the front end of carriage thills or poles, substantially as shown and described.

168,465. Solutions for Chemical Telegraphs. Thos. A. Edison, Newark, N. J., assignor to himself and Geo. Harrington, Washington, D. C. [Filed Jan. 16, 1875.]

Brief.—Treats sulfites solution with nitric acid till nearly colorless. Uses the styline. Oxygen evolved at styline-point forms protoxide of tin, which reduces the sulfites to its original state while the current is passing.

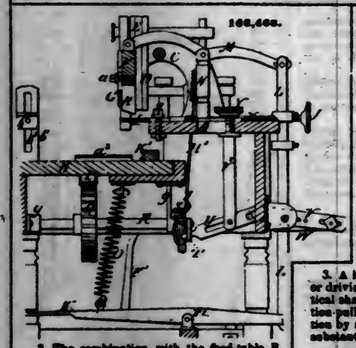
A chemical solution for telegraphic paper, containing sulfites in a colorless, or nearly colorless, condition, substantially as set forth, in order that the mark may be made by electrolysis, as specified.

168,466. Solutions for Chemical Telegraphs. Thos. A. Edison, Newark, N. J., assignor to himself and Geo. Harrington, Washington, D. C. [Filed Jan. 26, 1875.]

In a chemical solution for telegraphic paper, the combination of a paramalt of iron with a vegetable astringent and a condensing salt, substantially as set forth, in order that the mark may be made by electrolysis, as set forth.

168,467. Recording-Papers for Chemical Telegraphs. Thos. A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. [Filed Jan. 26, 1875.]

A recording-point formed of metallic ruthinian in a chemical telegraph, substantially as set forth.



168,468. Machines for Cutting and Pressing Insoles. E. H. Edwards, Grand Rapids, Mich. [Filed July 20, 1875.]

Brief.—The machine has sliding knives, which are adjustable, to cut out portions of the leaves, and a separate pressing device to print the insole between. The leaf is held to an automatically-sliding table by adjustable clamps.

1. In a machine for indenting insoles, the combination of the sliding or reciprocating footstable B, vertically-movable knives G H, horizontal bed-block I, treadle K, vertical connecting-rod L, and lever M, substantially as herein described.

2. The combination, with the movable knives G H and the fixed table B, of the centrally-fulcrumed lever M, treadle-connection K L, arm W, the connected levers T U V, the table-gear connection therewith, and the movable platen-post V, whereby the same movement of the treadle operates the knives and effects the feed of the table for a long or short cut, as regulated by the adjustment of the fulcrum-post, substantially as herein set forth.

168,468.

3. The combination, with the feed-table B and the cutting mechanism, of the printing-wheel A', bolt-rail B', separate carrying-rail frame C' D', spring C', and the treadle E', whereby the printing-wheel is adapted to be operated independently of the cutting device, and upon the reverse feed of the table, substantially as herein set forth.

4. The combination of the horizontally-adjustable bracket and cover, holding-guide a', and the vertically-adjustable cover-holder b', with the feed-table and cutting mechanism of a book-lettering machine, as and for the purpose set forth.

5. The separate movable knives G H, adjustable vertically and longitudinally, and combined with the horizontally-adjustable knife I, each adjustment being made in relation to each other, for the purpose set forth.

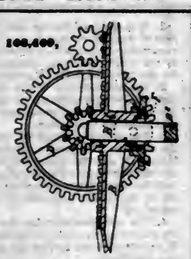
6. The combination of the slotted guide and movable fulcrum-post V' with the system of levers, and ratchet-and-pawl mechanism and feed-table, substantially as herein set forth, whereby the feed of the table is regulated to make a long or short cut, according to the length of the letter-strip and the spaces required for the lettering.

7. The combination, with adjustable fulcrum-post V' and the devices for sailing it with the table K and the feed-table E, of the clamping-nut Y and the slotted tabl A, whereby the fulcrum-post is secured in position when adjusted.

8. The combination, with the adjustable slotted flanged plate a' b' and the angle-slotted plate b', having the adjustable fretted holder b', of the longitudinally-adjustable gage-bar X', and its slotted and plated lV, whereby the book is secured and clamped upon the table in proper relation to the movable and fixed knives, as described.

9. In a machine for indenting books, the main table A, for supporting the entire cutting, grinding, and operating mechanism, in combination with the book-supporting and feeding-table B, placed in front of and at a lower level than the fixed table, and having a movement to the right and left to cut and print the leaves, as herein set forth.

10. The combination, with the separate knives G H I, of the covers J, a, d, and e, the slides B, and the adjustable pins r s in the grooved arms C D, as the means whereby the said knives are adjusted in relation to each other, as described.

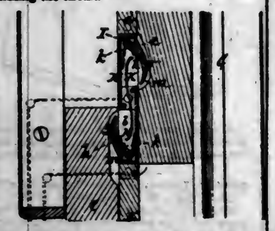


168,469. Horse-Powers. A. B. Forscher, York, Pa. (Filed Sept. 10, 1875.)

Brief.—The sides of the hub, instead of being vertical, are inclined from the center toward the upper and lower edges, to allow lateral play, and thus prevent the breaking of the vertical shaft by reason of the sagging or sinking of the floor on which it is supported.

1. A horse-power constructed with a vertical shaft or king-post, B, the upper end B' of which is squared or feathered, and works loosely in the eye b of a driving-wheel, B, the sides of such eye b being inclined, as curved from the upper and lower edges of the hub toward the center, substantially as and for the purpose described.

2. A horse-power constructed with a main or driving wheel, B, provided with an eye, b, mounted loosely on a vertical shaft or king-post, B', and supported on friction-pulleys F, substantially as shown and described.



168,470.

3. A horse-power constructed with a main or driving-wheel, B, mounted loosely on a vertical shaft or king-post, B', supported on friction-pulleys F and retained centrally in position by means of its hub b' and a step-box, b', substantially as shown and described.

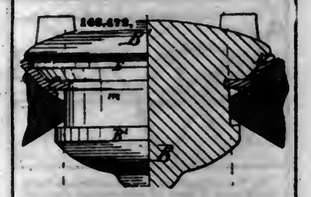
168,470. Circuit-Closers for Electrical Burglar-Alarms. Lewis Finch, Brooklyn, N. Y. (Filed Nov. 10, 1874.)

Brief.—Two circuit-closers arranged, as shown, in a frame, the movement of either each closing the circuit.

In combination with the pivoted circuit openers and closers I, having the cam-levers g, and wings h, the springs k, and the circuit tongue K, and all arranged within the box-frame H, having openings on opposite sides for the outward movement of the cam-levers, as herein shown and described.

168,471. Coupon-Letters. J. J. Flannery, Pittsburg, Pa. (Filed July 2, 1875.)

Brief.—An adjustable strap is provided with flexible handles, which turn or yield, so as to permit the strap to be withdrawn from under the body after it has been adjusted.

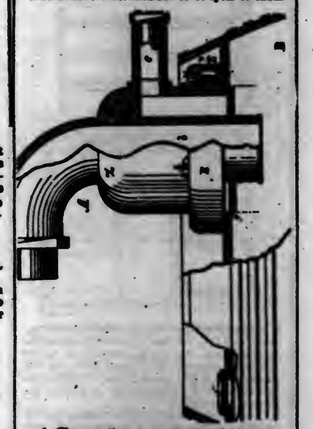


A coupon lifter and adjuster, consisting of adjustable strap A, provided with flexible hinged or yielding handles B, and either with or without adjusters C, substantially as shown and described.

168,472. Vault-Lights. John P. Foley, New York, N. Y. (Filed Aug. 16, 1875.)

Brief.—A vault-light in which the lens is secured in its cent by means of volute curves in its sides, which, when it is placed between projections or inner edges of the opening and turned, cause contact of the curves with the projections on lens-frame thereby holding them in position. The lens is provided with a groove, and also a rib, the latter taking into a yielding packing, and the former allowing the packing to enter, whereby a water-proof joint is formed.

168,473.



1. A vault-light having an overhanging head, B', and a body, B, having its surface formed with two or more volute curves, m m, as and for the purposes herein specified.

2. The circular groove in the body B, adapted to receive the inner edge of the packing C and hold it centrically, in combination with the overhanging head B', and with the curves m m below, adapted to lock the glass in the iron frame, as herein specified.

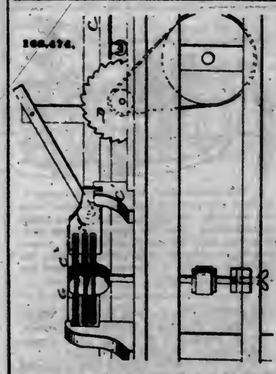
3. The glass E E', having a ridge or projection, F, on the under surface of the head, adapted to serve in combination with the said packing C, and with the volute or equivalent locking-curves m m on the body B, as and for the purposes herein specified.

168,474. Night-Soil and Sewage Apparatus. Charles B. Frazier, Baltimore, Md. (Filed Aug. 6, 1875.)

Brief.—A coupler has a central inlet, annular outlet, attached automatic closing-valve, and also a locking-ring with lugs, which slide under projections inside of a collar on the tank-head, for attachment of coupler to tank.

1. The coupling A, provided with the outer shell a, the inserted pipe b, and the extended coupler c, substantially as and for the purposes specified.

2. In said coupling A, the combination of the float-valve f with the outer shell a and the pipe b, substantially as and for the purposes specified.

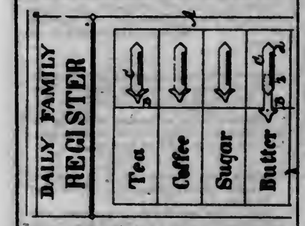


3. The deodorizing-vessel G, provided with the relief-pipe s and the perforated gratings r, in combination with the pump D, substantially as and for the purposes specified.

4. The combination of the coupling A, provided with the outer shell a, the inserted pipe b, the coupler c, the float-valve f, and the locking-collar A, also provided with the inclined lugs x, with the receiver B, provided with the neck B and the lugs v, also with the flexible tubes s and s', the pump D, and the deodorizing-vessel G, substantially as and for the purposes specified.

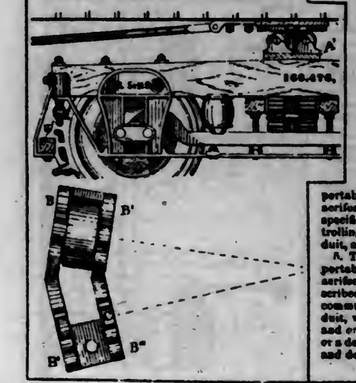
168,475. Grooved Rods and Lath Machines. John C. Gaither and Jos. T. Hill, Cumberland, Md. (Filed Feb. 20, 1875.)

Brief.—The bolt is first cut by a single saw, then carried forward to a gang of saws, which convert it into lath, while another bolt is being prepared by the bolting-saw.



168,476.

1. The combination, with the gang of saws G, of the guides C' C', weighted wheel k, rake-spring H, and roller i, substantially as and for the purposes herein set forth.



2. The combination of the table B B', carriage I, bolt-saw D, guides C C' C', gang-saws G, wheel k, rake spring H, and roller i, all constructed and arranged to operate substantially as and for the purposes herein set forth.

168,476. Indicators. Wm. L. Gallander, Elizabeth, N. J. (Filed July 24, 1875.)

The combination, with the tablet A, of the indicator B, provided with the leg or finger-piece b, and the hooper C, provided with the guiding-slot d, flanges e', and constructed as herein described, whereby said indicator and hooper are attached to each other and to the tablet without the use of rivets or other fastenings, substantially as set forth.

168,476. Side Bearings for Railroad-Cars. George Galloway, Buffalo, N. Y., assignor of one-half his right to Phillip Stallwagon, Wm. Miller, and M. J. Stark, same place. (Filed Mar. 26, 1875.)

A double shear, A, having its parallel sides B B' and B'' B''' arranged at an obtuse angle with each other, and at right angles with a line through the center of the bearing, and the king-bolt of the truck, and provided with semicircular excisions C, serving as bearings for the pivots of the wheels, all substantially as and for the purpose set forth.

168,477. Night-Soil Apparatus. Richard S Gillespie, New York, N. Y., assignor to Hamilton S. Tompkins and Samuel Samuels, same place. (Filed Apr. 23, 1875.)

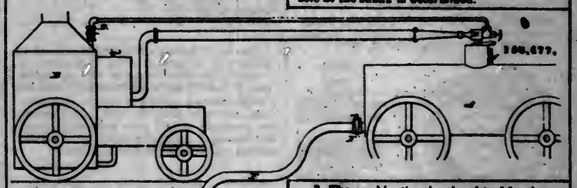
Brief.—Vacuum created in tank by an ejection of an aeriform fluid, such as steam or carbonic-acid gas. Vapors deodorized by such ejection, and passage through sprayed water and fire, or by ejection alone, or by other means. Solid sewage loosened by injection of steam or compressed air, or air and water. The injection agent for this purpose may be itself previously disinfected.

1. The method of withdrawing sewage, night-soil, and like matter from its receptacle into a transportable vessel, which consists in connecting such matter by an air-tight conduit with an air-tight transportable vessel, and then exhausting the air in the vessel by a jet of an expansive aeriform fluid, such as steam or carbonic-acid gas, substantially as described.

2. The method of withdrawing sewage, night-soil, and like matter from its receptacle into a transportable vessel, and at the same time deodorizing its fetid vapors and gases, which consists in connecting the matter by an air-tight conduit with an air-tight transportable vessel, and exhausting the air from the vessel outwardly through its extended outlet, or through that outlet and through either a shower of water or burning matter, or through an outlet, the water, and burning matter, substantially as described.

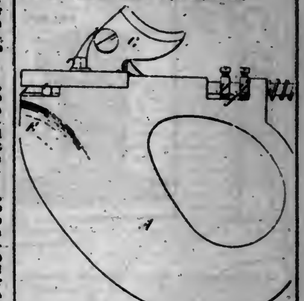
3. The method of loosening sewage, night-soil, and like matter preparatory to its removal, which consists in sucking up a stream of air or water, previously disinfected, or not so, and forcing it into the matter to be loosened by a jet of an expansive aeriform fluid, such as steam, carbonic-acid gas, or compressed air or water, substantially as described.

4. The combination of an air-tight transportable vessel, an ejector operated by an aeriform fluid, such as and in the manner as specified, a suction-conduit, and a valve controlling communication between tank and conduit, as and for the purpose specified.



5. The combination of an air-tight transportable vessel, an ejector operated by an aeriform fluid, such as and in the manner described, a suction conduit, a valve controlling communication between such vessel and conduit, with the extended outlet of the vessel, and *or* with an outlet, and either a condenser or a deodorizer, or with such outlet, condenser, and deodorizer, for the purpose set forth.

6. The condenser C, consisting of a water-chamber, vapor and gas chamber, communicating valve, distributing nozzle f, and suitable inlets and outlets, as and for the purpose set forth.



7. The combination of pipe I, within or without the cess pool, injector B, and pipe B', as and for the purpose specified.

8. The combination of suction-pipe F, vessel A, ejector B, fluid-generator F, pipe G, and suitable valves for controlling the ejector fluid and the sewage, as and for the purposes described.

168,477.

168,478. Hand-Tools for Channeling Soles. L. Geddes, Boston, Mass., assignor to American Cable-Screw-Wire Company, same place. (Filed Sept. 21, 1875.)

1. The combination, in a hand-tool for channeling the soles of boots and shoes, of an upper bearing-surface guide, E, a self-adjusting presser-plate, I, an edge-bearing for the sole, and a channel-cutter, C, substantially as herein set forth.

2. In a hand-tool for channeling the soles of boots and shoes, by means of a cutter carried thereby, a controllable edge-guide, F, substantially as herein set forth, whereby the distance of the channel from the edge of the sole at the shank is determined.

3. The combination, in a hand-tool for channeling the soles of boots and shoes, of an adjustable toothed edge-guide, F, with a toothed lever, G, and a spring H, substantially as herein set forth, whereby to determine the maximum and minimum movement of the edge-guide, as described.

4. The combination, with the controllable edge-guide F and its operating toothed finger-lever G, and the spring, of means for adjusting and regulating the movement of said edge-guide with respect to the channeling-tool, substantially as and for the purpose herein set forth.

5. A hand channeling-tool, provided with a palm-handle having a curved recess or hollow, m, on its inner surface to receive the edge of the sole as the knife is manipulated along the short curves in the channeling operation, substantially as set forth.

6. A hand-tool for channeling the soles of boots and shoes, consisting of a hollow curved palm-handled channeling-knife holder, A, an upper bearing-surface guide, E, a self-adjusting lower pressure-plate, I, a channel-cutter, C, and a controllable edge-guide, F, substantially as herein set forth.

168,479. Furniture-Casters. W. Gould, Minneapolis, Minn. (Filed Nov. 7, 1874.)

Brief.—The caster-shell, carrying on its inner surface a female screw-thread, to match with a male screw upon the caster-shank, is cast in two parts.

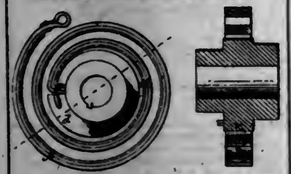
1. The sectional socket-plates D D', having the internal raised spiral threads *c c'*, forming a single continuous thread, substantially as and for the purpose set forth.

2. The sectional socket-plates D D', having the internal raised spiral threads *c c'*, forming a single continuous thread, the chamber *d*, and the contracted bearing-recess *b*, substantially as described.

3. The sectional socket-plates D D', having the single raised spiral threads *c c*, a smooth chamber, *d*, and contracted recess *b*, in combination with the tapering shank B, having a raised spiral thread, *c*, not in engagement with the spiral thread of the socket when inserted home, substantially as described.

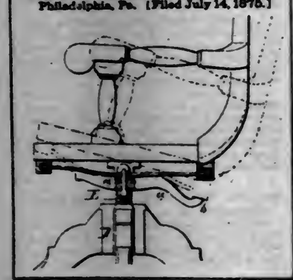
166,479.

166,480.



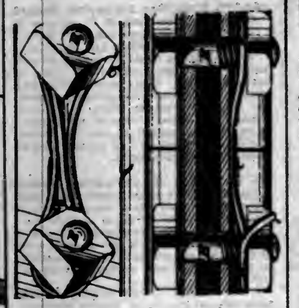
166,480. RAILROAD-RAIL JOINTS. Shipman W. Griffith, Union City, Pa. [Filed Aug. 24, 1875.]

1. The combination of the bolt *d*, having the heads *e f*, with a fish-plate, having the notches or recesses *h*, substantially as set forth.



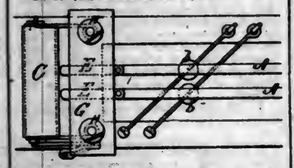
2. The combination of the bolt *d*, having the heads *e f*, spring *c*, fish-plates *a*, having the holes *g*, and recesses *h* and rails *a*, substantially as specified.

166,481. DEVICES FOR PREVENTING BACKLASH OF MACHINERY. John A. Hafner, Pittsburg, Pa. [Filed May 31, 1875.]



The combination of the hub B, having central flange *d* and notch *x*, and made larger at the bottom than at its top, with the spring A, made of a series of leaves of varying thickness, and having hook *c* and loop *d*, all substantially as and for the purposes set forth.

166,482. TILTING CHAIRS. Henry S. Hale, Philadelphia, Pa. [Filed July 14, 1875.]



The combination, in a chair with a tilting seat, of a spring-bar, F, attached to the seat and to the support of the same, with the long rear arm *a'* and its stop *b*, and the short front arm *a*, all as set forth.

166,483. NUT-LOCKS. Fred C Hamilton, Brooklyn, assignor to Edward J Brooks, New York, N. Y. [Filed Sept 3 1875.]

A double spring-washer, constructed of wire or rod in the form of a coil, and having loops *a a* to embrace a pair of bolts, and projections *b b* to lock the nuts thereon, substantially as herein shown and described.

166,484. PIANO-FORTE DAMPER ATTACHMENTS. M. Waldo Hanchett, Syracuse, N. Y. [Filed Mar. 6, 1875.]

The bar C, having straight edge, secured to hangers D, pivoted to arms F, attached to stand G, the screw-threaded rods I, thumb-nuts H, lever I, and connecting-rod J, and the damper-levers A, having upon their upper surfaces, and at or near the front ends thereof, the catches E, all said parts being constructed and arranged to operate substantially as described, and for the purpose set forth.

166,485. MANUFACTURE OF ARTIFICIAL LEATHER. John Harrington, Ryde, Isle of Wight, England. [Filed Jan. 20, 1873.]

1. A mold made of shellac, as and for the purpose described.

2. The combined process herein described of manufacturing artificial leather by first taking strong-fibered paper, staining or dying the body thereof, and applying glycerine to render it pliable, then coloring the surface, glazing, and then varnishing or waterproofing, and finally placing this paper on the mold, and transferring the impression thereon by pressure, all substantially as herein specified.

166,486. CAR OR BOAT ATTACHMENTS FOR BALLOONS. Jas. Hartness, Detroit, Mich. [Filed Mar. 6, 1875.]

Brief.—The car or boat is made in two sections, so arranged that they can be bolted together, so as to make a perfect whole, and in providing said car or boat with a suitable pump and connections, so arranged that the gas may be drawn from the balloon, and condensed within the walls of the boat or car, thereby avoiding the necessity of carrying ballast.

1. The boat or car A, made in two sections, *a b*, provided with two water and air tight coverings, so arranged as to leave space between the two for the purposes of inflation, and provided also with cap *d*, substantially as described, and for the purposes set forth.

166,486.

2. The combination, with the boat or car A, made in two sections, *a b*, and provided with two water and air tight coverings, of the pump D, connecting with the space between said coverings, and having the stop-cock *c* and coupling *e*, adapted to be connected with the interior of a balloon, substantially as and for the purpose set forth.

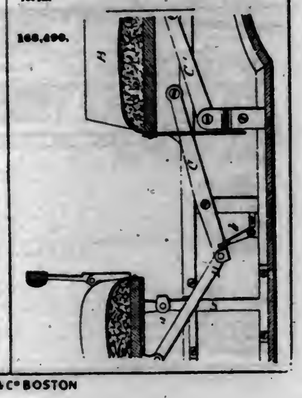
166,487. CHUCKS FOR TURNING WHIP-STOCKS. Charles G. Hartwell, Westfield, Mass., assignor to C. S. Peak and F. Grant, same place. [Filed Jan. 26, 1875.]

Brief.—The spindle enters a hole in the end of the whip-stock, which is firmly compressed against it by the collar.

An improved chuck for turning whip-butts, consisting of the combination of the socket A, the central spindle D, to support the hollow portion of the whip-butt, and the threaded holder B for holding it, substantially as described

166,488. CONFECTIONERY. Edwin Hawker, Lee, assignor to Cornelius Hanbury, London, England. [Filed Sept. 13, 1875.]

Jujubes or other confections of a deliquescent character, coated with an alcoholic solution of a gum, or resin, or pyroxyline.



166,489. NUT-LOCKS. Cyrus Henderson, Westmoreland County, Pa. [Filed May 10, 1875.]

Brief.—The screw-bolt is provided with longitudinal grooves. The nut is formed with a slotted extension corresponding to the grooves in the bolt. Keys are inserted in the slots, and covered by a screw-cap.

The cap-nut E, slotted nut B, and keys D, in combination with the bolt A, having grooves *a a*, substantially as herein described and set forth.

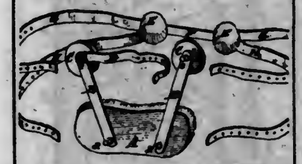
166,490.

166,490. WAGON-SEATS. David W. Horn and Paul Richards, Minneapolis, Minn. [Filed July 17, 1875.]

Brief.—A support for the connecting-arm.

The latch *b*, in combination with the arms C D, connecting the seats B and E, for the purpose described.

166,491. TRILL-COUPLINGS. Saml. L. Hill, Brooklyn, N. Y. [Filed Sept. 15, 1875.]



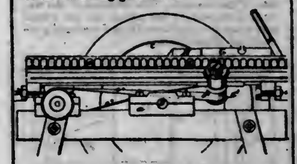
1. The combination of a recessed toe, *a*, on the shaft A, with two elastic cushions, *e f*, on the clip B, substantially in the manner and for the purpose herein shown and described.

2. The combination of a recessed toe, *a*, on the shaft A, with two cushions or bolts, *e f*, inserted at different levels in the clip B, substantially as set forth.

3. The combination of a recessed toe and lip *b* on the shaft A, with two cushions, *e f*, and a step, *g*, on the clip B, substantially in the manner shown and described.

166,492. TRUSSES. Siegfried L. Hockert, Cincinnati, Ohio, assignor of one-half his right to Henry Herckelrath, same place. [Filed Aug. 9, 1875.]

Brief.—A central abdominal pad is connected by pivoted flexible arms to two auxiliary pads placed above it. These latter pads are adjustably connected by straps to each other, and to two small pads in the rear by means of a double waistband.

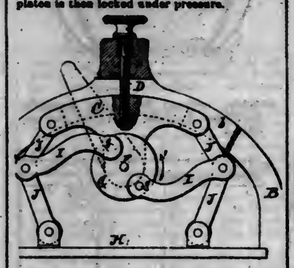


1. An abdominal supporter consisting of the central lever pad A, connected by pivoted arms B B, and the auxiliary pads C C, adjustably connected by straps D, the whole being combined substantially as and for the object specified.

2. In combination with the lower pad A, pivoted spring-arms B, auxiliary pads C, and adjustable straps D, the back-pads E E and straps G connecting the back-pads with the auxiliary pads C, substantially as shown and described.

166,493. MACHINES FOR GRINDING AND FITTING PEARL-WIDDERS. Jacob Hoffmann and Georg Hoffmann, Philadelphia, Pa. [Filed July 20, 1875.]

Brief.—The material is secured upon horizontally-sliding tables, which move upon oscillating frames, thus enabling the operator to bring the material into contact with the side of the revolving grindstone.



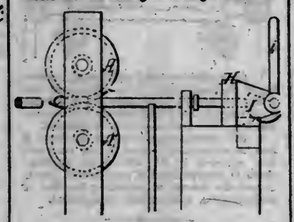
1. The end-beveled gage G, combined with beveled block H and beveled hinged dog I, as and for the purpose specified.

2. The combination, with carriages or plates E, of a vernier-gage and holder G having the recesses *g*, as and for the purpose specified.

3. The combination, with carriage-supporting frames D, of the block-bearings F, movable in slots *c c* of machine-frame, as and for the purpose specified.

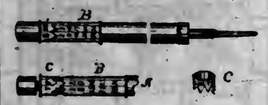
166,494. COPING-PRESSES. Wm. H. Hoffman, Passaic, N. J., and Buckingham St. John Hoyt, New York, N. Y. [Filed Sept. 16, 1875.]

Brief.—The plates are raised and lowered by means of a crank-disk, having its bearing in an adjustable cross-head, swinging beneath the arch of the standards. Said plates is connected to the cross-head by toggle-levers, which in turn are attached to the crank-disk by links. When the upper and lower sections of the toggle-levers are in vertical line, the plates is then locked under pressure.



1. The adjustable cross-head C, containing the bearing of the toggle-operating shaft F, in combination with said shaft and the arch B, for the purpose of adjusting the distance between the platen and bed-plate to accommodate books or articles of various thicknesses, substantially as herein described.

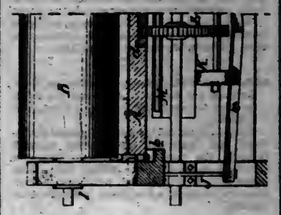
2. The combination of the platen H, the adjustable cross-head C, the toggles J, connecting-links I, disk or crank G, rotating shaft F, and arch B, substantially as herein described.



166,495. TUBE-ROLLING MACHINES. John Hoskin, Philadelphia, Pa. [Filed July 16, 1875.]

Brief.—The mandrel abuts against a yielding support, that permits movement thereof within the tube during the rolling of the tube.

The combination, in a tube-rolling machine, of the mandrel C with mechanism whereby motion is imparted to the said mandrel within the tube during the pushing of the latter over the mandrel by the rolls, as set forth.



166,496. COMBINED PENCIL-CASES AND CALENDARS. Richard Howland, Folkestone, England. [Filed June 16, 1875.]

1. In a pencil-case or pen-holder, or like pocket articles, the combination of a collar and a tablet, each having letters or figures thereon, and each having a correspondingly regularly serrated end adapted to fit closely together whenever the rotary position of the collar is changed, substantially as set forth.

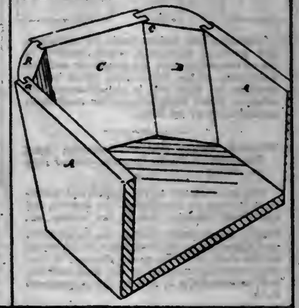
2. The combination with the pencil-case, or pen and pencil-case, A, of the tablets B, collar C, and screw-cap *c*, substantially as described and shown.

166,497. MACHINERY FOR GRAINING, PEBBLING, AND SOFTENING LEATHER. Henry Howson, Philadelphia, Pa., assignor to W. T. Warner, Wilmington, Del. [Filed Aug. 27, 1875.]

1. In a machine for graining, pebbling, and softening leather, the combination of the bed A with the roller B, the former being caused to traverse in a direction opposite to that in which the roller is caused to revolve for action on the folded leather, in the manner described.

2. The combination of the roller B with the reciprocating bed A, having rollers adapted to inclined ways on the frame-work of the machine, all substantially as specified.

3. The combination of the adjustable roller B, reciprocating table, bar F, and mechanism whereby the said bar is operated, in the manner described.



166,498. SNATCH-BLOCKS. Augustus Hunt, Philadelphia, Pa. [Filed Aug. 24, 1875.]

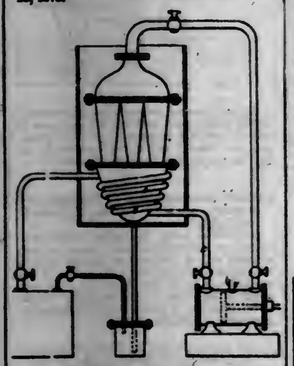
The combination, substantially as described, of the pulley-block and the coupled plate D and D', with the tubular block I of rubber, and the disks h and h', between which the said rubber is confined under pressure.

166,499. CONSTRUCTION OF CASKETS AND COFFINS. James M. Hutton, Richmond, Ind. [Filed Mar. 9, 1875.]

Brief.—The joints of wooden caskets and coffins are strengthened and concealed, and recessed curved corners are formed on the outside and flush joints on the inside of the same, by means of curved corner-pieces, provided at each end with a beveled tongue and beveled lip, in connection with centrally-grooved side and end sections.

As an improvement in the construction of coffins, the curved corner-pieces B, constructed as each edge with a beveled tongue, b, and internal feather or beveled lip c, in combination with the side and end sections A C, centrally grooved, as shown, so as to fit the pieces B, strengthen and conceal the joints, and form recessed curved corners on the outside, and flush joints on the inside, as specified.

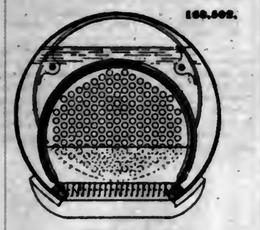
168,500. Ice-Machines. Augusto Jas, New Orleans, La., assignor of one-half his right to Alba. C. Jenks, same place. [Filed July 1, 1875.]



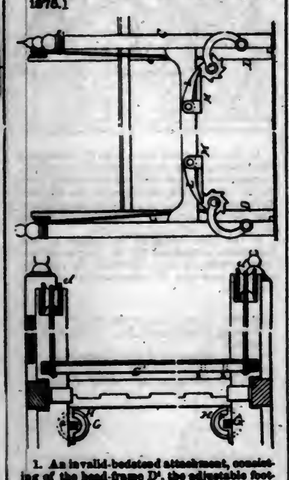
Brief.—Liquid refrigerants are passed downward and vaporous refrigerants upward through the partitioned boxes. Water is frozen in successive superadded films. The upper box is capable of withdrawal away from the lower by a flexible or telescopic connection.

The described freezing apparatus, consisting of two sheets formed each by the union of two parts constructed and put together to constitute a hollow structure with internal serpentine passage, as described, the two sheets being connected by flexible tubing, or its substantial equivalent, as specified, and adapted to operate in connection with a water mold or vessel placed between them, substantially as set forth.

168,501. Condensers for Ice-Machines. Augusto Jas, New Orleans, La. [Filed July 1, 1875.]



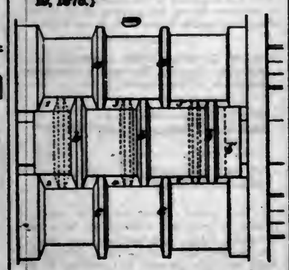
Brief.—Condensation of the refrigerant is assisted, and the cooling of the water to be afterward frozen is effected, by coiling the return-pipe about the lower chamber of the condenser found in Patent No. 161,337, March 23, 1875.



The described improvement on my aforesaid patented apparatus, which consists in the combination, with the condenser and the water-tank, of the return-pipe, which passes through the tank and is coiled around the lower or liquid receptacle of the condenser, substantially as set forth.

168,502. Steam-Boiler Furnaces. Emil Kaselowsky, Berlin, Prussia. [Filed July 10, 1875.]

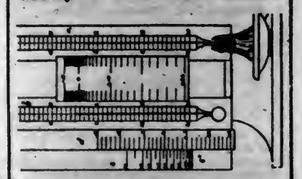
The combination of the cylindrical boiler-shell having an opening at the bottom, the cylindrical fire-box open at the bottom, arranged concentrically within the boiler-shell, and connected at its lower edges to the edges of the shell, and the grate situated within the existing openings of the shell and fire-box, substantially as and for the purpose set forth.



168,503. Invalid-Bedsteads. Abraham Kauffman, Annville, Pa. [Filed July 24, 1875.]

1. An invalid-bedstead attachment, consisting of the head-frame D', the adjustable foot-frame D², and the suspensible stretcher-frame S', having adjusting-perforations Z for the suspending-cords c, substantially as specified.

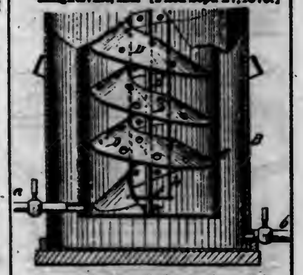
2. The combination, with the stretcher S and its suspending-cords c, of the head and foot supports D' D², having the winding-shafts G, pulleys H and d, pawl-arms M, pawls L, and the braces F, connecting the feet of said supports, substantially as specified.



168,504. Rolling-Mills. Norman King and Winfield Scott, Reno, Pa. [Filed Aug. 10, 1875.]

As an improvement in rolling-mills, the combination of two or more rolls, one or more of which is capable of endwise movement, and each presenting two or more plain cylindrical working-surfaces of different diameters, terminated by beveled collars, that alternate those of one roll with those of the next adjacent roll, substantially as described.

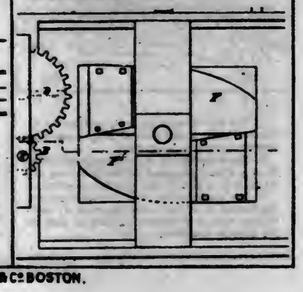
168,505. Pitch-Indicators. William Kinkelbur, Gottingen, Prussia. [Filed Aug. 20, 1875.]



Brief.—A sliding scale, by its varying adjustments with the scales of a moist and a dry thermometer, indicates the thawing-point. An additional scale is operated in combination with the above, to indicate the percentage of humidity.

1. The combination of a movable scale, c, bearing marks, the relative position of which are obtained in the manner herein described, with two scales, a b, one of which serves to indicate the temperature of a moist thermometer, and the other that of a dry thermometer, all as set forth.

2. The combination of the moving scale d with the percentage scale e e', both of these scales being provided with marks, the relative position of which is obtained substantially in the manner herein described.



168,506. Rotary Ovens. W. R. Langston, Knightsville, Ind. [Filed Sept. 27, 1875.]

The combination of the exterior and interior cylinders B C, with faucets a b, central shaft D', with frame f h, and spiral perforated conveyer D, all substantially as and for the purposes herein set forth.

168,507. Combined Water-Wheel and Gates. Young W. Lorman, Russellville, Ky., assignor of one-half his right to J. H. Bowden, same place. [Filed July 12, 1875.]

Brief.—This water-wheel has an air-tight case submerged in forebay, and provided with an adjustable gate and chutes, arranged above the wheel. The chutes flare at the mouth, and taper in cross-sectional area until the issue is reached, allowing for the natural waste of water, and making a solid current upon the floats of the buckets. The leverage of the water is increased by the bevels on the wheel-hub extending downwardly and outwardly toward the circumference.

1. The combination, with a turbine water-wheel, of an air-tight case submerged in forebay, and provided with adjustable gate and chutes, arranged above the wheel, as and for the purposes described.

2. A turbine-wheel, provided with overlying chutes and curved continuous buckets, reaching outwardly from top to bottom of wheel, as and for the purposes set forth.

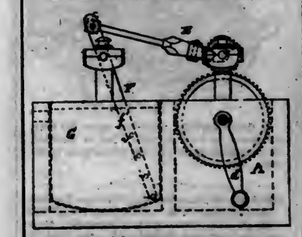
3. The flange F' on the lower bottom-edge chute, as and for the purpose specified.

4. The wheel-belt I, having bevels I extending outwardly toward the periphery of wheel, as and for the purposes described.

168,508. Apparatus for Cabbages Meats, &c. Whether Leland, Chicago, Ill. [Filed Aug. 14, 1875.]

1. The hinged sectional and flanged chopping-case J, constructed and adapted for the purpose stated.

2. The hopper H, having a long neck, c, and a stirring, S, in combination with the plunger D, in a machine for packing meats and other substances in cans, substantially as described.



168,509. Automatic Gates. N. H. Long, Muncie, assignor to himself and J. C. Long, Eaton, Ind. [Filed Aug. 6, 1875.]

Brief.—The notch c at the inner end of slot e prevents the pintle c from moving out of place when the gate is closed. The rib y forces the pintle out of the notch, and guides it along in the slot e, in the operation of opening and closing the gate.

The combination of the inclined frame D, having slot e, with notch c, and the pintle C, with rib y, substantially as and for the purpose herein set forth.

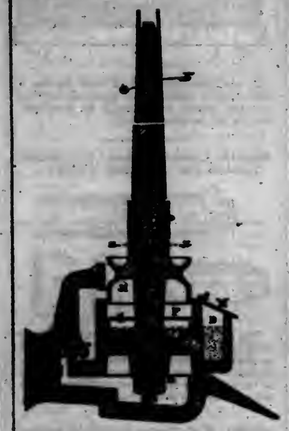
168,510. Bee-Hives. Martin Long, Claremont, N. H. [Filed Aug. 19, 1875.]

The combination of the box A, removable pan G, bonzer F, detachable connecting-rod B, and its vibrating mechanism, substantially as and for the purposes specified.

168,511. Pneumatic Furnaces. John C. Macdonald, Weldon, and Joseph Calvert, Surrey County, England. [Filed Dec. 29, 1874.]

1. The clamping-roller, constructed substantially as set forth, of a central perforated cylinder, b, blanket b or other absorbent material, perforated metal cylinder i, and outer covering of blanket a.

2. The combined arrangement for retaining the knife carried by cylinder f of the cutting apparatus, such arrangement consisting of bars or frames r fixed to the ends of the knife-bar p, and carrying rollers to bear upon the two opposite edges of fixed cams s s, substantially as set forth.



3. The combined arrangement for holding the cutting-knife, consisting of the carrying-bar p, clamp-bar p', and bars q q, for supporting the knife where it passes out from the cylinder f.

4. The combination, with the cylinder f, of the bar t, and adjustable bar t, these members being constructed and operating substantially as set forth.

5. The cylinder f', provided with a narrow-beveled inclined slit or opening, as set forth, against the side of which the knife of the cylinder f works.

168,512. Wool-Burning Machinery. C. Martin, Verviers, Belgium. [Filed June 11, 1875.]

Brief.—When the bobbin is full, and is to be changed, a few rounds of thread are wound on the tube placed on the lower part of the hame-spindle, which thread is not broken when the bobbin is removed to be replaced by another. The spindle is stopped, when desired, by means of a lever, one arm of which, on being depressed, causes the end to press against and stop the whirl.

1. The combination, substantially as hereinbefore described, with the roll J and spindle having the whirl H, of the lever S, provided with a lip, T, resting within the said roll, and counterweighted with the operating end R and Q for stopping the whirl, as set forth.

2. The combination of the tube F, the whirl H, and the loose spindle I, substantially as described, whereby the bobbins can be changed without breaking the thread, as set forth.

168,513. Annealing-Furnaces. William H. McKenna, Pittsburg, Pa., assignor of one-half his right to J. C. Ridgway, same place. [Filed May 14, 1875.]

Brief.—The products of combustion pass between the arches embracing the side retorts and supporting the upper retort, then forming flues, and, passing over the side retorts, descend into the outer of the alternately-connected horizontal flues under the side retorts. From the last of these the hot gases pass off through flues in the front wall, which pass back along the top, and lead to the chimney in the rear.

1. In a furnace for annealing tubes, the combination, with the retorts h e h, one or more, and the arches or walls k, forming flues l, of the closed-in horizontal flues c c, &c., substantially as shown and described.

2. The combination, with the annealing-ovens h e h, one or more, of the diving-flues f and closed flues c c, substantially as described.

3. The flue g, in combination with the horizontal annealing-ovens h h and closed flues c c, substantially as described.

4. In an annealing-furnace for solids, the horizontal annealing-oven of uniform bore, and made in one piece, substantially as specified.

5. The combination, with an annealing-oven of a door or cap at one end, having a correspondent opening, e, and for the purpose set forth.

6. The improved annealing-furnace, consisting of and comprising the internally-arched body a, the ovens h h e, one or more, of uniform bore, the ovens h h being arranged at the sides of, and the oven e above, the fire-place, and against the furnace-arch, the arches k supporting said oven e, and resting on ovens h, forming the lateral flues l, and the closed flues c c passing underneath the ovens h h, all as shown, and for the purpose specified.

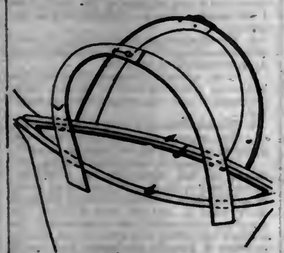
168,514. Terrestrial Globes. Malcolm McVicar, Potsdam, N. Y. [Filed Aug. 4, 1875.]

Brief.—The invention relates to globes used for illustration in geography and astronomy, and consists in the special construction and arrangement of the parts claimed for solving the various problems which arise in the study of these interesting sciences.

1. In a globe, the revolving equator B and circle C, suspended on the equator by the two points a a, so that, by its own motion on said points and the motion of the equator, the circle can be made to represent any great circle on the globe, substantially as set forth.

2. The movable three-quarter meridian D, fastened to the circle C, substantially as and for the purposes set forth.

3. A movable meridian, E, attached by a clamp-screw, in combination with the circle C, standing horizontally or at any desired angle to the horizon, and in which the axis of the globe is fastened perpendicular to its face, or at any desired angle, as herein set forth.

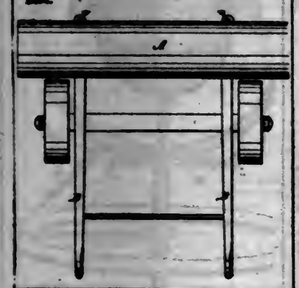


4. The combination of illumination and twilight H and I, fastened to the movable meridian E, substantially as and for the purposes set forth.

5. The semi-prime vertical K, fastened to the movable meridian E, substantially as and for the purposes set forth.

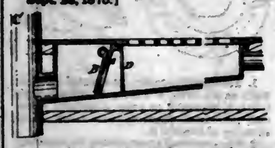
6. The combination, with a globe, A, of the movable equator B, pivoted circle C, meridian D E, combination of illumination and twilight H and I, semi-prime vertical K, pointer L, and the graduated circle M, all constructed and arranged substantially as and for the purposes herein set forth.

7. In a globe, a revolving equator, revolving independently of the globe, but on the axis thereof as a center, substantially as shown and described.



168,515. CATAMENIAL SACKS. G. Mascom, Beverly, Mass. [Filed Sept. 8, 1875.]

As an improvement in that class of catamenial sacks which embody an inner and an outer sack, and a fibrous material upon the edge where they are united, the combination of the outer sack, having a roll at its extreme upper edge, with the inner sack united to the outer sack at a distance below its upper edge, to form a flexible projecting lip, whereby a cast is formed between the lip and the roll to receive the fibrous material which is attached to the lip of the inner sack, substantially as herein shown and described.



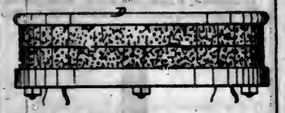
168,516. DRAIN. David Miller, Carrollton, Md. [Filed Sept. 7, 1875.]

Brief.—A log or cylinder of wood is provided upon one side with draft-staples and chain, and upon the opposite side handles are rigidly attached. To the handles, near the log, are secured track-wheels, which form a fulcrum to raise the log from the ground, to clear obstructions and turn at the end of the field.

The combination, with the log A forming the drag, of a pair of rearwardly-projecting handles, having wheels attached thereto, for the purpose of lifting and transporting the drag, substantially as described.

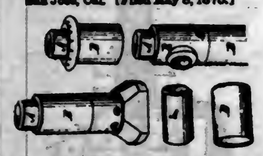
168,517. FLOODWAYS FOR WAREHOUSES. John R. Morrell, New York, N. Y. [Filed Sept. 20, 1875.]

In a floodway for warehouses and other buildings, the combination, with the leader-pipe C and the reclined bottom sink or reservoir opening into the room through gratings, of the setting D, and inclined obliquely-opening valve E, substantially as and for the purpose described.



168,518. BALE-TIES. Thomas H. Murphy, New Orleans, La. [Filed July 17, 1875.]

Brief.—The inclined side of the button facilitates its release from the slots.



The button c, provided with an obtuse-angled heel, the inclined side of which extends from the point of intersection between the said button and the loop to which it is attached to the inner side of the button, in combination with the loop code, as and for the purpose described.

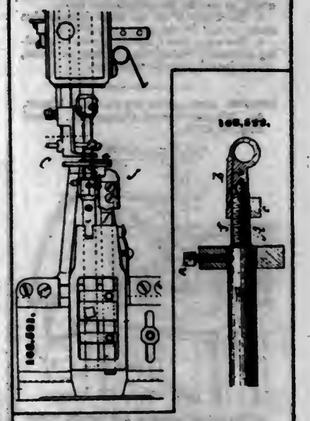
168,519. LOG-PRESERVING STOCKS. Henry H. Nash, Baltimore, Md. [Filed Sept. 20, 1875.]

A log-preserving stool or chair having a seat made of disks of cork confined between suitable boards, substantially as described, and for the purpose set forth.

168,520. CEMETERY-SEATS. T. C. Nuttrel, San Jose, Cal. [Filed May 6, 1875.]

The inner fan-sections A, beveled at their ends, and provided with vertical ribs, aligned as shown, in combination with the outer fan, formed of sections B, the joints of the sections of the one series alternating with those of the other, as and for the purpose set forth.

168,521. WAX-THREAD SEWING-MACHINES. J. M. Nichols, Madison, N. H. [Filed July 10, 1875.]



1. In a sewing-machine having two or more needles for parallel stitching, the arrangement and adjustment of said needles diagonally with respect to the line of feed, to determine the distance of the stitching-lines, substantially as herein shown and described.

2. In combination with the diagonally-adjustable needles, the adjustable thread-guides, substantially as shown and described.

3. The combination, with the cast-off fingers J, of adjustable blocks 16 and 17, substantially as and for the purposes set forth.

4. The combination, with the needle-plate O and movable guide-pieces c, of the rib-forming finger 9, substantially as and for the purposes set forth.

5. In combination with two or more needles arranged for parallel stitching, the intermediate rib-forming finger 9, for the purposes set forth.

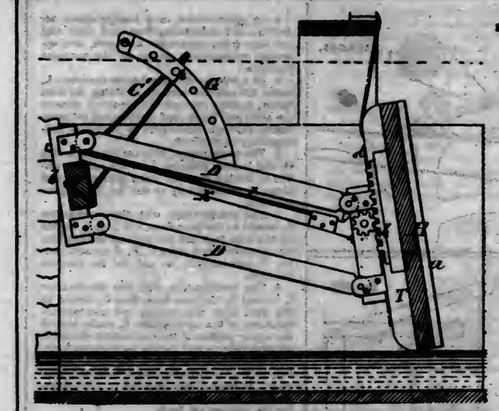
168,522. CLIPS FOR ROPE TRAMWAYS. H. Olsen, Jacob City, Utah. [Filed July 1, 1875.]

Brief.—A wire-rope-way clip in which the upper outward portion extends boat-toward the basket-shaft, and is provided with a downward-projecting leg, which fits into a slot in the body of the clamp. This leg has internal screw-threads, and acts as a nut for engagement with the screw formed upon the end of the basket-shaft, whereby the clamp can readily be tightened to the rope by turning the shaft. It is held in position by a set-screw.

1. The combination of the clip A, provided with the recess f, and having the nut or threaded leg c on the end of the leg b, and the shaft B, provided with the screw f, substantially as and for the purpose shown and described.

2. The combination, with the shaft B, of the collar g and set-screw h, substantially as shown and described.

168,523. CHILDREN'S CARRIAGES. Solomon Oppenheimer, Newark, N. J. [Filed Oct. 27, 1874.]



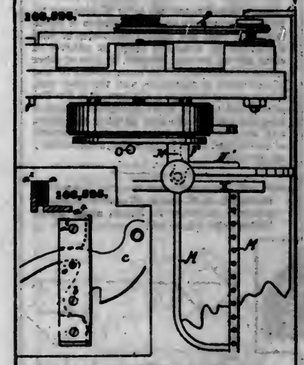
A child's carriage provided upon the rear, outside of its body A, with a box or pannier, D, substantially as and for the purpose specified.

168,524. SLIDE-GATES. Thomas Forbes, Menominee, Wis. [Filed Aug. 28, 1875.]

Brief.—The slide-gate is connected to a rock-shaft by two jointed rods, and held in position by an arm, segment, and pin. The knees of the jointed rods are vertically adjusted by a rock and pinion on the back of the gate, and are secured by a spring-stop.

1. The slide-gate H connected to a rock-shaft, C, by means of jointed rods D in combination with the arm O, segment G, and pin p, substantially in the manner and for the purposes set forth.

168,524.



2. The pivoted connecting-rods D combined with hooks c, vertically adjustable on the back of the gate B, substantially as and for the purposes described.

168,525. GATE-LATCHES. Jacob Fetterman, Short Creek, Ohio. [Filed Sept. 7, 1875.]

Brief.—The casing has a flange at right angles to its main body, to allow it to be secured to the post without mortising. Two holes are arranged to receive the pivot for the latch. The latch is reversed for changing from right to left hand, and vice versa, and the fulcrum-pivot changed. An extension of the latch downward forms a lever, against which the gate strikes, and then forces the latch into a locked position.

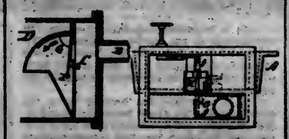
The combination of the casing c, composed of the plate a, having the flange a', and plate c, having holes b b, and the latch e, constructed as described, and all arranged to be reversible, substantially as set forth.

168,526.

168,526. HARVESTER-RAKES. Moses Bay, Valley Grove, W. Va. [Filed Mar. 20, 1875.]

Brief.—A pivoted adjustable frame carries the pulleys, on which passes an endless belt carrying a cam, which holds rigidly a bolley barrel having internal cam-grooves, through which the weighted rake-standard slips by gravity when said barrel assumes a vertical position by an arm, segment, and pin. The knees of the jointed rods are vertically adjusted by a rack and pinion on the back of the gate, and are secured by a spring-stop.

1. The combination of the casing c, composed of the plate a', having flange a', and plate c, having holes b b, and the latch e, constructed as described, and all arranged to be reversible, substantially as set forth.

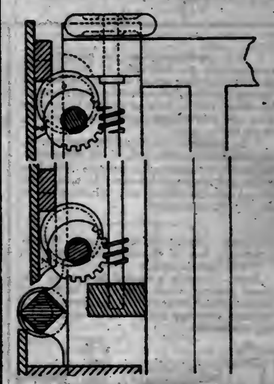


168,527. WATCH-KEYS. George P. Reed, Melrose, Mass. [Filed Sept. 15, 1875.]

The herein-described construction of watch-key, the same consisting of the tubular body A, with the reclined stem B secured to one end, and the swivel at its opposite end, composed of the pierced disk D and wire g, with its eye h, and as bent at its inner end to confine it within the bore of the disk, said disk being properly secured to the end of the body A, and constituting the head of the latter, and the whole being substantially as and for purposes stated.

168,528. WATER-METERS. Wm. P. Rhodes and John H. Bowers, Brooklyn, N. Y., assignors to said Rhodes and De Witt C. Traphagen, same place. [Filed June 12, 1875.]

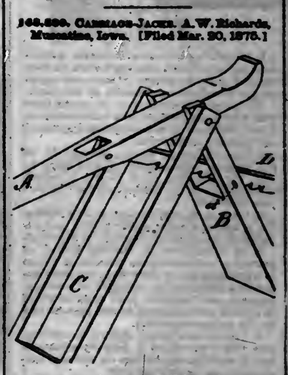
Brief.—A portion only of the water to be measured passes through the measuring mechanism—a portion always in the same ratio to the measured portion. To maintain this said proportion, two valves upon the same spindle are employed, one actuated by the measured current, and actuating the other valve, which controls the measured portion.



1. In a water-meter, the working and registering part of which receives a portion of the current to be measured, the combination of the valve G, which is controlled by the main current of water that does not enter the working and registering part of the meter, with the valve H, which controls the portion of water entering the meter proper, substantially as herein shown and described.

---

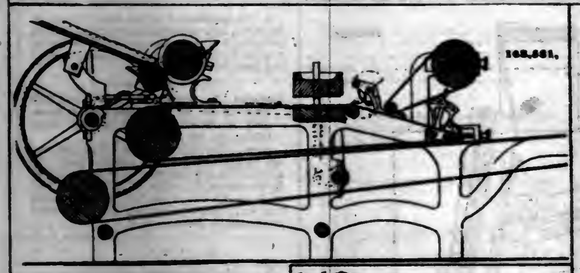
2. The combination of the valve G and H, spindle d, and counterpoise or spring f, with the body A of the meter, and with the water-conduit D, all substantially as herein shown and described.



168,529. PLANING-MACHINES. David Hall Bliss and Jno. W. Murkland, Lowell, Mass., said Murkland assignor to said Bliss. [Filed Jan. 13, 1875.]

Brief.—The bed is vertically adjustable, and can be carried forward in a curved path, concentric with and just outside the arc described by the cutter, by means of saddles attached to the under side of the bed, and embracing four concentrics, which support the four corners of the bed at the same level.

The combination of the adjustable table O with the concentrics X X, by means of the saddles S S embracing the concentrics and carrying the table upward and forward toward the cutter in a curved path concentric, or nearly so, with the cut, substantially as described.



168,530. CARRIAGE-JACKS. A. W. Richards, Muscatine, Iowa. [Filed Mar. 20, 1875.]

The recessed supports B C, hinged together, and adapted to be folded one within the other, in combination with the rack-bar D, bolt d, and lifting-lever A, all constructed and arranged as described.

168,531. CRACKER-MACHINES. J. W. Rogers, Rushville, N. Y. [Filed July 30, 1875.]

Brief.—A leaf of metal is secured to the frame, having one edge brought close to the feed-roll. Flour being placed thereon is spread over the surface of the roll by the revolution of the latter. A slotted plate, having its ends bent up, and pivoted upon the finger-bar, carries lifting-pieces, which may be adjusted laterally in the slot, and that is adapted to raise each alternate finger, or any number of the fingers simultaneously.

168,591.

1. In a cracker-machine, the combination, substantially as described, of the inclined shelves extending across the apparatus, and having their lower edges projecting closely against the dough-rollers, forming troughs for holding flour and distributing the same to the rollers, as set forth.

2. In a cracker-machine, the combination, substantially as described, of the separating-fingers for separating the crackers from the scrap, and the finger-bar carrying adjustable curved arms for raising and throwing down the fingers, as specified.

168,592. Machine for Boring Blind-Stiles. Jas. M. Seymour, Newark, N. J. [Filed Mar. 2, 1875.]

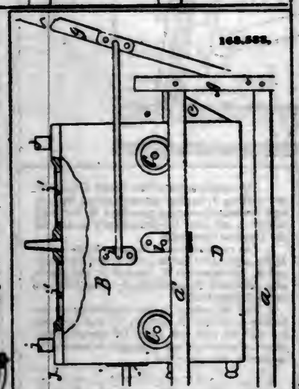
Brief.—The stile is carried forward by frictional gearing, which allows it to be stopped for a sufficient length of time to bore the hole without arresting the movement of the feeding mechanism.

1. The sliding bit-holder H, having a reciprocating as well as a rotating motion, in combination with the shifter S' and cam *o'*, arranged to operate substantially as described.

2. The spacing-carriage E, in combination with stop-rack *j*, pawl G, cam *o*, friction-drum A, and friction-cord *x*, arranged and operated substantially as described.

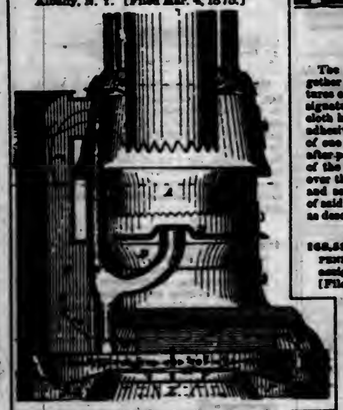
3. The transverse sliding carriage D, in combination with bed-plate C and stand A, with the connecting parts thereto attached, substantially in the manner and for the purpose described.

4. Gage *s*, in combination with a boring-bit, *p*, having a reciprocating motion, and bit-holder H, operated substantially as described.



5. In a machine for spacing, boring, or punching, and moving the material by means of friction, as herein described, the combination of a reciprocating boring-bit or punch, *p*, frame G, and stop-rack *j*, all being arranged to operate automatically, in the manner and for the purpose described.

6. The concave friction-drum A, in combination with friction-cord *x*, laterally-adjustable bed D, and spacing-carriage E, operated substantially as herein described.



7. The yielding clutch-shifter S', in combination with the reciprocating bit-holder H, and cams *o o*, constructed and operated substantially as and for the purpose herein set forth.

168,593. Churn. Israel M. Smith, York, Pa., assignor of one-half his right to E. K. Lectroon. [Filed Dec. 5, 1874.]

In a churn, the reciprocating perforated cream-tub B, having rollers C, hooks *l*, grooves *c*, and removable perforated partitions D', in combination with the frame A, provided with ways *n'*, and rods F F, having a perforated stationary damper, substantially as described, and for the purpose set forth.

168,593.

168,594.

168,594. Heating-Stoves. Hiles Smith, Albany, N. Y. [Filed Mar. 4, 1875.]

1. In a reversible-flue heating-stove, the combination of the combustion-chamber, two horizontal base-flues, and the flues G G, one of which is connected with each of said horizontal base-flues, substantially as and for the purposes set forth.

2. In a reversible-flue heating-stove, the combination of the direct horizontal base-flue, the ascending flue K, bisected in its lower portion, and the return base-flue, substantially as and for the purposes set forth.

3. The combination, with the base-side flues H H, made in the base proper of the stove, leading the hot gases from the descending flue at the rear forward, and in contact, in part, with the sides of the said base, to the front, of the descending flue I and sub-flues J J, and ascending flue K, substantially as and for the purposes set forth.

4. In combination, in a heating-stove, ascending and descending flues and base and sub-base flues, connected, arranged, and operating substantially as and for the purposes set forth.

5. In a heating-stove, a hot-air chamber, I, below the sub-pan combustion, receiving air from below, heating the same by means of flues in the sides and below, and discharging the same heated through openings in its periphery, substantially as set forth.

6. The combination, with the fire-pot A, flue G, and hot-air chamber I, of the annular air-flue O, having its outer walls perforated, and pipes H, substantially as and for the purposes set forth.

7. The combination, with the air-chamber I, heated by the base-flues, and flues G, heated by the heat from the fire-pot, and the combustion-chamber, and pipes H H', of the air-chamber F, substantially as and for the purposes set forth.

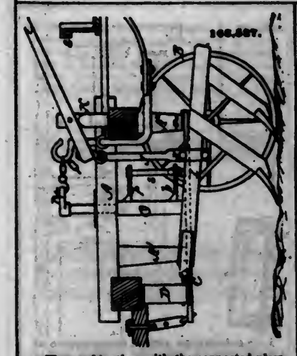
8. The combination, with the air-chamber I, heated by the base-flues, flues G, heated by the heat from the fire-pot and combustion-chamber, of the air-chamber B, made around the upper portion of the combustion-chamber, substantially as and for the purposes set forth.

9. The combination, with the hot-air chamber, located in the base of the stove, and heated by the heat of the base-flue or flues therein, of the air-wheel M, substantially as and for the purposes set forth.

168,595. Method of Binding Books. G. K. Snow, Watertown, Mass., assignor to Mary J. Snow, same place. [Filed Sept. 13, 1874.]

Brief.—Small slits are made in the line of the back of folded signatures. Short gummed strips are passed through these slits. One end of each strip is secured to the inside of the signature, while the other end passes across the back of its own, and is secured to the next signature.

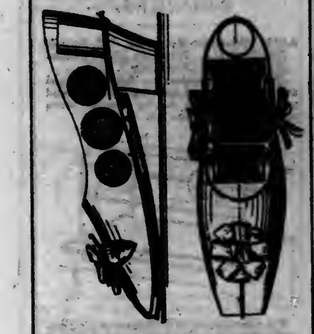
The method herein set forth of securing together two or more newspaper sheets or signatures of a book and the several leaves of said signatures by means of strips or patches of cloth having one end secured, by gum or other adhesive material, to the inner surface or leaf of one sheet or signature, and the other end, after passing through a slit formed in the line of the fold of said sheet or signature, folded over the back of the next sheet or signature, and secured in like manner to the outer leaf of said second sheet or signature, substantially as described.



168,596. Paper-Fastening and Card-Suppressing. G. K. Snow, Watertown, Mass., assignor to Mary J. Snow, same place. [Filed Sept. 13, 1874.]

A paper-fastener and card-suppressor having tongue A' cut from its body and turned down, leaving the loop A', all formed from a single piece of cloth, leather, or other flexible material, susceptible of being secured to sheets of paper by means of gum, glue, or other adhesive material, all as and for the purpose described.

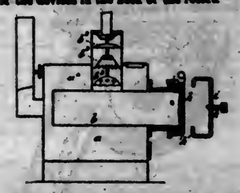
168,597. Sulky-Cultivators. Job Spain, North Lewisburg, Ohio. [Filed July 24, 1875.]



Brief.—Devices for swaying cultivator-beam connected together by an arch suspended from a lifting-lever.

168,597.

The combination, with the connected plow-beams I, of the rock-shaft J, with treadles *i* and handles N, vertical chafts O, with arms *o p*, and adjustable plate *s*, substantially as and for the purposes set forth.



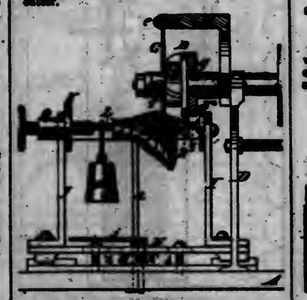
168,598. Grinder-Chair. J. B. Stearns, Jr., New York, N. Y., assignor of one-half his right to S. L. Stearns, same place. [Filed Aug. 30, 1875.]

A sewing-case composed of the spool-holder, needle-book, thimble-case, emery-cushion, and button-box, all combined and arranged as shown and described.

168,599. Gas Apparatus. H. J. Sherman, Belvidere, Maryland. [Filed June 8, 1875.]

Brief.—Pieces iron wire twisted with salammoniac in the final chamber of the wet purifier. Deliquescent gasifies the tar by aid of the devices in the seat of the retort.

1. In combination, the retort *b*, the branch *b'*, and the series of cups or bowls *b''*, constructed and arranged substantially as described.



2. The purifier *l*, constructed with compartments or chambers F F F F F, provided with self-acting doors *n*, and with the inner chamber *o*, as herein described, and for the purpose specified.

3. The method or process of purifying gas by the use of iron wire saturated by sal-ammoniac, in the purifier of a gas apparatus, for the purpose specified.

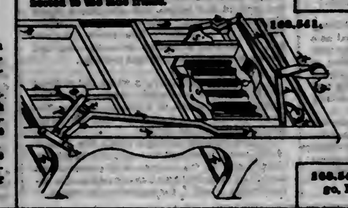
4. The apparatus for manufacturing gas, consisting of the furnace *a*, retort *b*, purifier *l*, and gas-holder, shown disunited, and their fittings and connections, as shown, or the equivalents thereof, constructed, combined, and operating as herein set forth.

168,600. Hose-Tightening Machines. Isaac Van Nostrand, Brooklyn, N. Y., assignor to himself and Thos. P. King, same place. [Filed Aug. 2, 1875.]

Brief.—The shoe or boot is supported upon the ends of two independently oscillating beams, so that the curved portions of the heel may readily be brought to the action of the cutter.

1. The gage-plate G, constructed as herein described, attached to the arm B by a screw, *s*, passing through a slot, *f*, and provided with the slot *g* for the passage of the shaft C, in combination with the rotary cutter-head and shaft, substantially as and for the purpose herein set forth.

2. The work carriage or jack, having its beams K K' arranged to oscillate independently of each other, whereby the work is enabled to automatically adapt itself to the cutters and gage-plate, substantially as herein described.



3. In combination with the two beams K K' of the jack the flexibly-connected crossbar L and adjustable weight M, for varying the relative pressure on the two beams, substantially as described.

4. The combination, with the slotted bed-plates H of the carriage or jack, of the eccentric J and handle or lever *j*, substantially as and for the purposes herein described.

5. The combination of the treadle P, rod *n*, cross-bar L, and beams or bars K K' of the jack and weight M, for feeding the work to and from the cutters, substantially as herein described.

168,601. Sewing-Machine. William P. Valentine, San Francisco, Cal. [Filed Dec. 31, 1874.]

Brief.—The thickness and taper of the shingle are regulated by means of a tilting table having an almost universal adjustment, by which the angle of the bolt is changed after each shingle is sawed. The receding movement of the bolt-carriage can be checked or stopped by a spring, which connects the ends of the side frames, and a buffer attached to the rear of the carriage. The dogs which grasp and release the bolt can be operated either by a pivoted lever attached to the carriage by an arm, and to a pair of toggle-levers actuated by a cord and weight, in connection with a pulley in the outer end of a buffer secured across the middle of the end of the main frame, or by a pivoted lever and foot-bar, provided with an angular end, and connected to the side frame.

168,601.

---

1. The spring K, for connecting the ends of the side pickers of the frame A, in combination with the carriage B, with its buffer *l*, substantially as and for the purpose above specified.

2. The pivoted bar *m*, with its angular end *o* and spring *p*, and the hand parallel bar *p*, in combination with the carriage B, with its arm *s* and pin *t*, substantially as and for the purpose above described.

3. The carriage B, with its arm *s'*, lever *u*, and toggle-levers *v v*, in combination with the buffer *n*, pulley *x*, cord *y*, and weight *z*, substantially as and for the purposes recited.

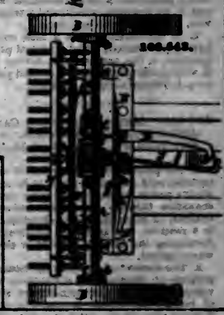
168,602. Distilling Oils. Cornelius Van Dorcort and Cornelius Van Fleet, Fishkill, N. Y. [Filed Sept. 9, 1875.]

Brief.—Metallic rim of cover cuts into the wooden tank until stopped by a flange. Cover clamped down onto the rim. Clamp may be swung away from the tank.

1. A cover metallic cover, *b*, provided with the flange *c* and steps *h*, in combination with a wooden tub, *a*, the flange *c* forming a tight joint, substantially as shown.

2. The combination of the rod 1, ratchet 2, lever 3, dog 4, and catch 5, substantially as set forth.

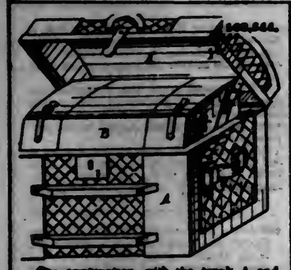
3. The combination of the hooked rod 1, ratchet 2, and a clamping device, the rod and ratchet being jointed together, so that the whole clamp may be laid back on the floor, substantially as set forth.



168,603. Horse-Rakes. Henry C. Velie, Poughkeepsie, N. Y., assignor to W. Adriance, same place. [Filed June 30, 1875.]

Brief.—The rake-head is supported upon a collar mounted on the main axle. A clutch secured to main axle interlocks with collar, and by tripping to it the motion of the axle the rake is thrown up and discharges load. The supporting-collar is provided with serrations, into which a lever engages, whereby the rake-head is retained in any position.

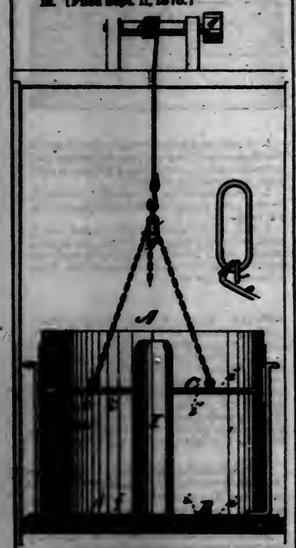
---



1. In a horse-rake, the clutch C and clutch-lever D, in combination with the collar G and rake-head H, the clutch and the collar being mounted on the axle A, substantially as described.

2. The combination of the collar G, having the serrations *s*, and supporting the rake-head H, with the lever J, substantially as described.

168,603.



168,604. Trough. Herman Vogler, Chicago, Ill. [Filed July 20, 1875.]

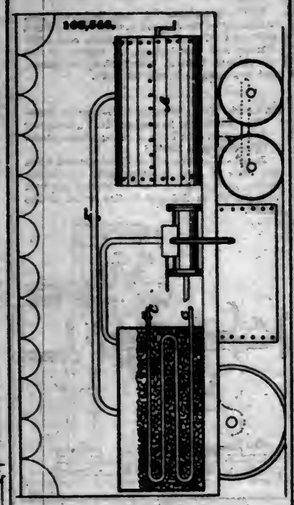
168,644.

The combination, with the trunk A and lid A', of the tray B, hinged to the trunk in advance of and concentric to the said lid, the vertical leaf-spring d, having the notch c on its rear side, and the stud f, the several parts being arranged and operating in the manner described and shown.

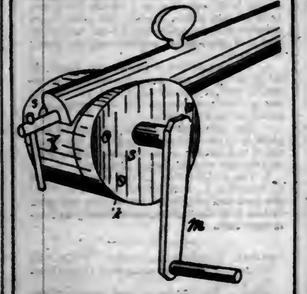
168,645. Dentists' Attachments for Oral-Pumps. Thomas Webber, Chicago, Ill. [Filed Sept. 11, 1875.]

1. In a tank-still pump, the combination, with a pump-bar, A, of the detached false bottom C, an elevating-wheel, and a tripping device, substantially as specified.

2. In combination with a false bottom, C, having perforations f and a center perforation, e, the pump-bar A, having bottom E, with perforations d, and a central pneumatic cave, I, substantially as specified.



168,646. Method of Using Carbonic-Acid Gas as a Motive Power. J. Westcott, Towd, Pa. [Filed Sept. 10, 1875.]

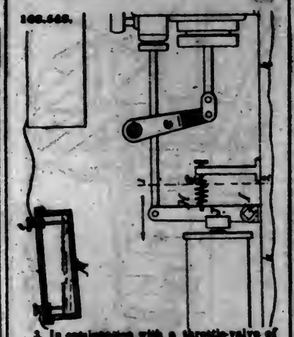


1. The herein-described method of utilizing carbonic-acid and other gases to be used as a motive power, by storing the same up by condensation through the surface attraction of charcoal or other equivalent absorbent placed in a receiver, and afterward discharging and developing the said gas by heat or electricity when desired.

2. The method of applying the heat, for the purpose of effecting the elaboration and development of the gas, by means of a vessel of boiling oil, which is made to circulate through pipes in the receiver, substantially as described.

168,647. Bottling Apparatus. Linton R. Wilson, Caldwell, Ohio. [Filed July 15, 1875.]

Brief.—Connected with the faucet is a chamber, in which revolves a piston to draw the liquid from the spigot and force it through the exit-pipe.



The combination, with the faucet, of the chamber c, ports b and d, cylinder A, crank-handle m, plate a, central piece x, and check-pieces s, as and for the purposes described.

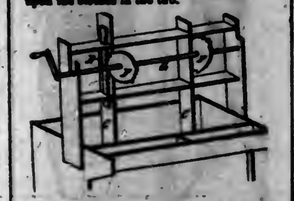
168,648. Electrical-Marine-Engine Governors. Christopher C. Walcutt, Washington, D. C. [Filed Sept. 7, 1875.]

Brief.—Making and breaking an electric current, due to motion of vessel, controls the force operating the throttle-valve of engine. The motion of vessel brings the mercury in the receptacle m in contact with the screw f, thus making circuit, and bringing the armature I in contact with the magnets. The armature draws back the rod G, drawn to admission to the rear of the piston, and the arm e closes throttle to prevent "racing" of engine. Upon receding of the mercury from screw f, the circuit is broken, armature released, and the piston returns to its original position.

1. A marine governor, in which the making and breaking of an electric circuit, due to the motion of the vessel, is made to control the force applied to operate the throttle-valve, substantially as set forth.

2. As a medium through which the motion of the vessel is caused to make and break an electric circuit, the receptacle M, containing a supply of mercury, and having adjustable attachments, e and f, for receiving the wire.

168,649.



3. In combination with a throttle-valve of a steam-engine a steam, air, or other engine for operating the said valve, and an electro-magnet for operating the valve of the said engine, all substantially as specified.

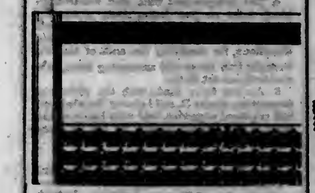
4. A cut-off motion, in which the making and breaking of electric circuit, due to the engine, is made to control the force applied to operate the cut-off valve, substantially as set forth.

REISSUES.

4,972. Washing-Machines. J. B. Barnes, Blizabeth, N. J. Patent No. 101,854, dated Apr. 12, 1870. [Filed July 7, 1875.]

Brief.—The pounders are formed of wood and metal slats, and are lifted by a cam and segment cog-gearing, making alternate blows upon the clothes in the tub.

The combination, in a clothes-washing machine, of the pounders constructed of slats of wood and metal, with the self-adjusting and self-regulating cog-gearing E and F F, the upright C C, and the shaft G with the bottom of narrow slats, as shown and described.

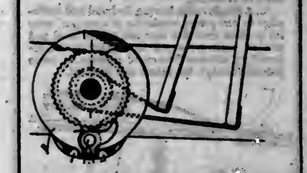


4,973. Sash-Doors. Reed Kehoe, Dayton, Ohio, assignee of Josephine Rogan, John Rogan, Harvey Rogan, Corrie Rogan, and Augusta B. Rogan, heirs of Bernard Rogan, deceased. Patent No. 97,978, dated Nov. 24, 1869. [Filed June 1, 1875.]

1. A distributing device for a force feed grain-drill, consisting, substantially, of a reciprocating or rotary hopper, having an elevated delivery-orifice, and a cam-wheel, having on its periphery a series of helical cavities, supported by a series of spiral ribs or projections for evenly distributing the grain, the parts being arranged substantially as shown and described.

2. The feed-wheel D constructed in sections *c c c*, or with notches *c c* in the spiral projections, substantially as and for the purposes set forth.

4,974. Wash-Boards. Wesley Todd, Ottawa, Ohio, assignor, by mesne assignments, to Silas P. Todd, D. A. Rinehart, and R. P. Doff, Wilkins Township, Allegheny County, Pa. Patent No. 111,668, dated Feb. 7, 1871. [Filed Sept. 7, 1875.]



1. A sheet-metal wash-board having a series of raised projections, B, each bounded by longitudinal and transverse grooves or depressions, substantially as set forth.

2. In a sheet-metal wash-board the projections B, each bounded by grooves or depressions, in combination with raised projections C in the bottoms of the lengthwise grooves, substantially as set forth.

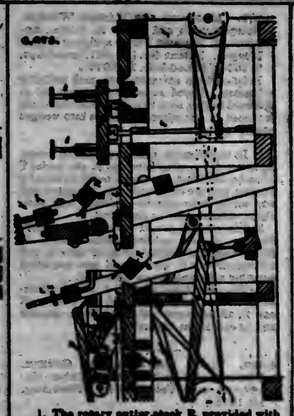
3. As a new article of manufacture a sheet-metal wash-board, having corrugations both longitudinally and transversely ribbed or corrugated, substantially as set forth.

4,975. Devices for Converting Motion. William F. Barnes, Rockford, Ill., assignor of one-half interest to John Barnes, entire piece. Patent No. 168,696, dated Jan. 20, 1874. [Filed Aug. 6, 1875.]

1. The driving-wheel, constructed as described, with a smooth-surfaced shoulder for the reception of a pawl-carrier and pawl, and a pinion-wheel, in which the pawl engages, between the wheel and shoulder.

2. The driving mechanism hereinbefore described, consisting of the combination of the shoes, its disk or flange, the pawl-carrier, and the pawl mounted thereon, both operated by the disk, as set forth.

3. The combination, substantially as hereinbefore set forth, of the trunnion, their crank, the driving-screw around which they pass in opposite directions, the disk on the screw, and a pawl-carrier and pawl operated thereby.



4. The mechanical movement hereinbefore described, consisting of the combination of a shaft, a driven wheel mounted thereon, a driving-disk or flanged shoe, an independent pawl-carrier, and a pawl mounted thereon driven by the disk, and acting upon the driven wheel, substantially as hereinbefore set forth.

5. The combination, as herein before set forth, of the driving-disk, the independent pawl-carrier, and the pawl pivoted thereon.

4,976. Machine for Making Wooden Gutters, &c. Benjamin Allen, K. P. Bullen, Gardiner, Me., assignor of part interest to H. W. Jewett and S. N. Emery, same place. Patent No. 117,660, dated July 25, 1871. [Filed Sept. 28, 1875.]

Brief.—Wooden gutters with closed ends are formed at one operation by means of a series of rotary cutters mounted in adjustable inclined frames, and arranged to cut the groove in the blank, so as to leave a single portion of it uncut at each end, and which does and form the exterior of the gutters in connection with a series of horizontal platforms, upon which the blank is placed, and suitable feeding mechanism.

4,976.

1. The rotary cutter-stock R, provided with its cutters to form the groove of the gutter, in combination with the inclined frame S, to operate as herein described, and for the purposes set forth.

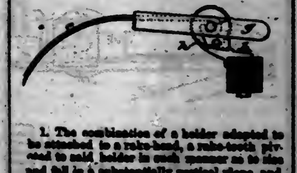
2. The combination of the rotary cutter-stock R, inclined adjustable frame S, the rotary cutter-stock W, with its adjustable frame T, and the platforms *c d*, for the purpose of digging the gutters, as herein described, and making the same at one operation of the machine, as herein specified.

3. The combination of the rotary cutter-stock R, frame S, rotary cutter-stock W, with its adjustable frame T, cutter-heads X Y, arranged as represented, and the rotary cutter-head Z, to plow, mold, and place the gutter, substantially as herein described.

4. The gutter-machine hereinbefore described, the same consisting of the series of platforms *a b c d e*, the guide *f*, the pressure-rollers *g h*, adjustable gage *m*, the feed and pressure rollers I K H, the rotary cutter-stock R, with its adjustable frame S, rotary cutter-stock W, with its adjustable frame T, the cutter-heads X Y, and the cylinder Z, all the cutter heads or cylinders being provided with cutters, and the whole being constructed and combined together and applied to the frame H, substantially in manner and so as to operate as and for the purposes specified.

4,977. Shafts. Oliver Edwards Fiereson, Mass. Patent No. 168,207, dated May 18, 1875. [Filed Sept. 1, 1875.]

1. A spring shaft-runner, formed at its front end into a rearward-inclined riser, A', with a slight re-entering curve, A', and a curved shoeing-support or bar, c, for the footpiece, the same being a combination or continuation of the runner, and of a gradual taper or decreasing vertical thickness, and slightly-increasing width from the point of the riser to the end of the support c, as and for the purposes described.



2. The combination of the shoeing heel-plate D', having depression *f'* and stud *h*, clamp-plate D, and screw *d*, with the adjustable bar C, substantially as described.

3. The combination of the shoeing heel-plate D', having depression *f'* and stud *h*, clamp-plate D, and screw *d*, with the adjustable bar C, substantially as described.

4. The adjustable clamp E, with curved to receive the side of the heel, and bent outward at the slot *f* to receive the clamp F, substantially as and for the purposes described.

5. In combination with the adjustable clamp E, curved outward, and then inward, to receive the side of the shoe, and bent outward at the slot *f*, the clamp F C, for securing the front of the shoe to the toe, as described.

4,978. Rakes. Sherman R. Nye, Winchendon, Mass. Patent No. 103,693, dated July 26, 1870. [Filed Aug. 2, 1875.]

1. The combination of a holder adapted to be attached to a rake-head, a rake-tooth pivoted to said holder in such manner as to rise and fall in a substantially vertical plane, and a torsional spiral spring supported entirely by said holder, and exerting a downward-yielding pressure by torsion on the pivoted tooth.

2. The holder *a*, in combination with the tooth *c* and torsional spiral spring *i*, substantially as described, for the purpose specified.

3. The brace or lever *g*, in combination with the holder *a*, tooth *c*, and stops *h d*, substantially as and for the purpose specified.

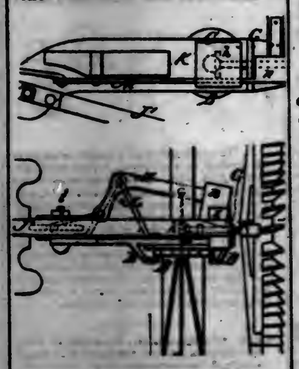
4,979. Horse-Rakes. Sherman R. Nye, Winchendon, Mass., assignor to himself and A. B. Barnard, same place. Patent No. 98,797, dated Jan. 18, 1870. [Filed Aug. 2, 1875.]

Brief.—The arrangement of the teeth prevents the escape of the hay being raked on the ends of the rake.

1. A hay-rake having its teeth arranged so as to present a concave or dished front at the part where the hay is raked, substantially as and for the purpose specified.

2. The compound lever G H, attached to the support *g* on the rake-axle, and to the framework of the rake in front of the axle, substantially as and for the purpose specified.

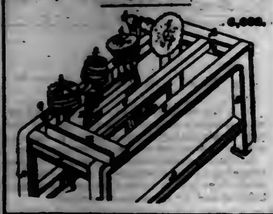
6,000. PAPER BOXES. Edwd. De F. Shelton, Birmingham, Conn. Patent No. 169,194, dated Oct. 26, 1874. [Filed Aug. 19, 1876.]



1. In a paper box made from a single piece of paper, the described method of forming its bottom without a tuck or fold exposed to the inside of the box, and each of its angles made secure and tight by drawing upward through the box the strip of which the bottom is an integral part, and upsetting the flaps of said strip, and, by so doing, covering all tucks and adjoining the bottom in plain, and locking them in securely by bending the end of the strip across the top of the box, and forming with it a part of the closing tuck.

2. As an article of manufacture, the box herein described, consisting of a blank cut from a single piece, to form the principal sides B B and A A, and the ends D I, with the auxiliary sides D D, and parts O O, F F, and I, H, folded and secured substantially as specified.

6,001. WHEELBARROW. Jas. Hall, Lafayette, Ind. Patent No. 169,604, dated Oct. 26, 1875. [Filed Aug. 14, 1876.]



Brief.—The principal vane is pivoted to the end of an extension of the ture-table, so that it allows the vane to swing around at right angles to the plane of the wheel without passing across the center of the turn-table. The arrangement of the parts about the vertical axis of the turn-table balances all the movable parts, whether the mill be running or at rest.

1. In the windmill described, the arm J, pivoted at i to the offset of turn-table extension K, and carrying on one end a vane, J, and on the other a balancing-weight, k, substantially as described.

2. In combination with the turn-table extension K, the vane I, wheel H, and the vane-carrying arm J, pivoted and balanced as described.

3. The pivoted vane-carrying lever J, lever M, connecting-rods m, and weight n, in combination with the wheel H, turn-table O, and vane I, substantially as described.

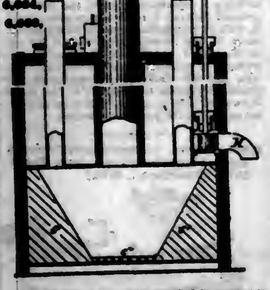
6,002. MACHINES FOR MAKING WIRE. Gerry Morgan and Jacob B. Foster, Andover, N. H.; said Foster assignor to said Morgan. Patent No. 14 3,227, dated Apr. 7, 1874. [Filed Mar. 15, 1876.]

Brief.—Three saw-mandrels, each carrying a fructum-shaped series of saws, are set at different angles, so as to cut the material which is placed on a reciprocating table into wedges at one operation.

1. In combination with a supporting-frame, A, and reciprocating carriage B, the series 1 of saws, the fructum-shaped inclined series 2 of saws, and the cutting-off saw F, constructed and acting in co-operative relation with each other, substantially as described.

2. The combination of the series of saws 1, fructum-shaped inclined series of saws 2, fructum-shaped inclined series of saws 3, and cutting-off saw F, constructed and operating together substantially as described.

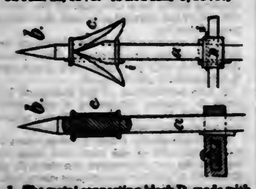
3. The combination of the two fructum-shaped series 2 3 of saws and the cutting-off saw F, all arranged substantially in manner and to operate as described.



6,003. TAPERS FOR ASPHALTIC CEMENT. Tobias Now, New York, N. Y. Patent No. 147,622, dated Feb. 10, 1874. [Filed Aug. 14, 1876.]

1. A package for liquid asphaltic cement, consisting of an air-tight shell, a lining of some substance that is a non-conductor of heat, and an inside furnace, to enable the cement to be retained as a liquid, in the manner described.

2. The construction, with chamber B, of the subjacent furnace C, having smoke-pipe passing up through chamber, as and for the purpose set forth.



3. The combination, with chamber B, of the tubes *f*, rising from an air-chamber around the fire-pot, as and for the purpose specified.

6,004. TAPERS FOR ASPHALTIC CEMENT. Tobias Now, New York, N. Y. Patent No. 147,623, dated Feb. 10, 1874. [Filed Aug. 14, 1876.]

The process of applying asphaltic cement to pavements, roofs, and analogous uses in a liquid state before the heat of distillation has passed away, substantially as and for the purpose specified.

6,005. IRON FENCES. John B. Wiebenham, Philadelphia, Pa. Patent No. 169,169, dated Jan. 28, 1876. [Filed May 8, 1876.]

1. The metal connecting-block D, made with holes through them for the bars and seats for the verdigris or keys that bind such blocks to the bars, substantially as set forth.

2. The plates of an iron fence made with the upper end of the iron picket projecting through and above the cast metal that forms the ornament contiguous to such upper end of the picket, as set forth.

3. The ornament *f* for an iron fence, containing a key-seat and secured to the iron picket by a wedge or key, substantially as set forth.

4. The independent cast-iron connecting-block D for an iron fence, made separately from and secured to the post *f*, and provided with holes entering such block in opposite directions, for receiving the ends of the two wrought-iron bars *c* and sustaining them, substantially as set forth.

5. An iron fence made with the pickets *c*, connecting-blocks D, rail *l* placed therein and rail *n* placed otherwise, said rails being at the sides of the pickets, as and for the purposes set forth.

6,006. BAND-RUFFLER. Geo. R. Wooster, New York, N. Y., assignor, by mesne assignments, of Thomas Rathbun. Patent No. 69,770, dated Sept. 1, 1868. [Filed Aug. 30, 1876.]

1. As a new article of manufacture, the band-ruffle described and shown, consisting of a strip of plaited muslin or other material, in which the plaits are narrow and regular, and extend across the strip, the strip being made to produce both the ruffle and the band by being stitched through the plaits with two rows of stitching, one of which is also made to secure the edge of the material, which is turned in to give a finish to the band, each plait being secured by a single and separate stitch, and the ruffle-edge being caused to have a corrugated or wavy appearance, substantially as described.

2. A single ruffle having a band formed out of the same strip with the ruffle-edge, said band being hemmed and reinforced still by being formed of narrow and regular plaits, fastened, and secured by two straight and continuous rows of stitching.

3. A single ruffle having its band and ruffle-edge in one piece, consisting of a strip of muslin or other material, hemmed at the band and plaited entirely across in regular plaits, secured by stitches formed of a series of loops passed through the fabric and secured.

6,007. MACHINES FOR MAKING BAND-RUFFLES. Geo. R. Wooster, New York, N. Y., assignor, by mesne assignments, of Thomas Rathbun. Patent No. 69,770, dated Sept. 1, 1868. [Filed Aug. 30, 1876.]

Brief.—A fastened tube has at one end a portion of its upper surface cut away, and one of the edges thus formed is folded upon itself, so as to turn under one edge of the strip of cloth as it passes through the tube. A spring plaiting-plate in line with and over this tube, and operating with its edge upon the cloth just in advance of its issue from the tube, is connected to a ball-crank lever, which is rocked forward by a cam to make a gather in the strip, and is retracted by a spring. The cloth-plate has two openings for the passage of the two needles, one of which stitches the turned-in edge, and the other makes a line of stitches near the middle of the ruffle, whereby a band is formed between the rows of stitches and a ruffle at one side.

1. In a ruffling or plaiting device, the combination, with the ruffling-tube, of a guide, arranged substantially as described, to guide and deliver the strip to be ruffled, and at the same time turn over the edge of such strip to form a hem for the ruffle, substantially as described.

2. The combination of a ruffling-tube and the supporting-plate of a sewing-machine, provided with openings for two needles, with a guide adapted to turn or hem the edge of the ruffle, and arranged to deliver the strip to be ruffled to receive two rows of stitches, and to form a band between the rows of stitches and a ruffle at one side thereof, substantially as described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 15. TUESDAY, OCTOBER 12, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

NOTICE TO MANUFACTURERS AND OTHERS.

UNITED STATES PATENT OFFICE,
Washington, D. C., October 5, 1875.

The COMMISSIONER OF PATENTS respectfully requests manufacturers of and dealers in engines, machines, apparatus, tools, and appliances of whatever kind, to send to this Office duplicate copies of all catalogues and circulars which they have issued or may issue from time to time.

R. H. DUELL, *Commissioner.*

COMMISSIONER'S DECISIONS.

IGNATIUS HAHN.—*Appeal.*

[*Appeal from the Principal Examiner in the matter of the application of Ignatius Hahn for letters patent for* HYDRAULIC UNIVERSAL MACHINE FOR SHEARING, *&c.—Decided September* 3, 1875.]

A functional claim is one that has for its subject the performance of an act merely, and not the means by which that act is executed. It is not for a substantive thing, but for a *result* which that thing accomplishes. Its language is usually in the participial form.

A claim for "The combination of two carriers, each capable of revolution around a central axis and both capable of lateral movement in the main frame, substantially as and for the purpose specified," held not to be functional, but as a claim for a particular arrangement of certain devices; and not for the motions of which they are capable when so arranged, nor for the subordinate means by which such motions are produced.

The rule that it is admissible under proper restrictions for parties to put their claims in different forms to prevent misconstruction of them by the public or the courts, reiterated and approved.

Broad claims give rise to the appearance of indefiniteness, but regard must be had to the specification as to their scope.

SPEAR, *Acting Commissioner:*

Applicant's invention relates to the construction of a hydraulic universal metal-working machine for cutting, straightening, riveting, heading, and testing strength of metals, &c.

His claims are as follows:

1. In combination with the main or supporting frame two tool posts or carriers, one of which is operated by a hydraulic piston, substantially as and for the purpose specified.

2. The combination of two carriers, each capable of revolution around a central axis, and both capable of lateral movement in the main frame, substantially as and for the purpose specified.

3. The combination of two tool-carriers, each capable of revolution around a central axis, and one or both operated by a hydraulic piston secured to the main frame, substantially as and for the purpose specified.

4. The combination of two tool posts or carriers, one or both of which are operated by hydraulic pistons attached to the main frame, the whole being mounted so as to be portable, substantially as and for the purpose specified.

5. The combination of two tool-carriers, each of which is capable of revolution around a central axis, two shear-blades, and suitable mechanism for operating the shears, substantially as and for the purpose specified.

The main objection of the Examiner to these claims is that they are functional. He says:

The first, third, and fourth claims are to the same combination of substantive things, being a frame, two carriers, and a hydraulic piston; but in order that each claim shall appear to be to a distinct invention, different functions are, in the several claims, ascribed to the different elements—functions, it should be understood, not inherent in those elements, but such as are due to, and improved by, other elements than those named. The differences between the three inventions are therefore purely functional differences, from whence it should seem to follow that the inventions themselves are likewise functional. The second claim is even more objectionable in this regard. Here is a single device—*i. e.*, a pair of tool-holders—a very common device, dependent entirely for its novelty or patentability on functions which it does not possess otherwise than as borrowed from other mechanism.

The same objection was made to the present fifth claim.

It is clear from the numerous decisions of the courts and Office on that point, that what is known as a functional claim is one that has for its subject the performance of an act merely, and not the means by which that act is executed. It is not for a substantive thing, but for the *result* which that thing accomplishes. Its language is usually in the participial form, as "producing," "operating," "determining," "so combining," "so constructing," &c. (See case of *Simonds*, C. D., 1870, 23, and that of *Cox*, 3 OFFICIAL GAZETTE, 2.)

An example is also given in the case of *Sickles* vs. *The Falls Company*, (2 Fish., 202.) There the claim of the patentee was as follows:

Imparting a coexisting movement to two reciprocating catch-pieces in the operation of trip-off valves.

On this the court said—

The claim, in terms, is for an effect or function, and therefore not patentable.

In *Renwick* vs. *Pond*, (5 Fish., 579,) the court held that—

claiming the arrangement of a combination, when the arrangement is such as to produce a given mechanical result of the combination, is not a claim to a function. The result is not claimed irrespective of the means of producing it. The means alone are claimed, and claimed only when specially arranged to produce a given result. This is very far from claiming a function.

Guided by these definitions I am unable to see that the claims of the present applicant are for functions. Take, for instance, the second claim, which perhaps covers broader ground than any of the others—

The combination of two carriers, each capable of revolution around a central axis, and both capable of lateral movement in the main frame, substantially as and for the purpose specified.

Clearly here the subject of the claim is a combination of elements—"two carriers;" and the balance of the claim is simply descriptive of the situation of the carriers, and of the mechanical result to be produced when so situated. The claim is not for *revolving* two carriers around a central axis, &c. That would be for the result; and if such a claim should be sustained by the courts, as has sometimes been the case, it would be construed as covering the *means* by which such result was produced—the means having been described in the specification, and referred to in the claim by the phrase "substantially as specified." But it is not the intention of the applicant here to cover by his claim the subordinate means he has described for producing certain motions, but certain devices so arranged as to be capable of those motions without regard to the special mechanism by which such motions are imparted. If two carriers have ever before been so combined that they were capable of being revolved around a central axis, and of moving laterally in a frame, then the applicant is not the first inventor, and should be rejected; but so far as the *form* of his claims is concerned, he has complied with the law by "pointing out and distinctly claiming the combination which he claims as his invention or discovery."

The Examiner himself asserts that "the first, third, and fourth claims are to the same combination of substantive things," but concludes that the differences between "the three inventions are purely functional," • • "the inventions themselves are likewise functional," and that the law does not contemplate that claims "should be predicated on or be interpreted by functions."

It is hard to imagine inventions that are not based upon some function they perform in the arts or sciences, and it is because they perform some "new and useful" function that they receive the protection of the patent laws. A *claim* for an invention, and the function which that invention performs, are very different matters, but the Examiner has apparently confounded them.

As to the first, second, and third claims being for the same thing, some doubt exists. The applicant insists that each claim contains those elements necessary to accomplish a distinct and definable result, and I am inclined to think his position is the correct one. I think, too, that this objection should be overruled, for the reason given by one of my predecessors in answer to a similar one:

It is admissible, under proper restrictions, for parties to put their claims in different forms to prevent misconstructions of them by the public or by the courts. (*Perry and Ley*, C. D., 1869, p. 3.)

The Examiner further objects that the claims are indefinite. They are very broad, and this fact gives rise frequently to the appearance of indefiniteness; but having regard to the scope intended for them by applicant, as described in his specification, I cannot think the objection a valid one in this case.

The decision of the Examiner is reversed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, NORTHERN DISTRICT OF NEW YORK.

GEORGE S. NEWELL *et al. vs.* GEORGE WEST *et al.*

[*In equity.—Before* WALLACE, *J.—Decided August*, 1875.]

The inchoate right of an inventor to an extension of his patent may be the subject of a contract of sale, and such a contract may be enforced by a bill for specific performance.

R. agreed with M. to apply for an extension of his patent, and to assign the same when procured to M. M. sold his interest in this contract to the U. P. B. Mach. Co. R. dying before the extension was had, his wife was appointed executrix of his will, applied for and procured the extension, and assigned the same to the U. P. B. Mach. Co., but in the assignment described herself as "administratrix," &c. The assignment was duly recorded. Subsequently the widow resigned her trust as executrix, and I. was appointed administrator with the will annexed. I. executed an assignment of the extended term of the patent to N., and N. brought suit for infringement: *Held*, that the recorded assignment to the U. P. B. Mach. Co., notwithstanding the erroneous description of the party executing it, was constructive notice to N. of the claim of an adverse title in the patent, the nature of which he should have ascertained by inquiry; and that this alone was sufficient to defeat complainant's title: *Held*, further, that, in fact, the assignment to the U. P. B. Mach. Co. was valid, notwithstanding the erroneous description of the representative character of the executrix.

[This was a suit in equity under a reissue of letters patent originally granted to Benjamin F. Rice, April 28, 1857, for an "Improvement in Machines for Making Paper Bags."

The complainants having filed their bill for a perpetual injunction and for an accounting, alleging the infringement by defendants of the patent in question, in which they professed to own the exclusive right for the State of New York, the defendants pleaded thereto that the Union Paper-Bag Machine Company was the owner of the patent in exclusion of the complainants. Complainants having taken issue by replication to the plea, the cause now comes on to be heard upon the pleadings and proofs.]

[*M. P. Norton*, for complainants.
H. Binney, Jr., 3d, for defendants.]

WALLACE, *J.*:

The material facts extricated from the mass of documentary and oral evidence contained in the proofs, a large portion of which seems utterly unimportant, are few and simple.

The complainants claim title by an assignment from Ingalls as administrator with the will annexed of Benjamin F. Rice, deceased, and the Union Paper-Bag Machine Company claim, by an assignment, prior in point of time, made by Roxana Rice while acting as executrix of the estate of Benjamin F. Rice.

Benjamin F. Rice was the inventor of the improvements for which the patent was obtained. Shortly before the term of the patent expired he entered into a written contract with one Morgan, who was a part owner of the patent, whereby Rice agreed to make application for an extension of the patent, and use all honorable means in his power to obtain it, and when obtained to set the same over to Morgan, and to execute an assignment thereof at any time upon demand. Morgan, in consideration of the agreement on the part of Rice, paid Rice $500, and agreed to pay him $1500 more upon the delivery of the assignment, and such sum in addition as Rice might expend in procuring the extension. Rice died without applying for the extension, the original term not having expired. He left a will, in which his wife Roxana and his daughter were made the sole beneficiaries, and by which he appointed his wife sole executrix. Subsequently the Union Paper-Bag Machine Company became the beneficial party in interest in the agreement in the place of Morgan, the latter having assigned his rights. Thereafter Mrs. Rice as the executrix of the inventor, and acting in the interest of the Union Paper-Bag Machine Company, applied for and obtained the extension of the patent, and thereupon the latter paid her the $1500 which Morgan had agreed to pay her husband, and she executed to the company an assignment of the extended letters patent. This assignment was duly recorded. It recited the obtaining of the original patent by Benjamin F. Rice, his death, the extension of the patent, and her appointment as his administratrix, and purported to convey her interest as administratrix in the patent as extended.

After the assignment was recorded she resigned her trust as executrix, and Ingalls was appointed administrator of the estate with the will annexed, and he as such administrator conveyed to the complainants the title upon which they now rely.

It is insisted on behalf of the complainants that the assignment to the Union Paper-Bag Machine Company by Mrs. Rice as administratrix, when she was in fact executrix of her husband's estate, did not pass her title as executrix. It is also insisted that if it would have passed such title it was not valid, because her daughter as a legatee under the will, did not assent to the transfer, and because the sale was not made upon the order of the probate court. If it should be conceded that the assignment to the Union Paper-Bag Machine Company was wholly invalid it does not follow that complainants acquired any title by the assignment to them.

They cannot be heard to set up their assignment against the Union Paper-Bag Machine Company, because the latter was equitably entitled to a conveyance of the title, and the complainants had notice of such equity when they procured an assignment to themselves. If Rice had lived and obtained the extended letters patent, Morgan, upon tendering performance of the conditions in the agreement on his part, could have enforced specific performance of Rice's covenant to convey. The inchoate right of an inventor to an extension of his patent may be the subject of a contract of sale. (*Clum* vs. *Brewer*, 2 Curtis, C. C., 506;) and a contract to convey such a right will be enforced by a bill for specific performance, (*Nesmith* vs. *Calvert*, 1 Wood and M., 34.) Where an invention is assigned before it is patented the assignor is estopped, upon obtaining the patent, from setting up any adverse title, (*Herbert* vs. *Adams*, 4 Mason, 15,) and the doctrine applies with equal force where he has agreed to assign, because in such case the purchaser, upon tender of the purchase-price, becomes the equitable owner of the patent, (*Hartshorn* et al. vs. *Day*, 19 How., 211.)

If Morgan could have required specific performance of Rice, the Union Paper-Bag Machine Company as the party in interest in the place of Morgan could have required it of Mrs. Rice as executrix. The patent, when obtained by her, devolved upon her as the legal representative of the inventor "on the same terms and conditions as the same might have been claimed or enjoyed by him in his lifetime." (Sec. 34, act of July 8, 1870.) The obvious intent of the law is to vest in the legal representatives of a patentee, upon his death, the same rights he would have enjoyed if he had lived. The executrix had no higher rights than Rice would have had, and when she received the $1500, which was to be paid upon the transfer of the extended letters patent, the Union Paper-Bag Machine Company became the owner in equity of the patent. Its rights are the same as though that had been done which ought to have been done, and no one, except a *bona fide* purchaser, can now assert the contrary in a court of equity.

The recorded assignment was constructive notice to the complainants of the rights of the Union Paper-Bag Machine Company. It was notice that the latter claimed to be the assignees of the patent which had belonged to the estate of the testator. It sufficed to direct the attention of a purchaser to the claim of an adverse title in the patent, and to enable the purchaser, by inquiry, to ascertain the extent of the right. Inquiry at proper sources would have revealed that Mrs. Rice, though not the administratrix, was the legal representative of her husband's estate when she executed the instrument, and that the consideration was received by her in her representative capacity, thus indicating the right of the Union Paper-Bag Machine Company to a reformation of the instrument by correcting the mistaken description of her representative character.

If these views are correct it is immaterial whether the assignment made by Mrs. Rice to the Union Paper-Bag Machine Company was valid to convey the title or not; but in my judgment it was valid to convey the title.

It has been held that an advertisement of an executor styling himself an administrator is a legal advertisement of himself as executor, sufficient to permit him to set up the running of the statute of limitation, (*Finney* vs. *Barnes*, 99 Mass., 401,) and an averment of one as an administrator, who is in fact an executor, does not constitute a variance in a pleading. (*Sheldon* vs. *Smith*, 97 Mass., 34.) The instrument in question clearly indicates the intent of the assignor to convey as the legal representative of a person deceased. It recites the decease of the inventor, and that the patent was extended, and that she "was duly appointed his administratrix." The only effect which can be given to it is that of a transfer in her representative character; and in view of the authorities which hold that as descriptive terms, the words are practically synonymous, I have no hesitation in giving force to the instrument as a transfer of her title as executrix.

The objection that she had no right to dispose of the estate of her husband without the order of the probate

court is based upon a section of the general statutes of Massachusetts, which enacts that on the application of an administrator or executor, or of any person interested in the estate, the probate court may order any part or all of the personal estate to be sold at public auction or at private sale, and in that event the executor or administrator shall account therefor at the price for which it sells. No authority is cited to sustain the position that this section precludes a sale without such order; and in the absence of a statutory limitation, it is to be assumed that executors in Massachusetts possess the same power that they do at common law. The reasonable construction is that the section in question was intended for the protection of executors, and to afford the aid of the probate court to them and to others interested in the estate, when particular circumstances may require it.

I do not understand that it is claimed that the daughter should have joined in the instrument in order to render the assignment valid at law. If the theory is that she was a *cestui que trust*, whose equitable rights have been disregarded, the sufficient answer is that she had none except in the proper application of the money paid, because the Union Paper-Bag Machine Company were the equitable owners of the patent.

For these reasons I am of opinion that the defendants must prevail upon their plea. A decree is ordered dismissing the bill with costs.

U. S. CIRCUIT COURT, DISTRICT OF CALIFORNIA.

NICHOLAS SIEBERT *vs.* WILLIAM T. GARRATT.

[*In equity.—Before* LORENZO SAWYER, *Cir. J.—Decided September* 30, 1875.]

[*A. H. Evans & Co.*, and *McAllister & Bergin*, for complainant. *M. A. Wheaton*, for defendant.]

DECREE.

SAWYER, *J.*:

This cause came on to be heard at the February term A. D. 1875 of this court, and was argued by counsel, and thereupon, upon consideration thereof, it was ordered, adjudged, and decreed as follows, viz:

That defendant, William T. Garratt, was not the first or original inventor or discoverer of the improvement or discovery claimed by him, in and by those certain reissued letters patent of the United States, number five thousand three hundred and twenty-eight, (No. 5,328,) for an alleged new and useful Improvement in Lubricators, issued by said defendant, William T. Garratt, on the 18th day of March, A. D. 1873, and is not entitled to a patent therefor; and that said reissued letters patent number five thousand three hundred and twenty-eight (No. 5,328) are declared void, and the same are hereby vacated and set aside by reason of their interference with those certain letters patent of the United States number one hundred and eleven thousand eight hundred and eighty-one, (No. 111,881,) for a new and useful Improvement in Lubricators, issued to complainant, Nicholas Siebert, on the fourteenth (14th) day of February, A. D. 1871.

It was also further ordered, adjudged, and decreed that complainant do have and recover of and from defendant his costs and expenses to be taxed herein.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date October 11, 1875.]

8,706.—Lantern.—CHRISTIAN HERTER, New York, N. Y. Application filed September 27, 1875. Term of patent 3½ years.

8,707.—Newell-Light.—CHRISTIAN HERTER, New York, N. Y. Application filed September 27, 1875. Term of patent 3½ years.

8,708.—Bottles.—GEORGE JAQUES, Boston, Mass. Application filed September 8, 1875. Term of patent 7 years.

8,709.—Coffin-Handle Tips.—GILBERT ROGERS, West Meriden, Conn., assignor to C. ROGERS & BROTHERS, same place. Application filed September 28, 1875. Term of patent 7 years.

8,710.—Butt-Hinges.—ELBRIDGE J. STEELE, Westville, assignor to THE BLAKE BROTHERS HARDWARE COMPANY, New Haven, Conn.—Case C. Application filed September 28, 1875. Term of patent 7 years.

8,711.—Latch-Handles.—ELBRIDGE J. STEELE, Westville, assignor to THE BLAKE BROTHERS HARDWARE COMPANY, New Haven, Conn.—Case A. Application filed September 28, 1875. Term of patent 7 years.

8,712.—Drawer-Pulls.—ELBRIDGE J. STEELE, Westville, assignor to THE BLAKE BROTHERS HARDWARE COMPANY, New Haven, Conn.—Case B. Application filed September 28, 1875. Term of patent 7 years.

8,713.—Fountain.—WILLIAM TWEEDDALE, Brooklyn, N. Y. Application filed July 24, 1875. Term of patent 14 years.

8,714.—Printing-Types.—JAMES M. CONNOR, Greenville, N. J. Application filed August 25, 1875. Term of patent 7 years.

8,715.—Shirt-Bosom.—CHARLES HENRY HORSFALL, New York, N. Y., assignor to BAXTER & SCRIVEN BROTHERS, same place. Application filed September 28, 1875. Term of patent 7 years.

8,716.—Inkstands.—CHARLES M. JENCKES, New York, N. Y., assignor to BLOOMFIELD BROWER. Application filed September 27, 1875. Term of patent 3½ years.

8,717.—Monuments.—WILLIAM T. PRICE, of Circleville, Ohio, assignor to HARSHA & PRICE, same place. Application filed September 18, 1875. Term of patent 14 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date October 12, 1875.]

3,019.—Fertilizers.—MANUFACTURERS' COMBINATION, New York, N. Y. Application filed September 16, 1875.
"letters and words as follows: 'P. S. G. PALMETTO STATE GRANGE.'"

3,020.—Skins and Leather.—WILLIAM QUIRIN & Co., Boston, Mass. Application filed August 23, 1875.
"word 'Tioga' placed above the monogram 'W. Q. & Co.'"

3,021.—Fish.—FRANKLIN SNOW & Co., Boston, Mass. Application filed June 7, 1875.
"the pictorial representation of a flying-fish, with the name of our firm, 'F. SNOW & Co.' above, and the word 'Trade-Mark' below it."

3,022.—Clocks.—SOUTHERN CALENDAR-CLOCK COMPANY, St. Louis, Mo. Application filed August 20, 1875.
"word or name 'FASHION.'"

3,023.—Medical Preparation.—TARRANT & Co., New York, N. Y. Application filed September 4, 1875.
"words 'SELTZER APERIENT.'"

3,024.—Medical Preparations.—TARRANT & Co., New York, N. Y. Application filed September 4, 1875.
"a representation of the coat-of-arms of the State of New York."

3,025.—Soap.—THE ALLAN HAY COMPANY, New York, N. Y. Application filed September 22, 1875.
"words 'WINDSOR FAMILY SOAP.'"

3,026.—Combs.—THOMSON, LANGDON & Co., New York, N. Y. Application filed June 19, 1875.
"a figure or picture of a crown, together with the phrase 'The Crown Comb, Unbreakable,' accompanied by the word Trade-Mark.'"

3,027.—Schiedam Gin.—GEORGE WHITELEY, Philadelphia, Pa. Application filed July 31, 1875.
"words and letters 'Oak-Leaf Gin, Schiedam, G. W., Triple Flavor,' and a stem, three oak-leaves, an acorn, a pod, and a scroll."

3,028.—Caviar.—MAX AMS, New York, N. Y. Application filed September 25, 1875.
"the representation of a double-headed eagle in connection with the words 'Russian Caviar.'"

3,029.—Soap.—L. I. FISK & Co., Springfield, Mass. Application filed September 1, 1875.
"words 'Japanese Soap,' used in connection with a human figure dressed in Japanese costume and carrying an umbrella."

3,030.—Food for Horses and Cattle.—GERALD GORDON, Philadelphia, Pa. Application filed August 30, 1875.
"words 'Gordon's Food for Horses and Cattle' and the facsimile of my signature."

3,031.—Canned Fruits and Vegetables.—GRIFFITH & DRAKELEY, Baltimore, Md. Application filed September 15, 1875.
"words 'BANNER BRAND.'"

3,032.—Cabinet-Organs.—FREDERICK W. HELMICK, Cincinnati, Ohio. Application filed September 16, 1875.
"words 'CHAMPION ORGAN.'"

3,033.—Fever-and-Ague Pad.—WILLIAM F. KIDDER & Co., New York, N. Y. Application filed July 22, 1875.
"the head and bust of a man with the said Holman's fever-and-ague pad suspended from the neck, and fastened around the chest under the arms, in such a manner as may be most convenient, just below and between the nipples, with the words 'Holman's Fever and Ague Pad' inscribed on the outside or front thereof."

3,034.—Cigars and Tobacco.—J. M. MORA & Co., New York, N. Y. Application filed September 13, 1875.
"words 'LA CUBANA.'"

3,035.—Paper Collars.—RAY & TAYLOR MANUFACTURING COMPANY, Springfield, Mass. Application filed September 1, 1875.
"imprint or picture of a hatchet, together with the words 'Geo. Washington Collar,' the words 'George Washington' being printed upon the handle of the hatchet, and the word 'Collar' printed beneath."

3,036.—Drawing Lead-Pencils.—GUSTAV SCHWANHÄUSSER, Nuremberg, Germany. Application filed September 25, 1875.
"device or representation of an anchor."

3,037.—Plows.—DAVID BUREL SMITH, Eastrop, La. Application filed September 23, 1875.
"word 'FARMER.'"

3,038.—Bevel and Try Squares.—ST. JOHNSBURY TOOL COMPANY, St. Johnsbury, Vt. Application filed September 9, 1875.
"a diamond-shaped figure."

3,039.—Cakes, Crackers, and Biscuits.—WALTER G. WILSON & Co., Philadelphia, Pa. Application filed September 22, 1875.
"words 'NONE SUCH' and a picture of the globe with a man protruding therefrom with extended arms."

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date October 12, 1875.]

339.—Title: **"Dr. Buhl's Rheumatic Wonder for External use."**—GEORGE BUHL, St. Joseph, Mo. Application filed October 2, 1875.

340.—Title: **"Dr. Buhl's Instant Relief for External and Internal use."**—GEORGE BUHL, St. Joseph, Mo. Application filed October 2, 1875.

341.—Title: **"Superlative Wool and Spindle Oil."**—E. H. KELLOGG, New York, N. Y. Application filed October 4, 1875.

342.—Title: **"T. Metcalf & Co., 39 Tremont St., Boston. Sachet Powder."**—THEODORE METCALF & Co., Boston, Mass. Application filed October 2, 1875.

343.—Title: **"Prof. Higgins' Healing Ointment."**—RIPLEY & CAMERON, Flint, Mich. Application filed October 4, 1874.

344.—Title: **"Prof. Higgins' Celebrated Condition Powders."**—RIPLEY & CAMERON, Flint, Mich. Application filed October 4, 1875.

345.—Title: **"Penna. White Lead Works."**—JAMES E. SCHWARTZ, Pittsburg, Pa. Application filed September 23, 1875.

346.—Title: **"Maryland Yeast-Powder."**—WORTHINGTON & TINGES, Baltimore, Md. Application filed August 10, 1875.

INDEX OF INVENTIONS PATENTED OCTOBER 11, 1875.

	Class No.	No. of Patent.
Aerial vessel, F. E. Schmidt	143	168,788
Agricultural implements, machine for shaping, E. Wansbrough	141	168,689
Air and gas engine, G. W. Daimber	2	168,623
Air, apparatus for purifying, drying, and cooling or warming, A. S. Lyman	166	168,634
Air injector for aero steam engines, W. M Storm	2	168,678
Alarm, burglar, J. Pennepacker	24	168 777
Barge, coal, Martin and Preston	13	168,655
Barrels, manufacture of, Phillips and Reid, (reissue)	40	6 699
Bed slat, T. L. Odell	62	168,664
Beefsteak tenderer, T. Billington	83	168,602
Bell, door, C. Coleman	24	168 721
Blank book, pocket, A. V. S. Smith	146	168,796
Boilers, sediment collector for steam, J. Popper	148	168,779
Bolt and rivet cutter, D. M. Kelley	14	168,568
Book stitching machine, L. Goddu	15	168,736
Boot and shoe counters, machinery for skiving, T. Andrews	16	168,596
Boot and shoe uppers, machine for embossing, E. B. Stimpson	16	168,804
Box machine, J. Kiser	174	168,752
Brick machine, J. R. Cross	20	168 724
Brick machine, W. L. Gregg	20	168,561
Brick machine, L. Patterson	20	168 667
Bricks, apparatus for pressing or molding, Durand and Marais	20	168,730
Bricks, &c., drying and burning, A Morand	20	168,765
Broom winding machine, Walrath and Bronson	22	168 814
Brush, sponge, H. S. Kerr, (reissue)	22	6,692
Building materials, machine for elevating, G. H. Kanmacher	79	168,749
Burial case, glass, S. H. Brooks	39	168,606
Burner, gas, E. Blackman	64	168,554
Burner, gasoline, J. C. Riley	90	168,783
Button fastening, J. H. Harrington	23	168,638
Button hole cutter, J. A. Sidle	44	168,794
Car brake, J. N. Sawkins	122	168,585
Car doors, operating street, D. Shield	121	168 791
Car, sleeping, F. W. Parsons	121	168 579
Car, street, J. Stephenson, (reissue)	121	6,696
Car, street, J. Stephenson, (reissue)	121	6,697
Car windows, ventilating screen for, C. F. Bridgman	123	168,712
Cars, cinder warder for railway, J. J. W. Taylor	122	168,681
Carbureter, W. D. Snow	27	168,797
Card, playing, A. Dougherty	143	168,626
Carpet stretcher, H. Goss	62	168 633
Carriage axle, A. E. Smith, (reissue)	31	6,694
Carriage axle, A. E. Smith, (reissue)	31	6 695
Carriage axle nuts, die for forging, H. Hammond	60	168 740
Carriage, child's, E. Krueger	31	168,647
Cartridge, blasting, Smith and Eggee	32	168,795
Chair, folding, I. N. Daun	62	168 725
Chair, tilting, S. Hoffman	62	168,744
Chandelier, R. Marsh	64	168,573
Chimney cowl, T. K. Griffith	166	168,738
Churn, W. P. Jones	45	168,748
Circus seat, G. F. Fisher	62	168,631
Cigarette maker, J. Shepard	160	168 709
Clamp, Walker and Devoe	29	168,593
Clams and oysters for food, preparing, C. Alden	58	168,703
Clocks, Lock work attachment for, Covell and Robinson	36	168,620
Clothes drier, A. Bragonier	91	168,605
Clothes drier, S. R. Kidder	91	168,751
Clothes drier, S. P. Mecay	91	168 628
Clothes drier, L. A. Wait	91	168 688
Cock, compression, J. McLaughlin	167	168,657
Compass, mariners', N. H. Dibble	50	168,736
Corn husker, W. A. Dick	59	168 624
Cradle, folding, Welch and Jefferys	62	168,691
Curry comb, C. A. Hotchkiss	144	168,745
Curry comb, R. F. Walsh	144	168,815
Cutter and cutter holder, T. T. Nash	100	168,576
Damper, automatic, S. F. Gold	154	168,737
Dental filling, L. W. Satton, Jr	46	168,680
Desk and wash stand, combined, E. E. Everitt	62	168,732
Diaper pin, I. W. Stewart, (reissue)	38	6,698
Door scourer, G. Burt	24	168,556
Doors, hanger for sliding, L. A. Cook	24	168,618
Drill, planter and roller, combined, S. Brown	133	168,714

	Class No.	No. of Patent.
Drill stock, J. Hammond	100	168,741
Dropper, potato, G. H. Zane	133	168,702
Dry dock, hydraulic lift, T. A. Blake	82	168,603
Eaves trough hanger, W. E. Manrow	126	168,572
Egg carrier, W. Weis	116	168,692
Electric machine, magneto, L. Drescher	50	168,560
Emery wheels, tool for turning, J. D. Huntington	70	168,643
Engine, road, J. H. Bange	94	168,600
Engine, steam, G. B. Stevenson	150	168,803
Engines, air injector for aero steam, W. M. Storm	2	168,678
Engines, packing for steam and other, W. Peters, (reissue)	151	6,688
Equalizer, draft, S. E. Winser	31	168,699
Equalizer of spring power, J. W. H. Doubler	67	168,729
Fare box, A. J. Cortis	42	168,619
Fare box, W. J. Cowing	42	168,722
Fare box, H. Tupper, (reissue)	42	6,689
Feather renovator, H. I. Linn	62	168,571
Fence, iron, T. J. W. Robertson	52	168,785
Fence wire, barbed, Armstrong and Doolittle	52	168,550
Fire arm, revolving, W. H. Elliot	123	168,562
Fire extinguisher, B. F. Cleminshaw	118	168,720
Fire extinguisher, P. M. Doughty	118	168,627
Fire place, portable, E. White	154	168,821
Flat iron, F. Stersing	154	168,800
Flooring board, S. A. Reed	39	168,672
Flour, packing, L. Mowry	57	168,767
Fruit drier, J. P. Neasle	48	168,769
Furnace for brick kilns, W. S. Colwell	50	168,617
Furnace for steam boilers, S. Moses	149	168,766
Furnace grate, J. Old	149	168,770
Furniture caster, J. F. Ohmer	24	168,773
Game board, W. F. Lamb	143	168,570
Gas, apparatus for the manufacture of illuminating, P. W. Mackenzie	66	168,758
Gas governor, S. D. Baldwin	64	168,551
Gas heater, G. Mooney	65	168,764
Gas holders, vertical bar for, J. W. Starr, Jr	64	168,799
Gas lighting apparatus, electric, R. Chamberlin	64	168,614
Gas shade support, F. F. McGann	90	168,761
Gate fastening, W. Leach	93	168,754
Glue, apparatus for cutting, H. Stevens	26	168,801
Glue, preparing and drying, H. Stevens	26	168,802
Gold from other metals, separating, C. Wiegand	99	168,695
Grate and stove front, J. Old	154	168,771
Grate bar, W. C. Childs	149	168,615
Grate bar, G. W. Todd	149	168,684
Grinding and amalgamating pan, C. Cummings	3	168,621
Grindstone frame, G. A. Whitney	70	168,694
Hame, S Shultz	72	168,793
Hame and collar combined, T. C. Love	72	168,756
Harness, W. H. B. Diehl	72	168,625
Harrow, L. H. McGinnis	73	168,762
Harvester, J. E. Buxton	74	168,609
Harvester, C. Lidren	74	168,653
Harvester, A. Palmer	74	168,578
Harvester dropper, Ratliff and Towle	74	168,670
Hat bodies, machine for stretching, R. Eickemeyer	76	168,731
Hatchway brace, J. Fleming	79	168,630
Heater, feed water, G. L. McCahan	148	168,760
Heater, fire place, J. B. Oldershaw	154	168,772
Heater, gas, G. Mooney	65	168,764
Hinge, B. Turner	94	168,592
Hoe, A. A. Porter	141	168,780
Hog lifter, N. Caldwell	79	168,612
Hoisting machine, J. Wallace	79	168,594
Hooks, wardrobe and other, C. H. Thurston	24	168,682
Horse collar, E. B. Crawford	72	168,723
Horses from cribbing, device for preventing, A. C. Tickner	144	168,683
Hydrant, G. C. Bailey	167	168,599
Ice machine, J. M. Beath	83	168,706
Indicator, station, P. H. Harris	120	168,639
Inkstand base, L. Rosenfeld	146	168,673
Insole, Blossom and Clark	16	168,604
Jack, lifting, S. E. Mosher	79	168,663
Jack, lifting, J. L. Vail	79	168,811
Jacket, hunting, H. L. Daigre	38	168,622
Jigger, J. B. Wilford	3	168,698
Journal box, J. Schellkopf	57	168,787
Key fastener, W. W. White	93	168,693
Knife sharpener and polisher, E. A. Bushell	70	168,717
Knife, shoemaker's, A. C. Wetherbee	16	168,818
Lamp bracket, D. Barcellos	90	168,705
Land marker, J. Angapurger	133	168,598
Lantern, Clark and Kintz	90	168,616
Lard rendering tank, N. Caldwell	26	168,611
Lard tank skimmer, N. Caldwell	26	168,610
Lath machine, J. C. Mackey	174	168,759
Ledger rest, F. O'L. Buck	146	168,715
Lever power, H. C. Bell	79	168,601
Lever, track lifting, W. H. Hargis	79	168,742
Lubricator, J. W. Reed	87	168,671
Measure, variable, C. P. Sullivan, Jr	132	168,679
Mechanical device, J. F. Kelley	67	168,645
Mechanical movement, J. McCloskey	67	168,575
Mill, distintegrating, J. M. Hendricks	57	168,642
Mining machine, J. J. Weinel	124	168,817
Mortising machine, Wilder, McNeil, Wilder, and Tyler	173	168,696
Mower, lawn, Turnbull and Frost	75	168,810
Mowing machine, D. Wolf	74	168,700
Neck tie, R. R. Parker	38	168,666
Nut fastening, R. C. Watson	14	168,690
Nut lock, J. B. Atwood	14	168,597
Oil reservoir, safety, T. Scantlin	107	168,676
Oils, method and apparatus for burning, E. E. Rice	149	168,702
Ordnance, shell for, G. E. Walker	105	168,813
Organ, &c., B. Dufner	106	168,561
Organ coupler, J. R. Perry	106	168,778
Packing for steam and other engines, W. Peters, (reissue)	151	6,688
Pad and collar fastener, combined, A. Racine	79	168,781
Padlock, W. Raether	93	168,669
Pan, J. C. Milligan	154	168,692
Paper collar, S. S. Gray, (reissue)	109	6,691
Paper fastener, J. M. Blanchard	146	168,709
Paper machines, stuff regulator for, J. W. Huested	108	168,746
Pavement, brick, H. M. Stow	110	168,805
Pessary, T. Braune	156	168,711
Piano and organ ottoman, J. Miller	62	168,661
Pipe coupling, Flagler and Dodge	167	168,733
Planing machines, adjusting feed rolls for, Lawrence and Ward	173	168,650
Planter and cultivator, combined, C. F. Keller	133	168,750
Planter, corn, A. Fox	133	168,633
Planter, seed, W. C. Champion	133	168,718
Plow, gang, D. Kendig	114	168,646
Plow, sulky, S. F. Woodworth	114	168,595
Power, equalizer of spring, J. W. H. Doubler	67	168,729
Power, lever, H. C. Bell	79	168,601
Power, transmitting, J. W. Woodruff	67	168,701
Press and former, brick, A. J. Haws	20	168,743
Press, cotton, B. F. Platt	7	168,668
Press for baling cotton, hay, &c., C. B. Churchill	7	168,557
Press, punch, A. H. Merriman	119	168,763
Printing press, Griffith and Byrne	117	168,635
Printing presses, feed gage for, S. D. Tucker	117	168,685
Printing presses, feed gage for, S. D. Tucker	117	168,686
Pulley, Bette and Howie	87	168,708
Pump, plunger, Hartley and Marshall	118	168,640
Pump, steam and vacuum, O. Jackson	118	168,747
Punch press, A. H. Merriman	119	168,763
Radiator tube, E. Russell	147	168,674
Railroad rail joint, H. Allen	120	168,704
Railroad rail joint, C. Dittman	120	168,558
Railroad track gage, S. Holbrook	120	168,567
Railroad track scales, T. Fairbanks	120	168,629
Rake, horse hay, Barclay and Kennedy	77	168,552
Rake, horse hay, Barclay and Kennedy	77	168,553
Rake, wheel hay, C. La Dow	77	168,648
Regulator, pressure, J. Taylor	50	168,807
Revolvers, locking catch for, F. H. Allen	123	168,549
Roll for rolling metal, G. P. Salisbury	125	168,584
Roof, iron, M. A. Shepard	126	168,587
Running gear, L. C. A. Schmidt	31	168,586
Sash holder, J. B. Wilford	24	168,697
Sash lock, McGregor and Voll, (reissue)	24	6,693
Saw for cutting stone, diamond, H. Rung	130	168,786
Saw handle, crosscut, C. M. Tanner	29	168,590
Saws, machine for jointing and dressing circular, W. Potter	131	168,580
Sawing machines, device for driving, F. Miller	67	168,660
Screen holder, adjustable, G. A. Blodget	154	168,710
Screw thread cutters, manufacture of, T. T. Nash	100	168,577
Separator, grain, H. Mielke	159	168,659
Sewing machine, L. Lyon	134	168,757
Sewing machine bobbins, machine for filling, G. Gowing	134	168,634
Sewing machine gathering attachment, A. Everess, (reissue)	134	6,690
Sewing machine hemmer attachment, W. L. Kotsum	134	168,753
Sewing machine, short thread, J. S. Hall	134	168,637
Sewing machine treadle, W. B. Higgins	134	168,565
Shade fixture, Brooks and Morell	62	168,713
Shoemaker's knife, A. C. Wetherbee	16	168,818
Shutter bower and fastener, combined, Fellows and Finnegan	24	168,563
Spindle bolster, W. Jenckes	87	168,644
Spinning rings, traveler for, H. Halvorson	142	168,739
Square, slotted framing, J. H. McInnes	29	168,636
Stereoscope, W. H. Lewis	157	168,652
Stone, artificial, P. B. Doty	153	168,559
Stone, compound for artificial, Lemon and Metcalf	153	168,651
Stone, diamond saw for cutting, H. Rung	130	168,786
Stove attachment, cooking, T. R. Timby	154	168,809
Stove door knob, M. W. Gardner	154	168,734
Stove leg, W. Tanner	154	168,589
Stove platform, S. L. Warren	154	168,816
Street sweeper, O. W. Kellogg	110	168,569
Sugar, machine for splitting bard, Dinkel and Elmenhorst	155	168,728
Temple teeth, machine for setting, N. Chapman	95	168 719
Tire tightener, W. R. Swarthout	31	168,806
Tobacco cutting machine, A. A. Hagen	160	168,636
Tool handle, J. C. Sears	29	168,789
Toy, J. J. White	143	168,819
Toy spring gun, P. R. Voorhees	143	168,812
Trap, animal, W. A. Shigley	143	168,792
Trunk fastening, R. Hilton	162	168,566
Trunk fastening, J. F. Simpson	162	168,677
Tubes, machine for rounding and sealing the ends of wrought iron, D. C. Stillson	163	168,588
Tubing, sectional core to be used in the manufacture of, Lemon and Cameron	20	168,755
Type setting machine, D. B. Thompson	117	168,591
Umbrella, cane, W. E. Engelhardt	165	168,638

	Class No.	No. of Patent.
Valve, W. Painter	118	168,775
Valve, W. Painter	118	168,776
Valve, G. T. Taylor	152	168,808
Vehicles, elevator for, R. R. Roberts	31	168,784
Vehicles, running gear for, C. M. Murch	31	168,768
Violin, H. W. White	102	168,690
Violin, guitar, &c., J. Oehrlein	102	168,665
Wagon, dumping, J. Bond	31	168,555
Wagon jack, B. W. Stanton	79	168,798
Wagon wheel scraper, N. Sage	31	168,675
Washer cutter, E. Brulé	14	168 607
Washing machine, G. W. Gilbert	91	168,735
Watch, E. J. Pacaud	36	168,774
Watches, barrel arbor for, A. H. Potter	36	168,581
Watches, compensation balance for, A. H. Potter	36	168,583
Watches, escapement for, A. H. Potter	36	168 582
Water closet, W. S. Carr	8	168,613
Water wheel, J. L. Helmer	168	168,641
Wells, apparatus for walling, Beach and Marshall	51	168,707
Wind wheel, horizontal, F. Burt	118	168,608
Windmill, J. M. May	118	168,574
Wire sign and banner, Upham, Garrett, and Tully	170	168,667
Wood splitter, W. Latue	174	168,649
Wringer, H. A. Buck	91	168,716
Wringer, T. J. Dickerson	91	168,727

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED OCTOBER 11, 1875.

	Patent No.
Alden, C., Preparing clams and oysters for food	168,703
Allen, F. H., Locking catch for revolvers	168,549
Allen, H., Railroad rail joint	168,704
Andrews, T., Machinery for skiving counters for boots and shoes	168,596
Armstrong, F., and G. Doolittle, Barbed fence wire	168,550
Atwood, J. R., Nut lock	168,597
Atwood, J. B., assignee	168,570
Augspurger, J., Land marker	168,598
Bailey, G. C., Hydrant	168,599
Baldwin, S. D., Gas governor	168,551
Bange, J. H., Road engine	168,600
Barcellos, D., Lamp bracket	168,705
Barclay, G., and J. Kennedy, Horse hay rake	168,552
Barclay, G., and J. Kennedy, Horse hay rake	168,553
Barnard, H., assignee	168,736
Baumgarten, R., assignee	168,786
Beach, W. H., and G. Marshall, Apparatus for walling wells	168,707
Beath, J. M., Ice machine	168,706
Bell, H. C., Lever power	168,601
Betts, R. W., and W. Howie, Pulley	168,708
Billington, T., Beefsteak tenderer	168,602
Blackman, E., Gas burner	168,554
Blake, T. A., Hydraulic lift dry dock	168,603
Blanchard, J. M., Paper fastener	168,709
Blodget, G. A., Adjustable screen holder	168,710
Blossom, E. F. and G. H. Clark, Insole	168,604
Bond, J., Dumping wagon	168,555
Bonsall, C., assignee	168,606
Boone, J. L., assignee	168,637
Bradford, H., assignee	168,697, 168,698
Bragonier, A., Clothes drier	168,605
Braune, T., Pessary	168,711
Bridgman, C. F., Ventilating screen for car windows	168,712
Bronson and Walrath	168,814
Brooks, J. T., and J. F. Morell, Shade fixture	168,713
Brooks, S. H., Glass burial case	168 606
Brown, S., Combined drill planter and roller	168,714
Brulé, E., Washer cutter	168,607
Buck, F. O'L., Ledger rest	168 715
Buck, H. A., Wringer	168,716
Burt, F., Horizontal wind wheel	168,608
Burt, G., Door securer	168,556
Bushell, E. A., Knife sharpener and polisher	168,717
Buxton, J. E., Harvester	168,609
Byrne and Griffith	168 635
Cady, A. F., assignee	168,569
Caldwell, N., Lard tank skimmer	168,610
Caldwell, N., Lard rendering tank	168,611
Caldwell, N., Hog lifter	168,612
Cameron and Lemon	168,755
Canaday, L., assignee	168,720
Carr, W. S., Water closet	168,613
Chamberlin, R., Electric gas lighting apparatus	168,614
Champion, W. C., Seed planter	168,718
Chapman, N., Machine for setting temple teeth	168,719
Childs, W. C., Grate bar	168,615
Churchill, C. B., Press for baling cotton, hay, &c	168,557
Clark and Blossom	168,604
Clark, P. J., and J. Kintz, Lantern	168 616
Cleminshaw, B. F., Fire extinguisher	168,720
Coleman, C., Door bell	168 721
Colwell, W. S., Furnace for brick kilns	168,617
Cook, L. A., Hanger for sliding doors	168,618
Cortis, A. J., Fare box	168,619
Covell, E. C., and M. M. Robinson, Lock work attachment for clocks	168,620
Cowing, W. J., Fare box	168,722
Crandall, C. M., & Co., assignees	168,819
Crawford, E. B., Horse collar	168,723
Cross, J. R., Brick machine	168,724
Cummings, C., Grinding and amalgamating pan	168,621
Dalgre, H. L., Hunting jacket	168,622
Daimber, G. W., Air and gas engine	168,623
Dann, I. N., Folding chair	168,725
Devoe and Walker	168 583
Dibble, N. H., Mariner's compass	168,726
Dick, W. A., Corn husker	168,624
Dickerson, T. J., Wringer	168,727
Diehl, W. H. B., Harness	168,625
Dinkel, G., and W. R. Elmenhorst, Machine for splitting hard sugar	168,728
Dittman, C., Railroad rail joint	168,558
Dodge and Flagler	168,733
Doolittle and Armstrong	168,550
Doty, P. B., Artificial stone	168,559
Doubler, J. W. H., Equaliser of spring power	168,729
Dougherty, A., Playing card	168,626
Doughty, P. M., Fire extinguisher	168,627
Drescher, L., Magneto-electric machine	168,560
Dufner, B., Organ, &c	168,561
Durand, F., and E. L. Marais, Apparatus for pressing or melding bricks	168,730
East New York Boot, Shoe, and Leather Manufacturing Company, assignee	168,600
Eggee and Smith	168,795
Eickemeyer, R., Machine for stretching hat-bodies	168 731
Elliot, W. H., Revolving fire-arm	168,562
Elmenhorst and Dinkel	168,728
Engelhardt, W. E., Cane umbrella	168,628
Everess, A., Gathering attachment for sewing machines, (reissue)	6,690
Everitt, E. E., Combined desk and wash stand	168,732
Fairbanks, T., Railroad track scales	168,629
Farnham Type Setter Manufacturing Company, assignee	168,591
Fellows, J., and J. Finnegan, Combined shutter bower and fastener	168,563
Finnegan and Fellows	168,563
Fisher, G. F., Circus seat	168,631
Flagler, H. K., and W. E. Dodge, Pipe coupling	168,733
Fleming, J., Hatchway brace	168,630
Fox, A., Corn planter	168,632
Friebee, R. H., assignee	168,633
Frost and Turnbull	168,810
Gardner, M. W., Stove door knob	168,734
Garrett, Tully, and Upham	168,667
Gibbard, C. G., assignee	168 727
Gilbert, G. W., Washing machine	168,735
Goddu, L., Book stitching machine	168 736
Godley, G. F., assignee	168,729
Gold, S. F., Automatic damper	168,737
Goss, H., Carpet stretcher	168 633
Gowing, G., Machine for filling sewing machine bobbins	168,634
Gray, S. S., Paper collar, (reissue)	6,691
Gregg, W. L., Brick machine	168,564
Griffith, F. W., and G. P. Byrne, Printing press	168,635
Griffith, T. K., Chimney cowl	168,738
Hagen, A. A., Tobacco cutting machine	168,636
Hall, J. S., Short thread sewing machine	168,637
Halvorson, H., Traveler for spinning rings	168,739
Hamburger, H., assignee	168,697
Hammond, H., Die for forging carriage axle nuts	168,740
Hammond, J., Drill stock	168,741
Hardick, S., executrix, assignee	168,640
Hargis, W. H., Track lifting lever	168,742
Harmony, L., assignee	168,807
Harrington, J. H., Button fastening	168 638
Harris, P. H., Station indicator	168,639
Hartley, R., and J. B. Marshall, Plunger pump	168,640
Haulenbeck, J. H., assignee	168,712
Haws, A. J., Brick press and former	168,743
Helmer, J. L., Water wheel	168,641
Hendricks, J. M., Distintegrating mill	168,642
Higgins, W. B., Sewing machine treadle	168,565
Hilton, R., Trunk fastening	168,566
Hoffman S., Tilting chair	168,744
Holbrook, S., Railway track gage	168,567
Hopkins and Dickinson Manufacturing Company, assignee, (reissue)	6,693
Hotchkiss, C. A., Curry comb	168,745
Howis and Betts	168,708
Huested, J. W., Stuff regulator for paper machines	168,746
Hunter, J. K., assignee	168,667
Huntington, J. D., Tool for turning emery wheels	168,643
Indiana Car Company, assignee	168,791
Jackson, O., Steam and vacuum pump	168,747
Jackson, R., assignee	168,653
Jefferys and Welch	168,691
Jenckes, W., Spindle bolster	168,644
Jones, F. A., assignee	168,774
Jones, W. P., Churn	168,748
Kanmacher, G. H., Machine for elevating building materials	168,749
Karuts, T., assignee	168,649
Keller, C. F., Combined planter and cultivator	168,750
Kelley, D. M., Bolt and pivot cutter	168,568
Kelley, J. F., Mechanical device	168,645
Kellogg, O. W., Street sweeper	168,569
Kendig, D., Gang plow	168,646
Kennedy and Barclay	168,552, 168,553
Kerr, H. S., Sponge brush, (reissue)	6,692
Kidder, S. R., Clothes drier	168,751
Kintz and Clark	168,616
Kisor, J., Box machine	168,752
Kotzum, W. L., Hemmer attachment for sewing machines	168,753
Krueger, E., Child's carriage	168,647

	Patent No.
La Dow, C., Wheel hay rake	168,648
LaJance and Grosjean Manufacturing Company, assignee	168,662
Lamb, W. F., Game board	168,570
Latas, W., Wood splitter	168,649
Lawrence, C. D., and C. E. Ward, Adjusting feed rolls for planing machines	168,650
Leach, W., Gate fastening	168,754
Lemon, H., and J. A. Cameron, Sectional core for use in manufacture of tubing	168,755
Lemon, H., and J. C. Metcalf, Jr., Compound for artificial stone	168,651
Lewis, W. H., Stereoscope	168,652
Lidren, C., Harvester	168,653
Linn, H. I., Feather renovator	168,571
Love, T. C., Combined hame and collar	168,756
Lyman, A. S., Apparatus for purifying, drying, and cooling or warming air	168 654
Lyon, L., Sewing machine	158,757
Mackenzie, P. W., Apparatus for the manufacture of illuminating gas	168 758
Mackey, J. C., Lath machine	168,759
Manning, J. C., assignee, (reissue)	6,688
Manrow, W. E., Eaves trough hanger	168,572
Marais and Durand	168,730
Marsh, R., Chandelier	168 573
Marshall and Beach	168,707
Marshall and Hartley	168,640
Martin, G. B., and J. A. Preston, Coal barge	168,655
May, J. M., Windmill	168,574
McCahan, G. L., Feed water heater	168,760
McCloskey, J., Mechanical movement	168,575
McConnell, J. H., assignee	168 5e9
McGann, T. F., Gas shade support	168,761
McGinnis, L. H., Harrow	168,762
McGregor, G., and G. Voll, Sash lock, (reissue)	6,693
McInnes, J. H., Slotted framing square	168,656
McLaughlin, J., Compression cock	168,657
McMillan, J. H., assignee	168,581, 168 582, 168,583
McNeil, Wilder, Tyler, and Wilder	168,696
Macay, S. P., Clothes drier	168,658
Merriman, A. H., Punch press	168,763
Metcalf and Lemon	168 651
Mielke, H., Grain separator	168,659
Miller, F., Device for driving sawing machines	168,660
Miller, J., Piano and organ ottoman	168,661
Milligan, J. C., Pan	168,662
Mooney, G., Gas heater	168,764
Morand, A., Drying and burning bricks, &c	168,765
Morrill and Brooks	168,713
Moses, S., Furnace for steam boilers	168,766
Mosher, S. E., Lifting jack	168 663
Mowry, L., Packing flour	168,767
Murch, C. M., Running gear for vehicles	168,768

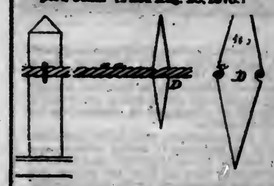
TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED OCT. 11, 1875.

168,549. LOCKING-GAUGING FOR REVOLVERS. F. H. Allen, Norwich, Conn. [Filed Sept. 10, 1875.]



Brief.—When the arm is not in use the hammer is securely locked down by withdrawing the center-pin, to allow the locking-latch to engage with a shoulder on the rear of the recoil-shield.

1. The automatic latch D, hung on the lower part of the hammer, in combination with the recess F, as and for the purpose specified.

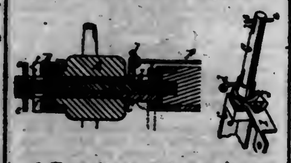
2. The latch D, so arranged in line with the center-pin B, that by direct pressure on the center-pin the latch is released, as and for the purpose specified.

168,550. BARBED FENCE-WIRE. Frank Armstrong and George Doolittle, Bridgeport, Conn. [Filed Aug. 20, 1875.]

The barbed fence-wire cable formed of two strands of wire and having sheet or plate metal barbs with two points and notched edges confined between them, with their flat sides in the same longitudinal plane, or nearly so, with the cable, the wires being wound spirally upon the barbs by passing them on the outside and into the notches between the points of the barbs, substantially as and for the purpose described.

168,551. GAS-GOVERNORS. S. D. Baldwin, Chicago, Ill. [Filed Dec. 11, 1874.]

Brief.—The gas-passage is in the wall of the chamber. The latter is made in two sections, which hold between them the diaphragm, which also serves as a packing. The self-sealing cap is to be filled with wax.



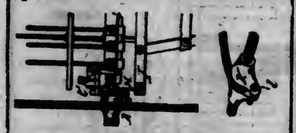
1. The combination of the sections A B and the interior gas-passage a with the diaphragm e, serving as a packing for the sections and gas-passage, all constructed and arranged substantially as specified.

2. The combination of the self-sealing cap opening a g with a gas-governor, substantially as specified.

168,552. HORSE HAY-RAKES. George Barclay and Jas. Kennedy, Oshawa, Canada. [Filed Jan. 19, 1875.]

Brief.—The hollow axle of each carrying-wheel has within it a bar having an arm at its inner end, projecting upwardly through a slot in the axle, and connected through a cord with a foot-lever, and provided at its outer end with a pin, engaging, when the bar is drawn inward, with the grooved face of the hub, causing the teeth to rise and discharge their load. As the wheels continue to revolve, a cam on the collar of the drag-bar breaker strikes the arm and shoots the bar outwardly, (being sustained therein by a retaining spring within the axle,) releasing the wheels and allowing the teeth to regain working position.

1. The combination of the spring shooting-bar D, having pin c, slotted hollow axle C, and collar E, having radial grooves f, with the wheel A, to operate substantially as described, for the purpose set forth.



2. The draw-bracket I, depved on the axle, and provided with the cam projection J, in combination with the bar D, provided with the arm d, and arranged within the hollow axle, and operating substantially as described.

3. The pivoted locking-lever M, provided with the spur or shoulder m, and operating in combination with the link-connection between the hand-lever and rake-head, as described, for holding the rake down to its work.

4. The tooth-holder K, bolted to the axle, and formed with a slotted vertical projection, L, and having a slot, k, in the base to hold the teeth in position, substantially as set forth.

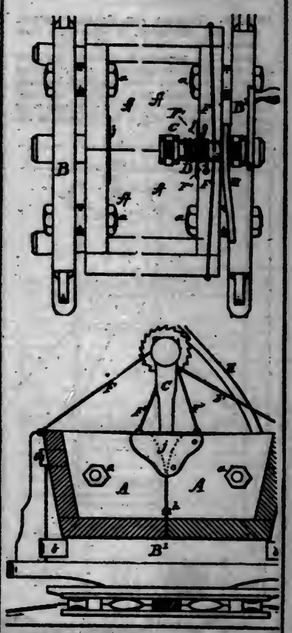
168,553. HORSE HAY-RAKES. George Barclay and Jas. Kennedy, Oshawa, Canada. [Filed Jan. 19, 1875.]

Brief.—An elbow-lever, pivoted to an arm journaled on the axle of driving-wheels, is caused, through a foot-lever and cord, to engage with a cog-wheel formed on the hub of the driving-wheel, whereby the rake-teeth are lifted to dump the hay. At the proper point of the rotation, a projection on the detent-arm of the lever strikes a spur on the draw-bar, releasing the lever from the cog-wheel, and permitting the teeth to resume raking position.

1. The cog-wheel B, affixed to the hub A, and the pawl-bracket C, secured to the axle, and having the spring-pawl D arranged to operate as described, in combination with the projecting arm or spur H, secured to the draw-bar, and operating to release the pawl D, as set forth.

2. The thimble K, provided with the central groove and with the lugs g, and pin or bolt f, for securing the rake-teeth, as set forth.

168,554. GAS-BURNERS. Hermann Headman, Brooklyn, N. Y. [Filed July 30, 1875.]



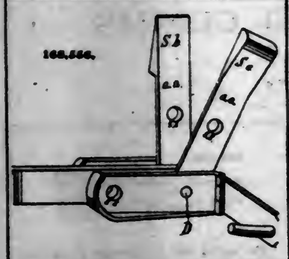
Brief.—The sliding tube governs the flow of gas through perforations in the interior nipple, which extends up into the heating-chamber.

168,555.

The spring-slide or regulator D, in combination with gas-burners, for the purpose of regulating and measuring the quantity of gas passing through graduated openings, substantially as described.

168,556. DUMPING-WAGGON. Jacob Bond, Cleveland, Ohio. [Filed Feb. 24, 1875.]

1. In a dumping-wagon, the halves A A of the box or body, balanced on pivots a a, and to be operated by means of cords F F', extending from the outer and inner ends of the parts A A, and combined with a windlass, D, substantially as shown and described.

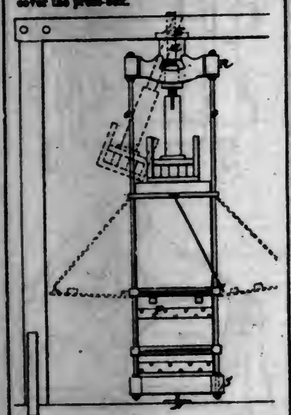


2. In a dumping-wagon, the combination of the centrally-divided box A A, balanced on pivots a a, with the end boards B B', constructed for adaptation to ordinary running-gear, substantially as shown and described.

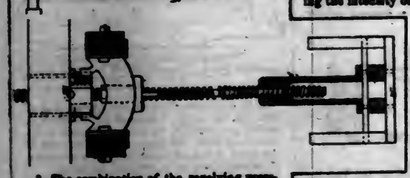
168,557. DOOR-BRACKETS. George Burt, Denver, Colo. [Filed May 28, 1875.]

Brief.—As an improvement on a similar device heretofore patented, the curved hook is interposed between two reversed wedge-plates, either or both of which can be used when the thickness or space between the edge of the door and the casing requires; the wedge-plates folding in, and secured in like manner with the hook-plate, or, when not needed, can be dropped down out of the way, thus giving the device ready adjustability.

HELIOTYPE RELIEF PROCESS, JAMES R. OSGOOD & Co. BOSTON.



168,556.



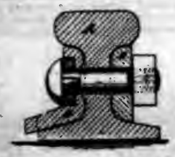
The two plates a c, working upon the rivet D, with the orifices a c, by means of which they may be locked in position, in combination with the reversed wedges S b and S c, attached thereto, respectively, in the position and substantially as described and shown, for the purpose hereinbefore set forth.

168,557. PRESSES FOR BALING COTTON, HAY, &c. Cornelius B. Churchill, New Orleans, La. [Filed Apr. 17, 1875.]

Brief.—The pressure is obtained by means of a vertical screw operating in a revolving press-box, the screw being held from turning, and being provided with right and left hand threads. The screw is capable of being swung laterally, carrying with it the follower, to uncover the press-box.

2. The combination of the revolving press-box, a stationary right-and-left-hand screw, and two revolving nuts, the lower one of which receives the lower end of the screw, and is rigidly attached to the follower, substantially as shown and described.

2. The combination of the revolving press-box and a right-and-left-hand screw, working in two revolving nuts, the upper one of which is made capable of lateral movement in its bearings, substantially as and for the purpose indicated.



3. In combination with the revolving press-box and nuts, a stationary screw, the upper and lower ends of which are free to move laterally when the follower is raised, so as to swing the follower away from the top of the press-box, substantially as and for the purpose indicated.

4. A follower arranged to swing away from the top of the press-box by the lateral movement of the screw, the center of such movement being above the follower, substantially as set forth.

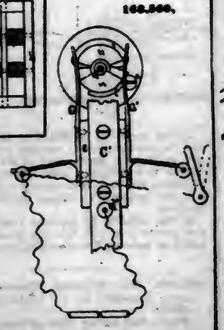
5. In combination with the nut which receives the lower end of the screw, the lug B", or equivalent device, by means of which the nut and follower are locked in position when raised from the press-box, substantially as and for the purpose set forth.

6. The combination of the revolving press-box and a circular guide for guiding and supporting the same, such guide having an internal diameter sufficient to permit the lateral movement of the screw as the follower is swung away from the top of the press-box, substantially as shown and described.

168,558. RAILROAD-RAIL JOINTS. Casper Dittmar, Lancock, Pa. [Filed Aug. 21, 1875.]

1. Recessed fish-plates, substantially as described, in combination with elastic rings placed within such recesses, and bolts which pass through the rings, with the heads resting upon the elastic rings, so as to avoid all injurious effects of the strain and jar upon the fish-plates, bolts, and nuts.

2. Recessed fish-plates, substantially as described, in combination with elastic rings placed within such recesses, and flanged bolts which pass through the rings and interior oval recesses of the fish-plates, and bind the elastic rings, fish-plates, and the ends of the rails to each other by the aid of the bolt-heads and nuts.



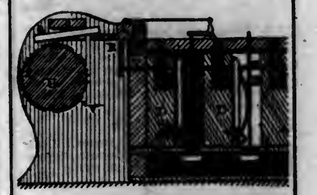
168,559. ARTIFICIAL STONE. Peter B. Doty, Conneaut, Ohio. [Filed Sept. 17, 1875.]

The combination of sand, slaked lime, calcined pulverized plaster, resin, coal-tar, and sulphate of iron for the manufacture of artificial stone, substantially in the manner herein described.

168,560. MAGNETO-ELECTRIC MACHINE. Louis Druecker, New York, N. Y. [Filed Oct. 19, 1874.]

Brief.—Utilizes the secondary or "extra" current produced at the momentary interruptions of the primary induced current. Adjusts the commutator-cams about the axis of the helix, thus altering the position with relation to the poles, the electro-magnet, and varying the intensity of the current.

168,560.



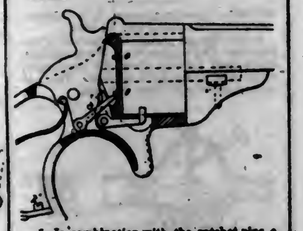
1. Segmental commutator-cams a a, embracing arcs of different degrees, combined with the helix r, tangential insulated springs G G', and electrical conductor C d, of a magneto-electric machine, substantially as and for the purpose herein set forth.

2. In a magneto-electric machine, constructed substantially as herein described, wherein a primary circuit may be established at will between the opposite poles of the helix, through the commutator-cams, their springs, and a conducting-medium between the springs, the combination of electrodes, the one connected directly with one of the cams independently of the springs, and the other with any given point of the aforesaid primary circuit, whereby a second circuit may be established, which shall be automatically closed at each semi-revolution of the helix, at the moment the primary circuit is opened, all substantially as and for the purpose herein set forth.

3. In a magneto-electric machine, constructed with a revolving helix, the combination of the commutator-cams which open and close automatically the circuit induced in the coil, with a collar encircling the shaft or arbor of the helix, substantially as and for the purpose herein set forth.

4. A magneto-electric machine, constructed substantially as herein described, to deliver both primary and secondary electric currents from the same helix, in manner as herein set forth.

168,561. ORGANS, &c. Bernhard Dufner, Buffalo, N. Y. [Filed Aug. 26, 1875.]



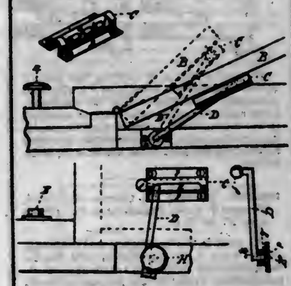
1. The combination, with the auxiliary chests B, each provided with a full set or stop of pipes, of the chest-valves I, arranged to be operated substantially as described, whereby any one or more set or sets of stops may be engaged or disengaged at pleasure, for the object specified.

2. The combination, with the auxiliary chests B, of the partitions D, having wind-passages E, and the vertically-pivoted pipe-valves F, operated by the rods T, in the manner substantially as described, for the object specified.

3. The combination, with the main chest A, of the auxiliary chests B, partitions D, provided with the wind-passages E, valves I and F, all arranged as set forth, and a suitable operating mechanism, substantially as described.

168,562. REVOLVING FIRE-ARMS. William H. Elliot, New York, N. Y. [Filed Sept. 9, 1875.]

1. In combination with the ratchet-plate c, the groove c', when arranged in the breech-plate directly behind the chambers of the cylinder, substantially as and for the purpose specified.



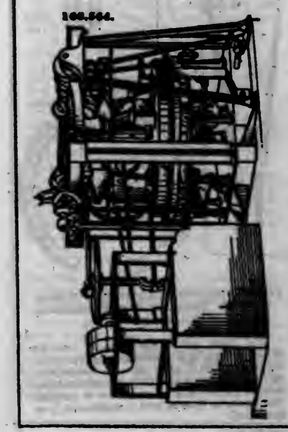
2. The construction and operation of the ratchet-plate, breech-plate, and revolving pawl, whereby the revolving pawl operates upon the ratchet directly in the rear of the chambers, and behind the breech-plate, without coming in contact with the cartridges, substantially as specified.

3. The two extended points of the locking-bolt, whereby that device embraces each one of the chambers as they come around to lock the cylinder, as herein set forth.

4. The S-shaped mainspring k, when immovably fixed upon its rest k', and provided with a fixed partially-rotating bearing in the hammer, whereby it is made to give off a combined parallel and lateral force, substantially in the manner and for the purpose specified.

168,563. SHUTTER-BOWERS AND FASTENERS. Joseph Follows and John Finnegan, Philadelphia, Pa. [Filed Sept. 2, 1875.]

Brief.—A bell-end hook is carried in an elongated case or socket, having a longitudinal slot and a series of cross-slots. The bell-end is interchangeably moved from one cross-slot to another without detaching, thus enabling the hook, by engagement with a stationary socket on the window-sill, to bow the shutters in desired position. The construction also is such that, by changing the position of the bell-end hook in relation to the slotted case, the hooked end passes under a suitable knob, to fasten the shutter in position when thrown back against the wall.



1. The elongated case or socket C, having a longitudinal slot, d, and a series of cross-slots, e, and rod D, having a neck, h, bell f, and hook k, in combination with the shutter B and stationary socket E, for holding the shutter in its closed and bowed positions, substantially as set forth.

2. The combination of the elongated socket E and rod D, constructed as described, with the shutter B and stationary knob H, for holding the shutter in its backward position, substantially as set forth.

3. The socket E, having an enlargement or inside shoulder, g, in combination with the rod D, having a hook, k, provided with the lip p for holding the rod securely in its locked position, substantially as set forth.

168,564. BRICK-MACHINES. WM. L. GREGG, Chicago, Ill. [Filed Aug. 23, 1875.]

Brief.—A horizontal mold-table is intermittently revolved by belting and cog gearing. The clay is pressed by a rolling wheel, successively, into series of molds, which, in their progress, is compacted and ejected.

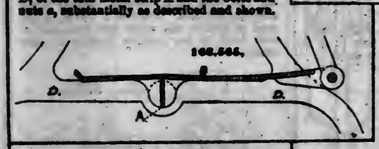
1. The combination, in a brick-machine, of an intermittently revolving mold-table and its mold-boxes, a pressure-wheel rotating in a fixed box, a cam and toggle-joint levers, which compress the clay in the mold-boxes between a pressure-plate on the upper surface thereof and a plunger beneath said mold-boxes, and cams and toggle-joint levers, which compress the clay between a pressure-plate below the boxes and a pressure-box above them, said pressure-box being provided with downwardly-moving plungers having springs interposed between them and their operating-levers, substantially as and for the purposes set forth.

2. The combination, in a brick-machine, of an intermittently-revolving mold-table and its mold-boxes with a vertically-moving plunger to expel the finished bricks from the mold-boxes, a horizontally-moving plate to remove the bricks from the mold-table, and cams and rocker-shafts which operate the plunger and plate during the intervals of rest of the mold-table, substantially as set forth.

3. The combination, in a brick-machine, of an intermittently-revolving mold-table and its mold-boxes, and a movable pressure-plate, which closes the tops of the mold-boxes during the intervals of rest of the mold-table, and is released therefrom during its motion, substantially as set forth.

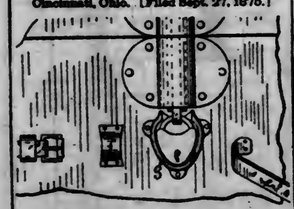
4. The combination, in a brick-machine, of an intermittently-rotating mold-table and its mold-boxes, and a movable pressure-box, having separate plungers actuated by cams, each plunger being provided with an independent spring to regulate the pressure applied to the clay, substantially as set forth.

168,565. SEWING-MACHINE TREADLES. W. B. Shapter, San Francisco, Cal. [Filed Mar. 13, 1875.]



Brief.—An elastic metal blade, carrying the sandal, is rigidly secured to the lower part of the frame, whereby frictional surfaces are avoided.

1. In combination, the sandals B, pivoted at their front end to the pitmen E, the thin metal blade A, set on edge and secured rigidly to the under side of the sandals, substantially as described and shown.

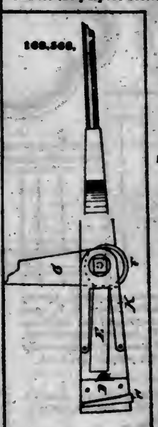


2. In combination, the sandals B, pivoted at their front end to the pitmen E, the thin metal blade A, set on edge and secured rigidly to the under side of the sandals, the said blade A having its ends adjustably secured in the table legs or frame, adapted to have its tension changed at pleasure, substantially as described and shown.

3. The combination, with table legs or frame D, of the thin metal strip A and the bolts and nuts c, substantially as described and shown.

168,565.

168,566. TRUNK-FASTENINGS. Robt. Hilton, Cincinnati, Ohio. [Filed Sept. 27, 1875.]



1. The socket g, for the purpose of receiving and protecting the padlock of a trunk-fastening, substantially as described.

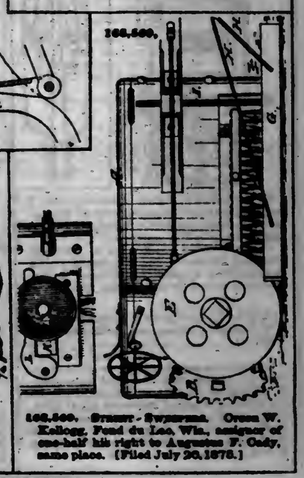
2. The combination of socket g and strap s, substantially as and for the purpose set forth.

168,567. RAILWAY-TRACK GAGES. Sylvester Holbrook, Rockport, Mass. [Filed Mar. 16, 1875.]

The combination and arrangement of the square A, having a recess, f, for the beam B when set in use, the projecting arms D D, the beam B, the thumb-screw b, by which the square A is adjusted onto the beam B at height above the rail, said screw also operating as a pivot to the beam B when laid at rest in the recess f, the level C and the forked gage E having a slot therein, and an adjusting thumb-screw, c, by which said gage E is held to the square A, and may be moved backward and forward, substantially as shown, and for the purpose described.

168,566.

168,567.

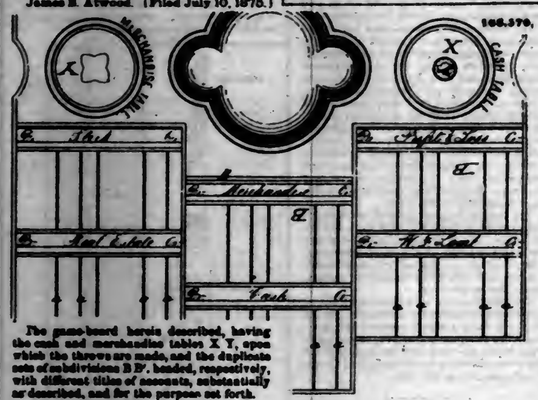


168,568. BOLT AND RIVET CUTTERS. David M. Kelley, Burke, N. Y. [Filed Aug. 6, 1875.]

Brief.—The main bar is provided with an end flange. The removable cutter is adjusted by means of a wedge placed between the end flange and the serrated edge of the cutter. A brace-plate extends from the pivot to the main bar.

The combination, with the bar A, having slots e and support g, serrated removable cutter D, with bolts d, and the wedge C, of the lever G, with shoulder h, and the cutter or chisel K, with eye F, and the brace-plate K, constructed to operate substantially as specified.

168,569.



168,569. STREET-SWEEPERS. Orson W. Kellogg, Fond du Lac, Wis., assignor of one-half his right to Augustus F. Cady, same place. [Filed July 30, 1875.]

1. The combination of frame A, pole F, broom-shaft B, and truck-wheels E E, as above arranged and substantially specified.

2. The arrangement of the scraper G, connected to the pole F by draw-rods H H and standard I, substantially as specified.

3. Bearings K, with lugs and eccentric to turn L, and wrenches M, with ratchet and pawl and lever wheel, substantially as specified.

168,570. GAME-BOARDS. Watson F Lamb, Wilbraham, Mass., assignor to himself and James B. Atwood. [Filed July 10, 1875.]

The game-board herein described, having the cash and merchandise tables X Y, upon which the throws are made, and the duplicate sets of subdivisions B B', headed, respectively, with different titles of accounts, substantially as described, and for the purpose set forth.

168,571. FEATHER-RENOVATORS. Henry L. Linn, Gilson, Ill. [Filed Aug. 31, 1875.]

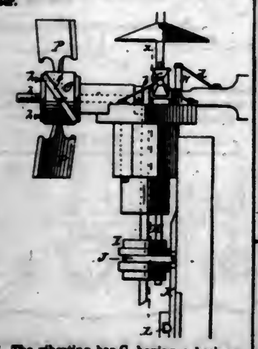
1. The spout I, having stationary sides i, and hinged sides i', combined with the feather-renovator case and stirrer E, substantially as and for the purpose specified.

2. The stirrer E, constructed as described, with hub E' arms e^2 and e^3, combined with the frame-bars e, spout G, and doors K, substantially as and for the purpose specified.

168,572. HAYES-TROUGH HANGERS. Wm. B. Morrow, Goshen, Ind. [Filed July 30, 1874.]

In an eaves-trough hanger made of hoop-iron, the combination of a rigid cross-piece, B, having the head a and downward-projecting shoulder b, with a malleable metal strip, C, the latter so arranged that it projects laterally outward from the cross-piece B, and at right angles to the shoulder b, substantially as and for the purpose specified.

168,573.



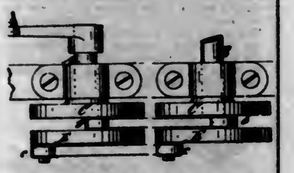
2. The combination of the vibrating bar G with links a b, the vertical bar H, and grooved sleeve I, for moving and controlling a wind-wheel and vane, substantially as herein set forth.

3. The combination of the lever L with weight M, connecting-bar K, with clutch J, grooved sleeve I, vertical bar H, vibrating-bar G, and the links a b, connecting the same with the wind-wheel and vane, all substantially as and for the purposes herein set forth.

4. The combination of the hub O, adjustable sails or wings P, with stems f, and set-screws h, substantially as and for the purposes herein set forth.

168,574. WINDMILLS. John M. May, Cedar Rapids, Iowa. [Filed Feb. 24, 1875.]

Brief.—A solid wheel and a vane pivoted or jointed to a principal casting or part that revolves horizontally at the head of the post that sustains the mill, the face of the wheel and the vane being brought parallel when stopping the mill. There is a vibrating bar used to revolve the wheel and vane, and to hold them in any position relative to each other.

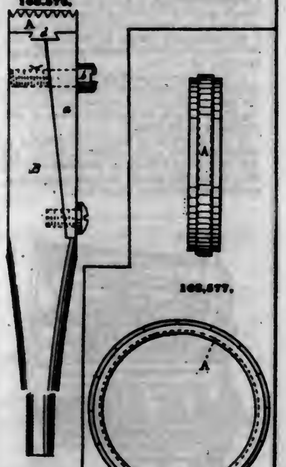


1. The vibrating bar G, having a horizontal, vertical, and spiral motion, and used to revolve a wind-wheel and vane, and to hold them in any desired position relatively to each other, substantially as herein set forth.

168,575. CRANDLESTICKS. Riverius Marsh, Flushing, N. Y. [Filed Feb. 20, 1875.]

In a chandelier constructed, substantially as set forth, so that one portion of the same, together with its arms and burners, will serve as an adjustable weight or balance for elevating or lowering the other portion of the same chandelier, including its arms and burners, the two sections combined substantially as described.

168,576. MECHANICAL MOVEMENTS. John McCloskey, New York, N. Y. [Filed Aug. 20, 1875.]

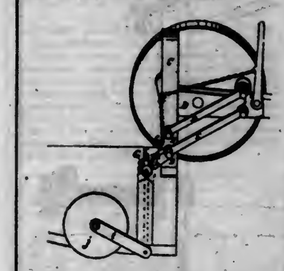


The two shafts A B, carrying the disks C E, provided with the crank-pins b a, which are connected by the pitmen F D, the whole combined and arranged substantially as specified, to cause the pitmen to travel simultaneously, but not alternately and both within the same radius from the axes of the shafts A B, as described.

168,578. CUTTERS AND CUTTER-HOLDERS. Thomas T. Nash, Philadelphia, Pa. [Filed Aug. 27, 1875.]

The stock B, having a cap, c, and confining-screws b and b', in combination with the detachable chaser A, having a male dovetail, d, substantially as and for the purpose set forth.

168,576.

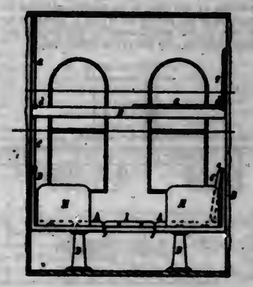


168,577.

168,577. MANUFACTURE OF SCREW-THREAD CUTTERS. Thomas T. Nash, Philadelphia, Pa. [Filed Sept. 20, 1875.]

The mode above described of making chaser-cutters, by first concentring the cylinder A with one or more annular channels, c, on its periphery, and a threaded internal surface, and separating it into pieces of suitable dimensions to form cutters C, substantially as described.

168,579. HARVESTERS. Aaron Palmer, Rochester, N. Y. [Filed Aug. 6, 1874.]



Brief.—The grain-platform and tongue-frame are connected together by parallel bars, so that the platform can be raised or lowered, and maintain a horizontal position.

1. The combination of the broom D and E, casting E and standard C, shaft G, and arm f, substantially as shown and described.

2. The combination of the parallel braces D E, tongue-casting E, and platform-standard C, whereby the horizontal position of the platform on the line of the path of the machine is maintained whether raised or lowered.

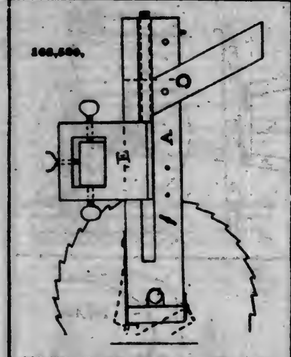
168,580. SLEEPING-CARS. Francis W. Parsons, Dedham, Mass. [Filed Feb. 6, 1875.]

1. In a railway-car, the combination of two adjacent pivoted seats, A A, with supports D D, and capable of sliding diagonally on the supports D D, substantially as and for the purpose set forth.

2. The upper berth B, in combination with guide g, sliding bearing h, and pivot i, substantially as and for the purpose set forth.

3. The combination of seat A, plate F, and standard D, substantially as set forth.

4. The combination of the seat A, vertical back E, and inclined back C, the inclined back C being hinged to the top of back E, substantially as and for the purposes set forth.



5. The combination of the seat A, removable arm I, and fixed arm H, substantially as described, and the arm I to be removed and used to form part of bed, as set forth, and for the purpose set forth.

6. The combination of plate f, having a socket for pivot-pin i, sliding bearing h, and guide g, substantially as and for the purpose set forth.

7. In a car, the upper berth B, having hits a hinged to the back E for forming partitions, substantially as set forth.

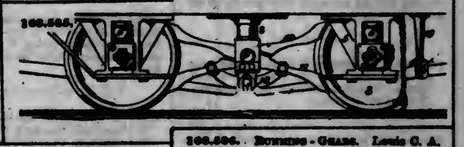
168,581. MACHINES FOR JOINTING AND DRESSING CIRCULAR SAWS. Wm. Potter, Leyden, N. Y. [Filed July 30, 1875.]

In a machine for jointing and dressing circular saws, the slotted frame A, having the two arms provided with clamps and openings, to receive and hold the saw-shaft, in combination with the moving frame B and the saw F, all constructed to operate as set forth.

1. The bellow-bar C, having an independent bearing, a, constructed with the wheel g, and arranged around the axle a of the main wheel B, in combination with the mainspring D and barrel G, substantially as and for the purpose set forth.

2. The main wheel B, having the axle a formed rigidly thereon, and constructed with the pivots a', in combination with the mainspring connecting said wheel, whereby increased stability and steadiness is given to the wheel, and provision is made for leveling the pivots a', substantially as set forth.

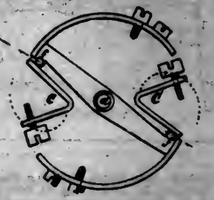
3. The combined main wheel and winding device, comprising the bellow-hub C', having an independent bearing, a, and constructed with the wheel g, the main wheel B, having the axle a formed rigidly thereon, and constructed with the pivots a', the mainspring D, and the barrel G, locking with the main wheel by a pawl or click, c^2, the whole arranged for use and operation substantially as and for the purpose set forth.



168,581.

168,582.

168,583.

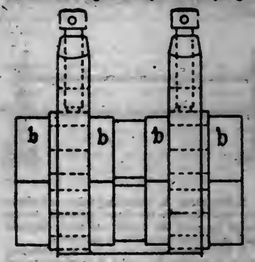


168,582. ESCAPEMENTS FOR WATCHES. Albert H. Potter, Chicago, Ill., assignor of one-half his right to J. H. McMillan, same place. [Filed Aug. 11, 1875.]

Brief.—Arranging the trip-spring in a chronometer-escapement at an acute angle to the lever carrying the locking-pallet, by attaching it to a radial arm on said lever.

The locking-bar A, having at one end the arm b, carrying the trip-spring c at an acute angle to the said bar, and at the other provided with the locking-pallet C, in combination with the trip-pallet I, impulse-pallet K, and escape-wheel L, the whole arranged for operation substantially as and for the purpose specified.

168,584. COMPENSATION-BALANCES FOR WATCHES. Albert H. Potter, Chicago, Ill., assignor of one-half his right to J. H. McMillan, same place. [Filed Aug. 11, 1875.]



Brief.—Auxiliary bows, having their inner portion brass and outer portion steel, are pivoted to the arms of the balance, to provide additional compensation.

The balance, constructed with the adjustable auxiliary bows C adjustably loaded, as described, substantially as and for the purpose set forth.

168,585. ROLLS FOR ROLLING METAL. Geo. F. Salisbury, New Haven, Conn. [Filed June 2, 1875.]

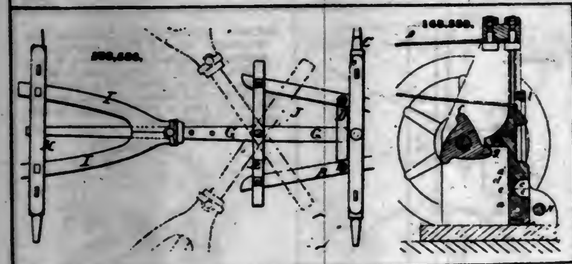
Brief.—The enlargements give the rolls increased stiffness and strength, so that when screwed close together they will not spring.

Rolls, for rolling metal, extending outside the frame A, and having the enlargements b b b, substantially as and for the purpose specified.

168,586. CAR-BRAKES. Jos. H. Sawtine, Philadelphia, Pa. [Filed June 15, 1875.]

Brief.—By depressing either of the levers, one of the brake-bars is made to engage with both wheels and cramp them tightly.

The combination of two cramp-bars, 10 11, pivoted to the pendant 3, connecting-bar 12, and two adjacent wheels, 2 2', on which said cramp-bars operate, substantially as set forth.



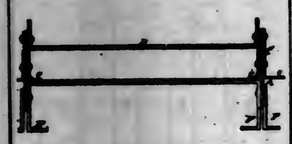
168,585.

168,586. RUNNING-GEARS. Lewis C. A. Schmidt, Tiffin, Ohio. [Filed July 30, 1875.]

Brief.—Reach pivoted upon cross-bars at rear of front bounds, front end of reach moving loosely on side-bar.

1. The front bound, constructed with a rear extension, having a cross-bar slide, D, and arching supporting cross-bars E and F in rear of the front axle, substantially as and for the purpose described.

2. The front bounds, constructed with a cross-bar slide, D, and an arching supporting-bar, F, in combination with a reach, passed over the supporting cross-bar F, under the cross-bar slide D, and terminated behind the front axle C, and coupled to the front bound B by a pivot-pin, J, substantially as described.



168,688.

168,689.

168,687. Barn Doors. Merrill A. Shepard, Lebanon, Ill. [Filed Aug. 10, 1875.]

Brief.—Rafters of plate-iron extend above and below the roof-plates, the latter being attached about mid-way of the vertical depth of the rafter by bolts. The rafters are secured at foot to the walls by plate-anchors, and are laterally braced by cleats extending across from rafter to rafter near the top and bottom edges thereof. A curved plate protects the ridge, a ventilating-space being left. A flanged cap covers each rafter, and is bolted through cap, rafter, and roof-plate flanges. The roof-plates have steps or offsets, and the caps are notched to fit the steps when ties are used.

1. The rafter A, extending below and above the roof B, with the latter attached to the rafter between the upper and lower edges of said rafter, substantially as set forth.

2. The combination of rafter A, extending above and below the roof B, with flange-cap C c, substantially as set forth.

3. In combination with the rafter A and cap C c, the combined braces and supports D above and below, extending from rafter to rafter, substantially as and for the purpose set forth.

4. The inverted trough E at the peak of the roof, with ventilating-space e e between the trough and the main part of the roof, and forming a flexible connection between the two sides of the roof, substantially as set forth.

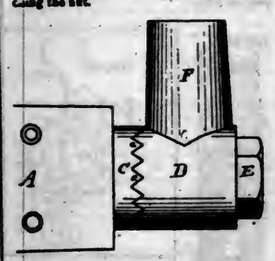
5. In combination with a tile roof, the notches or steps f in the lower edges of the cap C, substantially as set forth.

6. In combination with the rafter A, the anchors F F, consisting of duplicate plates, constructed and arranged substantially as set forth.

168,688. Machines for Rounding and Shaping the Rims of Wrought-Iron Tubes. Daniel C. Stillman, Boston, Mass. [Filed Apr. 7, 1870.]

Brief.—The wall of the tube is drawn inward upon itself and welded; the disc a a', for this purpose, presenting, when closed, a horizontal and concentric oval-shaped opening at e, and recesses c c next the end of the tube.

1. In a machine for forming and welding the ends of metallic pipes, the die a a', having each of its faces formed with a semi-globular recess, e, a semi-recess, d, and connecting-groove d, substantially as above and described.



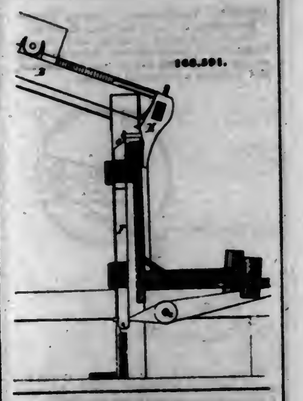
2. The improved machine for forming and welding the ends of metallic tubes, consisting of the die, having stationary and movable parts a a', the tapering retaining-spring D, the series of lifting-arms f, and the rocker catch-bar provided with a lip, l, and mechanism for throwing the same out of action, the whole being constructed and arranged in manner as described.

168,689. Stove-Legs. William Tanner, New Brighton, Pa., assignor of one-half his right to James H. McConnell. [Filed July 17, 1875.]

A stove-leg constructed with a rigid foot, a, and provided with a caster, b, located above the base of said foot, as specified, whereby the caster will rest upon the floor only when the stove is tilted, substantially as and for the purpose set forth.

168,690. Crosscut-Saw Handles. Chas. M. Tanner, Defiance, Ohio. [Filed Aug. 23, 1875.]

Brief.—The saw is attached to the handle by means of two metal plates, each having half of the shank, on which is secured a sleeve-socket having ratchet-teeth, which mesh with like teeth on a collar placed next to the plates. The handle is secured in position by a set screw on the end of the shank, and can be readily adjusted to any desired angle by loosening the set.

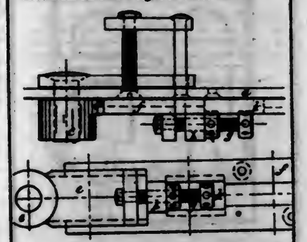


The plates A A, having each the half-shank B, the toothed collar C, the toothed sleeve D, having the handle-socket F, and the nut E, all constructed as and for the purpose herein set forth.

168,691. Type-Setting Machines. David B. Thompson, Hartford, Conn., assignor to the Farnham Type-Setter Manufacturing Company, same place. [Filed May 22, 1875.]

Brief.—The type-carriers receive their letters from inclined ways, and, when moving sideways by meshing the keys, carry one letter at a time into the bites, which conduct them to the galley.

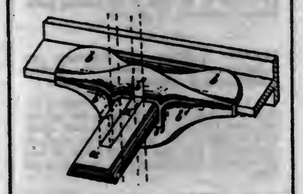
1. The oscillating lever H, with its arm f and lips e and c, in combination with the shoulder a as a retaining mechanism for types retained in a channel, B, and pressed forward toward it, substantially as herein described.



2. The bar F, having the inclined slot e near its top, in combination with the retaining-lever H, for giving it a lateral retaining motion, substantially as herein described.

168,691.

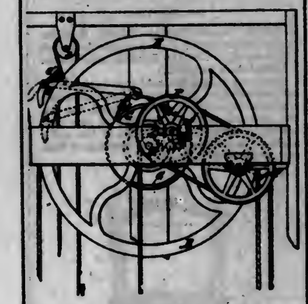
168,692. Hinges. Benjamin Turner, London, England. [Filed Aug. 10, 1875.]



Brief.—A hinge or hinged plate, for heavy swinging doors, is constructed with a double plate, one carrying the socket and partially sliding within the other, and provided with a lateral adjusting-screw and lock-nut, which are reached, for adjustment, through a suitable aperture, without removal from the door; the construction being such as to allow the position of the door to be readily adjusted in relation to the center on which it turns, so as to take up and compensate for any drop of the door from its own weight or other cause.

The plates e and f, sliding in one another, and having the door attached to one of them, and the socket c, upon which the door turns, to the other, the relative position of the two plates being adjusted by the screw g and the lock-nut i, substantially as and for the purpose described.

168,693. Gearing. William L. Walker and Benj. O. Dovee, Kenton, Iowa. [Filed Jan. 6, 1875.]

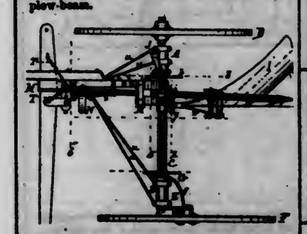


Brief.—The cross-rails of fences are clamped to the posts by means of an upper plate, having a grooved horizontal plate, and a slotted vertical plate provided with a flange, having recesses for the reception of the post, when inserted in a slot in the shank of the lower plate, which is T-shaped, and provided upon the upper face of its horizontal part with projecting studs, which fit in suitable holes in the rail.

A clamping device, formed of two parts, A B, the lower part A having a shank a provided with a slot a', and studs a', in combination with the upper part B, having aperture b', flange b', recesses b', and the groove b', substantially as and for the purpose specified.

168,694. Hoisting-Machines. John Wallace, Chicago, Ill. [Filed Apr. 8, 1875.]

Brief.—Gearing with the shaft of a large overhead pulley, over which passes the hoisting-rope, are two parallel counter-shafts, each having a pulley with two or more peripheral grooves on it, around which a counterbalancing hoisting-rope is wound several times, with the object of keeping each hanging part in an unvarying vertical line. The end of the brake-lever has a pawl pivoted to it.



1. The combination, in a hoisting-machine, of the drum-sheaves F F', having two or more peripheral grooves, and the hoisting-rope passed two or more times around them, the ends of said rope being attached, respectively, to the platform and counterbalance-weight, the drum-sheave F being connected by intermediate gearing with the motor-pulley B, substantially as described.

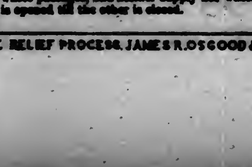
2. The combination of brake-lever L and pivoted pawl c, arranged to be thrown outward from said lever, and a stationary ratchet or catch-block, O, substantially as shown.

168,695. Sulky-Plows. S. F. Woodworth, Rockford, Ill. [Filed Aug. 2, 1875.]

Brief.—Peculiar form of axle, crank, and lever, and of devices for elevating the plow-beam. Devices for pivoting the tongue, and movably attaching to it the front end of the plow-beam.

1. The crank-formed lever axle-arm B, composed of arms a a' a'', brace d, and lever c, in combination with the internally-toothed segment-ratchet G, as and for the purpose set forth.

2. The combination of the angle-lever J, segment-toothed ratchet k, link l, curve-slotting device k, and curved guide-bars H, for the purpose of raising and lowering the plow, and holding it in position, substantially as shown and described.



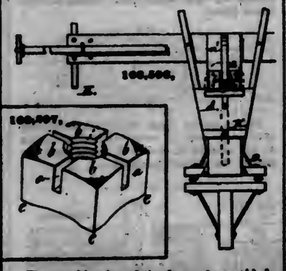
3. The tongue K, hinged to the plow-beam between the axle and the clevis, substantially as described, in combination with the guide-plate Q, secured to the rear end of the tongue, to work in the grooved curved guideway p, secured to the elevating device A, the upper projecting radial arm of clevis L, fitted to slide in loop r on tongue K, all these members being constructed and arranged to operate substantially as described, for the purpose of holding the tongue rigid with the plow-beam laterally, and to permit of a free independent vertical movement, as described and shown.

4. The lever M and link z, in combination with the tongue K and clevis L, for the purpose of tilting the plow on the axle, and holding it in the tilted position, substantially as described.

5. The coiler W, yoke w, clevis y, bars v, tube x, and yoke t, in combination with the axle and plow-beams adjustable thereon, as described.

168,696. Machinery for Shaving Counters for Boots and Shoes. T. Andrews, Boston, Mass., assignor to himself and A. Osbourne, same place. [Filed Sept. 21, 1875.]

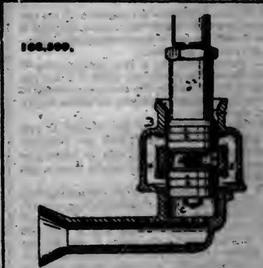
Brief.—By means of the sliding die plate, the rotary depresser, and stationary knife, the stiffener-blank is molded into shape, and trimmed at one operation.



In a machine for shaving counters, the combination of the slide-molds B (i. the knife I, the series of fingers K, and the rotary depresser M, all being arranged and applied together or in a frame, and provided with operative mechanism, all substantially as specified and shown.

168,697. Nut-Locks. James B. Atwood, Wilbraham, Mass. [Filed Sept. 2, 1875.]

An improved nut-lock, having its outer end or face provided with one or more slots or cavities, c, dividing that portion of the nut into two or more divisions. b, in combination with the projecting part c of the bearing, opposite the divisions c, whereby the latter is thrown inward against the threaded portion of the bolt when the nut is turned up to a bearing, substantially as described.



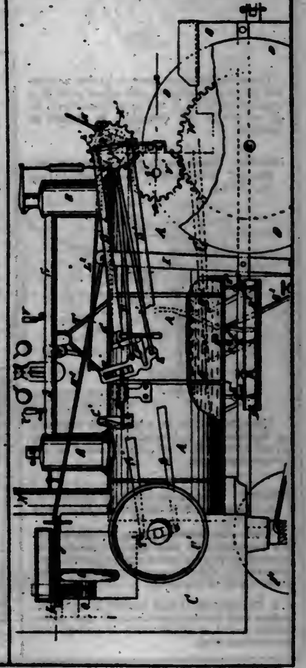
168,698. Land-Markers. J. Angermeyer, Trenton, Ohio. [Filed June 14, 1875.]

The combination of the frame A, provided with the furrowers B E, the auxiliary frame D, provided with the furrower I, and pivoted by the bolt K to turn horizontally on the frame A, and held in the proper position thereon by a catch, c, and the hangers C, attached to the frame D, substantially as and for the purpose herein specified.

168,699. Hydrants. George C. Bailey, Pittsburg, Pa. [Filed Aug. 26, 1875.]

Brief.—Side ports or passages, both ends of which open into the cylinder, are so arranged with reference to pistons, which each carry an arranged with reference to intermediate parts opening into the hollow rod, that the said side ports operate alternately as supply and waste passages, and neither supply nor waste is opened till the other is closed.

168,699.



1. In a hydrant valve-case, one or more lateral ports, c, opening at both ends into the valve-chamber, in combination with a suitable arrangement of valves, substantially as set forth, whereby each port or ports are employed alternately as waste and supply ports.

2. The piston-valves b b', having intermediate parts c, communicating with a hollow water-way, in combination with waste and supply port or ports c in the valve-case, relatively arranged and combined substantially as set forth.

3. The piston-valves b b', arranged in the barrel or chamber c relatively to each other and to the upper and lower ends of a port or ports, c, and a waste-passage, c', substantially as set forth, whereby the waste and supply shall each be closed in advance of the opening of the other.

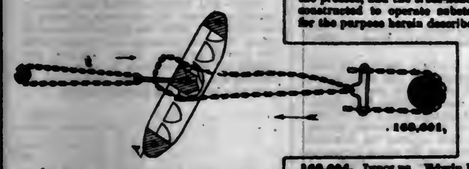
168,700. Road-Engines. John H. Range, Edwardsville, Ill. [Filed Sept. 11, 1875.]

Brief.—The boiler is divided into compartments, to prevent the water from collecting at the lower end when the engine is on an incline. The compartments are connected with the throttle by steam-pipes. Water-tanks are connected by separate pipes to each. By detaching the connecting gear-wheels, the engine may be used as a portable engine.

1. The combination of the partitions Q, the two steam-domes E E, and the connecting-pipes S and T with the boiler A, substantially as herein shown and described.

2. The combination of the throttle-valve W with the middle part of the pipe T T and the pipe S, that connects the two steam-domes E of the boiler A, substantially as herein shown and described.

3. The combination of the receiver D^1 and its pipes F^1 and valves F^2 with the compartments of the boiler A, and with the feed-water pump A^1, substantially as herein shown and described.

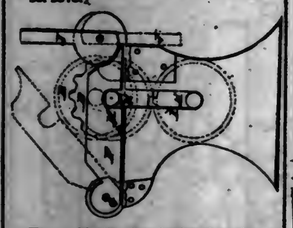


4. The combination of the connecting-rods H, the upright levers I, the connecting-rods H^1, the bent levers J, the chains K, and the shaft gear-wheels and bevel-wheels L M N P with the forward axle G, the boiler A, and the box C, attached to the forward end of the said boiler A, substantially as herein shown and described.

5. The combination of the small gear-wheels L^1, the shaft K^1, the detachable intermediate gear-wheels V^1, and the large gear-wheels W with the axle R of the drive-wheels D, and with the piston-rod P^1 of the cylinder A^1, substantially as herein shown and described.

6. The combination of the gear-wheels L^1, the shaft K^1, the double cranks R^1 T^1, and the two connecting-rods S^1 with the driving-pulley U^1, and with the piston-rod P^1 of the steam-cylinder A^1, substantially as herein shown and described.

160,601. LEVER-TOOTHER. Henry C. Bell, Milan, Mo. [Filed Sept. 4, 1875.]

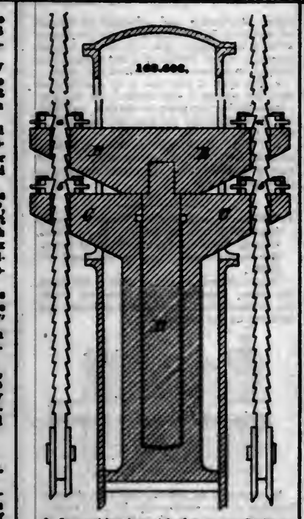


Brief.—On each side of the point of connection of a lever is an oblong opening, with a slotted block on one of its sides, to admit of the chain being drawn through, when alternately slackened in the reciprocation of the lever.

160,601.

The combination of lever A, having a chain-lock, notch or notches on each side of pivot B, a connecting-chain, a, and hoisting-chains C D, all as shown and described, to operate as specified.

160,602. BEAM-STEAM TRIP-HAMMER. T. Hilliard, Weatherford, Tex. [Filed July 10, 1875.]



The combination, in a beat-hook tripper, of the rollers A B, hinged arms F, cam-lever J, and springs H, substantially as and for the purpose set forth.

160,603. REVERSIBLE-LIFT DRY-DOCKS. T. A. Hicks, San Francisco, Cal. [Filed July 27, 1875.]

Brief.—The pontoons, having a short stroke, are provided with port-blocks, operating in connection with notched rods supporting the girders, by which means the stroke of the pontoons may be repeated.

1. The girders G and pontoons D, in combination with the notched rods E and port-blocks a a b b, substantially as and for the purposes set forth.

160,602.

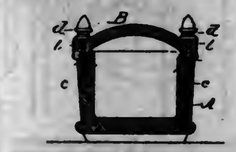
2. In combination with the pontoon D, having a stroke shorter than the distance through which the vessel is to be raised, the ratcheted rods E, provided with pawls, the arms C upon the pontoon, and the cross-heads B, the whole constructed to operate substantially as and for the purpose herein described

---

160,604. INSOLES. Edwin F. Blossom and Geo. H. Clark, Beverly, Mass. [Filed May 28, 1875.]

Brief.—The insole consists of a shortened or top-sole of water-proof cork, bound with leather on the edges, and having a cloth shank-piece.

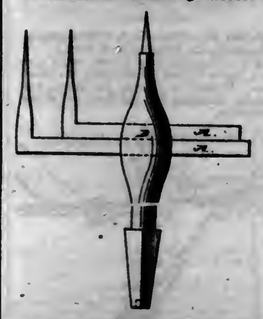
The improved insole described, consisting of the cork body D, rubber-cloth shank-piece A, and binding E, combined substantially as and for the purpose specified.



160,605. GLOVERS'-DRYING. A. Bregnier, Middletown, Md. [Filed June 26, 1875.]

Brief.—The bars are held between the wire and the upper shelf, and when not in use the upper ends are held by their loops, which rest on the wire, and the lower ends rest in the notches on the lower shelf.

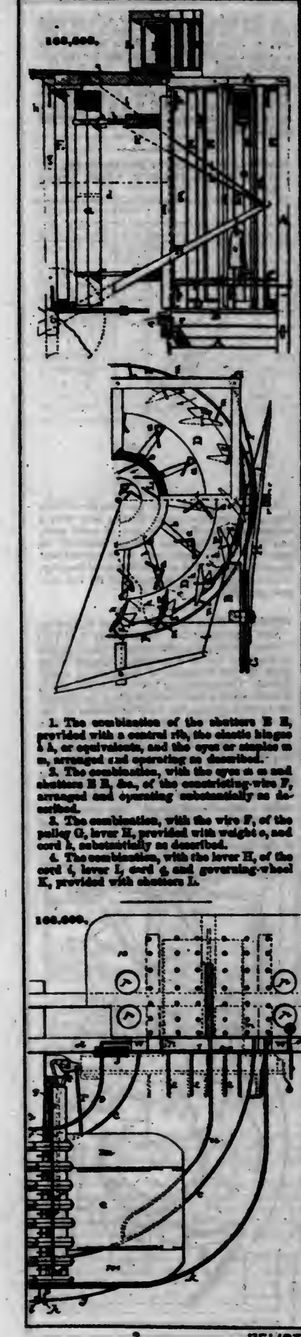
The clothes-rack herein described, consisting of the connecting bent plate A, shelf B, curved supporting-wire C, secured to the bent plate, and supported directly under the outer edge of the shelf, rack-bars D, depending by elongated loops E from the wire, and held in a horizontal position between the shelf B and wire C, and the lower shelf A, provided with perforations a to receive the free ends of the bars D, and secured to the lower portion of the bent plate, all constructed and arranged as and for the purpose set forth.



160,606. GLASS BURIAL-CASES. Stephen H. Brooks, Darby, Pa., assignor of one-half his right to Charles Bonsall, same place. [Filed July 14, 1875.]

Brief.—A glass coffin held together by bolts has projections in the cover, to give a strengthened bearing-surface to the bolt-head, and the nut into which the inner end of the bolt screws is embedded in the side of the coffin itself, so as to strengthen the bearings at that end and prevent fracture.

The glass body A, with nuts *a* embedded therein, below the upper edge of the body at the sides thereof, in combination with the glass lid B, formed with projections *b*, and screw-bolts *d*, whereby both the nuts and heads of the bolts have increased bearing-surfaces, substantially as and for the purpose set forth.



160,607. WASHER-CUTTERS. Henry Brule, Nellsville, Wis. [Filed Aug. 14, 1875.]

An apparatus for cutting leather washers, the cutter-holder constructed of two sections, O D, in combination with the centers A A, adjustably held in a slot of section D by means of a screw-connection, substantially as shown and described.

160,608. HORIZONTAL WIND-WHEELS. F. Buck, Van Wert, Ohio. [Filed Aug. 31, 1875.]

Brief.—The weight of the lever keeps the wire extended or from counteracting the shutters. When the wind is too strong the governor-wheel winds up the cord, which causes the lever to tighten the wire by reeling the pulley, thereby closing the shutters, preventing the action of the wind to the wheel, causing the edges of the shutters to be all brought into a line or circle not to overlap each other. When tank is full an overflow-spout fills the bucket at the end of the cord, and elevates the lever, tightens the wire, and closes the shutters.

160,609.

1. The combination of the shutters E E, provided with a central rib, the elastic hinges I I, or equivalents, and the eyes or staples n, arranged and operating as described.

2. The combination, with the eyes n n and shutters E E, &c., of the counteracting-wire F, arranged and operating substantially as described.

3. The combination, with the wire F, of the pulley G, lever H, provided with weight o, and cord k, substantially as described.

4. The combination, with the lever H, of the cord i, lever I, cord q, and governing-wheel K, provided with shutters L.

160,609. HARVESTERS. John B. Burton, Owatonna, Minn. [Filed Feb. 6, 1875.]

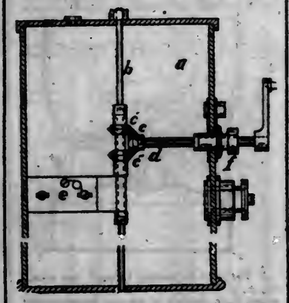
Brief.—The cut grain falls upon a swinging platform, which carries the grain to the binders' table.

1. The combination of the swinging platform and rake *f* hinged thereon, substantially as described.

2. The combination of the rake *f*, platform, rod *h*, ball or catch *i*, rod *j*, and wall *k*, substantially as shown.

3. A movable platform, sliding upon suitable ways, and provided with folding wings, substantially as shown and described.

4. The combination of the platform *e*, rod *i*, wings *m*, lever *n*, and connecting-rods Q *r*, substantially as set forth.



5. The combination of the swinging platform, binders' platform, and rake for sweeping the grain from the swinging platform, substantially as described.

6. The combination of the bent lever V, lever X, rod *p*, bar 1, tooth 2, and spring 3, substantially as shown.

7. The combination of the tubes 5, supports 6, bar 7, bent 8, curved rod 9, and rake *f*, having the hook *p*, substantially as shown and described.

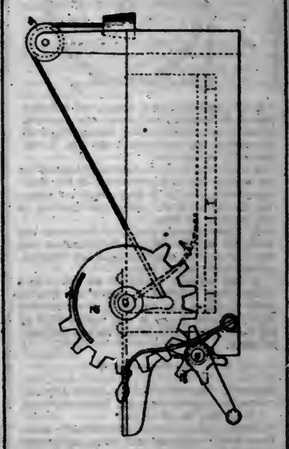
160,610. LARD-TANK STRAINERS. Nathaniel Caldwell, Cincinnati, Ohio. [Filed May 31, 1875.]

Brief.—On the center bolt are placed two gear-wheels. The strainer-blades are fastened to the gear-wheels by means of sleeves, the whole being held in place by set-collars, and operated by means of the turning-crank and wheel.

1. The above-described strainer, consisting of the wheels *c c'* *c''*, shaft *d*, bolt *b*, blades *e e*, and crank *h*, all constructed and arranged substantially as and for the purposes set forth.

2. The combination of the tank *a*, having an outlet, *i*, and the shaft *d*, the bolt *b*, wheels *c c'* *c''*, and blades *e e*, as and for the purposes described.

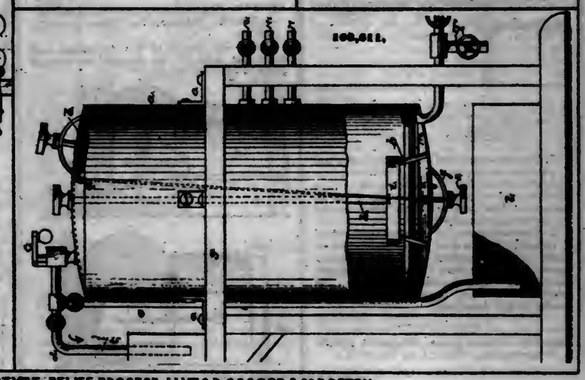
160,611. LARD-RENDERING TANKS. Nathaniel Caldwell, Cincinnati, Ohio. [Filed Apr. 21, 1875.]



1. The combination of the lower tank-head, having a man-hole, with the plate *j*, chain *k*, arch *p*, and bolt *n*, as and for the purpose specified.

2. Combination of the pipe T *m* (the pipe *m* extending inside the tank, and perforated inside the tank) with the tank *a*, whereby either water or steam may be admitted to the lard-tank as required, substantially as set forth.

3. Combination with the head of a lard-tank of the rod A, the brace or arch *i*, and the man-hole plate *j*, whereby the heads of the lard-tank are braced or supported when the man-hole is in the center, substantially as described.

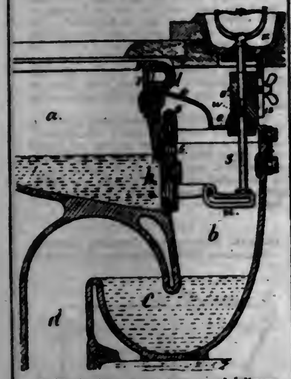


4. The lard-rendering apparatus, consisting of a suitable frame, the tank *a* supported by the legs *o o*, and braced by the rod A, and cross-bar or arch *i*, and having man-hole *k j*, as described, and inlet water or steam pipe T *m*, perforated on the outer side, and outlet-pipes *d a*, and hooks *f* and *i*, substantially as described.

160,612. HOG-LIFTERS. Nathaniel Caldwell, Cincinnati, Ohio. [Filed Apr. 21, 1875.]

The above-described hog-lifter, consisting of the gear-wheel *b*, having a part of the cogs removed, and provided with the step A, the wheel *d*, lever *f*, clutch *j*, the arms *f* attached to the shaft *e*, the counter-balance weight working over the sheave *p*, arranged and combined to operate substantially as set forth.

160,613. BOG-LIFTERS. Nathaniel Caldwell, Cincinnati, Ohio. [Filed Apr. 21, 1875.]



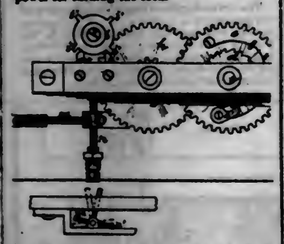
160,613.

The above-described hog-lifter, consisting of the gear-wheel *b*, having a part of the cogs removed, and provided with the step A, the wheel *d*, lever *f*, clutch *j*, the arms *f* attached to the shaft *e*, the counter-balance weight working over the sheave *p*, arranged and combined to operate substantially as set forth.

168,612. Water-Closets. Wm. S. Carr, New York, N. Y. [Filed May 10, 1875.]

Brief.—The bowl and trap are made of porcelain or earthenware, in one piece, the opening between the bowl and trap being circular and tapering in form, to serve as a seat for a valve, constructed to retain the water in the basin, and yet allow an overflow when the water has reached a certain height.

1. The basin *a*, pipe *b*, trap *c*, and delivery-pipe *d*, all made in one piece, with a circular tapering valve-seat around the opening from the side of the basin *a* into the pipe *b*, substantially as set forth.

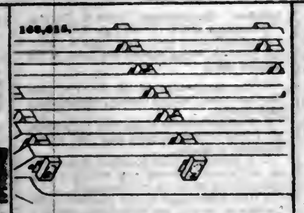


2. The valve *h*, made double, and clamping the elastic ring, and provided with the openings *i* and *k*, so as to form a dam for retaining the water in the basin and allowing an overflow, as set forth.

3. The removable cover *o* to the pipe *b*, carrying the supply-cock *m'*, in combination with the pull and the lever that operates the cock, substantially as set forth.

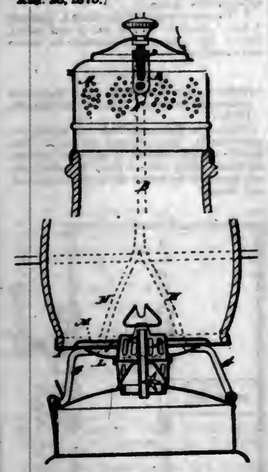
4. The valve *h*, united to the basin by a hinge joint and bolt, *f*, above the opening from the basin *a* to the pipe *b*, in combination with the cam *s*, arm *u*, and slotted lugs at the back of the valve, as and for the purposes set forth.

168,613. Electro Gas-Lighting Apparatus. Reuben Chamberlin, Hartford, Conn. [Filed May 26, 1875.]



Brief.—Escapement-stops vibrated by armature-lever, releasing and stopping motive power for turning the cock.

1. The combination of the escapement-wheel *i*, provided with the spurs *i'*, with the vibratory escapement-fork *n n' n''* hung on an axis at right angles to the shaft or axis of the escapement-wheel, all operating substantially as shown and described.

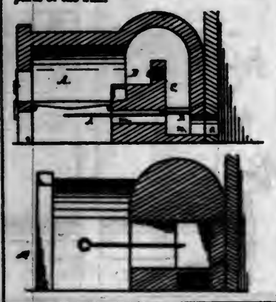


2. The combination of the escapement-wheel *i*, vibratory fork *n n' n''* hung on an axis at right angles to the shaft or axis of the escapement-wheel, ping-shaft *o*, gas-cock *r*, berzer *s*, armature-lever *v*, electro-magnet *k*, and conductors *w w'*, all operating substantially as shown and described.

168,614. Grate-Bars. Walter C. Childs, Pittsburg, Pa. [Filed Aug. 28, 1875.]

A grate-bar, having independent detachable lugs attached to the same, substantially as set forth.

168,615. Lanterns. Patrick J. Clark and Jos. Kiats, West Meriden, Conn. [Filed Aug. 28, 1875.]



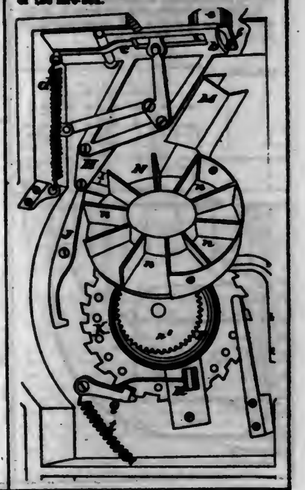
1. The yoke B, passing through the metal cup A, in combination with the nut D and a screw, E, in the top of the cup, substantially as specified.

2. The metal cup, having the yoke passing through slotted holes in its sides, in combination with the globe C, fastening-screw E, and nut D, substantially as specified.

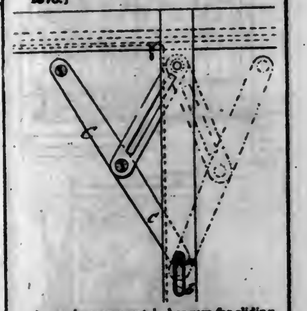
3. The combination, with burner K, cap M, and perforated disk L, of a base-plate, I, having a large central hole, J, and other holes on the outside of disk, as and for the purpose specified.

168,616. Furnaces for Brick-Kilns. W. S. Colwell, Pittsburg, Pa. [Filed Sept. 20, 1875.]

Brief.—By means of the partitions and gates, the heat can be directed to various parts of the kiln.



1. The gates D and chamber *c*, in combination with the fire arches or flues *e* of the kiln and the chambers O B A of the furnace, substantially as herein described, and for the purpose set forth.



2. The movable partitions *c*, in combination with the gates D, chamber *c*, fire flues or arches *e*, and chambers O B A of the furnace, substantially as herein described, and for the purpose set forth.

168,617. Furnaces for Brick-Kilns. W. S. Colwell, Pittsburg, Pa. [Filed Sept. 20, 1875.]

Brief.—By means of the partitions and gates, the heat can be directed to various parts of the kiln.

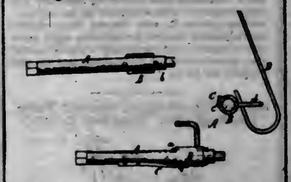
168,618. Hangers for Sliding Doors. L. A. Cook, Dansville, N. Y. [Filed July 17, 1875.]

As an improvement in hangers for sliding doors, the combination of sliding door with a swinging lever, sliding in slot of main post, and with a rocker-bar pivoted centrally to lever and to the main post, to be opened and closed by the parallel motion produced thereby, substantially in the manner and for the purpose set forth.

168,619. Face-Boxes. Aaron J. Curtis, San Francisco, Cal. [Filed July 7, 1875.]

Brief.—An open casket or cavity is arranged at the free end of a swinging hinged metal plate, for the reception of the coins or metal tickets. On depressing the metal plate, which is retained at a horizontal position by a suitable tension spring, the coin contained in the cavity is expelled by a sliding false bottom into the discharge-chute, from whence it passes into one of the radial compartments of the intermittingly-revolving wheel. At the same time the alarm-bell is sounded and the depression registered. The depression of the plate effects the intermittent and partial rotation of the radial compartment-wheel. The coins, after exhibition for a half-revolution, pass beyond the guard-plate, and fall into the locked till of the face-box.

1. The plate A, hinged at one end and provided with a pocket, *a*, and sliding false bottom, *f*, in combination with the lever G, substantially as and for the purposes set forth.

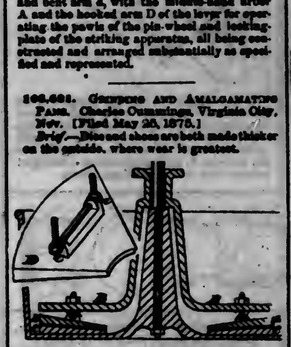


2. The plate A, with its face receiving and depositing socket or cavity *a*, and lever H, with its attached pawl I and detent *J*, in combination with the toothed wheel K, index-fingers *n* and W, gear-wheels *n' n''*, and angularly-rotating wheel N, with its radial compartments, substantially as and for the purpose described.

3. The hinged plate A, with its face receiving and depositing socket *a*, in combination with the spout M and angularly-rotating wheel N, having the radial compartments *n n* and guard-plates O, substantially as and for the purpose described.

4. A combination face-box, alarm, and register, so constructed that the faces shall be received in radial compartments *n n* of a wheel, N, and carried by each wheel during half of its revolution, and then deposited in the drawer of the box, the faces in the compartments of the wheel being open to inspection during the revolution of the wheel N, substantially as and for the purpose described.

168,620. Lockwork Attachments for Clocks. E. C. Covell and M. M. Robinson, Laconia, N. H. [Filed Sept. 21, 1875.]



Brief.—Device for permitting the hands to be turned backward without operating the striking mechanism.

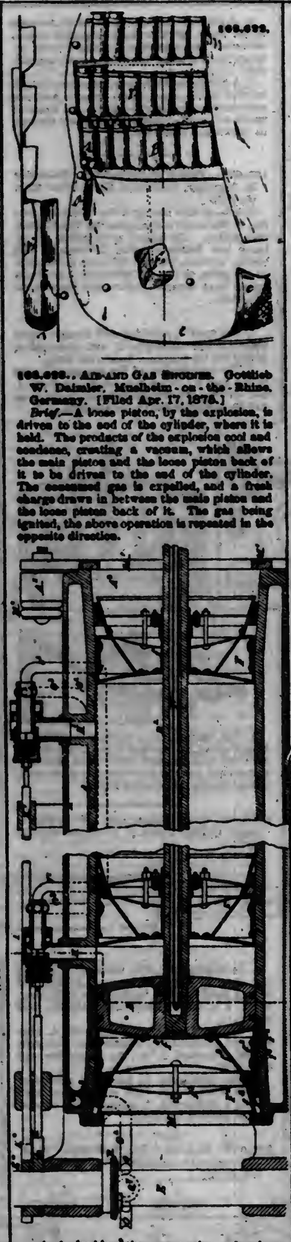
In a clock the combination of the locking-spring C and the rotary sleeve B, its stud *c*, and bent arm *d*, with the minute-hand arbor A, and the hooked arm D of the key for operating the pawls of the pin-wheel and locking-plate of the striking apparatus, all being constructed and arranged substantially as specified and represented.

168,621. Grinding and Amalgamating Pans. Charles Cummings, Virginia City, Nev. [Filed May 20, 1875.]

Brief.—Dies and shoes are both made thicker on the outside, where wear is greatest.

In an amalgamating pan, the mullers B, in combination with the dies C and shoes D, having a gradually-increasing thickness of metal toward their outer edges, substantially as shown and described, and for the purposes set forth.

168,622. Hunting-Jackets. H. L. Daigre, Alexandria, La. [Filed July 10, 1875.]



1. A sportsman's coat, provided with game-pockets at the side flaps or skirts, having side gussets and bottom net-work, for the purpose set forth.

2. In a game-pocket, constructed substantially as described, the small front gusset and loop, in connection with fastening-button, to afford convenient opening and closing of upper part of pocket for introduction of game, as specified.

3. The covering-flaps of the game-pockets, having button-holes at lower part, in combination with buttons of the same for looping up flaps for exhibiting the game, substantially as set forth.

168,623. Air-and Gas Engines. Gottlieb W. Daimler, Mualheim-on-the-Rhine, Germany. [Filed Apr. 17, 1875.]

Brief.—A loose piston, by the explosion, is driven to the end of the cylinder, where it is held. The products of the explosion cool and condense, creating a vacuum, which allows the main piston and the loose piston back of it to be driven to the end of the cylinder. The consumed gas is expelled, and a fresh charge drawn in between the main piston and the loose piston back of it. The gas being ignited, the above operation is repeated in the opposite direction.

1. A double-acting gas-engine, wherein a partial vacuum is formed by the expansion and cooling of the products of combustion alternately on each side of the working-piston, the atmospheric pressure on the other side of the piston producing motive power, substantially as herein described.

2. A double-acting gas-engine consisting of a cylinder open at both ends to the atmosphere, and having a working piston, on each side of which is a loose piston, so arranged that at the end of each stroke the one loose piston, by the explosion of a charge, is propelled to the end of the cylinder without doing work, and is held there while the gaseous products of combustion contract, and the working piston, together with the second loose piston, is caused by atmospheric pressure to perform its stroke, substantially as herein described.

3. In a double-acting gas-engine, the cylinder A, with splayed open ends A', operating in combination with the working piston B and two loose pistons, F F', having conical segment rings *f'*, substantially as herein described.

4. In a double-acting gas-engine, the loose pistons F F', and a device for arresting the motion of said pistons to form a space for the explosive gas, operating alternately in combination with the piston B as working piston, substantially as herein described.

5. In a double-acting gas-engine, the method of effecting the simultaneous expulsion of the products of combustion on one side of the working piston, and the drawing in of an explosive charge on the other side of the piston, substantially as herein described.

6. In a double-acting gas-engine, the working piston B with rod G, operating in combination with the loose pistons F F' in such manner that, as the piston B toward the end of its stroke approaches the one loose piston, so as to expel the products of combustion, the drawing in of the next explosive charge is simultaneously effected by arresting the motion of the second loose piston, substantially as herein described.

7. In a gas-engine, a loose piston propelled by the explosion, in combination with devices for wedging said piston, whereby it is held at the end of its stroke by absolute counter-pressure exerted thereon by the cylinder-surface, as distinguished from mere frictional contact, substantially as herein described.

8. The loose piston F with cylindrical part *f'* fitting with packing *f''* against the cylinder, and conical part *f'* with conical segment-ring *f'*, controlled by springs *f'*, and operating, in combination with the conical ends A' of the cylinder A, substantially as herein described.

9. In combination with the loose pistons, a broad ring of leather or other suitable material, held at its middle by a ring, *f*, so that while the piston can move loosely in the cylinder, the pressure acting on the leather ring on the one side or the other of the piston will insure its working air-tight, substantially as herein described.

10. In combination with the loose pistons and the segment-ring for wedging the same in the cylinder, a device or devices for releasing the loose pistons when pushed by the working piston, substantially as described.

11. The yielding annular leather-piston M, operating, in combination with the piston F, for effecting a close contact between them and the working piston, substantially as herein described.

12. The method of regulating the power of gas or petroleum engines by entirely cutting off the supply of combustible gas or vapor when the engine is running above its normal speed, while the working piston remains continuously in motion, substantially as herein described.

13. The combination of a governor, the valve of the gas-supply-pipe, and suitable intermediate mechanism for causing the governor to fully open or close the gas-supply, whereby a uniform quantity of gas for each charge is insured, substantially as herein described.

14. The valve P with stem P' and head P'', operating, in combination with the governor G and projection E', so that the governor only serves to bring parts into motion, whereby the gas-supply is either entirely closed or fully opened, substantially as herein described.

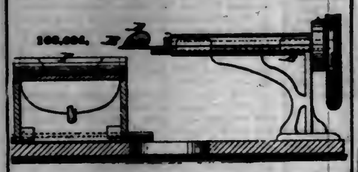
15. In combination with the gas-supply pipe of a gas or vaper engine, the flap-valve R, provided with an adjustable weight, R', substantially as and for the purpose specified.

16. The admission-valve apparatus L, with lumen for both gas and air formed in the valve and valve-stem itself, and so arranged that by the closing of the valve the gas and air supply are simultaneously cut off, substantially as herein described.

17. In admission-valve apparatus to gas or petroleum engines, the gas-jet *l''* burning in the chamber *b'*, with air-holes *l''* and chimney *l'''*, the said gas-jet being made to ignite the

charge in the engine-cylinder by causing a portion of the flame to be conveyed by means of the disk F^5 into the valve-chamber, substantially as herein described.

15. The admission-valve apparatus I, with valve I^2, air and gas passages I^3 I^4 I^5, chamber I^6, apertures I^7, disk I^8, and gas-jet I^9, arranged and operated by means of the rod K and spring I^{10}, as herein described.



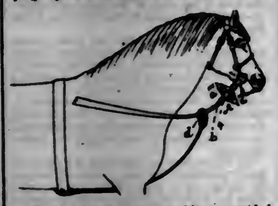
16. An admission-valve for air or gas engines provided with inlet-passages for air and gas, said passages being heated by the flame that ignites the charge, substantially as specified.

20. The hollow pistons B and piston-rod B', supplied with water from the water-jacket of the cylinder by the valve W, receptacle V^1, and pipes V^2 V^3 V^4, substantially as herein described.

21. The double-acting gas or petroleum engine, consisting of the cylinder A, pistons B B', admission-valves I I^1, and regulating-valve I^5, all combined and operating as herein described.

168,624. Cork-Burrers. William A. Dieh, Cleves, Ohio. [Filed June 26, 1875.]

Brief.—A rotating shaft, provided with a bit and point, bores or turns off the cork, and severs the bottle from the ear, which is placed on a sliding table, and pushed in a line with and toward the boring-tool.



168,624.

The combination of the rotating, boring, and cork-cutting tool D E, and the sliding table F, substantially as and for the purpose set forth.

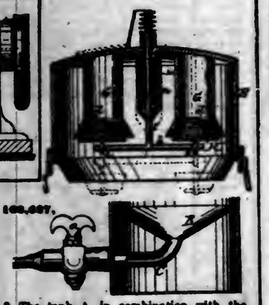
168,625. Harness. W. H. B. Diehl, Richland Centre, Pa. [Filed July 26, 1875.]

Brief.—The extensions to the frame of the buckle prevent the martingale-ring from slipping beyond it toward the ring of the bit.

The combination of the buckle A, provided with the lateral projections a^{x} a^{xx}, and attached to the ruin, which is connected to the bit, as described, with the ring D of the martingale, substantially in the manner and for the purpose hereinbefore set forth and described.

168,626. Playing-Cards. A. Dougherty, Brooklyn, N. Y. [Filed Oct. 6, 1875.]

1. A playing-card the face of which consists of the usual figure or spots, together with a miniature representation of the card itself, arranged at the upper left-hand corner, as specified.



2. A triplicate playing-card the face of which consists of the usual figure or spots and two miniature representations of the said figure or spots, arranged at diagonally opposite corners, as shown and described.

168,627. Fire-Extinguishers. Philander M. Doughty, Louisville, Ky. [Filed Mar. 18, 1875.]

Brief.—A case having in the interior a funnel, at the lower part connecting with the discharge-pipe. The hinged cover has on the interior two bottles opening downward. The bottles contain, the one acid, the other alkaline solution, so that the necessary ingredients are all kept separate before the occasion to mix them.

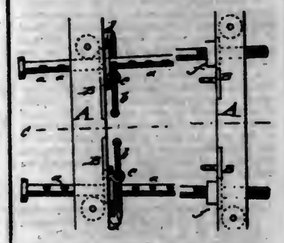
1. The tank A, provided with funnel-shaped bottom B and outlet-pipe C, with stop-cock a, as and for the purposes herein set forth.

2. The combination of the stoppers H, with eyes c, rods h i, tubes m n, packing p, hook J, and spring s, all constructed substantially as and for the purposes herein set forth.

168,627.

3. The tank A, in combination with the hinged cover E, provided with bottles for the soda and acid, the said cover being arranged to open and uncover the entire top of the tank, as and for the purposes set forth.

168,628. Cane-Umbrellas. W. H. Engelhardt, College Point, N. Y. [Filed Sept. 1, 1875.]

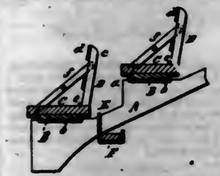


168,628.

1. In combination with the staff A, having the stem F and shoulders A' A', the ribs having short sections between the collapsing-joints b i, substantially as described and shown.

2. In combination with the staff A, constructed, substantially as described, with stem F and shoulders A' A', the removable end ferrule F.

3. The oversleeve E, having a polygonal rim, in combination with a polygonal staff having a depression, I, substantially as and for the purpose set forth.



168,629. Hatchway-Braces. J. Fleming, Buffalo, N. Y. [Filed Sept. 17, 1875.]

As an improvement in hatchway-braces for grain elevating and shoveling devices, the combination of sheave-timbers A, having supporting-plates B, with lateral brace-rods C and adjusting devices for securing rigid position of sheave-timbers for any width of hatchway, substantially in the manner and for the purpose set forth.

168,630. Corn-Planters. Alpheus Fox, Rock Falls, Ill. [Filed Feb. 10, 1875.]

Brief.—Within and upon one side of the hopper is pivoted the vertical segmental seed-wheel, having suitable seed-orifices, and limited in its vibration by coming in contact with a bevel-stop. The seed is then delivered into the furrow-opener through orifices in the side of the hopper. Outside of the hopper, and upon a square bolt, is pivoted a connecting-rod, one end of which is attached to the vibrating bar, and the other to the vertical cut-off.

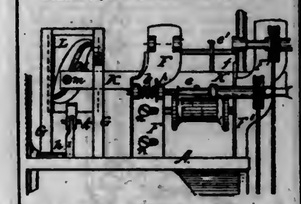
168,630.

1. In combination with the uprights A the movable stirrups E, adapted to receive a plank foot-rest, substantially as described and shown.

2. In combination, the chair C, the uprights A, the planks B, the movable stirrups E, and the foot-rest F, all constructed and arranged substantially as described and shown.

168,631. Circus-Seats. George T. Fisher, Cincinnati, Ohio. [Filed Sept. 11, 1874.]

1. In combination with the uprights A the movable stirrups E, adapted to receive a plank foot-rest, substantially as described and shown.

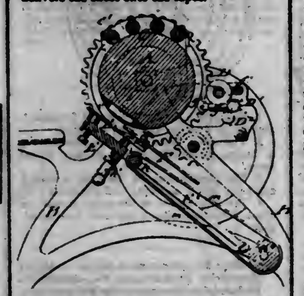


2. In combination, the chair C, the uprights A, the planks B, the movable stirrups E, and the foot-rest F, all constructed and arranged substantially as described and shown.

168,632. Car-Brakes. Henry Goss, Union City, Pa., assignor of one-half his right to E. H. Frisbee, same place. [Filed Aug. 14, 1875.]

The combination of a rake, c, bar or cord e, and slide d with a rod, g, and operating device f, substantially as shown.

168,633. Machines for Filling Sewing-Machine Bobbins. George Gowing, San Francisco, Cal. [Filed June 22, 1875.]



1. In a bobbin-winding machine, the combination, with the reciprocating plate I, of the adjustable cam M and reciprocating bar K, substantially as described and shown.

2. In a bobbin-winding machine, the combination of the standard F', carrying the bobbin holding and driving spindles, with the adjustable standard F, carrying the spring holding-pins, substantially as described and shown.

3. In an automatic bobbin winding machine having the capacity to receive and fill two or more bobbins at the same time, the combination, with the table A, of the standards F F, carrying the spindles d and pins b, arranged as described, the standard G, carrying the reciprocating cam-plate L, and the bar K, reciprocating behind the spindles with an increase of velocity at each end of its movement, all substantially as described and shown.

168,634. Fastening Fabrics. Frederick W Griffith and George P. Byrne, New York, N. Y. [Filed Mar. 1, 1875.]

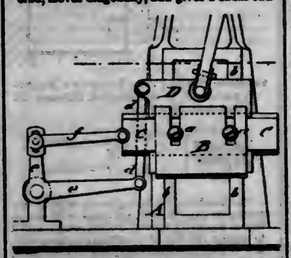
Brief.—The lubing-rods revolve around the cylinder which holds the cloth, while the pistons oscillate to make the impression, and deliver the sheet onto the tapes.

1. The combination of the roller-frame C, provided with cam-edge g^1, laterally-sliding connecting-roller D^1, and longitudinally-reciprocating changer D, for suspending contact of the latter with the former during the passage of the lubing-rollers against the changer D, constructed and operating substantially in the manner described and specified.

2. The combination, with the pistons E' piston-frame E, and guide-frame F, of the conveying-tapes m, arranged in substantially the same plane with the pistons, substantially as described and specified.

3. The combination of the receiving and driving roller D^2, reciprocating revolving roller D, and intermediate connecting-roller D^1, with the roller-frame C, rollers C', and stationary distributing-cylinder A, constructed and operating substantially in the manner described and specified.

4. The combination, with the stationary cylinder A, having a chase-bed with grooved flanges, which are in a plane at right angles to the axis of the cylinder and terminate in seats for supporting the chase, of the lubing-rollers C' and frame C, which revolve down over the chase, so as to tend to retain and force it into place between said flanges, substantially in the manner described and specified.

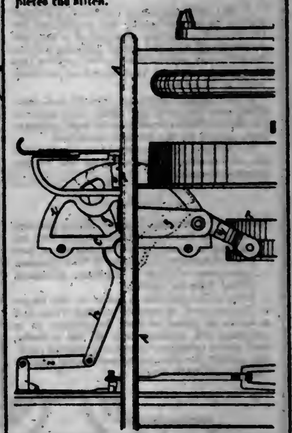


5. The adjustable plates E', combined with guide-frame F and notched guide-rods h, as and for the purposes specified.

6. The arms i and cams l combined with guide-frame, as and for the purposes described.

7. The combination of the roller-frame C, spur-wheel a, bevel A', gear-wheel d, and single intermediate pinion l connecting the shaft and roller-frame, so that said roller-frame will revolve in the reverse direction to the driving-gear wheel, substantially in the manner described and specified.

168,635. Tobacco-Cutting Machines. A. A. Hagen, New York, N. Y. [Filed Aug. 7, 1875.]



Brief.—The cutter, as it is raised and lowered, moves diagonally, and gives a shear-cut.

The combination, in a tobacco-cutter, of the horizontally-sliding plate C, carrying cutting-knife B, the vertically-movable plate or head D, and the link or levers d e f, substantially as and for the purpose specified.

168,636. Sewing-Machine. John S. Hall, San Francisco, Cal., assignor to J. L. Boone, same place. [Filed Mar. 25, 1875.]

Brief.—An independent needle, operated by pawches formed upon vibrating arms, is arranged in a frame having a reciprocating motion, so that the needle, in its downward stroke, will be carried through the edge of the cloth, and on its return movement pass around the edge of the same, forming thereby the ordinary overseam stitch. An arm, provided with a hook at its outer end, is arranged upon the main driving-shaft in such a position that it passes between the thread and needle at every descent of the same, and carries the thread around a pulley, which movement draws the thread through the cloth and completes the stitch.

1. In an overseaming sewing-machine, the combination of a loose reciprocating needle, with an inclosing-guide to retain it and prevent breaking, substantially as set forth.

2. The independent needle V and pawches n n, in combination with a reciprocating frame, C, substantially as and for the purpose above described.

3. The reciprocating frame C, with its recess O, and having the opposite ways or grooves X, in combination with the arms f f, with their pawches n, and the independent needle V, substantially as and for the purpose above described.

4. The cam-wheel r and pivoted over q, in combination with the reciprocating needle-frame C, substantially as and for the purpose above described.

5. The stationary wheel S and revolving arm t, with its hooked end W bent, as described, in combination with the independent needle V, pawches n n, and reciprocating frame C, substantially as and for the purpose above described.

168,637. Short-Thread Sewing-Machines. John S. Hall, San Francisco, Cal., assignor to J. L. Boone, same place. [Filed Mar. 25, 1875.]

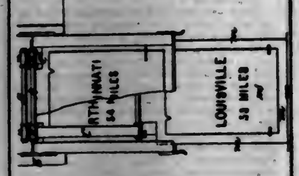
Brief.—An independent needle, operated by pawches formed upon vibrating arms, is arranged in a frame having a reciprocating motion, so that the needle, in its downward stroke, will be carried through the edge of the cloth, and on its return movement pass around the edge of the same, forming thereby the ordinary overseam stitch. An arm, provided with a hook at its outer end, is arranged upon the main driving-shaft in such a position that it passes between the thread and needle at every descent of the same, and carries the thread around a pulley, which movement draws the thread through the cloth and completes the stitch.

1. In an overseaming sewing-machine, the combination of a loose reciprocating needle, with an inclosing-guide to retain it and prevent breaking, substantially as set forth.

2. The independent needle V and pawches n n, in combination with a reciprocating frame, C, substantially as and for the purpose above described.

3. The reciprocating frame C, with its recess O, and having the opposite ways or grooves X, in combination with the arms f f, with their pawches n, and the independent needle V, substantially as and for the purpose above described.

4. The cam-wheel r and pivoted over q, in combination with the reciprocating needle-frame C, substantially as and for the purpose above described.

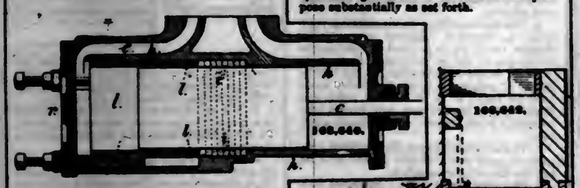


5. The stationary wheel S and revolving arm t, with its hooked end W bent, as described, in combination with the independent needle V, pawches n n, and reciprocating frame C, substantially as and for the purpose above described.

168,638. Button-Fastenings. James H. Harrington, Providence, R. I. [Filed Sept. 17, 1875.]

The combination of the pivoted hook-eye B and the spring C, with the back A, of a button, to adapt it to be secured to the garment by the insertion of the eye of another button or a ring in said hook-eye, substantially as herein shown and described.

166,639. STATION-INDICATORS. Pliny H. Harris, San Antonio, Tex. [Filed Mar. 18, 1875.]



1. In a railroad-station indicator, a series of sliding cards containing the names and distances of the stations arranged in a box, and so combined that the act of drawing out one from the box returns into the box any one that they previously have been drawn out, substantially as described.

2. The sliding carrot or card-frames, combined with the box, the bands C C, and the two series of transverse wires or rods, substantially as and for the purpose described.

3. The springs s, combined with the box and the card-frames, substantially as and for the purpose described.

166,640. PLUNGER-PUMPS. Roger Hartley and John B. Marshall, Pittsburg, Pa., assignors to Sarah Hardick, executrix, and John Ryer and Abraham H. Van Hoesen, executors, of Chas. B. Hardick, deceased. [Filed July 12, 1875.]

Brief.—The cylinder is bored or cast larger at the rear end, to receive packing-rings and a sleeve or gland of such proportions as to complete the uniform bore of the cylinder, said sleeve being set up to compress the packing around the plunger by set-screws passing through the head-head.

1. The screws s passing through the removable head-head r, in combination with the sleeve i, packing-rings i, and cylinder A, as and for the purposes set forth.

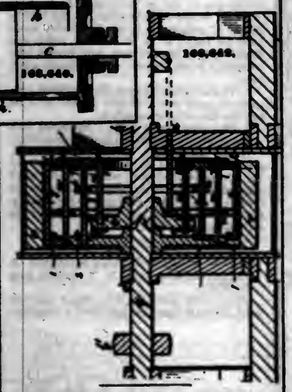
2. The sleeve i and lugs i, forming bearings in combination with the screws s and cylinder A, having grooves for such lugs, substantially as specified.

166,641. WATER-WHEELS. Jas. L. Keiser, Rome, N. Y. [Filed July 31, 1875.]

Brief.—Between the curb and the wheel is placed a gate, which has a flange formed around its outer top edge, for lapping over the top of the curb, for the double purpose of forming a water-tight joint and supporting the gate. Dovetailed in the top of the gate is an arm that is bifurcated at its outer end, and has an eye or ring formed in its inner end, for fitting around the extension of the bearing-box. This arm serves to open and close the gate, and also prevents side movement, friction, or play on the gate while moving.

1. The gate A, having the flange f, recess 1, and flange 2 on the wheel, as specified.

2. The hub a, formed as shown, and having a flange, 2, formed around its top, as set forth.



3. The combination of the gate A, arm l, and extension a, as shown and described.

4. The combination of the shaft o, disk or crank 3, friction-roller 4, and arm l, as specified.

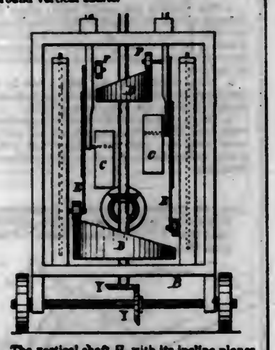
166,642. DISINTEGRATING-MILLS. J. Moore Hendricks, Philadelphia, Pa., assignor to Philadelphia Disintegrating-Mill and Manufacturing Company. [Filed June 22, 1875.]

Brief.—A disintegrating-mill having parallel disks or rings carrying annular rows of bars or cages, arranged alternately, and rotated in opposite directions. The disks, which support the inner ends of the interior series of cross-bars, are set back from the free ends of said bars, leaving a clear space between their extremities and opposite disks, to avoid clogging of ground material.

The combination of the rings f and s with the cross-bars f and n, respectively, when said rings are set back from the free ends of the cross-bars, which are shortened sufficiently to leave a clear space between the ends of the bars and the opposite disks or rings of the respective cages in the manner and for the purpose substantially as set forth.

166,643. TOOLS FOR TURNING EMERY-WHEELS. J. D. Huntington, Chicago, Ill. [Filed Aug. 30, 1875.]

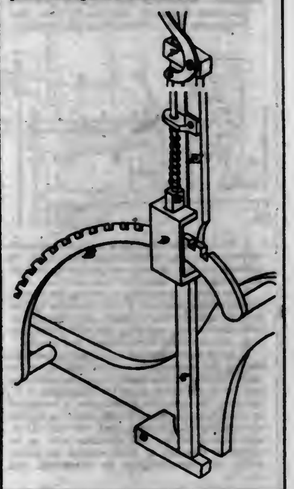
The head-tool for facing emery-wheels, consisting of the shank B, provided with the series of wheels D, having the spurs d, adapted to engage the faces of the wheel consecutively, and loosely journaled upon one end the same shaft, as specified.



166,644. SPINDLE-BOLSTERS. W. Jenckes, Manchester, N. H. [Filed Sept. 6, 1875.]

A spinning-frame spindle-bolster, A, provided with an elongated open slot, C, extending up within the bolster ring or shoulder B, and connecting with a passage, D, through said ring, all constructed substantially as set forth, for the purpose specified.

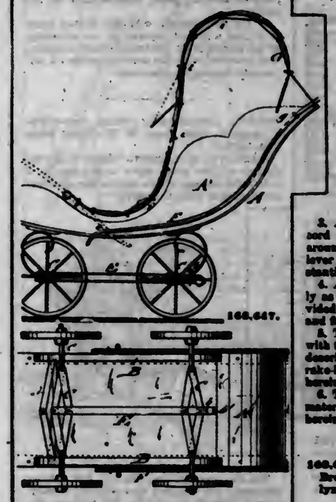
166,645. MECHANICAL DEVICES. Joseph P. Kelley, Washington, D. C. [Filed Aug. 16, 1875.]



Brief.—Power applied to a vertical shaft, having on it a horizontal fly-wheel, revolves the axle-tree of a street or other carriage by bevel-gearing; motion further regulated by weights and friction-rollers on inclined planes around vertical shafts.

The vertical shaft H, with its inclined planes D D, friction-rollers F F, weights C C, toggle-levers E E, rack J, cog-wheel G, bevel-gearing N, S, T, and Y, and fly-wheel P, all arranged, combined, and operating as herein described, and for the purposes set forth.

166,646. GANG-PLOWS. Daniel Kendig, Napa City, Cal. [Filed July 26, 1875.]

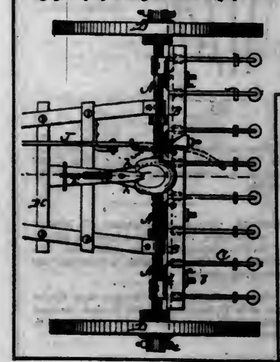


Brief.—An eccentric lever has its pawl and spring upon a sliding frame, and accommodates itself to the curve of the rack, which passes through said frame or box.

The semicircle or rack B, in combination with the lever C, having the sliding boxes D and F, and their connecting-arm E, and the pawl G, rod H, and operating lever I, the whole constructed substantially as and for the purpose herein described.

166,647. CHILDREN'S CARRIAGES. Ernst Krueger, New York, N. Y. [Filed June 19, 1875.]

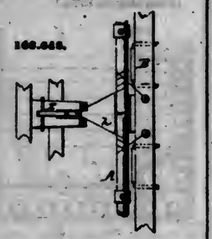
Brief.—The top is supported by curved guide-rods and the body upon lazy-tongs.



1. The curved guide-rods C C, combined with sides A' A', and a cover, movable relatively to the guide-rods, in the manner described.

2. In combination with the rigid sides and flexible bottom of the carriage-body, the pairs of lazy-tongs C C, one of which has the extension b', and the bars E, and the locking-pin h, as shown and described, for the purpose specified.

166,648. WIRE HAY-RAKES. Charles Le Dow, Ballston, N. Y. [Filed Sept. 2, 1875.]



Brief.—The friction-head is double, each part extending around a different section of the axle, so that if one wheel is stationary, as in turning short around, the motion of the other wheel may be made to raise the rake-head. The curved head-lever may be made to engage with one of the teeth to hold the head in its elevated position, and may be disengaged by operating the friction-gripe.

1. The combination of a friction-gripe with the axle and rake-head, for locking them together, for the purposes set forth.

2. The longitudinally-grooved button G, pivoted to the front of the rake-head, in combination with the bent rake-teeth and grooves in the head, whereby the teeth are secured to the head, and a free hinge movement of the same permitted, substantially as herein set forth.

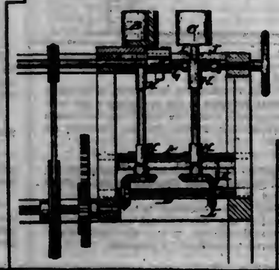
166,649. WOOD-SPLITTERS. Wm. Lotus, Brooklyn, assignor to T. Karuts, Brooklyn, E. D., N. Y. [Filed July 24, 1875.]

3. A friction-gripe consisting of a wire or cord connected to the rake-head, wrapped around the axle, and connected to the foot-lever for locking the axle to the head, substantially as set forth.

4. A friction-gripe, constructed substantially as described, in combination with the divided axle, secured firmly to the wheels, as and for the purposes set forth.

5. The curved lever-handle, in combination with the friction-gripe, substantially as herein described, the axle carrying the wheels, the rake-head, and the rake-teeth, for the purposes herein set forth.

6. The sleeve d, of india-rubber or equivalent material, adjustable upon the rake-teeth C, as herein set forth.

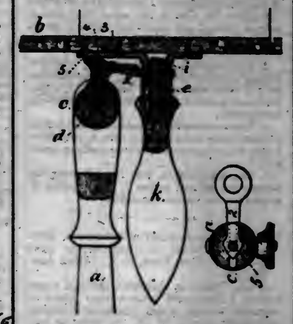


166,650. WOOD-SPLITTER. Wm. Lotus, Brooklyn, assignor to T. Karuts, Brooklyn, E. D., N. Y. [Filed July 24, 1875.]

A wood-splitter for operation by hand, consisting of a bed having head D and guides C C, a knife, E, having racked shank E, and a lever, G, having a toothed arc and, F, all constructed and arranged as shown and described.

166,651. ADJUSTING FEED-ROLLS FOR PLANING-MACHINES. Chas. D. Lawrence and Chas. H. Ward, Fairfield, Me. [Filed July 17, 1875.]

Brief.—The feed-rolls are moved to and from the table on rocks by pistons, whose bearings are supported by feed-screws working through the same.



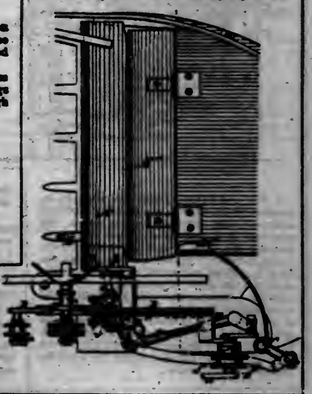
The combination, with feed-roll shaft, rod F, screw-rod G, stationary racks J, and shaft I, having pinion at each end, of a feed screw-nut and sleeve provided with bearings for the feed-roll shaft and the shaft I, as and for the purpose specified.

166,652. COMPOUND FOR ARTIFICIAL STONE. Hans Lassen and James C. Metcalfe, Jr., Memphis, Tenn. [Filed Aug. 28, 1875.]

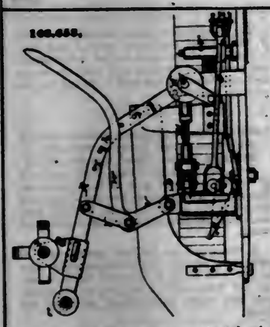
Brief.—Four parts of clear sand, two parts of cement, and one part of clay (pre-calcined burnt) are mixed dry, and to every bushel of the above are added one quart oxide of iron, one pound sal-ammoniac, and three gallons of water.

A compound for artificial stone made of clear sand, cement, and powdered burnt clay mixed with oxide of iron, the whole subsequently mixed with a solution of sal-ammoniac and water, substantially as above set forth.

166,653. STEREOSCOPES. Wm. H. Lewis, Brooklyn, E. D., N. Y. [Filed Jan. 10, 1876.]



1. The stud 5 upon the joint a, entering the hole 4 in the plate 3 of the nut i, in combination with the arm 2, screw-handle b, column c, and stereoscope k, substantially as set forth.



2. The arm 2 upon the joint-plate of the column, having a hole through which the screw c of the handle b passes, in combination with the nut i upon the stereoscope-base, substantially as set forth.

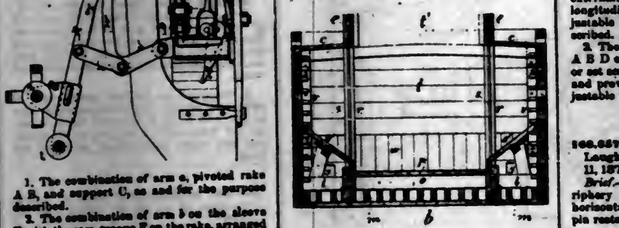
166,654. HARVESTERS. Christopher Lidren, La Fayette, Ind., assignor to himself and R. Jackson, same place. [Filed June 5, 1875.]

Brief.—The rake, after sweeping over the platform, is caused to return beneath it. The rod is adjustable along the lever on which it is mounted, and is also vertically adjustable.

160,653.

1. The combination of arm c, pivoted rake A B, and support C, as and for the purpose described.

2. The combination of arm b on the sleeve E with the cam-groove F on the rake, arranged to turn on its axis at the same time that it swings forward and backward, and the sleeve E swings free or independent of the rake to some extent, substantially as specified.



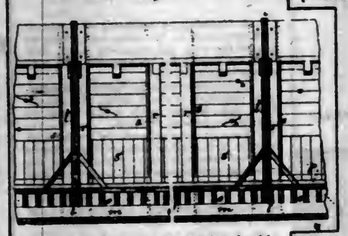
3. The suspended or overhanging platform having a flexible front portion, in combination with a rake arranged to pass over it going back, and under it going forward, substantially as specified.

4. The combination of stationary cam L with the oscillating and swinging rake A, projection b, and the cam-groove F, substantially as specified.

5. The combination, with lever R, carrying adjustable rod and pulley T, of the pulley S, as and for the purpose specified.

160,654. APPARATUS FOR PURIFYING, DRYING, AND COOLING OR WARMING AIR. Abel S. Lyman, New York, N. Y. [Filed Apr. 26, 1875.]

Brief.—Water is sprinkled through a pan having a perforated bottom onto pieces of charcoal, through which passes, or is driven, an upward current of air. In order to cool the air, the water may be cooled by the refrigerator of an ice-machine, or otherwise. In order to warm the air it is passed, after purification, through the air-chambers of a heating apparatus. Some warmth may be gained in very severe weather by use of well-water.



1. The combination, with the room to be purified, of the filter A, composed of pieces of charcoal, coke, or other similar pieces, the sprinkler D S, and air-chambers F and R, whereby the filter is supplied with sprayed water, and the air passed upward through the filter is purified and cooled or warmed, as desired, for the purposes specified.

2. The combination, with the room to be ventilated, of the filter A, composed of pieces of charcoal, coke, or other similar pieces, the sprinkler D S, and air-chambers F and R, with the fan or other arrangements for urging the circulation of the air up through the filter, for the specified purposes.

3. The combination of the filter A, composed of pieces of charcoal, coke, or other similar pieces, the sprinkler D S, and air-chambers F and R, with the boiler or heater G, and the pipes H and I, substantially as and for the purposes set forth.

160,655. COAL-RANGES. George B. Martin and Julius A. Francis, New Haven, Conn. [Filed May 10, 1875.]

1. The bolt-heads f, made with boards with dovetailed ends received between the vertical studs e that are secured to the sides of the boat or barge, in combination with the bolts c passing through the combings and keelsons, as set forth.

2. The boat or barge, made with dovetails or combings 2, that taper and project within the vessel, for the purposes set forth.

3. The longitudinal string-pieces m beneath the beams l, and receiving the planking, in combination with the floor-timbers o and planking p, as and for the purposes set forth.

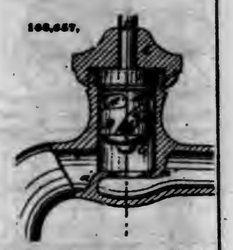
4. The bolt-heads, constructed as aforesaid, in combination with the inclined partitions r and m, as set forth.

5. The combination, in a barge, of the longitudinal keelsons f, the combings e, the connecting-bolts c, and the transverse bolt-heads f, substantially as and for the purposes set forth.

160,656. SLOTTED FRAMING-SQUARES. J. H. Molineux, San Francisco, Cal. [Filed Nov. 6, 1874.]

Brief.—The scribing-points are screw-threaded, and pass through screw-threaded holes in the clamps, so that the points can be retracted or projected at pleasure.

160,656.



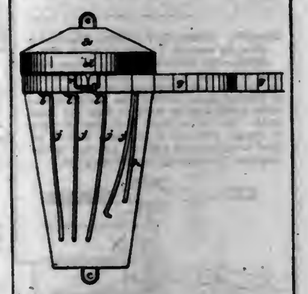
1. The set or adjusting screw, having its externally screw-threaded stem perforated longitudinally, and provided with an adjustable scribing-point, substantially as described.

2. The combination, with the slotted arms A B D of a framing-square, of the adjusting or set screws E E, perforated longitudinally, and provided with the scribing-points f f, adjustable therein, as described.

160,657. COMPRESSION-COCKS. James McLoughlin, New York, N. Y. [Filed Sept. 11, 1875.]

Brief.—The spiral groove formed in the periphery of the plug-valve terminates in a horizontal recess, within which the guiding-pin rests and locks the valve.

160,657.

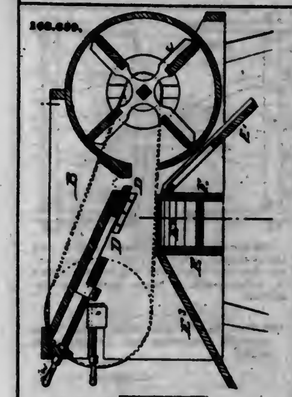


The two opposite plug-grooves, *d d*, almost horizontal near top, and then winding spirally toward bottom, as and for the purpose described.

160,658. CLOTHES-DRIERS. S. P. Mccay, Kilbourne, Ohio. [Filed Sept. 6, 1875.]

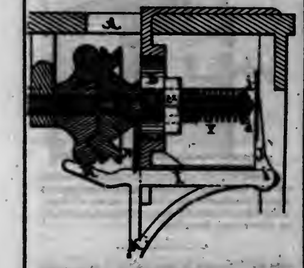
Brief.—The arms are pivoted to the vertical board, and, when raised to a horizontal position, bear against the springs until they rest on the shoulders at the upper ends.

160,658.



The combination of the board c, semicircular board d, staples e, arms f, wire i, and springs j, substantially as shown and described.

160,659. GRAIN-SEPARATORS. H. Mellen, Watertown, Wis. [Filed May 20, 1875.]

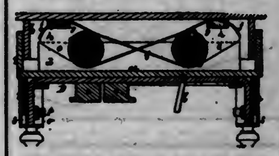


Brief.—Arrangement, in connection, of a hopper with adjustable slide, a blast-fan, and diverging chutes.

The combination, with hopper and fan, of the slide D, partition-walls E, and inclined planes F F F, as and for the purpose specified.

160,660.

160,660. DEVICES FOR DRIVING SEWING-MACHINES. Francis Miller, Albany, assignor of one-half his right to the East New York Boot, Shoe, and Leather Manufacturing Company, New York, N. Y. [Filed Aug. 7, 1874.]



1. The bracket B, having a slotted opening, b, in combination with the adjustable sleeve C and shaft D, substantially as and for the purpose herein specified.

2. The driving-shaft D, carrying the friction-wheel H, and having its sliding movement controlled by the spring F and lever I, in combination with an independent shaft, G, carrying the friction-wheel H, as and for the purpose set forth.

3. The combination of the lever I and brake M with the spring E, substantially as and for the purpose described.

4. The combination of the bracket B, adjustable sleeve C, shafts D and G, friction-wheels H and H, springs F and E, lever I, and brake M, substantially as and for the purposes herein specified.

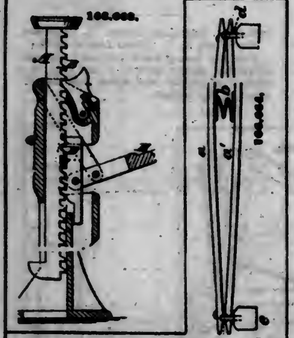
160,661. PIANO AND ORGAN OTTOMANS. James Miller, Boston, Mass. [Filed July 15, 1875.]

1. The combination of the rocker-shafts *e e*, cams *c c c c*, provided with flanges *f*, the crossed metal belt or band *i*, lever *l*, and legs or cars *g g g g*, the whole being arranged substantially as shown and described.

2. The combination, with the folding legs, of the turning brass-rod D and the bars *o o*, provided with clamp-screws *p p*, as shown and described.

160,662. PAPER. John C. Milligan, South Orange, N. J., assignor to Lalance & Grosjean Manufacturing Company, New York city. [Filed Sept. 23, 1875.]

Brief.—The downwardly-deflected portion of the bottom is slightly raised from the supporting-surface by the legs.



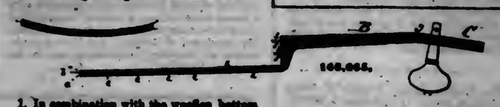
A sheet-metal pan having, in combination with a downwardly-deflected portion of the bottom *a'*, supporting-legs C, attached to the undeflected part *b* of the bottom, substantially as specified.

160,663. LIFTING-JACKS. Saml. R. Mosher, Chillicothe, Ohio. [Filed June 10, 1875.]

Brief.—The teeth on the lifting-bar are interlocked by a short rack pivoted at the end of a lever suspended by a link to the post.

The block D, provided with several teeth, that catch simultaneously in those of bar A, and pivoted to the lever E, as and for the purpose specified.

160,664.



160,664. BED-SLATS. Thos. L. Odell, Iowa Falls, Iowa. [Filed Nov. 22, 1875.]

The combination of the boards *a a'*, secured together at their ends by means of bolts, spiral springs *b*, cross-bars *c*, and staples *d*, as and for the purposes described.

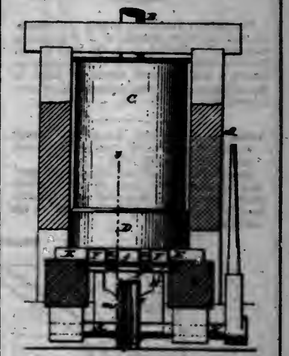
160,665. VIOLINS, GUITARS, &c. J. Cabriate, New York, N. Y. [Filed Sept. 7, 1875.]

Brief.—The neck and scroll is all in one piece, and built up of longitudinal veneers. Between the veneers of which the back is constructed strengthening-wires are laid.

1. In combination with the wooden bottom A of a string instrument, which is composed of a series of veneers, the strands *e e* of wire placed between said veneers, substantially as specified.

2. The neck B and head or scroll C of a string instrument, composed of continuous layers *f f* of veneer, with parallel grain, the whole being bent at the junction *g* of the neck and neck or scroll, substantially as specified.

160,666. NECK-TIES. Reginald B. Parker, Indianapolis, Ind. [Filed Apr. 24, 1875.]



1. The shield A, having an upper convex edge, and arranged within the folds of the scarf, substantially as set forth.

2. The combination, in a neck-tie, of the loop *d* and loop *e*, having the adjusting-hook *f* and eye *a*, substantially as set forth.

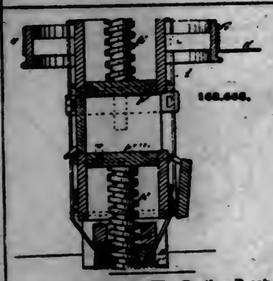
160,667. BRICK-MACHINES. Leonard Patterson, Parker City, Pa., assignor of one-half his right to John K. Hunter, same place. [Filed May 10, 1875.]

Brief.—Through the bottom of a vertical hopper the clay is forced by a screw bladed shaft into a horizontal mold-frame, made to reciprocate, for the delivery of its bricks on each side, by means of a rocking segment and chains.

1. In a brick-machine, a hopper, C, having the molds formed in, or as an attachment to, its lower end, substantially as set forth.

2. In a brick-machine, the molds B, forming the discharge from the hopper, whereby the bricks are formed by the act of forcing out the clay, as described.

3. The rack F, having the grooves *c* in which to lay the boards H, to receive the bricks from the molds, as shown.



4. The combination of the rack F and boards H with the levers *a a'*, whereby the bricks are raised upward ready for delivery, as specified.

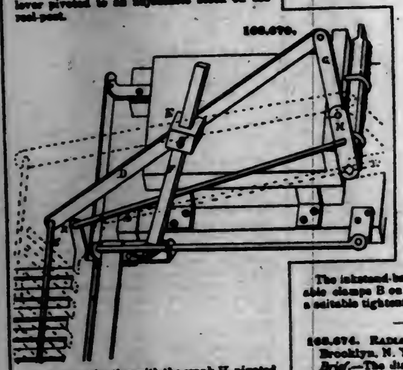
5. In a brick-machine in which the molds form a part of the hopper, the combination of the segment J, chains *i*, and rack F, whereby a charge of bricks is alternately delivered at opposite sides of the hopper, as set forth.

160,668.

160,668. COTTON-PRESSES. Emil. P. Platt, Vienna, La. [Filed Aug. 14, 1875.]

The combination, with screws B, having follower at the end, and working in nuts E, of a press-box, A, rigidly fastened within a rotary wheel, G, as and for the purpose specified.

168,668. PARLOCKS. Wm. Reather, Brooklyn, N. Y. [Filed Aug. 21, 1875.]



The pallets described, having the tumbler D, with the three notches *d' d² d³* engaging successively with the pin in the bolt, in combination with the bolt B *b' b*, turning on the center A, and traversed across the notch in the casing A by two semi-movements, as herein specified.

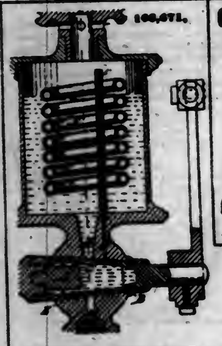
168,669. HARVESTER-DROPPERS. Joseph C. Roloff and Jos. W. Tovrie, Richmond, Ind. [Filed Feb. 6, 1875.]

Brief.—The cut-off and dropper are operated simultaneously from the same crank-shaft. The cut-off is carried on a balance-lever pivoted to an adjustable block on the rear-post.

168,670.

1. In combination with the crank H, pivoted bar D, and cut-off finger C, the connecting-bar G, arranged substantially as shown and described, for the purpose specified.

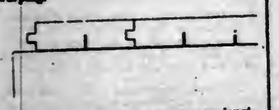
2. In combination with the rear-post F, the sliding adjustable block K, pivoted bar D, cut-off finger C, connecting-bar G, and crank H, for the purpose specified.



168,671. LUBRICATORS. Joseph W. Reed, Kalamazoo, Mich. [Filed Sept. 4, 1875.]

1. The combination, with bottom plug in lower part of oil-holder, of the pipe F and oil-passages in cap, all arranged as set forth.

2. The valve I, combined with hollow plug of an oil-holder, having vent-passage K, as and for the purpose described.

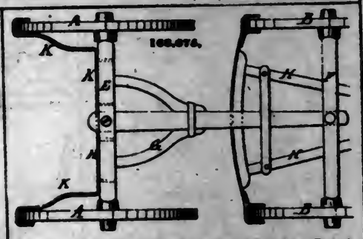


3. The combination of plugs L M, with hollow plug E, as and for the purpose specified.

168,672.

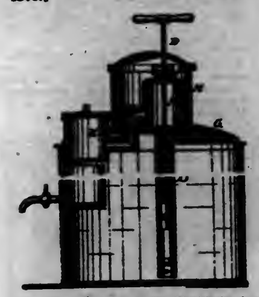
168,672. FLOORING-BOARDS. S. A. Reed, Washington, D. C. [Filed Mar. 22, 1875.]

Brief.—Longitudinal cuts are made in the under side of the flooring-boards, to prevent warping.



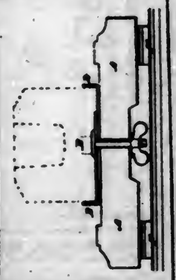
A flooring-board having one or more longitudinal kerfs or slits cut in the under side thereof.

168,673. DRESSING-BASES. L. Rosenfeld, New York, N. Y. [Filed Aug. 6, 1875.]



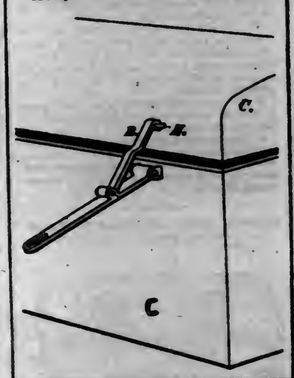
Brief.—A base or tablet to which is attached adjustable clamps, secured to the base by a screw from beneath, and which hold the ink-stand tightly in place.

168,674.



The combination of the bar or bars K, and the U shaped scrapers *b'*, with the rear bolster E or rear axle U, and with the rear wheels A, substantially as herein shown and described.

168,675. SAFETY OIL-RESERVOIRS. Thos. Sanctlin, Evansville, Ind. [Filed May 6, 1875.]



A reservoir for oil and other liquids, having a pump and filling-compartment connected by a pipe, communicating with a series of mooring-vessels inside the reservoir, substantially as shown and described.

168,676. INKSTAND-BASE. A. Rosenfeld, New York, N. Y. [Filed Aug. 6, 1875.]

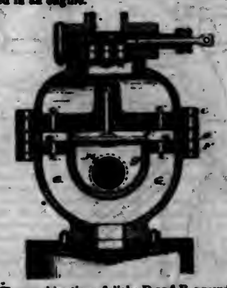
The inkstand-base A, provided with adjustable clamps B on sliding bars C, secured by a suitable tightening screw or screws.

168,677. THUMB-FASTENINGS. J. Forrester Simpson, Philadelphia, Pa. [Filed Sept. 4, 1875.]

In combination with the body and top of a trunk the lever A and hooked rod E, constructed and operating substantially as described.

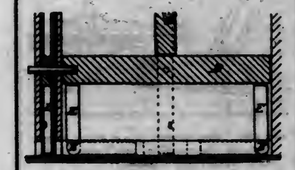
168,678. RADIATOR-TUBES. Edm. Russell, Brooklyn, N. Y. [Filed Sept. 27, 1875.]

Brief.—The diaphragm is perforated to facilitate the initiation of circulation.



In a straight radiator-tube, closed at one end and open at the other for connection with a steam-chest or base, a central longitudinal diaphragm, terminating a short distance from the closed end of the tube, and having perforations at prescribed intervals, as and for the purpose described.

168,679. WAGON-WHEEL SCRAPERS. N. Sage, Pekin, Ill. [Filed Aug. 6, 1875.]



168,680. AIR-INJECTORS FOR AERO-STEAM ENGINES. Wm. Mont Storm, New York, N. Y., assignor to himself and W. L. WILLIAMS, same place. [Filed Apr. 24, 1874.]

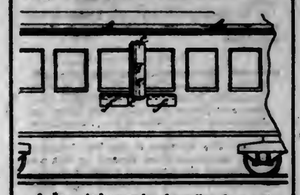
Brief.—Air and steam are mingled to be used in an engine.

The combination of disks D and F, provided with coincident orifices C' and *a*, the ring D', which forms the space *s*, and the check-valve, substantially as described.

168,681. VARIABLE MEASURES. Charles P. Sullivan, Jr., Line Creek, S. C. [Filed Aug. 21, 1875.]

1. The combination of box A, movable bottom B, pins C, and turning-sticks D, substantially as specified.

2. The combination of pivoted pieces E with the box A and movable bottom B, substantially as specified.



168,682. DENTAL FILLINGS. Lyman W. Sexton, Jr., Jersey City, N. J. [Filed Aug. 14, 1875.]

Brief.—The metallic tin is obtained by being precipitated on a strip of zinc placed in a solution of muriate of tin.

As a new dental filling, crystallized metallic tin, substantially as specified.

168,683. CINDER-WARPERS FOR RAILWAY-CARS. Jas. J. W. Taylor, Bloyes de Grasse, Md. [Filed Sept. 21, 1875.]

Brief.—Troughs are placed over the windows to collect the cinders. To prevent their being drawn into the windows when blown over the edges, employ whirling fans having their rear and sides fastened by fenders arranged at the sides of the windows.

1. In a cinder-warder for railroad-cars, the whirling fan *c*, in combination with its partially-inclosing feeder-case *c*, as and for the purpose described.

2. In a cinder-warder for railroad-cars, the combination of the whirling fan *c*, its case-feeder *c*, and fenders *f f*, as and for the purpose described.

3. The cinder-collecting troughs A over the line of window-whirls, as and for the purpose described.

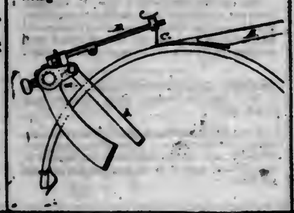
168,684. WARDROBE AND OTHER HOOKS. Charles E. Thurston, Marlborough, N. H. [Filed Sept. 7, 1875.]

Brief.—A single piece of wire is bent into suitable shape, doubled upon itself to form a loop or head, and ornamentally twisted, the free end being screw-threaded for convenience of attachment as a wardrobe hook, or for analogous uses.

A hook made from a single piece of wire that is doubled upon itself, twisted, and bent into shape, as shown, and provided with a head or loop, *c*, and a screw, *d*, substantially as and for the purpose described.

168,685. DEVICES FOR PREVENTING HORSES FROM CRIBBING. Arvin C. Tickner, Syracuse, N. Y. [Filed Sept. 20, 1875.]

The metallic collar A, provided with means for holding it in place, as set forth, in combination with the spring C, provided with the square D and the strap F, which passes under the neck of the horse, substantially as described.

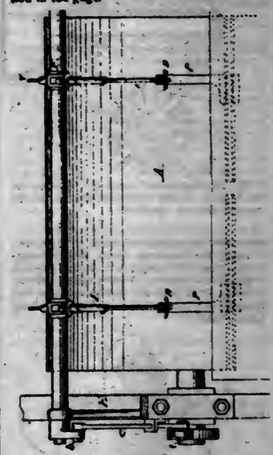


168,686. GRATE-BARS. George W. Todd, Allegheny, assignor of one-half his right to W. W. Speer, Pittsburg, Pa. [Filed Sept. 16, 1875.]

The grate-bar A, constructed with enlarged, curved, rearward-projecting portion B, and air-passage or tube D, extending entirely through the body of the bar from front to rear, up through the enlarged part B, and discharging over the fire-wall of the furnace, substantially as and for the purpose described.

168,687. FEED-GAGES FOR PRINTING-PRESSES. Stephen D. Tucker, New York, N. Y. [Filed June 23, 1875.]

Brief.—The gage recedes slightly before rising.



1. A feed-gage whose stock or base forms arms which embrace the actuating rock-shaft, to which it is connected by means of a flexible strap, so as to swing thereon when a horizontal reciprocation is imparted to it, and having a suitable stop, which connects it to the rock-shaft so as to produce its vertical movement, substantially as described.

2. The combination of the arms I J of the gage-arm with the flexible strap K and the rock-shaft L, substantially as described.

3. The combination of the arms I J of the gage-arm with flexible strap or spring K, slotted strap M, and rock shaft L, substantially as described.

168,688. FEED-GAGES FOR PRINTING-PRESSES. Stephen D. Tucker, New York, N. Y. [Filed June 23, 1875.]

Brief.—Gage draws back and then rises by the oscillation of shaft in an elliptical perforation in the gage.

1. A feed-gage having an elliptical opening through its base, in combination with its actuating rock-shaft, to a hub upon which it is so hung that it shall be capable of moving into positions relative thereto, fixedly determined by the periphery of its opening, to produce its horizontal reciprocation, and afford a seat to secure its vertical motion, substantially as set forth.

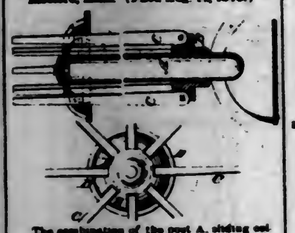
2. The combination of a feed-gage, whose base is provided with an elliptical opening, with a rock-shaft, to which it is hung by a pivot, whereby both horizontal and vertical reciprocations are imparted to it, substantially as shown and described.

3. In combination with the screw-threaded arm J, the sleeve I, arms O H, and adjusting-nut M, substantially as described.

4. The screw-threaded arm J, sleeve I, adjusting-nut M, and clamping-jaws P', combined substantially as described.

168,689. WIRE SIGNS AND BANNERS. Henry H. Upham, John Garrett, and John Tully, New York, N. Y. [Filed Aug. 23, 1875.]

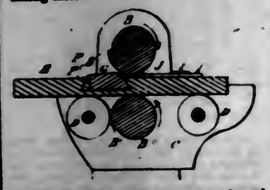
Brief.—The frame is made of sheet-metal, in the form of a folded strip, and V-shaped, to which is attached, on the inside, rods of metal, for the reception of the ends of the wires, and forms a border to the open-work. Pins are inserted through the folded sheet-metal, to retain the open-work when stretched, and at the top of the frame is a removable head-piece.



1. The sheet-metal frame made of a folded strip, in combination with the open-work wire sign or banner and its surrounding rod *b*, substantially as set forth.

2. The removable head-piece A and rings *n*, in combination with the sheet-metal frame *d*, wire open work *a*, and rods *b*, as set forth.

3. The pins or screws *c* passing through the folded strips *d* of sheet metal forming the frame, in combination with the wire open-work sign or banner *a*, as and for the purposes set forth.



168,687. Clothes-Dryers. Lewis A. Watt, Stamford, Mass. [Filed Aug. 14, 1875.]

The combination of the post A, sliding collar B, arms C, and revolving slotted cap D, substantially as specified.

168,688. Machines for Shaping Agricultural Implements. Benj. Wansbrough, Pittsburg, Pa., assignor to Alex. Speer & Sons, same place. [Filed Sept. 10, 1875.]

Brief.—The rolls are geared together, and press equally upon the bottom and top of the sliding table.

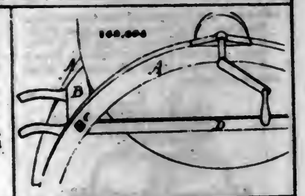
1. In combination with the eccentric-formed rolls B B' B B', the table or platform E sliding between said rolls and adapted to receive pressure therefrom at top and bottom, as and for the purposes described.

2. In combination with the rolls B B' B B' and sliding platform or table E, the die G, formed with curved inclined or beveled mouths G', secured in the face of the table, as and for the purposes described.

3. In combination with the rolls B B' B B' and table E, sliding between said rolls and receiving pressure therefrom the stops H H' for limiting the movement of said table, as described.

4. In combination with the sliding table E and die or former G G', the adjustable removable gages I and set screws I' for holding the metal secured its edges in position beneath the rolls while being pressed, as described.

5. The combination of eccentric rolls B B' B B', sliding table E, die G G', and gages I I', as and for the purposes described.

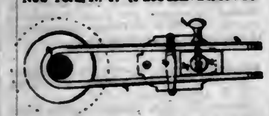


6. The improved machine for beveling or forming the edges of agricultural steels, consisting of eccentric rolls B B' B B', table E, die G G', stops H H', and gages I I', all constructed, arranged, and adapted to operate as and for the purposes described.

168,689. Nut-Fastenings. R. C. Watson, Maysville, Ohio. [Filed Sept. 11, 1875.]

The combination with the bolts B, of locking plates C C, fastened over them by one end, D, as an eye-stud, A, of the fish plate, and overlapped at the center and secured by a stud-pin, K, of the fish-plate, and a locking key, F, substantially as specified.

168,691. Fulcing Cradles. John Worth and John Jeffreys, New York, N. Y. [Filed Apr. 24, 1875.]

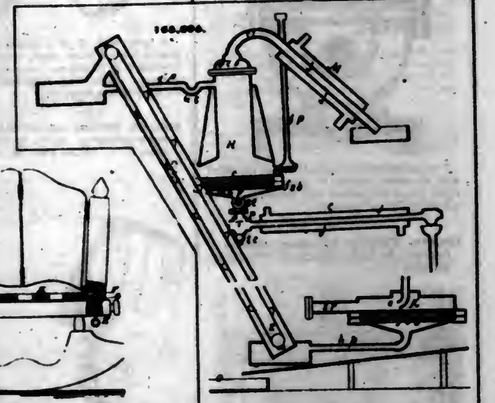


In combination with a folding cradle the pans E, having heads F, and the slotted plates G, as and for the purposes described.

168,692. Egg-Carriers. Wendelin Weis, St. Paul, Minn. [Filed Aug. 21, 1875.]

In egg-carriers the bread lateral partition-strips, provided with bottom extension-strips of less width than the said, and with narrow top extension pieces to form supporting strips for the bottom strips of the adjoining trays above, substantially as and for the purpose set forth.

168,693. Key-Fastenings. W. W. White, New York, N. Y. [Filed Mar. 26, 1874.]



The combination, with a bow, D, hanging from the knob-shaft and passing through the key-loop, of the block B, resting the arms of bow on each side thereof, and provided with a set-screw, F, as and for the purpose specified.

168,694. Grindstone-Frames. George A. Whitney, La Grange, Ohio. [Filed Aug. 28, 1875.]

The grindstone-frame herein described, consisting of the arches A A, bent from one piece of wood, and united with the cross-bars B B, legs C, and rails D D, as and for the purpose set forth.

168,695.

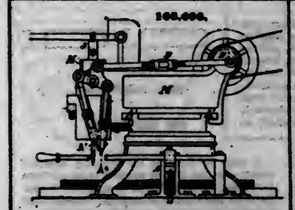
168,696. Separating Gold from other Metals. General Wiegand, Virginia City, Nev. [Filed July 9, 1874.]

1. The process herein described for refining gold, consisting essentially of the following steps: First, the conversion of all amalgamable metals into one amalgamated mass; second, removing the silver therefrom, as hereinbefore specified; third, reducing the remainder, containing the gold, into a highly porous or spongiform mass; fourth, reacting the same with gases of air; fifth, dissolving the base-metal oxides in dilute sulphuric acid; sixth, digesting the residuum in hot strong sulphuric acid, or in dilute nitric acid, or in weak nitro-sulphuric acid; seventh, washing the remaining gold with water: eighth, melting.

2. The heater H, constructed with the strainer, as described, and with suitable supports for the same, substantially as set forth.

3. The collector K, constructed with a discharger, D', composed of the plate b p l, wire-cloth p l, and cloth r, lying contiguous to each other, substantially as and for the purpose set forth.

4. In combination with the silver-separating and lifting apparatus herein before described, the quicksilver-trap consisting of the shedding floor or table S T and tank A, as set forth.



5. In combination with the heater H and the condenser M, the strainer s s s, as herein described.

168,697. Mortising-Machines. Moses G. Wilder, Meriden, Conn., Wm. H. Moffatt, Lancaster, Mass., Solomon H. Wilder, Meriden, and Henry T. Tyler, Deep River, assignors to Pratt, Read & Co., Deep River, Conn. [Filed Apr. 6, 1875.]

Brief.—The mortises in the key-board of musical instruments are formed by this machine through the agency of a pair of reciprocating chisels moving in inclined ways.

1. The chisels F F, reciprocated in inclined paths, in combination with a supporting-table for holding the work, sliding frame H, and lever I, for bringing the chisels gradually into action to sink a V-shaped mortise, as and for the purposes specified.

2. The adjustable stop K, in combination with the reciprocating chisels F F, and frame H and lever I for bringing the same gradually into action, as herein specified.

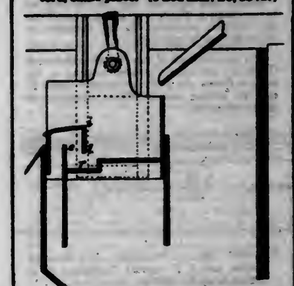
K The adjusting-set c in the connecting-rod B, in combination with the crank D', and the lever G, adapted to allow the equalization of the descent of the obliquely-traversing cutter-bar M, as herein specified.

4. The traversing-carriage M, and the cutter bar M, and other mechanism mounted thereon, in combination with arms B C for communicating power thereto in every position, adapted to traverse along a fixed key-board, and to mortise at any desired point in its length, as herein specified.

5. The clamping-bar P, bosslugs or guides A', wedge-bar B E' E', springs p, and adjusting-screws T, arranged to serve, relatively to the key-board, as and for the purposes herein specified.

6. The drift-slide N and its operating lever O, in combination with the chisels F F and their operating means, as and for the purposes herein specified.

168,698. Sash-Holders. John R. Wilford, Philadelphia, Pa., assignor to Hezekiah Bradford and Hermon Eisenbrey, same place. [Filed Mar. 9, 1875.]



Brief.—The object accomplished being the dispensing with a spring-rod, the double pair of inclines acting to force the pressure-plate, with uniformity, against the window-frame.

1. The sash-holder having the double pairs of inclines 6 7 8 9 upon the pressure-plate and the corresponding double pairs of inclines 2 3 4 5 in the cam a, substantially as set forth.

2. The combination of the lever r, link s, and spring t with the pressure-plate c and cam a, each having the double pairs of inclines, for the purposes and as set forth.

168,699. Jacques. John R. Wilford, Philadelphia, Pa., assignor to Hezekiah Bradford, same place. [Filed Mar. 20, 1875.]

A reciprocating jig having the upper delivery-dam f for the lighter material and the lower delivery-dam e for the heavier material, in combination with the depression r in the perforated bottom of the reciprocating jig, that allows the heavier material to pass freely beneath the lower edge l of the dam f, for the purposes and as set forth.

168,700. Draft-Equalizers. Silo B. Winsor, Peru, Ill. [Filed July 31, 1875.]

Brief.—A frame specially adapted to carry an equalizing device.

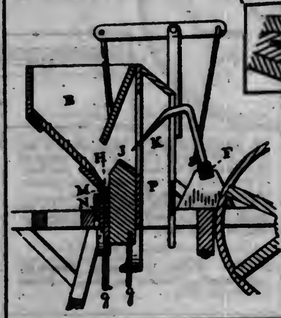
The frame A, made, as herein described, with projecting arms B B, carrying the pulleys C C, and with the pipe D, in combination with the pulleys I I, the levers L L, and the rope or chain J, substantially as described.

168,701. Mowing-Machines. David Wolf, Avon, Pa. [Filed Apr. 24, 1875.]

The combination of stay-brace C, curved downwardly as well as outwardly, and having flange *c'*, the shoe D, pivoted at the rear to the forward side of said stay-brace, and the regulating-lever G, pivoted to said flange *c'*, all constructed and arranged substantially as and for the purposes specified.

168,702. Devices for Transmitting Power. John Wesley Woodruff, Jollytown, Pa. [Filed Aug. 28, 1875.]

Brief.—Two wheels in parallel planes, a rod between, attached to the disks at opposite ends of their diameters, working in a ball-joint bearing.



168,703.

The combination, shown and described, of drive-wheel A, crank-rod B, and driven wheel D, the crank-rod being attached to the circumference of each wheel and held intermediately by a ball-joint in a bearing, b, as and for the purpose specified.

168,704. Potato-Droppers. George H. Sims, Shoemakertown, Pa. [Filed Jan. 23, 1875.]

Brief.—Working vertically in the hopper are two wedge-shaped slides—one for carrying potatoes up within reach of a carrying-fork, and the other for cutting off the supply, in connection with springs, to prevent the potatoes from being crushed.

168,705.

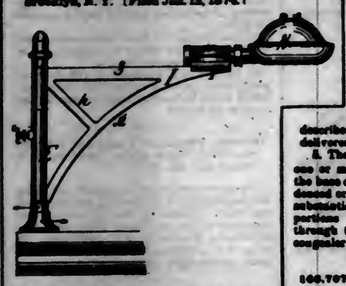
1. The slides H J, rocking arms G, rock-shaft F, and rocking arm E, combined and operating substantially as and for the purpose set forth.

2. The springs M N, in combination with the slides H J and hopper B, substantially as and for the purpose set forth.

3. The fork K, in combination with the hopper B, conveyer P, and alternately rising and falling slides H J, substantially as and for the purpose set forth.

168,706. Preparing Clams and Oysters for Food. Chas. Alden, Newburg, N. Y. [Filed Apr. 28, 1875.]

The process of preparing oysters and clams for preservation by separating the meat from the liquor, desiccating and pulverizing the meat and mixing the liquor with alimentary substances, desiccating and pulverizing the mass, and combining it with the desiccated meat, substantially as described.

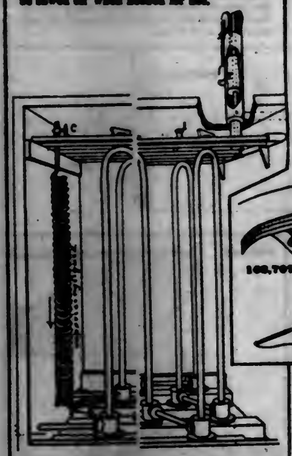


168,707. Railroad-Rail Joints. H. Allen, Titusville, Pa. [Filed Sept. 28, 1875.]

Brief.—The fish-plates are constructed by differential screw-bolts, without heads and threaded throughout, the lower threaded portion being of smaller diameter and of quicker pitch than the upper threaded portion, so that the plates are powerfully drawn together, and by a differential pitch as small as to form an efficient nut-lock. A block is located in the joining of the rails, to surround the bolts and prevent vibration of the same, and also to prevent vertical displacement of the ends of the rails.

1. As a new article of manufacture, the headless clamping-lock-bolt C, provided with square upper end, and screw-threaded from thence to its termination, the diameter of the upper screw-threaded portion being greater than the diameter of the screw-threaded lower end, and the screw-threads of the latter being coarser than the screw-threads on the upper end, substantially as specified.

2. The headless clamping-bolt C, constructed as set forth, in combination with the block D', fitting in a slot in the rail, and provided with perforations of the same diameter as the upper screw-threaded part of the bolt, substantially as described, and for the purpose set forth.



168,706. Lamp-Brackets. Daniel Barcellos, Brooklyn, N. Y. [Filed Jan. 12, 1874.]

The lamp-bracket, made of the standard a B, tube E, arm f, brace g h, in combination with the lamp M, trunnion e, and clamp P, substantially as set forth.

168,707. Ice-Machine. John M. Heath, San Francisco, Cal. [Filed Jan. 14, 1874.]

Brief.—Congealer-cover having water-tight floor and sides, and inclosed in non-conducting material. Refrigerant passes either way through congealer, as directed by a two-way cock. Automatic water-feed regulator. Inclined floor directs course of water through a filter into well beneath pump. Hash sprayer intended to reach specially the vertical pipes which are not cast, but ascend from it. Washes the formed ice by running streams of water. Needs no freezing-tank. Ice-house may be filled, ice remaining on congealers to be moved off when needed for use.

168,707.

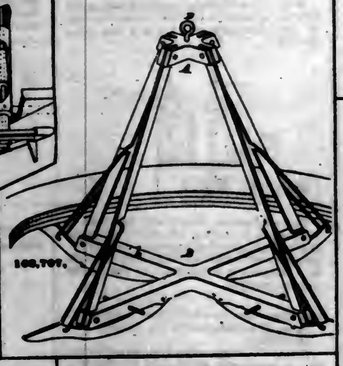
1. The improvement in the manufacture of ice which consists in forming the ice on freezing-surfaces, in the case of which the refrigerant is applied, and through which it operates by congealing portions of water applied to and traversing said freezing-surfaces in flowing streams, substantially as described, whereby the surface of the ice is freed from objectionable matter, as specified.

2. The herein-described process of manufacturing ice around cores, through which the freezing agent flows, by showering or throwing the water upon them, so that constant currents or films of water shall flow over the surface of the ice during its formation, substantially as specified.

3. In an ice-making apparatus, whereby ice is formed by the congelation, on vertical freezing-surfaces, of water which traverses the same in flowing streams, an inclined vertical congealer, mounted on a base which not only supports the congealer, but also affords a distinct support for the ice formed thereon, substantially as described, whereby the employment of a freezing-tank is obviated, and the ice, in any desired bulk or quantity, may be formed upon the congealer without liability of cracking or straining the same, as set forth.

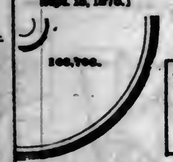
4. The combination, with a congealer composed of pipes for containing the refrigerant, of a water-feeding apparatus, substantially as described, whereby the water to be frozen is delivered on all sides of the congealer.

5. The combination, with a base-pipe and one or more vertical congealers, of a trap at the base of each congealer for containing condensed or liquefied portions of the refrigerant, substantially as described, whereby gaseous portions of the refrigerant will be passed through the liquid in the passage from one congealer to another, as specified.



168,708. Apparatus for Walling Wells. Wm. H. Beach and George Marshall, Belleville, Ill. [Filed July 27, 1875.]

Brief.—A hanging frame supports the bearing, upon which the wall of the well is built, and is gradually lowered during the erection of the well-walling thereon. A number of trip-arms sustained by links are tripped by contact with the bottom of the well, so as to relieve the frame from the wall, and allow it to be drawn out of the well.

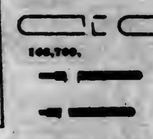


1. The frame A B C E, constructed for support of the well-wall, and for connection to a derrick or equivalent device, so as to operate substantially as and for the purposes set forth.

2. The combination of the frame A B C and drop or trip arms E, substantially as set forth.

3. The combination, with the frame A B C and arms E, of the links D and catch c, substantially as set forth.

168,707.

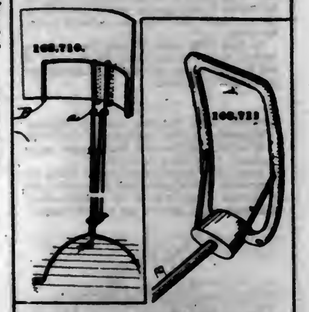


168,708.

1. As a new article of manufacture a metallic pulley, faced with a strip or strips of paper wrapped or bent around the periphery of the pulley, and secured thereto, substantially as and for the object set forth.

2. The combination, with a pulley, f, facing of paper, prepared and applied substantially as herein described.

168,709. Paper-Fastening. James M. Blanchard, Washington, D. C. [Filed Sept. 24, 1875.]



A clasp or fastener for securing together sheets of paper, having upon its inner surfaces protuberances, which are arranged substantially as shown and described, whereby they are made to perforate the paper and to interlock by the act of closing the two limbs of the fastener together.

168,709.

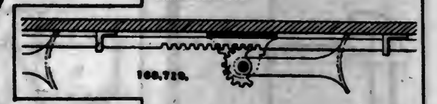
168,710. Adjustable Screen-Holder. Gardner A. Hodget, Elmira, N. Y. [Filed Sept. 1, 1875.]

The standard A, provided with the guide-loops a a, in combination with the adjustable screen holder B, constructed, arranged, and operated substantially in the manner described.

168,710.

168,711.

168,711. Furnaces. Thilo Bruno, Chicago, Ill. [Filed Sept. 10, 1875.]

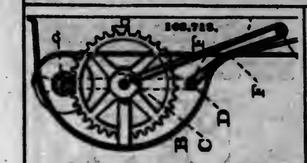


Brief.—A stem which passes into the stirrup is hinged at its enlarged base to an open frame, and held at an angle to it by means of springs.

The combination of the ball or ring A, stem B, and enlarged base C, provided with a suitable spring, substantially as and for the purpose set forth.

168,712. Ventilating-Screens for Car-Windows. Charles F. Bridgman, Brooklyn, N. Y., assignor of two-thirds his right to John H. Hazlenbeck, Norwalk, and F. F. Rice, Danbury, Conn. [Filed Aug. 30, 1875.]

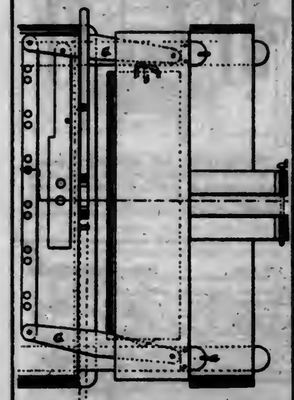
Brief.—The deflector may be reversed, so as to occupy a position at either edge of the car-window, according to the direction in which the car is traveling.



The combination of the swinging deflector C, having its arms d pivoted midway of the window-frame, the pinion or toothed sector E, and the sliding rack-bar G, substantially as herein described.

168,712.

168,713. Shade-Fixtures. J. T. Brooks, Berlin, and J. F. Morell, Tuckahoe, N. J. [Filed Aug. 30, 1875.]



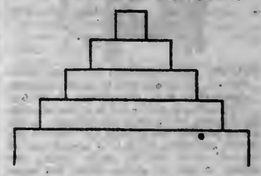
The combination, with the shade-roller bracket B, provided with the projecting pins D E, and the wheel b, provided with the projecting pin C, and gearing with the pinion a, of the cotton rotator band F, all constructed and operated substantially in the manner and for the purpose herein set forth.

168,715.

168,714. Corrugated Drills, Planters, and Rollers. Samuel Brown, Lebanon, Mo. [Filed Nov. 6, 1873.]

Brief.—The frame supporting the hopper and drill-teeth is hinged to the main frame at the rear, and adjusted by the cam-lever. Motion is given to the slide by cams on the roller striking the pivoted levers attached to the seed-slide.

The hinged seed-hopper frame provided with drill-teeth and carrying seed-discharge slides and parallel operating-levers G, and the pivoted cam-lever E, the main frame and roller journaled thereon and provided with end cams b b, all arranged as shown and described, to operate as and for the purpose specified.



168,715. Knife Sharpeners and Polishers. Edward A. Bushell, Oakland, Cal. [Filed Oct. 10, 1873.]

Brief.—An elastic corrugated surface is covered with a polishing-powder. The coarser particles, lodging in the grooves, are brought into contact with the tool being polished by greater pressure.

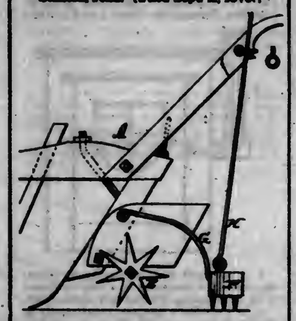
The above-described knife-sharpener, having a corrugated elastic surface, and provided with a covering material, in the manner set forth.

168,716. Seed-Planters. W. O. Champion, Stanton, Tenn. [Filed Sept. 11, 1875.]

168,716. Lemon-Squeezer. Frank. O'L. Rook, Clearfield, Pa. [Filed Aug. 30, 1875.]

A ledger or boot rest consisting of a block, A, provided with steps or shoulders a, substantially as and for the purpose herein described.

168,717. Wrenches. Henry A. Rust, Pescadero, N. Y. [Filed Aug. 23, 1875.]

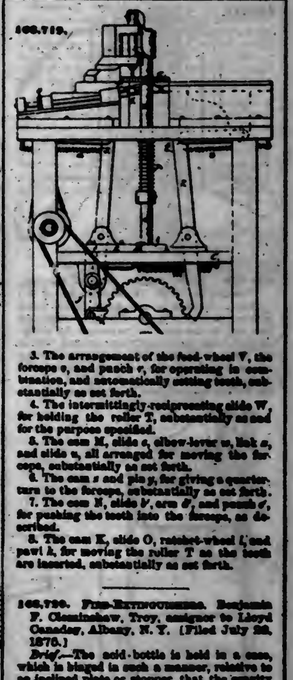


Brief.—The journal-boxes are attached to cylindrical metal rods, which turn in their bearings, and have screw-clamps at their lower ends. A vibrating journal-bearing is pivoted to an extension-arm.

1. In a wrench, the combination of the rotating rods B, having a clamp, K, upon their lower ends, with the bevel-gears C D, and rollers D D', substantially as specified.

2. The combination, with the rollers D D' and rod B, of the vertically-vibrating journal-bearing H, pivoted to extension F and having an oblong perforation, i, receiving the said rod, substantially as specified.

168,716.



The combination, with the plow A, of the seed-box, the seeding-wheel, and the spoke-wheels B, the drag F, as constructed, and the rods G and H, all as and for the purpose set forth.

168,718. Machines for Setting Teeth-Tenons. H. Chapman, Hopedale, Mass. [Filed Sept. 9, 1875.]

1. The forceps s, for receiving the teeth and carrying them forward for insertion into the roller T, substantially as set forth.

2. The drill S and punch r, mounted upon the slide X, and operating substantially in the manner and for the purposes set forth.

168,719.

3. The arrangement of the feed-wheel V, the forceps s, and punch r, for operating in combination, and automatically setting teeth, substantially as set forth.

4. The intermittingly-reciprocating slide W, for holding the roller T, substantially as and for the purpose specified.

5. The cam M, slide c, elbow-lever u, link x, and slide v, all arranged for moving the forceps, substantially as set forth.

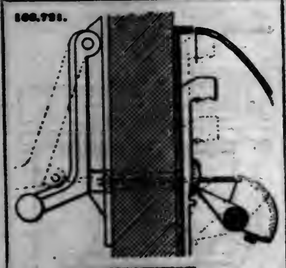
6. The cam r and pin p, for giving a quarter-turn to the forceps, substantially as set forth.

7. The cam M, slide b', arm S, and punch r', for pushing the teeth into the forceps, as described.

8. The cam K, slide O, ratchet-wheel l, and pawl k, for moving the roller T as the teeth are inserted, substantially as set forth.

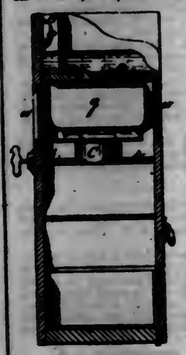
168,720. Fire-Extinguishers. Benjamin F. Glenister, Troy, assignor to Lloyd Saunders, Albany, N. Y. [Filed July 20, 1875.]

Brief.—The acid-bottle is held in a case, which is hinged in such a manner, relative to an inclined plate or stopper, that the gravity of the bottle will close its mouth hard against the plate. Also, when the device is inverted, the gravity of the bottle will withdraw its mouth from the plate, and so discharge its contents.



The inclined concavery valve G and the frame H, hinged to the cap E, and containing the acid-bottle K, in combination with the chamber A, all substantially as and for the purpose set forth.

168,721. Door-Bells. Cornelius Coleman, West Meriden, Conn., assignor to Parker & Whipple Company, same place. [Filed Sept. 22, 1875.]



The combination, in a bell mechanism, of a rock-shaft arranged upon and parallel with the plate, and provided with one arm in connection with the pull, and a second arm to actuate the hammer, and a spring to return the said shaft, with the sliding hammer constructed with a shoulder, upon which the said second arm acts, and a spring to throw the said hammer after it escapes from the said arm the construction and arrangement being substantially such as described.

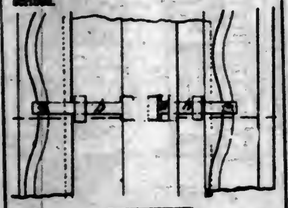
168,721.

168,722. Fare-Boxes. Wm. J. Cowing, Washington, D.C. (Filed Sept. 28, 1875.)

Brief.—The fare is introduced in the usual manner, strikes an incline arranged within the box, and is arrested for inspection by a cup-shaped receptacle centrally pivoted within the walls of the box. By means of a spring attached to the shaft of the cup, the latter is returned to its normal position, after the fare has been inspected, and finally deposited.

The single-compartment fare-box A, provided with the central cup C, the rod *r*, and the spring *s*, arranged with relation to the incline *i*, the opening *o*, and the windows *w w*, substantially as and for the purposes herein set forth.

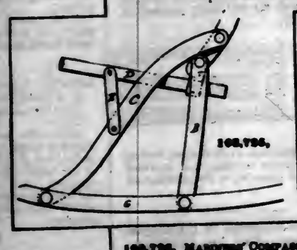
168,723. Horse-Collars. H. B. Crawford, Sioux City, Iowa. (Filed July 14, 1875.)



1. In a collar composed of two hinged sections of hard material, the shouldered top, in combination with a suitable fastening, as described.

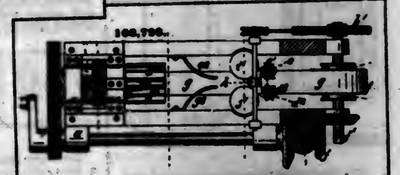
2. The spring catch or fastening, in combination with the shouldered and tapping sections of a horse-collar, composed of hard material, substantially as described.

168,724. Brick-Machines. John B. Crosa, New York, N. Y. (Filed Jan. 14, 1875.)

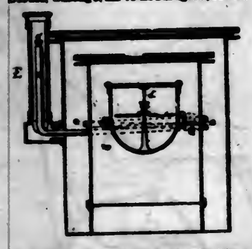


1. In a brick-machine, the molds *a*, located at one side of the center of the mark, whereby the clay is forced through a greater compressing-space, and is consequently more fully and uniformly compressed, substantially as described.

2. In a brick-machine, the combination of the plungers *b d b d* with the mold-curb, said plungers being forced alternately into the molds in said curb from opposite sides, in such manner as to move the clay brick back and forth in said molds, and finally to expel it therefrom, substantially as shown and described.



168,725. Folding Chairs. Isaac N Dana, New Haven, Conn., assignor to the New Haven Folding-Chair Company, same place. (Filed July 27, 1875.)

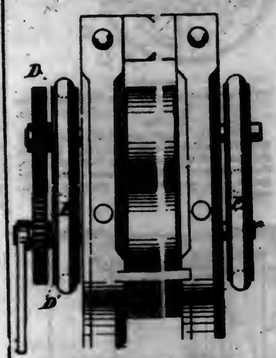


In a folding chair, the combination of the back A, the rear legs B, pivoted thereon, the front legs C, pivoted to the bent above the said rear legs, the seat D, hinged to the said back, and connected to the front legs by the pivoted support E, and the rockers G, pivoted to the lower ends of the legs, substantially as described.

168,726.

168,727. Machinery Companies. Noah H. Dibble, Chicago, Ill. (Filed Aug. 10, 1875.)

1. A mariner's compass having its binnacle inclosed or immersed in a fluid contained in an outer casing, substantially as described.



2. In a mariner's compass, substantially as described, the means for filling the binnacle with dry air or gas, consisting of the coiled pipe *c*, having a screw-plug, *p*, substantially as described and shown.

3. In a mariner's compass, substantially as described, the means for filling the binnacle-casing with a fluid, consisting of the bent pipe E, having a screw-cap, F, substantially as described and shown.

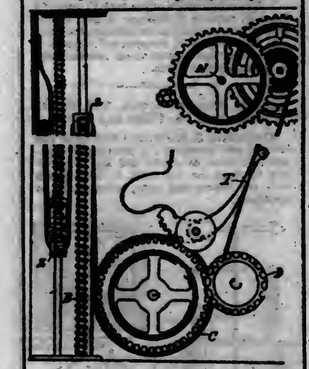
4. In a mariner's compass, the step-stud *d*, pendent from the binnacle-glass, as and for the purposes set forth.

168,728. Whetstone. Thos. J. Dickerson, Auburn, N. Y., assignor of one-half his right to C. G. Gibbard, same place. (Filed Sept. 4, 1875.)

Brief.—The rollers are driven by gearing, and adjusted by tension-bands on pulleys on the shafts of the rollers. The pulleys on the upper shaft are loosely applied, and on the under shaft rigidly attached.

The combination, with rollers B B', operated in opposite directions by suitable gears, of the tension bands E, pulleys D, loosely applied upon one of the rollers, and pulleys D', rigidly secured to the other, substantially as specified.

168,729. Machines for Splitting Hard Sugar. O. Dinkel and W. B. Himmelwright, Jersey City, N. J. (Filed Sept. 10, 1875.)



Brief.—Sugar slab is fed to a pair of rotating clippers, which cut it into prisms. A belt moves beneath the clippers and receives the prisms, conveying them to a second pair of clippers, which cut the sugar prisms into cubes. A pair of guides direct the sugar prisms toward the middle of the belt, and a feed-roller holds them in position while being presented to the second pair of clippers.

1. In a machine for splitting hard sugar into cubes, a pair of rotary cutters, substantially such as described, mounted in parallel horizontal bearings, and a carrying apron or belt arranged under such rotary cutters, and moving in a direction parallel to the axis of such rotary cutters, in combination with a pair of rotary cutters arranged in vertical bearings, substantially as and for the purposes set forth.

2. In a machine for splitting hard sugar into cubes, the traveling apron *p*, and the feed-rollers *f* and *f'*, in combination with the vertical rotary cutters *S* and *S'*, substantially as and for the purposes set forth.

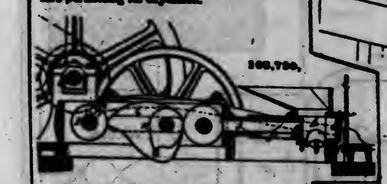
3. The combination, with a pair of rotary cutters, substantially such as described, of the traveling apron *p* and the feed-roller *h*, for the purpose of supplying opposite sides of a slab of sugar and delivering it to the rotary cutters, substantially as set forth.

168,730. Separating or Screens. Perrin W. H. Dunbar, Philadelphia, Pa., assignor of one-half his right to O. P. Godley, same place. (Filed Sept. 27, 1875.)

1. The winding-drum B, constructed as described, and operating in conjunction with the frame to equalize spring-power.

2. The combination, with the drum B and frame D, of the barrel C, for winding the spring-connecting cord.

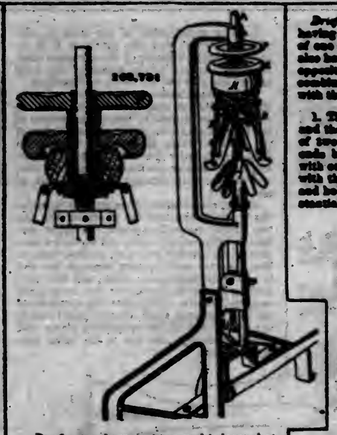
3. The combination, with a spring-power substantially such as described, of a power-equalizing combination, substantially as shown and described.



4. The described compact arrangement of the several series or sets of springs in rows parallel with each other, the spring-connecting cord being guided in one direction across one row, and in the opposite direction across the next adjacent row.

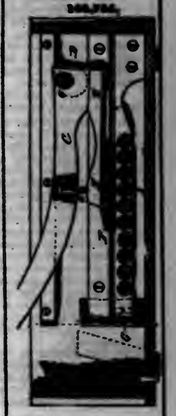
5. In combination with the gear-wheel F on the barrel-shaft, the eccentrically-geared bushing-lever T, substantially as and for the purposes set forth.

6. The pulley-disks E, constructed, as described, with curved guide-bearings 2 2, adapted to bear upon the outside of the springs, substantially as shown, and for the purposes set forth.



7. The combination of the frame D, drum B, barrel C, parallel rows of springs, intermediate cords, and cords *a* and *a'*, substantially as and for the purposes set forth.

168,731. Machines for Stretching Hat-Bodies. Rudolf Hutmacher, Yonkers, N. Y. (Filed Oct. 30, 1875.)



The combination, in a machine for making bodies, of the shrouding-cloths: the mold A, the plates *f*, the double-acting cam *i*, the vertically-sliding dies or bottom *D*, and the stirrup *g*, all arranged and operating substantially as specified.

168,732. Cushioned Desks and Wash-Stands. Elisha H. Everitt, Philadelphia, Pa. (Filed Jan. 12, 1875.)

As a new article of manufacture, the combined desk and wash-stand, constructed with the cabinet-base A, having receptacles B C, &c., and the projecting ledge D, having an internal recess to hold tools, &c., and a hinged lid, forming a desk-leaf, substantially as shown and described.

168,733. Pipe-Couplings. H. K. Flagler and W. R. Dodge, Boston, Mass., assignors to the National Tube-Works Company, same place. (Filed Aug. 18, 1875.)

Brief.—A coupling composed of a socket having its ends beveled, attached to the end of one section of pipe, and an abutment-ring, also having its ends beveled, attached to the opposite section of pipe, both of its ends, in combination with a clamp, adapted to engage with the outer beveled ends of the coupling.

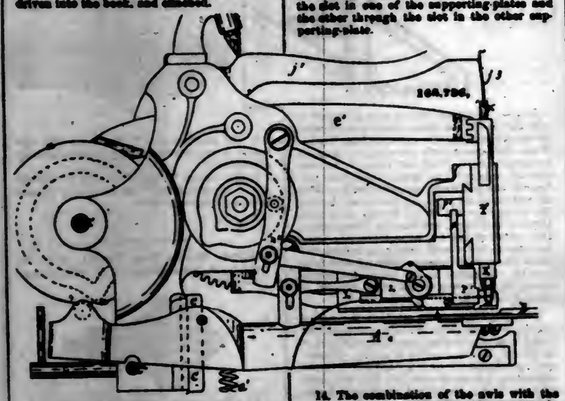
1. The coupling consisting of the socket A and the abutment-ring C, applied to the ends of two sections of tubing, and having their ends beveled, as described, in combination with one or more clamps, adapted to engage with the outer beveled ends of the coupling, and hold the parts A C thereof together, substantially as and for the purpose specified.

2. The packing-ring F, combined with the socket A and abutment-ring C, substantially as described.

3. The clamp D, combined with the socket A and abutment-ring C, substantially as and for the purpose specified.

168,734. Stove-Door Knobs. Miles W. Gardner, Green Island, N. Y. (Filed Aug. 30, 1875.)

As a new article of manufacture, a knob for stove-doors composed of a hollow perforated metal base, a non-conducting wood disk, and central fastening bolt and nut, substantially as and for the purposes set forth.



168,735. Washing-Machines. George W. Gilbert, East Prospect, Pa. (Filed Oct. 4, 1875.)

1. The frame C, provided with the friction-rollers, and having the spring-bars E horizontally attached to the end of said frame, and carrying the corrugated rubber F and vertical guide-pins c, in combination with the vessel A, and rollers journaled in the cylinder-bars G, substantially as shown and described.

2. The combination of the hollow rollers I, mounted upon the metallic rods resting in metallic bearings h, centered to each end of the supporting spring-bars G, and capable of rotating therewith, the whole forming the lower rubbing-surface of the apparatus, substantially as described.

160,726. BOOT-SUPPORTING MACHINES. L. Godin, Winchester, Mass., assignor, by mesne assignments, to H. Barnard, New York city. [Filed May 26, 1874.]

Brief.—While the heel is clamped it is penetrated by the awls, and the wire being fed over the mandrel is formed into a staple, driven into the heel, and clinched.

160,726.

1. The combination of the vert-supporting table A with the vertically-adjustable slide G by means of the pivots D, as described.

2. The combination of the vert-supporting table A, pivoted at D and operated by arms c, with the overhanging arm, substantially as described.

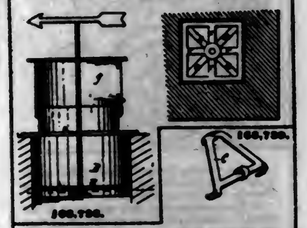
3. The combination of the penetrating-awls, the staple-driver, and the staple-clinchers with the clamping-table A and the overhanging arm, substantially as described, for the purpose of compressing the pamphlet between the latter, while the former operate to puncture the material and insert and clinch the staple.

4. The combination of the stock E, carrying a pair of awls for puncturing the material, the stock H, carrying the staple-former G, and the driver J, working within the former G, with the slide F and suitable actuating mechanism, substantially such as described, the whole combination being and operating substantially as specified.

5. The former-bed M, constructed in two parts, n and n', substantially as described.

6. The combination of the former G with the former-bed M, constructed in two parts, n and n', substantially as described.

7. The combination of the driver J, the former G, and the former-bed M, made in two parts, n and n', substantially as described.



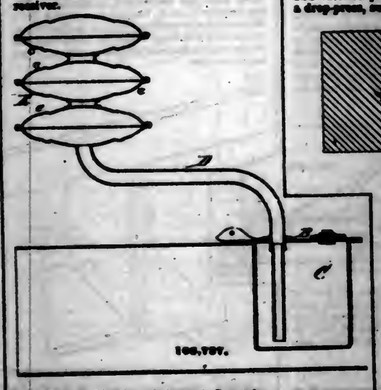
8. The combination of the feed-slide L and the former-bed M, in such relation to each other that the wire-channel in the feed-slide opens upon wire-channel in the former-bed when the slide is advanced, the two channels then forming one continuous channel until the end of the wire has entered the channel in the feed-slide, substantially as described.

9. The combination of the feed-slide L, the former-bed M, having a wire-channel across its face and in line with the wire-channel in the feed-slide, and the former G, substantially as described.

10. The clincher B, having a working surface at an angle with the surface of the material, and which moves on an axis toward the surface of the material in order to clinch the staple-leg, as described.

11. The combination of the table A, the clincher-lever c', and the clincher B E, so that the seating-surface of the clincher shall be moved axially by the action of the lever toward the plane of the table, as described.

12. The combination of the penetrating-awls, the staple-driver, and the clinchers with the slotted supporting-plates, the upper surface of the vibrating table, and the under surface of the overhanging arm, as described, so that the awls shall operate through the slot in one of the supporting-plates, and their penetrating-points shall enter the slot in the other supporting-plate, and so that the staple-drivers and clinchers shall operate, one through the slot in one of the supporting-plates and the other through the slot in the other supporting-plate.



160,726.

160,726.

160,727. AUTOMATIC DAMPERS. S. F. Gold, Rockwood, N. J. [Filed July 12, 1875.]

Brief.—Steam being generated in the tank, water is forced into and through tube into the receiver.

160,727.

1. The combination of the tank C, receiver B, and pipe and lever D, arranged relatively to each other substantially as hereinbefore set forth.

2. The combination of the tank C, pipe and lever D, receiver B, and damper E, substantially as hereinbefore set forth.

3. The combination of the tank C, pipe and lever D, receiver B, damper E, and steam-pipe A, substantially as hereinbefore set forth.

4. The receiver B, constructed in parts a, having openings between them, substantially as hereinbefore set forth.

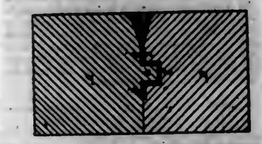
160,728. CHIMNEY-COWLS. T. K. Griffin, Fayette City, Pa. [Filed Aug. 9, 1875.]

The pedestal B, constructed with upper and lower spurt-arrestors c d, arranged to intersect each other, as shown, and also constructing bearings for the shaft, in combination with the bonnet and vane, substantially as specified.

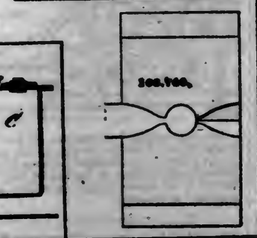
160,728.

160,729. TRAVELING FOR SPINNING-ROVER. Heiver Halverson, Cambridge, assignor to G. A. Shaw, Boston, Mass. [Filed Feb. 10, 1875.]

1. A spinning-ring traveler having a triangular body, and provided with the heels or legs d d and n, substantially as and for the purpose specified.



2. In a spinning-ring traveler, constructed substantially as described, the yarn-hook a, arranged as shown and for the purpose specified.



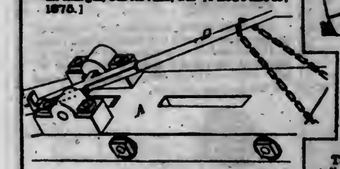
160,730. DIES FOR FORGING CARRIAGE-AXLE NUTS. Henry Hammond, Hartford, Conn. [Filed Oct. 2, 1874.]

Brief.—Compressing faces on the sides of the dies strike out a circular disk from bar, to serve as a blank out of which the nut is to be formed. This blank is then placed between the finishing-dies and brought to the desired form.

1. The circular compressed faces c c, upon and in combination with dies for forming the finished nut, substantially as described.

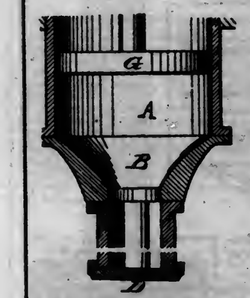
2. The dies composed of two parts, upper and under, constructed as herein described, and suitable for giving form to the exterior and interior portions of an axle-nut under a drop-press, substantially as set forth.

160,730.



160,731. DRILL-STOCKS. J. Hammond, Belleville, Ind. [Filed June 26, 1875.]

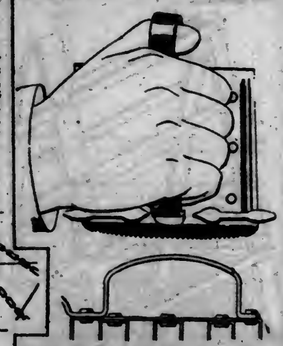
160,742.



In a drill-stock, the stop-sleeve F, shouldered and screw-threaded at its under end, in combination with the pinion-box D, pinion C, shouldered pinion-shaft E, screw-threaded at its lower end, and removable from the pinion at its upper end, and removable tool-socket G, substantially as described, and for the purpose set forth.

160,743. TRACK-LIFTING LEVERS. William H. Hargis, Cartersville, Ga. [Filed June 10, 1875.]

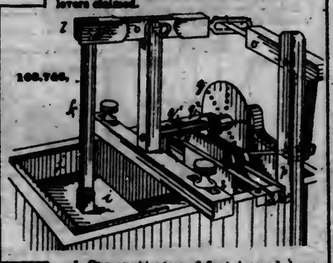
The combination, substantially as described, of the lever D, having the journal-arms c and hook h, in combination with the fulcrum-blocks B, cage O, and base-plate A, constructed as described.



160,744. BRICK PRESSES AND FORMERS. Andrew J. Hawn, Johnstown, Pa. [Filed Aug. 14, 1875.]

The cylinder A, having plunger G, in combination with the cone E, mold O, having lugs c, and removable stopper D, provided with hooks h, the whole constructed, arranged, and operated in the manner and for the purpose set forth.

160,745. OVERT-COMBS. C. A. Hotchkiss, Bridgeport, Conn. [Filed Nov. 20, 1874.]



Brief.—The back of the comb is provided with a rigid bail or handle for the fingers to grasp, and the side has a ring for the thumb to enter.

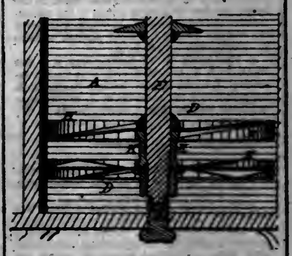
The carry-comb provided with a rigid metallic handle on its back, and a thumb-rest, substantially as specified.

160,746. STUFF-REGULATORS FOR PAPER-MACHINES. John W. Hunsted, Schuylerville, N. Y. [Filed Mar. 15, 1875.]

Brief.—As the floor lifts it shifts the sliding gate to throw the outflow into the machine or back into the stuff-chest. The amount of play of gate is governed by the arrangement of levers claimed.

160,746.

1. The combination of feast f, arm h, lever i, cross-lever o, arm o', lever o², disk q, cogs q' and r, and shifting or sliding plate s, in the manner substantially and for the purpose described and set forth.

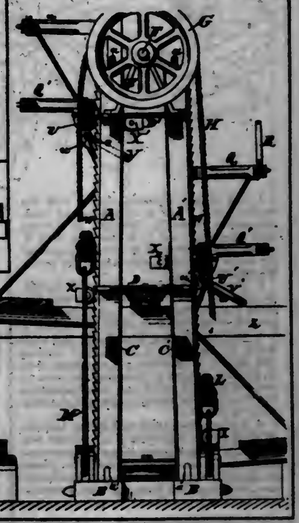


2. The combination of disk or wheel q, shifting-plate s, and lever l, constructed and arranged to operate substantially in manner and for the purpose described and set forth.

160,747. STEAM AND VACUUM PUMPS. O. Jackson, Portland, Me. [Filed Nov. 12, 1874.]

Brief.—Steam is applied in one chamber, while a vacuum is created in the other, and vice versa. The power of said chambers is transmitted to two cams, in which the water is raised alternately from one to the other.

The combination of the chambers I L having the domes M, ports r s, and valves V V with the donkey-pump D, pipes P P' P², having perforated ends, cock T, pipes s n, and pump sections or reservoirs A O F B E H, substantially as described, for the purpose specified.

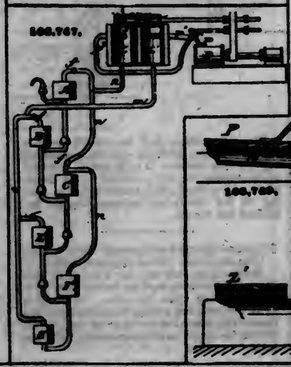


160,748. CHURNS. William P. Jones, Clio, Iowa. [Filed Aug. 21, 1875.]

The combination of the perforated propeller-wheels D, constructed as described, with the central shaft E and adjustable thimbles K, as and for the purpose hereof set forth.

160,749. MACHINES FOR REMOVING BUILDING MATERIALS. George H. Kennedon, Columbus, Ohio. [Filed June 24, 1875.]

Brief.—On a foundation-piece four posts, with attaching horizontal platforms, are each adapted to vertical extension by means and mortises at their sectional ends. Sliding on the outside of each pair of posts, and guided by friction-wheels, is a platform-frame, overbalanced by one on the other posts, both vertically counterpoising by a hoisting-rope over a wheel at top. On each there is a counterbalancing crank-shaft, having pawls working on ratchets along the posts. Each frame has at top a detachable load-carrier.



160,750. TRUSSED CHAINS. S. Hoffman, St. Louis, Mo. [Filed June 21, 1875.]

The combination of spider D E F and cast L with the spring consisting of stirrup H, coils I I, and arms K K, having bearings G and M, respectively, upon the arm F, and beneath the cast-frame L, substantially as set forth.

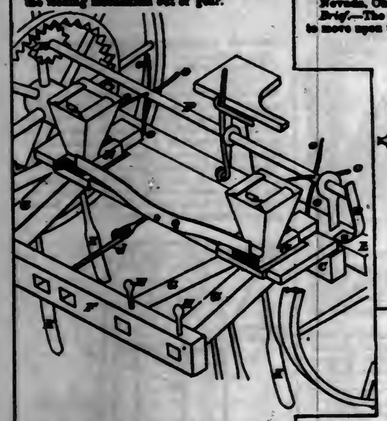
160,751. SAFETY-VALVES. Thomas Jones, Jr., Pittsburgh, Pa. [Filed Aug. 21, 1875.]

160,751.

1. The combination of the valve-seat A, valve B, and the lever C, provided with the weight D, and the pin or projection E, substantially as and for the purpose specified.

2. The combination of the valve-seat A, valve B, lever C, weight D, and the pin or projection E, with the stop-pin F, substantially as and for the purpose specified.

1. The combination of bars E, forming the side support of the elevator, sectional and detachable standards A A' C A' A' C', and detachable platforms D D', supported by the braces C C' of the standards A A A' A', the upper platform D' carrying the upper mechanism, to which the elevator-platforms are attached, substantially as and for the purpose set forth.



2. The platform I, consisting of vertical bars J J, sliding on the sides b of the standards A A' A', and connected by cross-bars K L, the rollers X X', attached to said bars J J, and adapted to run respectively in front and rear of the standards, in combination with braces O, platform P, and brackets R on the outside of the elevating-frame, as set forth.

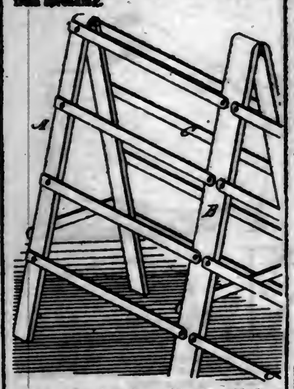
3. The supplemental and detachable bed-frame, consisting of uprights Q' Q', supporting-brackets Q Q', and angular arms R, the lever bracket Q' having pulley T for attachment to the cross-bars K, in combination with the vertical bars J J, having obdents or slips S, substantially as set forth.

4. The parts U' U', having legs u u, the crank-shaft V, provided with pins v v for operating the parts, and having bearings in hangers b b of the cross-bars K, in combination with standards A A, having racks W W, as set forth.

168,750. COMBINED PLASTERER AND OUTLOOK-TAPPER. Charles F. Keller, Healdsburg, Cal. [Filed July 26, 1875.]

Brief.—To the axle is hinged a frame provided with adjustable beams, carrying spring and covering teeth. Upon this frame is secured a cross-bar for supporting seat-bars, with slides extending rearward, which are thrust by arms on a revolving shaft and forced forward, but are instantaneously forced back by a retracting-spring. The shaft carrying the arms has an end-wise movement to throw the feeding mechanism out of gear.

1. The hinged adjustable frame, with the mortised bar F and V-shaped ends of teeth supporting beams G, adjustable to or from each other upon rod C, so that the teeth K will serve as cultivators, or to mark the ground for and cover the seed, substantially as herein described.

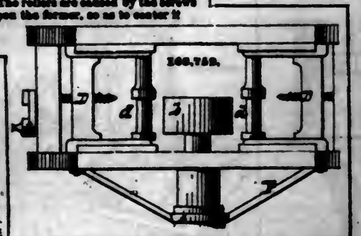


2. The rotating and adjustable shaft P, with its rotating arms O, in combination with the slides M and spring Q of a seed-dropping apparatus, substantially as herein described.

3. The combination, in a planter and cultivator, as described, of the shaft P, having seed section in its bosom, and operating lever T, for the purpose of throwing the arms O and the plates R out of gear simultaneously, together with the returning-spring U, substantially as described.

4. An interchangeable seed-covering and cultivating device, consisting of the hinged and adjustable teeth-bearing frame, in combination with the seed-dropping device M N and the shaft P, with its radial arms O, to determine the spaces for dropping seed, substantially as herein described.

168,751. CLOTHES-DRIER. Saml. R. Kidder, Bantam Falls, Conn. [Filed Aug. 26, 1875.]



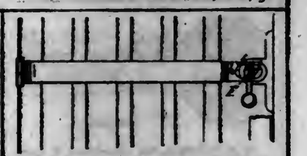
Brief.—The central uprights are longer than the end uprights, which prevents the frame from upsetting.

In a clothes drier the combination, with the hinged end uprights A and the pivoted bars C, of the central uprights B, having their hinged upper ends above those of the two end uprights, substantially as described.

168,752. BOX-MACHINE. John Kiser, Nevada, Ohio. [Filed July 24, 1875.]

Brief.—The rollers are caused by the screws to move upon the former, so as to center it

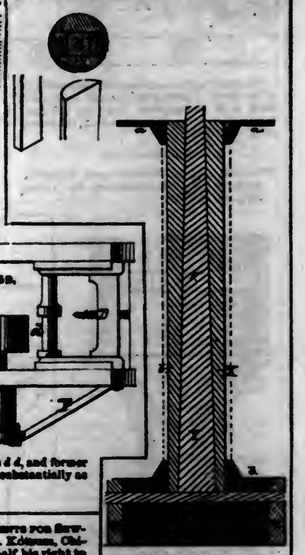
The sliding frames D, rollers *d d*, and former or cylinder *b*, in combination, substantially as and for the purpose set forth.



168,753. HORSE-ATTACHMENTS FOR SEWING-MACHINES. Wessel L. Edgerton, Chicago, Ill., assignor of one-half his right to Henry H. Scotchmer, same place. [Filed May 18, 1875.]

The combination, with the needle-bar of a sewing-machine, provided with the removable leg *a*, of the beamer D attached to the foot of the presser-bar, and provided with a shoe-plate and spring-knife, operating by the said leg on the needle-bar, substantially as described and shown.

168,754. GATE-FASTENINGS. Wm. Leach, Omaha, Nebr. [Filed Sept. 13, 1875.]



Brief.—A pivoted rod has a weighted handle upon one end, and an arrow head with beveled wings upon the other. This rod is upon the post, and a plate is secured upon the gate. The plate has an angular slot, which strikes the arrow and automatically locks the gate.

The pivoted rod R, having arrow-head with reversely-beveled wings, and in the same plane therewith a right-angled catch-arm, O, in combination with an angle-plate, E, having the slot *b*, as and for the purpose described.

168,755. SECTIONAL CORES TO BE USED IN THE MANUFACTURE OF TUBING. H. Loomis and J. A. Cameron, Memphis, Tenn. [Filed June 9, 1875.]

A core for tubing, consisting of a square tapering center, V, and four tapering side pieces, I, II, III, and X, in combination with the fishing-plates *a* and *b* and the bar-wedge VI, all constructed to operate substantially as and for the purpose set forth.

168,756.

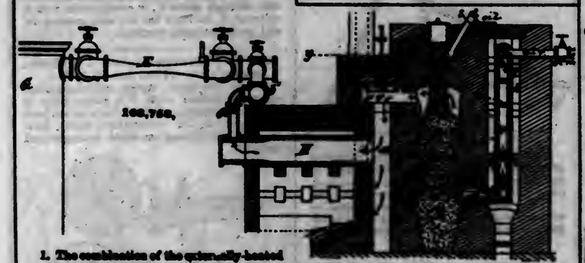
168,757. SEWING-MACHINES. Lorin Lyon, New York, N. Y. [Filed Apr. 12, 1875.]

The combination, with the rock-shaft r, provided at one end with an arm, *i*, for operating the feeding of a sewing-machine, of the adjustable rod *l*, eccentric *k*, shaped crank *p*, adjustable slide *m*, the set-screw *q*, passing through the crank *p*, and slide *m*, for moving the latter back and forth, as and for the purpose described.

168,758. CORNISH FASTENING AND COLLAR. Thomas C. Love, Waldo, Me. [Filed Aug. 10, 1875.]

In a horse-collar, the pads D D, constructed with a flexible web, *d*, intermediate to the attaching-cams, for the purpose of increasing the flexibility and elasticity of the pads, in the manner substantially as herein before shown and described.

168,759. BOX-MACHINES. John Kiser, Nevada, Ohio. [Filed July 24, 1875.]



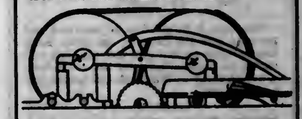
The combination, with the former or cylinder *b*, of the sliding frame D, rollers *d d*, and the pivoted arm E, having a roller, *e*, and the pivoted arm F, having a roller, *f*, substantially as and for the purpose set forth.

168,760.

168,761.

168,760. APPARATUS FOR THE MANUFACTURE OF ILLUMINATING-GAS. Philip W. Mosbach, Hunterdville, N. Y. [Filed Nov. 7, 1874.]

Brief.—The decomposing-chamber is air-tight. Air to steam combustion is admitted by way of the separately-heated steam-decomposer. The proper heat having been attained, air is shut off and steam admitted. Resultant gases are fixed. To his former apparatus adds fixing-retorts. The valve between retort and chamber has a sand-seal.



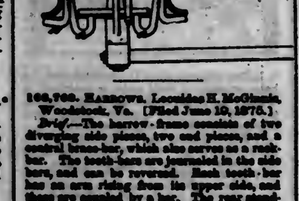
1. The combination of the externally-heated vertical end chambered steam-retort A, having upper steam-inlet *b* and lower superheated steam-outlet *c*, with the gravitous decomposing-chamber B and one or more separately-heated fixing-retorts, H, substantially as specified.

2. The combination of the externally-heated vertical end chambered steam-retort A, having upper steam-inlet *b* and lower superheated steam-outlet *c*, with the gravitous decomposing-chamber B, having an upper hydrocarbon-supply pipe, *e*, and with one or more separately-heated fixing-retorts, H, as and for the purpose described.

168,760. LATH-MACHINES. J. C. Mosher, Chicago, Ill. [Filed Nov. 14, 1874.]

Brief.—The cutting lathe from belts of varying thickness, the saw or saws that cut the laths, and the feed and delivery rollers, are caused to revolve in the same direction by a peculiar arrangement of driving-pulleys and their belts with relation to the saws.

The combination of the saw-arbor *i*, carrying pulley P, belt J, and pulley I on shaft A, with belt K, and pulley F on shaft D, whereby the rollers H and H' are revolved in the same direction as the saws B, substantially as described.



168,761. GAS-BRACKET SUPPORTS. Thomas F. McGann, Boston, Mass. [Filed Sept. 20, 1875.]

A globe-holder, with a bearing-piece, A, having projections, and a series of bent spring-supports, B, the bent spring-supports B being formed at *c'* to support the under side of the globe E, and at *d*, to embrace the inside thereof, the whole being constructed substantially as shown and described.

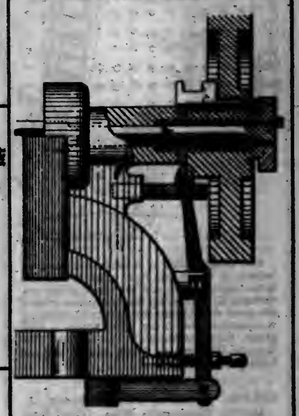
168,761.

168,762. HARROWS. Lucrédus H. McGinnis, Woodstock, Va. [Filed June 10, 1875.]

Brief.—The harrow-frame consists of two diverging side pieces, two end pieces, and a central brace-bar, which also serves as a rocking-bar. The teeth-bars are journaled in the side bars, and can be reversed. Each teeth-bar has an arm rising from its upper side, and these are coupled by a bar. The rear standard enters a pawl, which works in notches in the upper edge of the brace-bar, thus holding the teeth at any desired angle. The rear end of the harrow-frame is adjusted by means of a rock-bar and wheels, and the forward end is supported by a detachable caster-wheel. Each teeth is supported upon the under side of the beam by a flanged washer.

168,762.

1. The harrow-frame having the end-ranging detachable side pieces D and central beam F, in combination with the reversible teeth-bars C, substantially as described, and for the purpose set forth.

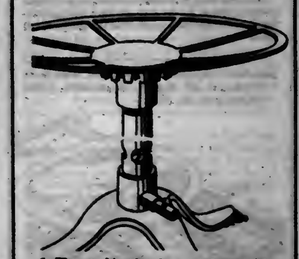


2. The flanged washers I, combined with bars C and teeth G, substantially as described, and for the purpose set forth.

3. The harrow-teeth G, the bows and of which is bread and beveled on both sides, and double-beveled from its vertical axis to its vertical sides, so as to form parallel cutting-edges, substantially as described.

4. In a harrow, the combination, with the pivoted teeth-beams C, of transporting-wheels K K, rocking bar J, lever-arm *a*, shaft *f*, and blocking-cranks *g g'*, whereby the wheels and the teeth-beams may be operated independently or together, substantially as described.

168,763. PUNCH-PRESSES. Alanson H. Morrison, West Meriden, Conn. [Filed Sept. 20, 1875.]

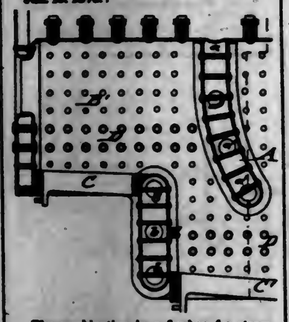


Brief.—The cam-shaft of the plunger is entirely freed from the friction of the balance-wheel when unclutched therefrom.

A stationary bearing upon the horn of a press, substantially as and for the purpose set forth.

168,764. GAS-HEATERS. George Mooney, Providence, R. I., assignor to Providence Gas-Burner Company, same place. [Filed Sept. 16, 1875.]

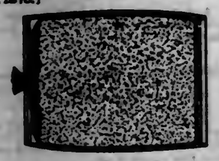
Brief.—Gas issuing from a narrow slit is more readily mingled with air. The depending notched flange breaks the flame and allows freer access of air.



1. The combination, in a gas-heater, of an atmospheric chamber and a gas-slit, which is located within and connected to the chamber adjacent to the air-induction apertures, and is provided with one or more rectangular slots, substantially as described, whereby the gas is delivered into the atmospheric chamber in a thin, attenuated, flattened column, as and for the purposes set forth.

2. The combination, with a gas-jet and an atmospheric chamber, which delivers the mixed gas and air in radial jets from the top of the chamber, of a flame-spreading plate having a downwardly-projected flange provided with openings, substantially as described, and for the purposes set forth.

168,766. MEMBERS OF DRYING AND BURNING BRICKS, &c. Augustus Morand, Germantown, Pa. (Filed Dec. 15, 1873.)



The improvement in the art of drying and burning bricks and other wares and materials, consisting of the introduction of electrized air or of air charged with ozone, into the interior of the kiln, for the purpose of intensifying the combustion therein, and of heightening the color of the brick, substantially as set forth.

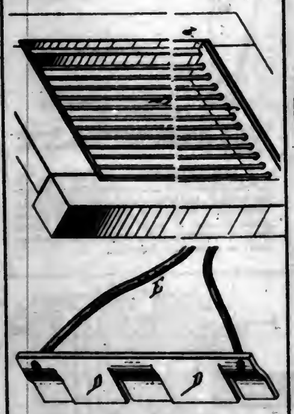
168,767. FURNACES FOR STEAM-BOILERS. Sandford Morse, Clinton, Iowa. (Filed Jan. 18, 1875.)

The combination, in a fire-box for steam-boilers, of the upper front grate C and the lower rear grate C', and the intermediate water-leaf E, supporting the contiguous ends of the same, with the depending curved water-leg A, extending below the upper grate C, said grates being arranged to receive the fuel through the door, as herein shown and set forth.

168,768. MODES OF PACKING FLOUR. L. Mowry, Minneapolis, Minn. (Filed Sept. 17, 1875.)

An article of commerce, consisting of flour packed within a barrel lined with fibrous material, substantially as and for the purpose set forth.

168,769. RUNNING-GEARS FOR VEHICLES. Chauncey M. Marsh, Cincinnati, Ohio. (Filed Aug. 18, 1875.)



1. In the running-gear of vehicles the frame, composed of the T angle-bars B F F' D, and interposed between the springs and the fifth-wheel, substantially as and for the purpose specified.

2. In combination with the ordinary springs of a vehicle the spring G and bracket F, connected and operating substantially in the manner and for the purpose specified.

168,770. FRUIT-DRIERS. John P. Nessle, Newark, N. J. (Filed Sept. 20, 1875.)

Brief.—The slides can be used to clear the wires of fruit. They also support the wires. The handle is used to push the slides on the wires.

1. The combination of the frame A, having grooves or offsets a a, the parallel wires B B, and slides C C having tongues b b, substantially as and for the purposes herein set forth.

2. The pronged handle D E, in combination with the slides C C and tray A B, substantially as and for the purposes herein set forth.

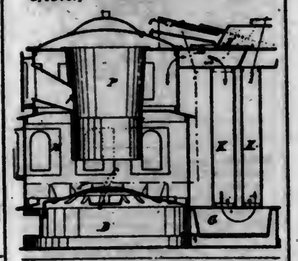
168,770. GRATES FOR FURNACES. Jas. Old, Allegheny, Pa. (Filed Aug. 23, 1875.)

Brief.—The cranks work in holes formed in the grate-bars.

1. The agitating-bars D, provided with the holes or slots in their ends, as described, to confine the wrists of the cranks, in combination with the wrists a, cranks C, and rock-shafts B B', substantially as set forth.

2. The stationary bars E, provided with the flanges f, arranged between the cranks to fill the spaces between the agitating-bars, and hold them in position on the wrists of the cranks, in combination with the agitating-bars D, crank-wrists a, and rock-shafts B B', substantially as set forth.

3. The projections c, on the shafts B B', in combination with the short bars D and rock-shafts, substantially as described.

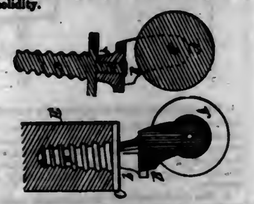


4. The combination of a grate, constructed as described, with the fire-chamber of a furnace-stove or open fire-place, substantially as described.

168,771. GRATE AND STOVE FRONTS. Jas. Old, Allegheny, Pa. (Filed Mar. 18, 1875.)

The grate-front A, having spaces a, constructed as described, in combination with spaces B and flue D, substantially as and for the purpose hereinbefore described and set forth.

168,772. FIRE-PLACE HEATERS. John B. Oldershaw, Baltimore, Md. (Filed Aug. 6, 1875.)



1. The combination of cylinder-section D, box G, extension K, and section L, as and for the purpose described.

2. The magazine P, open at top and at the side through plate O, in combination with a cylinder, R, having a top and side opening, as and for the purpose specified.

168,773. FURNITURE-CASTERS. J. F. Ohmer, Dayton, Ohio. (Filed Apr. 13, 1875.)

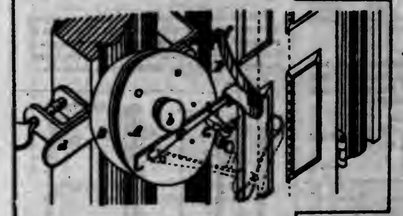
Brief.—The screw, flange, and connecting-rivet are formed solid, of a single piece of metal, and riveted or headed down on the horn of the caster, the construction being inexpensive, and giving increased strength and solidity.

The solid screw D, the disk or flange C, and the rivet d, formed of one piece of metal, in combination with caster-horn B, substantially as and for the purposes set forth.

168,774. WATCHES. Eugene J. Pecaud, Schaffhausen, Switzerland, assignor to Florentino A. Jones, same place. (Filed June 30, 1873.)

The screw A, threaded at its inner end, and provided with the flange F, the latter being located between the dial and top plate of a watch, in combination with the elbow-lever g, substantially as described, and for the purpose specified.

168,775. VALVES. William Painter, Baltimore, Md. (Filed Oct. 6, 1875.)



The combination, with a flexible valve cover or covers, provided with longitudinal stiffeners or bosses, of the side plates, substantially as and for the purposes specified.

168,776. VALVES. William Painter, Baltimore, Md. (Filed Oct. 6, 1875.)

A valve provided with the flexible covers, having bosses or stiffeners, and seated one against the other at top and sides, substantially as described.

168,777. BURGLAR-ALARMS. Jno. Pepper, Philadelphia, Pa. (Filed Sept. 9, 1876.)

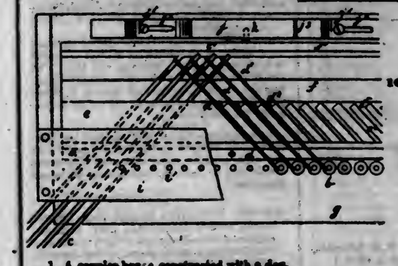
1. The gong B or cap B thereto formed, with a hollow shaft or threaded post for the reception of the screw S', substantially as shown and described.

2. In combination with the gong B and face-plate A, the tripper C, hinged at c', and provided with a pin, c, for engagement with the escapement S'.

3. An organ-escapier embodying in its construction a series of levers, c d, interposed between the pitmen b, and supported at opposite angles, the one to the other, within a escapier-bar, e, having a double tier or series of gains or channels, e' e', arranged at reverse angles to and one above the other, substantially as shown and described.

4. The combination, with the keys e, of the levers c d, escapier-bar e, gains e' e', hinged platform f, pitmen b, and valves m, all constructed and arranged to operate substantially as shown and described.

168,778. SEDIMENT-COLLECTORS FOR STEAM-BOILERS. Joseph Popper, Vienna, Austria, assignor of one-half his right to David Popper, same place. (Filed June 20, 1876.)



Brief.—The sediment is deposited upon false bottoms or linings, through which the circulation of water is maintained by means of raised or nipple-opening. Said linings are located concentric to the boiler-plates, and held in position by cross-ties.

1. Roller-linings consisting of a series of detached curved metal plates, T, provided with pyramidal tubes or cones S S', constructed as shown and described, and legs or supports s, said series of plates being so arranged as to overlap each other, inducing currents in certain portions of the boiler, leaving places of rest in others, substantially as and for the purposes specified.

2. Roller-linings consisting of a series of metal plates T, arranged above the fire-tubes, and provided with slots o o and oblique flaps f, substantially as described, in combination with the bottom linings U, arranged and operating substantially as shown, and for the purposes specified.

168,779. ORGAN-COUPLERS. Jos. R. Perry, Wilkesbarre, Pa. (Filed Aug. 6, 1875.)

1. A coupler-bar, a, constructed with a double tier or series of gains or channels, d d', arranged at reverse angles to and one above the other, and adapted to receive and support the levers c d, substantially as shown and described.

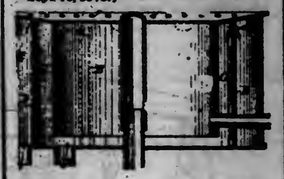
2. The combination, with a coupler-bar, a, provided with a double tier or series of gains or channels, d d', arranged at reverse angles to and one above the other, of the levers c d and hinged platform f, substantially as shown and described.

3. Roller-linings consisting of a series of removable curved and overlapping metal plates, T, constructed substantially as shown and described, and arranged not parallel to the boiler-plates, but approaching nearer to them toward the water-line, for the purposes set forth, said series of plates being held in position by means of the supports or legs s and T T and the brass-rods s, as shown and specified.

168,780. HOES. Archibald A. Porter, Griffin, Ga. (Filed Aug. 20, 1875.)

Brief.—The blade is clamped between two jaws, that are brought and held together by means of a screw-thread upon the handle operating upon an interior thread in the socket.

The shank C and lip A, socket B and screw F, in combination with the blade A and handle B C, as specified.



168,780.

168,781. CORNERED PADS AND COLLAR-FASTENINGS. Almo Beckes, Fort Wayne, Ind. (Filed Sept. 20, 1875.)

The combination, with a horse-collar, of a pad, A, metal plate C, slotted posts D D, and key G, all substantially as and for the purposes herein set forth.

168,782. METHODS AND APPARATUS FOR BURNING OILS. Elisha E. Bliss, San Francisco, Cal., assignor of one-fourth his right to G. W. Dyer, Washington, D. C. (Filed Sept. 16, 1875.)

1. The method, substantially as described, of regulating the height of oil burning upon the surface of water, by means of connecting the chamber containing the water which carries the oil, by passages or openings at its bottom, with a water-chamber entirely around the first-named chamber, and with suitable overflow pipes or passages at its top, leading into a third chamber entirely around the second, from which last-named chamber the water has free outlet.

2. The method, substantially as described, of increasing the combustion of oils burning in a thin film upon the surface of water, by introducing vertical jets of air into the center of the fire above the water by a central vertical pipe with a perforated top.

3. The method, substantially as described, of converting the flame of oils burning in a thin film upon the surface of water into a blast, by introducing vertical currents of live steam into the center of the flame by a central vertical pipe with a perforated top.

4. The method, substantially as described, of converting the flame of oils burning in a thin film upon the surface of water into a blast, by introducing vertical central currents of live steam into the flames, and at the same time introducing radial currents of air, entirely around the periphery of the flames.

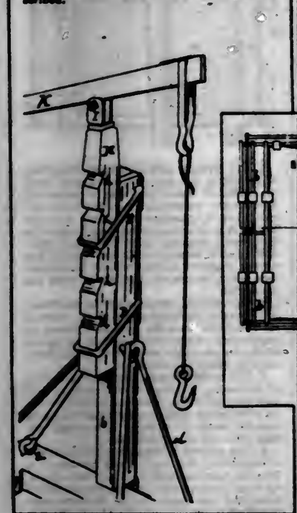
5. In the apparatus described, the combination of the chamber I, provided with water and oil inlet pipes, and the chamber G, provided with overflow pipes or passages at its top, connected by openings or passages at the bottom with the chamber I, substantially as and for the purposes set forth.

6. In the apparatus described, and in combination with the chamber I, the central steam or air pipe J, with a perforated top, and adapted to be raised a little above the surface of the water and oil contained in said chamber.

7. In the apparatus described, and in combination, the chamber I, connecting by passages at the bottom with the chamber G, the chamber G, having overflow-passages at its top, leading into the chamber C, and the chamber C, having outlet D, all substantially as and for the purposes set forth.

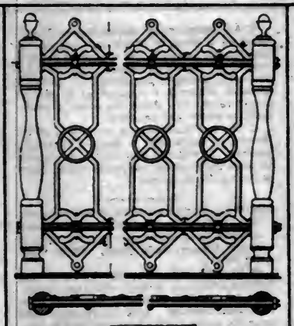
8. In the apparatus described, and in combination, the air-pipe E in the chamber C, the top cover H, having an annular series of openings, h, and a central steam-pipe, J, substantially as and for the purposes described.

9. In the apparatus described, the combination of the tanks M and N, with connecting-pipes g i, and the chamber L, substantially as and for the purposes set forth.



166,786. GASOLINE-BURNERS. J. C. Riley, Cincinnati, Ohio. [Filed Aug. 28, 1875.]

The combination of burner, A B D F, removable cap or nozzle G E I J K L, and regulating-screw M N, substantially as herein described and illustrated.



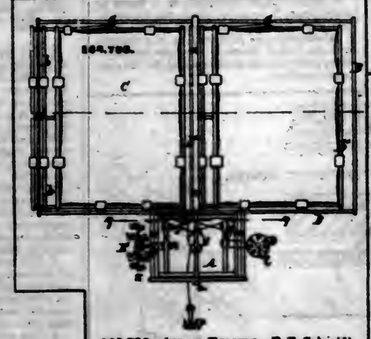
166,784. ELEVATORS FOR VESSELS. Robt. B. Roberts, Vermilion, Ill. [Filed July 6, 1875.]

The portable lifting mechanism described, consisting of the standard b, head c, rods d, staples e, upright bar H, provided with notches h, links p, swivel I, and lever K, all combined and arranged as and for the purposes described.

166,785. BOOT FRAMES. T. J. W. Robertson, New York, N. Y. [Filed June 30, 1860.]

A frame-panel constructed of sections having alternate side depressions, so arranged as to form openings for the reception of the rods, substantially as described.

166,786. DIAMOND SAWS FOR CUTTING STONE. Henry Rung, Chicago, Ill., assignor of one-half his right to R. Baumgarten, same place. [Filed Aug 10, 1875.]



The saw-blade A, built up of two strips, and a series of spacer-blocks, B, as described, and the combination therewith of the gibs C and keys D, as and for the purposes set forth.

166,787. JOURNAL-BOXES. J. Schellhoop, Tidioute, Pa. [Filed Sept. 20, 1875.]

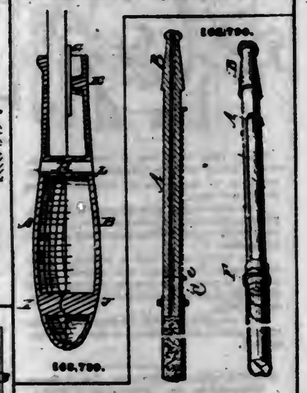
The journal-box A, provided on two diametrically-opposite sides with pivots e, in combination with holders B B, one of which is provided with a depression to receive one of the pivots, and the other with a mortise to receive the other pivot, substantially as and for the purposes specified.

166,788. AERIAL VESSELS. P. S. Schmidt, Hoboken, N. J. [Filed Sept. 2, 1875.]

Brief.—When both propeller-screws are turned in a vertical position by means of a bevel cutting on the swivel-brackets, they serve to raise or depress the aerial vessel. The propeller-screws are set in motion by means of the fly-wheel and the transmitting-pulleys. On the top of the frame-sails is secured a rod with knees, which prevents the sails, when filled with gas, from rising above the frame. There is an anchor with its windlass and rope attached for landing the aerial vessel.

1. The construction of an aerial vessel, as shown in the drawing, Fig. 1, composed of the folding parts, viz.: pool a, frame B, sails C, and frame sail-yards and frame b b' for propelling the aerial vessel by catching the wind, also the wheel or passenger house A, fly wheel d, transmitting-pulleys g h i j n o, propeller-screws D E, swivel-brackets F for raising, lowering, and steering the aerial vessel by turning the fly-wheel, substantially as set forth.

2. The combination of vertical swivel rods and frame b b' with sails C C, as shown in the drawing, Figs. 1, 2, and 4, substantially as described.



3. The combination of propeller-screws D E, which have their bearings in the swivel-brackets F, as shown in the drawing, Figs. 1 and 3, substantially as described.

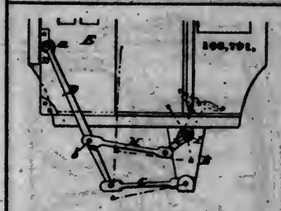
4. The combination of a wheel or passenger house A, of buoyant sails C C forming air-tight chambers filled with gas, as shown in the drawing, Figs. 1 and 2, substantially as described.

166,789. TOOL-HANDLES. John O. Sears, St. Louis, Mo. [Filed Aug. 17, 1875.]

Brief.—A tool can be readily attached to the handle without fitting or the use of fastening, by means of a metal handle formed in two parts, and provided with three bearing-points, of which no two are opposite each other.

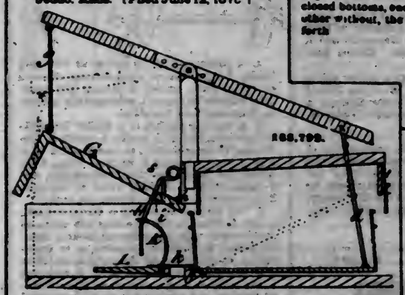
The herein-described tool handle, consisting of the parts A and B, bearings C, D, and E, arranged as described, and the projections I, K, J, and L, constructed as described, substantially as and for the purposes set forth.

166,790. CIGARETTE-MAKERS. Jacob Shepard, Williamsburg, Brooklyn, N. Y. [Filed July 24, 1875.]



Brief.—The slotted tube is moved outward until its end is supported by the plunger, and is filled with tobacco through the slot. The paper wrapper is then wound around the tube, and the elastic band placed around it, when the tube is drawn backward; the device is then ready for being smoked.

In a cigarette maker and smoker, the combination of the plunger and mouth-piece A B, the open metallic tube or former C, and the elastic ring or band F, substantially as herein described.



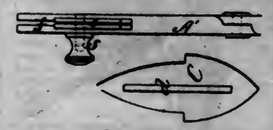
166,791. OPERATIVE STREET-CAR DOORS. David Shield, Cambridge City, Ind., assignor of three-fourths his right to Indiana Car Company, same place. [Filed June 16, 1875.]

1. In combination with a car-door the lever D, lever G, pivoted to a fixed fulcrum, lever E, lever F', and a head or foot lever, substantially as and for the purposes set forth.

2. In combination with car-door, the lever D and lever G, the lever G pivoted to a fixed fulcrum, and the lever D to a moving adjustable fulcrum, and operated by mechanism under the control of the driver or conductor, as may be desired.

166,792. ANIMAL-TRAPS. W. A. Shipley, Jeddo, Kans. [Filed June 12, 1875.]

The vertically-vibrating lid G, having slot a and lip i, in combination with a notched rod, H, rod K, and vibrating detaching-board I, substantially as specified.



166,793. HAMES. Samuel Shultz, Moscow, Ky. [Filed Mar. 25, 1875.]

The combination of the hame A, plate B, with groove a, hook C, frame D, with prongs d, and spring-catch f, substantially as and for the purposes herein set forth.

166,794. BUTTON-HOLE CUTTERS. John A. Sias, Comstock, Mich. [Filed Aug. 26, 1875.]

Brief.—A four-edged, double-pointed, lozenge-shaped cutter is slotted lengthwise, and detachably inserted in a curved enlargement of one lever of a pair of shears, being held in place by a thumb-screw, and so arranged as to be reversible as well as detachable. The other lever of the shears is formed into an extension-bar, through which is cut a longitudinal slot, of such width as to receive the point of the cutter, the lateral edges of this extension being beveled. A grooved spring-slide, having end-wise movement on the extension-bar, adjusts the button-hole cut, and a guard-frame on the upper lever forms a sheath for the cutter.

1. In a button-hole cutter, the reversible and detachable lozenge-shaped cutter C, having slot d, in combination with shear-lever A', having a curved split enlargement, b', and thumb-screw S, substantially as specified.

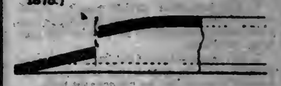
2. The guard e on lever A', in combination with a lozenge-shaped four-edged and double-pointed blade, C, substantially as specified.

166,795. POCKET BLANK-BOOKS. Andrew V. S. Smith, Washington, D. C. [Filed June 8, 1875.]

Brief.—A check-book in the cover of a bank-book, and separated from the latter by a flap.

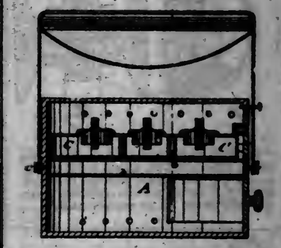
As an article of manufacture, the within-described bank and check book, consisting of the cover B, with flap C, the check-book G, bank-book A, pocket D, and flap E, all substantially as and for the purposes herein set forth.

166,797. CARBURETTERS. William D. Snow, Brooklyn, N. Y. [Filed Oct. 6, 1875.]



In an apparatus for carbureting air or gas, the combination, with the carbureting-vessel A, of the foraminous or wire-gauze basket E, provided with horizontal foraminous partitions for supporting the packing, and narrowed toward the bottom, so as to leave an annular space for the hydrocarbon liquid, the upper part being of such size as to fill or nearly fill the gas-chamber of the vessel A and prevent the collection of explosive gases, substantially as described.

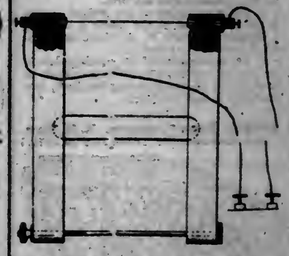
166,798. WAGON-JACKS. R. W. Stanton, Almena, Mich. [Filed Sept. 11, 1875.]



The combination of the slotted standard A, casting B, with hooks b, L-shaped arm C, with pin d, lever D E, and slide h, all constructed substantially as and for the purposes herein set forth.

166,799. VERTICAL BARS FOR GAS-HOLDERS. Jesse W. Starr, Jr., Camden, N. J., assignor to Jesse W. Starr and Jesse W. Starr, Jr., same place. [Filed Sept. 24, 1875.]

As a new article of manufacture, a vertical bar for gas-holders, having its body of trough-section, provided with side flanges, and tapered at one end into a flat head in line therewith, substantially as set forth.



166,800. FLAT-IRONS. Fred Sterning, Austin, Tex. [Filed Sept. 6, 1875.]

The combination of the hollow reversible sad-iron A, having the interior shelf h, with the removable lamp C, having shield D, and burners d, substantially as and for the purposes herein shown and specified.

166,801. APPARATUS FOR CUTTING GLUE. Hezekiah Stevens, Brazoria, Tex. [Filed May 15, 1875.]

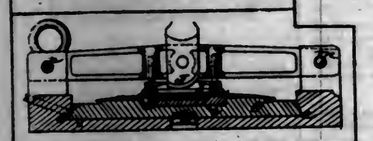
Brief.—A platinum wire, made taut in a frame, is connected at each end with conducting-wires attached to a battery. The glue is fused, then being covered by the wire passing through its mass when electrically heated.

The combination of a glue-cutting frame, having cutting-wires applied across it, conducting-wires, and a galvanic battery, substantially as herein described.

166,802. PROCESSES FOR PREPARING AND DRYING GLUE. Hezekiah Stevens, Brazoria, Tex. [Filed May 15, 1875.]

Brief.—Superheated steam is used as a hygroscopic agent in glue-drying. The glue is exposed in shallow pans or trays within a closed vessel, to which the superheated steam is admitted from the generator. A pipe at the top of the chamber draws off the steam previous to its point of saturation, and utilizes its heat in preparing another charge of glue contained in a suitable vessel.

168,896.



1. The process of drying glue by enveloping it in superheated steam introduced into a chamber, substantially as and for the purpose described.

2. The combination of the superheating apparatus and the glue-drying chamber, substantially as and for the purpose set forth.

168,897. STEAM-ENGINE. Geo. B. Stevenson, Upper Sandusky, Ohio. [Filed Aug. 21, 1875.]

The cross-head J, having the sockets s, the covers sides g with the chamb s, and the set-screws s, in combination with the horizontal cylinder C, having concave slideways h, substantially as and for the purpose set forth.

168,898. MACHINE FOR RECORDING THE UPTIME OF BOOTH AND SHOES. Edwin B. Stimpson, New York, N. Y. (Filed Aug. 2, 1875.)

1. The combination of the male roller-die B with the female reciprocating flat or bed die C, substantially as shown and described, and for the purpose herein set forth.

2. The combination of the toothed sectors E and F, the shaft D, the pinion f, the rack h, the male roller-die B, and the female bed-die C, essentially as specified.

3. The combination of the pressing-plate I, the cam J, and the adjustable cross beam or lever K with the reciprocating bed-die C, substantially as herein set forth.

168,899. BRICK PAVEMENTS. H. H. Stow, San Francisco, Cal. [Filed July 20, 1875.]

1. A pavement composed of hard-burned bricks placed on an earth foundation, with intervening spaces, cells, or recesses for the top dressing to find lodgment, and thereby firmly unite with the latter substructure, and so prevent rising of, as described and represented.

2. In a pavement having a hard-brick foundation laid with intervening spaces, cells, or recesses a concrete top dressing, composed of coal-tar pitch, dried oil or coal-tar, unslaked lime, sulphur, and broken stone, gravel, or sand, prepared and applied substantially as herein described and represented.

168,900. TRAP-TIGHTENERS. William R. Swarthout, Penn Yan, N. Y. [Filed Sept. 22, 1875.]

The prop A, clasp B, and wedge C, made substantially as specified and combined, for the purposes set forth.

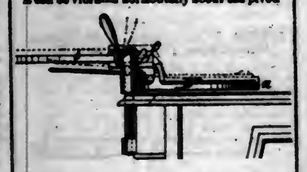
168,901. PRESSURE-REGULATORS. John Taylor, Lockport, N. Y., assignor of two-thirds his right to Lewis Harmony and J. S. Woodward, same place. [Filed Apr. 20, 1875.]

Brief.—Fluid flows through a hollow valve-seat, and exerts pressure on the upper side of a diaphragm. The valve passes through a stuffing-box, and may be adjusted to any desired pressure.

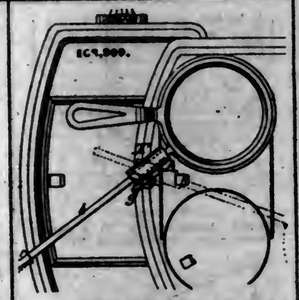
In a pressure regulator, the combination of the diaphragm B cylindrical valve-seat C, and vertically-adjustable valve C, whereby the passage d leading to the main is closed by pressure exerted on the top of the diaphragm, substantially as and for the purposes specified.

168,902.

168,903. VALVES. George T. Taylor, Boston, Mass. [Filed July 6, 1875.]



Brief.—Valves are so seated in recessed cages that air entering the disjointed coupling must make two returns to enter the pipe, and in the first it encounters the valve, and by its own pressure closes it.

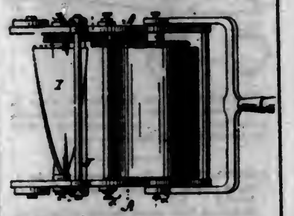


In a vacuum air-brake for railway-cars, the pipes A A', couings B B, valves H H, and rods F F, constructed and arranged to operate substantially as set forth and specified.

168,904. ATTACHMENTS FOR COOKING-STOVES. Theodore R. Timby, Tarrytown, N. Y. (Filed Sept. 18, 1875.)

Brief.—The device can be elevated by means of the lifter. It can be moved horizontally by sliding the handle through the orifice, and it can be vibrated horizontally about the pivot.

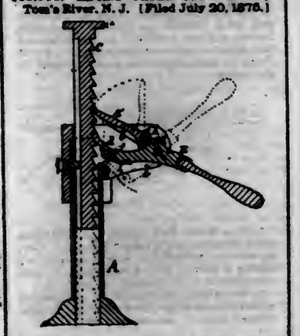
168,905. STEAM-COOKERS. Andrew Turnbull and Francis N. Frost, New Britain, assignors to Franklin Roys, East Berlin, Conn. [Filed Jan. 9, 1874.]



1. A swinging cooking utensil or swinging holder for griddles or other articles of stove or range ware, having a pivotal and vertically-adjustable support, substantially as herein illustrated and described.

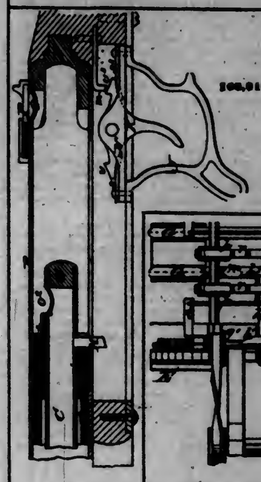
2. A cooking utensil, or a holder for cooking utensils, having a handle, h, which is non-circular in cross-section, in combination with a support, T, having a vertical pivot, d, on which the handle can turn horizontally, and a guide-orifice, f, through which it can slide back and forth, for the purpose set forth.

3. The support T, having a movable head, e, and b lifter, c, for elevating the same, in combination with the holder or cooking utensil having a handle, h, non-circular in cross-section, as described, for the purpose specified.



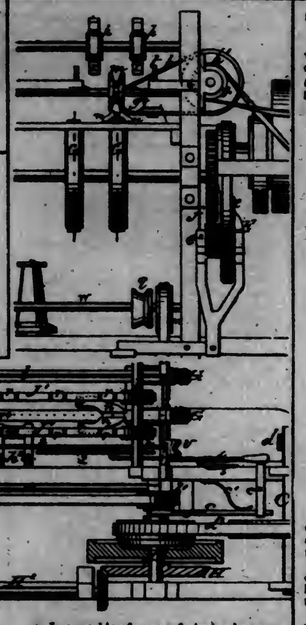
4. The combination of a pivot, d, attached to the stove or range, a rotary hand, e, mounted thereon, and constructed with a horizontal guide-orifice, f, an interposed lifter, g, engaging with the stationary pivot, and a handle, h, which is non-circular in cross-section, substantially as shown in Figs. 1 and 2, for the purpose specified.

168,906. LAWN-MOWERS. Andrew Turnbull and Francis N. Frost, New Britain, assignors to Franklin Roys, East Berlin, Conn. [Filed Jan. 9, 1874.]



The combination, in a lawn-mower, of the cutter-shaft I and frame A, with the loose collar i, substantially as and for the purposes set forth.

168,907. LIFTING-JACKS. Jacob L. Vail, Tom's River, N. J. [Filed July 20, 1875.]



1. The steps g g', attached to the lever-rest E, in combination with the lever E, having the pawls d d', said steps being located on opposite sides of the fulcrums e, substantially as described.

2. In a tilting-jack having the stand A, adjustable rest C, and pawl-lever E, the cam b, having oblique slots b', open at one end, to allow the pivot e to be slid in and out, as shown and described.

168,912.

1. In a machine for manufacturing brooms, the combination of the endless belt F, having the U-shaped holders r, and the holding spring-rods t, supported at their ends only, and situated below and laterally of the belt, substantially as described.

2. The carriers G for the covers, in combination with the hollowed anvil-bed A, armed with spotting-knives b', said belt operating at a right angle with the carriers, for the purpose of spotting or beveling the broom-corn stock while the covers are being carried to the operator.

3. The combination of a grooved presser-roller, a, with the spurred and belt G which carry the covers, for the purpose of pressing the heads of the covers down upon the spurs, substantially as described.

4. In combination with spurred carriers for the covers of the brooms, and with spotting-knives b', stripping device s s, which will partially or completely free the trimmed or spotted heads from the spurs of said carriers, substantially as described.

5. In a machine for making brooms, a laterally-movable pulley-guide, s, for the wrapping-wire pulley w p, and the friction-straps S, in combination with a treadle and a bobbin, substantially as described.

168,913. TOY SPRING-GUNS. P. B. Voorhees, Washington, D. C. [Filed July 21, 1875.]

Brief.—The projectile inserted in the inner barrel is expelled by means of the annular spring situated between the two barrels, which spring is recessed by the sliding trigger and guard, and released by the same trigger.

1. The combination of the outer and inner barrels B C, provided, respectively, with the orifices O O', with an interposed annular spring, all constructed and arranged to operate substantially as described, for the purpose set forth.

2. The vibrating trigger K, provided with the end catches V V', in the manner substantially as described, for the purposes set forth.

3. The combination of the guard J with the sliding block N, provided with springs s s', one or both, the trigger K, provided with catches v v', and the pins or stops H and m, all in the manner substantially as described, for the purposes set forth.

168,914. BROOM-WINDING MACHINES. A. Walrath and E. D. Bronson, Amsterdam, N. Y. (Filed May 26, 1875.)

Brief.—Endless bands are arranged for carrying the broom-corn material to the "winder." The carrying-bands can be thrown in and out of gear at the will of the winder, so that the material can be fed fast or slow, as desired.

168,914.

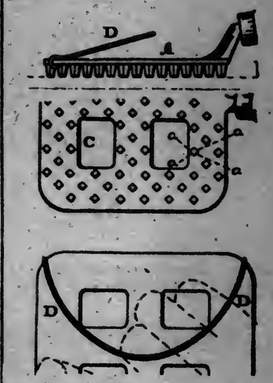
1. In a machine for manufacturing brooms, the combination of the endless belt F, having the U-shaped holders r, and the holding spring-rods t, supported at their ends only, and situated below and laterally of the belt, substantially as described.

2. The carriers G for the covers, in combination with the hollowed anvil-bed A, armed with spotting-knives b', said belt operating at a right angle with the carriers, for the purpose of spotting or beveling the broom-corn stock while the covers are being carried to the operator.

3. The combination of a grooved presser-roller, a, with the spurred and belt G which carry the covers, for the purpose of pressing the heads of the covers down upon the spurs, substantially as described.

4. In combination with spurred carriers for the covers of the brooms, and with spotting-knives b', stripping device s s, which will partially or completely free the trimmed or spotted heads from the spurs of said carriers, substantially as described.

5. In a machine for making brooms, a laterally-movable pulley-guide, s, for the wrapping-wire pulley w p, and the friction-straps S, in combination with a treadle and a bobbin, substantially as described.



168,915. BROOM-WINDING MACHINES. Josiah J. Weisel, Allegheny Township, Westmoreland County, Pa., assignor of one-half his right to Hiram H. Wray. [Filed July 12, 1875.]

1. The combination, with drill-frame A, of sliding plate B' on cross-bar b', lever C, having pawls, and plate D, having teeth d, all arranged as and for the purpose described.

2. The combination of drill-frame A, the frame G, held in a slot thereof between nut and plate g, and the adjustable brace I, as and for the purpose specified.

168,916. CURRY-COMBS. Robt. F. Walsh, Philadelphia, Pa. [Filed May 14, 1875.]

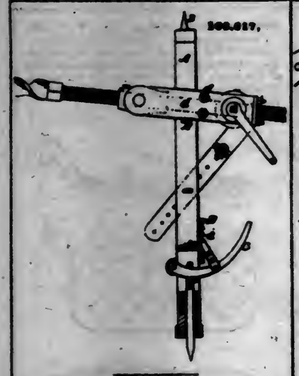
Brief.—The teeth are bent, with angle sides, which sides are diagonal to the sides and ends of the comb. A boldback on the tar end is grasped by the fingers, while the thumb engages under the tang.

1. The curry-comb provided with teeth, each tooth having a series of scraping-faces, a a, substantially as and for the purpose set forth.

2. The teeth C, having their scraping-faces extend diagonally to the transverse and longitudinal directions of the comb, substantially as and for the purpose set forth.

3. The combination, with the curry-comb, of a boldback, consisting of the loop D attached to the front end thereof, substantially as and for the purpose set forth.

168,917. STOVE-PLATFORMS. S. L. Watson, Chicago, Ill. [Filed Aug. 28, 1875.]



The combination of the metallic shell formed of sheet metal by spinning into shape, in combination with the filling of non-conducting cement and the cross-pieces at the bottom, provided with dovetailed or other shaped projections extending into the shell for the purpose of holding the cement in place, substantially as described.

168,917. MINING-MACHINES. Josiah J. Weisel, Allegheny Township, Westmoreland County, Pa., assignor of one-half his right to Hiram H. Wray. [Filed July 12, 1875.]

1. The combination, with drill-frame A, of sliding plate B' on cross-bar b', lever C, having pawls, and plate D, having teeth d, all arranged as and for the purpose described.

2. The combination of drill-frame A, the frame G, held in a slot thereof between nut and plate g, and the adjustable brace I, as and for the purpose specified.

168,819.

168,819. Shoemakers' Knives. Albert O. Webster, Hammonton, N. J. [Filed Aug. 24, 1875.]

The combination of the slotted handle A, curved blade B, and blade-adjusting screws *c d*, substantially as and for the purpose described.

168,819.

168,820. Toys. Jos. J. White, New Lisbon, N. J., assignor to C. M. Crandall & Co., Montrose, Pa. [Filed Sept. 28, 1875.]

1. As a new article of manufacture, a toy figure of a horse or other animal, having the neck and legs jointed and held in any position by bolts or rivets, with the aid of friction, and provided with holes for receiving other figures (as a jockey) thereon, substantially as shown and described.

2. As a new article of manufacture, a jockey toy figure, constructed with pegs on his boots, arms, and cap, substantially as and for the purpose described.

3. The combination of a jockey toy figure, having pegs on his boots, arms, and cap, with a jointed horse-figure having holes in the back of the same to receive said pegs, substantially in the manner described.

4. In combination with the toy figure of a jointed horse and jockey, a base provided with a series of openings for the reception of the feet of a jointed horse or other animal and jockey, substantially as and for the purpose described.

168,899.

168,899. Violins. Hiram W. White, Anderson, Ind. [Filed Mar. 23, 1875.]

1. The bass-bar B, constructed with a back or lower edge straight, or nearly so, and an upper edge conforming to the curvature of the front plane of the violin, as herein shown and described.

2. The bass-bar B, constructed with a back straight, or nearly so, in combination with the central lateral extensions *d d*, as and for the purpose set forth.

168,921.

168,921. Portable Fire-Places. Ellen White, Joliet, Ill. [Filed Apr. 22, 1875.]

The combination, in a fire-place heater, of the back plate G and rear dust-flue C, opening into the room beneath the ash-pan, and the plate I, of one piece of metal bent forward at an angle to the top front of the fire-place, forming a contracted throat, *a*, and thence bent rearward at an angle, forming a gradually-widening flue, *b*, and extended through the top of the fire-place, substantially as herein set forth.

REISSUES.

6,668. Packing for Steam and other Engines. Joseph C. Manning, trustee, Baltimore, Md., assignee, by mesne assignments, of Wm. Peters, deceased. Patent No. 94,262, dated Jan. 21, 1862. [Filed June 8, 1875.]

1. Asbestus combined with vegetable or animal fibre or other material, as and for the purposes above set forth.

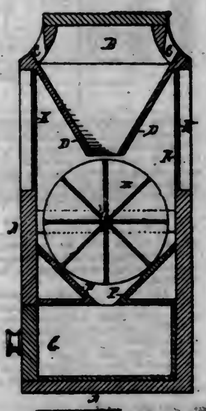
2. Asbestus applied and used around steam, water, and other joints, where it is useful to resist high degrees of heat, pressure, and other destructive agents, as above set forth.

3. Asbestus packing compressed into the required form and dimensions, as and for the purposes above described.

6,669. Farm-Rollers. Horace Tupper, Bay City, Mich., assignor, by mesne assignments, to J. B. Sherman, New York city. Patent No. 31,705, dated Mar. 19, 1861. [Filed Aug. 12, 1875.]

Brief.—The farm falls down the incline into the rotary arrest, where it is inspected, and then deposited in the money-drawer by the driver turning the arrest.

1. A fare-box provided with an opening, C, through which to deposit the fare in the box, with an inclined guide, D, and with an opening, E, for its inspection, in combination with a rotating receiver, constructed and arranged to turn in a vertical plane, so as to present a series of arrests for the separate and temporary detention of the different fares for inspection, substantially as set forth.

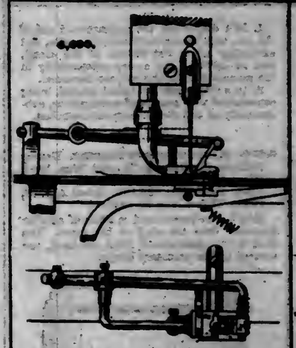


2. A fare-box provided with a rotating arrest turning in a vertical plane, and with an opening, C, and inclined guide, D, substantially as set forth.

3. A fare-box, provided with a rotating arrest turning in a vertical plane, and with inclined slide-guards F F, and a locked money-drawer, G, substantially as and for the purpose set forth.

4. The combination, in a fare-box, of the inclined slides D and F with an arrest, E, rotating in a vertical plane, substantially as set forth.

5. A rotating arrest, E, for a fare-box, provided with glass partitions *e*, substantially as and for the purpose set forth.



6. A fare-box provided with an opening, C, box or receptacle L, and door J, the whole arranged in the manner and for the purposes set forth.

6,668. Gathering Attachments for Sewing-Machines. Alfd. Everiss, New York, N. Y. Patent No. 99,970, dated Aug. 24, 1869. [Filed Sept. 28, 1875.]

Brief.—To the rear of the presser-foot projects a right-angular heel rod, having upon its rear end a sleeve, which is free to oscillate thereon. Through this sleeve passes a lever, having an adjustable fulcrum centered to its rear end, with its other or free end extending some distance in front of the needle, where it is bent at right angles to its main body, and supports the ruffling-blade, which is held by means of a spring in contact with an inclined surface formed on the top of the presser-foot, over which surface passes the material to be ruffled, the whole device being so arranged that, as the presser-foot is raised and lowered by the action of the feeding mechanism, the free end of the lever, which carries the ruffling-blade, is caused to rise and fall in a similar manner, which motion actuates the edge of the ruffling-blade to travel up and down the inclined surface on the presser-foot, and thereby form the ruffles or plaits. A spring secured upon the top of the presser-foot, and resting against the under side of the said lever, serves to raise the same when the presser is lifted by the foot.

6,666.

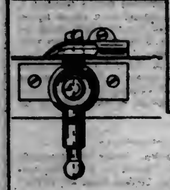
1. The combination, with a presser-foot, of a movable ruffle-forming blade, connected to and adapted to rise and fall with the presser-foot.

2. The combination, with a presser-foot, of a movable ruffle-forming blade, adapted to bear against the presser and form folds or gathers in a strip resting between the blade and presser.

3. The combination of the presser with a movable ruffle-forming blade and guide, connected and adapted to rise and fall with the presser, the guide guiding the edge of the strip being ruffled, and acted on by the moving blade, and resting between its edge and the presser.

4. A presser-foot and movable ruffle-forming blade carried by it, in combination with a cloth-support and feed adapted to sustain a fabric to which a ruffled strip is to be secured, fed to and fixed the material with its connected ruffle, substantially as described.

5. A gathering attachment, substantially as described, combined with and operated through the movement of the presser, as and for the purpose set forth.

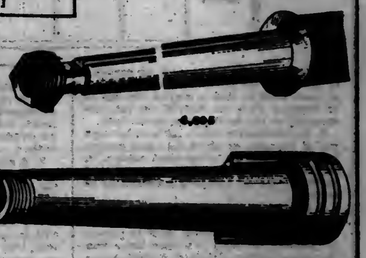


6. The combination, with a projection carried by the presser-foot, of a lever pivoted thereto, and with a movable blade carried by the lever, and adapted to operate against the presser.

6,666. Sash-Locks. George McGregor and George Voll, Cincinnati, Ohio, assignors, by mesne assignments, to the Hopkins & Dickinson Manufacturing Company, New York city. Patent No. 66,316, dated Mar. 30, 1869; reissue No. 5,202, dated Jan. 31, 1873. [Filed Aug. 10, 1875.]

A vibrating lever, provided with a bolt, in combination with a striking plate or hook and with a catch-segment, behind which the bolt can pass, formed upon the plate upon which the lever is pivoted, the whole constituting a catch-fastener, and the parts connected in the chain being and operating substantially as specified.

6,666.

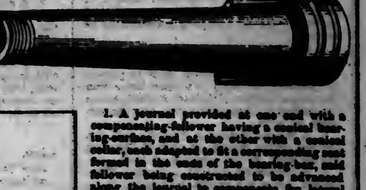


6,666. Carriage-Axles. Alfred E. Smith, Bronxville, N. Y. Patent No. 68,490, dated Dec. 22, 1859; reissue No. 3,091, dated May 24, 1870. [Filed July 9, 1875.]

1. The combination, with the conical follower, of the axle-spindle and the chain or box, the several parts being so united as to form a recess, *c*, between them, substantially as described.

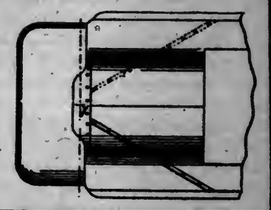
2. The axle-spindle, with or without the groove *d*, having the threaded nib *e*, conical follower B, recess *c*, and nut G, substantially as described.

Brief.—The axle carries upon the screw-threaded end a conical compensating-follower and a D-shaped washer or nut, and upon the other end of the bearing-surface E has a similar conical bearing formed thereon.



6,666.

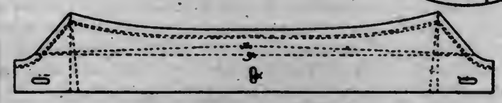
1. A journal provided at one end with a compensating-follower having a conical bearing-surface, and at the other with a conical collar, both adapted to fit a corresponding conical bearing in the ends of the bearing-box, said follower being constructed to be advanced along the journal to compensate for lateral wear, substantially as described.



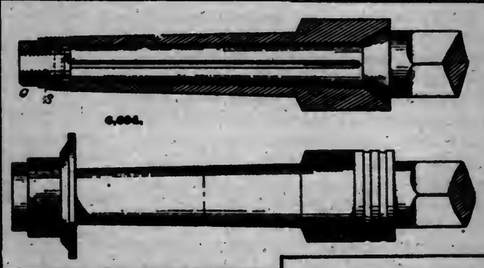
2. A journal having a compensating-follower provided with a conical bearing-surface and an internal polygonal bore, in combination with a screw-threaded nut abutting against said follower, and serving to adjust the latter upon the plygonal-shaped end on the journal, substantially as described.

6,666.

6,666. Gimlet-Cases. John Stephenson, New York, N. Y. Patent No. 61,482, dated Jan. 22, 1867. [Filed July 23, 1875.]



6,691.



6,691. Paper Collars. Sidney S. Gray, Boston, Mass., assignor, by mesne assignments, to the Union Paper-Collar Company, New York city. Patent No. 32,091, dated June 23, 1859; reissue No. 1,040, dated Mar. 29, 1864. [Filed Sept. 2, 1875.]

The mode described of first making a curved indentation in the collar and then folding the same on the indented curve, as set forth.

6,692.

6,692. Sponge Brushes. Hugh S. Kay, Philadelphia, Pa. Patent No. 125,909, dated May 7, 1872. [Filed Sept. 9, 1875.]

Brief.—A head of sponge held by a loop of wire, the ends of the wire twisted to form a shank or tang.

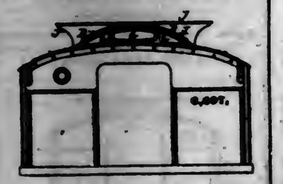
The brush consisting of the head A, of sponge, in combination with a loop, B, of wire, encircling the head, and continued into a twisted shank, C, substantially as and for the purpose set forth.

6,694.

6,694. Carriage-Axles. Alfred E. Smith, Bronxville, N. Y. Patent No. 68,490, dated Dec. 22, 1859; reissue No. 3,091, dated May 24, 1870. [Filed July 9, 1875.]

1. A strut-car in which the body and roof are made of the same, or, for all practical purposes, of nearly the same, length, substantially as and for the purposes set forth.

2. An independent canopy, D, for covering or protecting the platforms of cars, it being so constructed as that it may be attached to or detached from the body of the car, substantially as and for the purposes set forth.



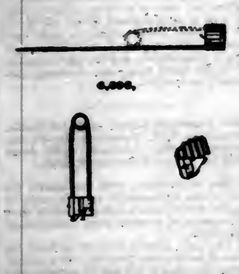
3. In combination with a car-body having a roof of the same, or about the same, general length as itself, an independent canopy, D, capable of being attached thereto or detached therefrom, for the purposes substantially as set forth.

4. In combination with a car-body having a roof of about the same general length as itself, a canopy or bonnet to cover or protect the platforms, arranged in a plane lower than the central portion of the roof A which covers the car-body, substantially as and for the purposes set forth.

5. A frontlet or canopy, F, at the end of a car-roof, whose general length is the same as the car-body, for the purposes set forth.

6. A detachable frontlet or canopy, F, arranged above the vestibule-opening G, in combination with the roof of a street-car whose general length is the same as the car-body, for the purposes set forth.

6,697. STREET-CARS. John Stephenson, New York, N. Y. Patent No. 61,452, dated Jan. 22, 1867. [Filed July 28, 1875.]



1. A street-car constructed with an arched roof at or near its central part D, and with correspondingly-shaped ends to admit of openings G being formed in the latter, in the manner substantially as and for the purposes set forth.

2. A street-car provided with a frontlet, I, and a canopy, F, arranged in a plane below the general plane of the roof, and with an opening or openings, G, between the two, substantially as set forth.

3. The combination of a car body, provided with an opening or openings, G, in its end or ends, with an elevated dome, J, provided with an opening or openings, a, substantially as set forth.

6,698. DIAPER-PINS. Isaac W. Stewart, New York, N. Y. Patent No. 106,422, dated Aug. 16, 1870. [Filed Aug. 20, 1875.]

1. In a diaper-pin, the sharpened end of the pin, bent at or nearly at right angles, and extending across the bottom of the shield, and re-entering the same, substantially in the manner and for the purpose described.

2. In a diaper-pin, the shield thereof, being constructed with a series of corrugations, substantially as and for the purposes described.

6,699. MANUFACTURE OF BARRELS. Dewey Phillips, Shelbyburg, Va., and Wm. Reid, West Hebron, N. Y., assignors to Wm. Reid. Patent No. 62,850, dated Apr. 16, 1867. [Filed June 10, 1875.]

Brief.—The barrel-head is made of smaller diameter than the shell at the crown. The shell is then compressed upon the head, and secured by the necessary hoops.

The method herein described of putting the heads or bottoms in casks, or other vessels, by making the heads or bottoms of less diameter than the inner diameter of the shell or cylindrical part in the crown, and then compressing the ends of the shells in close contact therewith, and putting on the necessary hoops, substantially as described.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 16. TUESDAY, OCTOBER 19, 1875. PRICE { $6.00 per year—single. $5.00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

NOTICE TO MANUFACTURERS AND OTHERS.

UNITED STATES PATENT OFFICE,
Washington, D. C., October 5, 1875.

The COMMISSIONER OF PATENTS respectfully requests manufacturers of and dealers in engines, machines, apparatus, tools, and appliances of whatever kind, to send to this Office duplicate copies of all catalogues and circulars which they have issued or may issue from time to time.

R. H. DUELL, *Commissioner.*

COMMISSIONER'S DECISIONS.

CHARLES L. YOUNG.—*Interlocutory appeal.*

[*Appeal from the Principal Examiner in the matter of the application of Charles L. Young for letters patent for* "IMPROVEMENT IN AXES."—*Decided October* 18, 1875.]

The Board of Examiners-in-Chief is the judge of the sufficiency of the "reasons of appeal."

The Primary Examiner may traverse or controvert, but cannot ignore them.

The "reasons of appeal" must form the basis of subsequent arguments submitted to the board, which will determine as well upon the pertinence as upon the validity of the arguments submitted.

SPEAR, *Acting Commissioner:*

This appeal is taken from the refusal of the Examiner to send forward an application twice rejected and appealed to the Board of Examiners-in-Chief, the refusal being on account of alleged insufficiency of the reasons of appeal.

Rule 42 requires that a party taking an appeal to the Examiners-in-Chief, shall, with the petition, file a statement of the reasons upon which the appeal is taken, which statement shall point out distinctly and specifically the supposed errors of the Examiner's action. This statement shall constitute a brief of the argument upon which the applicant will rely in support of his appeal. The rule further prescribes that, before the appeal is entertained by the Board, this statement shall be submitted to the Primary Examiner, who will make answer in writing touching all the points involved therein.

Nothing more than this is required of the Examiner, and his duties end with this answer. If no adequate reasons are given, or such reasons as, in his judgment, require no answer, nothing more is demanded of him than to point this out and send forward the case to the tribunal to which appeal is taken.

It remains for the Board to decide whether the reasons urged before them at the hearing are the same as those contained in the brief and submitted to the Examiner; and the spirit of the rule would seem to require that, if new reasons are brought before the Board as grounds for reversing the Examiner's action, which reasons were not submitted to the Examiner, and upon which he had not been heard, these reasons, reduced to writing, should be sent to the Examiner for his answer thereto.

The reason of the rule which requires this brief is obvious. The Board of Examiners-in-Chief, not being experts in the particular art, as the Examiner is, need to be informed by him upon many points, which may be urged upon appeal; and if these points which are urged in an appeal are first submitted to the Examiner, the Board may then have the benefit of such answer as he may be able to give. But to give the Examiner the authority to judge of the sufficiency of the reasons of an appeal from his own decision, or to allow him to dictate what sort of a brief the appellant shall make up for presentation to the Board, might, on the one hand, involve great hardship to the appellant; and on the other hand, in case he should appeal from that officer's refusal to act to the Commissioner in person, under rule 44, unnecessarily increase the labor of the Office, by compelling the Commissioner to examine a case in which he could decide nothing. The Examiners-in-Chief must be the judge of the sufficiency of the reasons presented to them on appeal, on which they are

asked to reverse the decision of the Examiner; and, plainly, they are the only proper tribunal to determine whether or not appellant confine his argument to his brief, and urge no reasons not previously submitted to the Examiner. Undoubtedly they will not be imposed upon to the extent of permitting one case to be presented in the brief and answered by the Examiner, and quite another submitted in arguments to influence their judgments in the decision of the case. But of the conduct of cases before them, the Board and not the Examiner must be the guardians.

I therefore direct that the Examiner send this case, the fee having been paid, and other formalities properly complied with, directly to the Board, with such answer to the reasons filed as he may deem proper. If the Board think the reasons insufficient, it is competent for them to remand the case to the Examiner and require more explicit statements of the grounds urged for the reversal of the Examiner's decision, and the answer thereto by the Examiner.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF NEW YORK.

GEORGE H. WOOSTER *vs.* EDMUND W. TAYLOR, JR., AND MARGARET WOODBURY.

[*In equity.—Before* BLATCHFORD, *J.—December*, 1874.]

W., the assignee of the extended term of the patent, entered into an agreement in writing, under seal, with T. & W., which recited that T. & W. were "desirous of obtaining a license to use the improvement secured by said letters patent, to the extent of the use of binders necessary to their business," and which granted to them for a nominal sum, as a "personal privilege," and "for and in consideration of, and in case of, the due and faithful keeping and performing of each and all of the conditions," &c., the license "to use the said improvement, to the said extent, for and during the space of one year," at their specified place of business, "and not longer, otherwise or elsewhere, without written permission of" W.; said agreement further providing that W. might revoke the license on the failure of T. & W. to perform any of the conditions therein contained, "in which case this license and all rights and privileges hereunder shall forever cease and determine."

After the expiration of the one year, T. & W. continued to use nineteen of the patented machines, claiming that they had them lawfully in use at the end of the first term of the patent, and that by virtue of section 67 of the act of July 8, 1870, they had a right to continue the use of them so long as they remained capable of use. On application for injunction to restrain such use, *Held*, that, whatever rights, in respect to the further use of the patented machines the defendants had when they took the license, they waived and surrendered by taking the license containing the conditions it did; and that, although the term of the license had expired, the defendants were bound and estopped by the recitals and covenants in it.

[*W. D. Shipman* and *F. H. Betts*, for complainant.
L. E. Chittenden, for defendants.]

BLATCHFORD, *J.*:

The plaintiff is the owner of reissued letters patent granted to him December 10, 1872, for an "Improvement in Folding-Guides for Sewing-Machines." The original patent was granted to Alexander Douglas, as inventor, October 5, 1858, and was extended to him for seven years from October 5, 1872. The patent, as extended, was assigned to the plaintiff, and the reissue was granted to him as assignee. The plaintiff now applies for a preliminary injunction to restrain the defendants from using folding-guides or binders for sewing-machines in violation of the patent.

The defendants have nineteen of such guides which embody the invention covered by the patent. They claim the right to continue their use, on the alleged ground that the nineteen guides were lawfully in use when the first term of the patent expired. The lawful use set up is an alleged verbal permission or license given by Douglas, the inventor, during the first term, in pursuance of which it is claimed the nineteen guides were made and put into use. The giving of the permission is denied, and it is further claimed on the part of the plaintiff that, at the time when the permission is alleged to have been first given, and during all the time thereafter until the expiration of the first term, the title to the patent for the first term had passed out of Douglas and was held by one Wheeler, so as to make such permission invalid for want of power in Douglas to grant it. But, in the view I take of the case, it is not necessary to consider any questions arising out of the foregoing matters, for the reason that another aspect of the case is controlling against the defendants.

The right to use set up by the defendants is claimed, as matter of law, under the provision of section 67 of the act of July 8, 1870, (16 U. S. Stat. at Large, 209,) which declares that "the benefit of the extension of a patent shall extend to the assignees and grantees of the right to use the thing patented to the extent of their interest therein." The alleged facts set up as constituting a lawful use of the nineteen guides at the time the first term of the patent expired, were known to the defendants at the time such first term expired. After the extension had been granted, and after the patent, as extended, had been assigned to the plaintiff, an agreement in writing, under seal, was entered into between the plaintiff and the defendants. This instrument, which is dated October 5, 1872, after reciting the granting of the patent and its extension, and its assignment to the plaintiff, sets forth that the defendants "are desirous of obtaining a license to use the improvement secured by said letters patent to the extent of the use of binders necessary to their business," and that the plaintiff, "for and in consideration, and in case of, the due and faithful keeping and performing of each and all of the conditions, agreements, and admissions hereinafter contained to be kept and performed by the" defendants, has granted to the defendants the license "to use the said improvement to said extent, for and during the space of one year from the date hereof, at their place of business, No. 55 Hudson street, in the city of New York, and not longer, otherwise or elsewhere, without written permission of" the plaintiff. The instrument then proceeds to say that the defendants agree to pay to the plaintiff, as a patent fee, the sum of $100, and agree to stamp on each folding-guide used the words—

Patented October 5, 1858; extended September 24, 1872; licensed to Taylor & Woodbury only.

There are agreements by the defendants not to contest the validity of the patent, and not to refuse to pay the license fee, although other parties contest the patent, and then the instrument provides that, on the failure of the defendants to perform any of said conditions and promises, the plaintiff may revoke and annul the license, "in which case this license and all rights and privileges hereunder shall forever cease and determine." The instrument further provides that the license is "to be considered solely as a personal privilege" to the defendants, "and no folding-guide licensed hereunder is to be considered as lawfully made, so as to vest any property for sale of the same in the user, or so as to permit the said guide to be transferred, so as to vest in the purchaser or user other than" the defendants "any right to use the same."

It is contended for the defendants that the taking of this license to use an unlimited number of guides for one year was no waiver of any right which they had, because the license was taken under a mistake of law, they not having at that time been advised that they could set up, in law, the right to use which they now set up, and because the license covered more guides than the nineteen then in use; and that, when the license expired, the defendants were remitted to all rights which they had at the time the license was taken.

These views, it seems to me, are not sound. On the contrary, whatever rights the defendants had when they took the license, in respect of the further use of the guides, they waived and surrendered by taking the license containing the provisions it does contain. The defendants expressly show that they have never used any guides but the identical nineteen. The license sets forth that they are desirous of *obtaining* a license to use the invention patented, to the extent of the use necessary to their business, which includes the further use of the nineteen guides. This is inconsistent with their then *having* a right to use the nineteen without the new license. The license is not limited to guides in excess of the nineteen. Then the license is to use the guides to the necessary extent (and which necessity is shown to have extended to the use of no greater number than the nineteen) for one year "and not longer" or otherwise, without written permission of the plaintiff, and the keeping of the agreements made by the defendants is declared to be the consideration and condition of the granting of the license by the plaintiff. Then each one of the guides used (which includes the nineteen) is to be stamped as "licensed," and the form of stamp given means a license under the extension and a license under such written license. The further provisions of the license, as before recited, confirm this view. No mistake of fact is alleged nor any fraud on the part of the plaintiff. Mistake of law furnishes no ground for escaping the force of the covenants in the license. Although the term of the license has expired, the recitals and covenants in it bind and estop the defendants. One of those covenants is that, in consideration of the license for one year, the guides are to be used for no longer than one year.

It appears by an indorsement on the license, and it is shown to be the fact, that the license was granted for the sum of $100 as a nominal sum, at the special request of Douglas, and that such sum was not to be considered as a sum to govern the price of any other license. The defendants not having set up, when the license was granted, any existing right to use the nineteen guides, and the plaintiff having licensed such nineteen guides for a nominal sum for a special reason, it would be inequitable to allow the defendants to evade the force of the terms of the license, for the plaintiff has allowed them to enjoy for one year, without molestation and for a nominal sum, the use of the nineteen guides when it is manifest that he would not have allowed such use under the claim now set up, without resistance.

The motion for an injunction must be granted.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date October 19, 1875.]

8,718.—Cooking-Stove.—JAMES BROWNBACK, THOMAS J. MARCH, JAMES ROGERS, and MICHAEL TOWERS, JR., Limerick Station, Pa. Application filed October 2, 1875. Term of patent 7 years.

8,719.—Candlesticks.—WILLIAM H. ROBY, East Cambridge, Mass. Application filed September 30, 1875. Term of patent 3½ years.

8,720.—Statuary.—JOHN ROGERS, New York, N. Y. Application filed September 22, 1875. Term of patent 14 years.

8,721 to 8,739, inclusive.—Embroidery-Patterns.—WILLIAM STEINHAUS, New York, N. Y., assignor of one-half his right to OTTO FRICKENHAUS, same place. Applications filed September 20, 1875. Term of patents 3½ years.

8,740.—Calendar.—JAMES E. BLYTHE, St. Louis, Mo. Application filed May 26, 1875. Term of patent 7 years.

8,741.—Book or Secretary Cases.—HUGH S. KERR, Philadelphia, Pa. Application filed October 2, 1875. Term of patent 7 years.

8,742.—Clock-Case.—HERMANN J. MULLER, New York, N. Y. Application filed September 25, 1875. Term of patent 14 years.

8,743 and 8,744.—Hobby-Horse.—ADOLPH SHOENINGER, Chicago, Ill. Applications filed September 16, 1875. Term of patents 3½ years.

8,745.—Knitted Skirts.—SAMUEL WALLIS, Newton, Mass. Application filed September 4, 1875. Term of patent 7 years.

8,746.—Toy Money-Box.—JOHN MURRAY and JOHN A. C. J. SMITH, Philadelphia, Pa. Application filed September 30, 1875. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date October 19, 1875.]

3,040.—Lager Beer, White Beer, Ale and Porter.—JOHN E. KUHELY, New York, N. Y. Application filed September 18, 1875.

"letters and the word 'U. S. CENTENNIAL.'"

3,041.—Medicine for Rheumatism.—WILLIAM WELLS BROWN, Boston, Mass. Application filed May 10, 1875.

"An Indian as the center figure. On the right of the Indian are figures of two men and one woman—one man on crutches, and the other man and the woman with canes—all represented to be lame. To the first of these the Indian is handing a package on which is printed the word 'Komoko.' At the left of the Indian are all three of the figures first represented, passing on in a well condition. In the space above the figures is the word 'Komoko,' in large letters, while in the foreground lie heaped together the crutches and canes of the figures as first represented."

3,042.—Silvered Glass.—DOMINIQUE DURAND, New York, N. Y. Application filed September 6, 1875.

"a seven-pointed star, in the center of which are two letters, 'D. D.,' (the initials of my name,) one of the letters being inverted, and in the belt or ring between those letters and the points of the star the words 'Trade-Mark,' and in each of the spaces between the points of the star a small five-pointed star."

3,043.—Tobacco and Cigars.—M. FALK, New York, N. Y. Application filed August 11, 1875.

"the words 'Centennial seal,' and the double seal."

3,044.—Leather Preservative and Water-Proof Polish.—GEORGE W. GRAHAM, Philadelphia, Pa. Application filed August 18, 1875.
"words and letters 'The Comet and Swan.'"

3,045.—Copied Pictures.—PARKER C. HARLEY & Co., Arlington, Mass. Application filed August 12, 1875.
"words 'FERRO CHROMO.'"

3,046.—Hair-Dressing Preparation.—W. N. HEDGES & Co., Springfield, Ohio. Application filed December 24, 1874.
"words and letters 'COCOAKREMOLLA.'"

3,047.—Lubricating and Illuminating Oils.—ELI E. HENDRICK, Carbondale, Pa. Application filed September 22, 1875.
"word 'EMERALD.'"

3,048.—Soap.—JAMES S. KIRK & Co., Chicago, Ill. Application filed August 20, 1875.
"words 'Savon Imperial,' in connection with the design."

3,049.—Cigars.—PETER KUMPF, Detroit, Mich. Application filed August 14, 1875.
"words 'CROWN EAGLE.'"

3,050.—Writing-Paper.—MASSASOIT PAPER MANUFACTURING COMPANY, Springfield, Mass. Application filed September 1, 1875.
"words 'Century Mills,' with a female figure in a sitting posture, representing the Goddess of Liberty, and the figures representing the years '1776' and '1876.'"

3,051.—Scythe-Stones.—J. C. ORNE & Co., Westmore, Vt. Application filed June 26, 1875.
"words 'WILLOUGHBY LAKE.'"

3,052.—Liniment.—CATHERINE SCHAEFFER, New York, N. Y. Application filed June 14, 1875.
"words 'St. Antonius Liniment,' and the engraving of the head of the saint."

3,053.—Spirits produced by the Fermentation and Distillation of Wood and Woody Fiber.—THE BURCEY CHEMICAL COMPANY, Waterbury, Conn. Application filed August 20, 1875.
"word and letters 'METHAL.'"

3,054.—Christmas Candles and Toys.—A. WEIDMANN & Co., New York, N. Y. Application filed July 14, 1875.
"A flying angel with trumpet, holding in its left hand a staff, from which is suspended a star."

3,055.—Sheet-Iron.—J. WOOD & BROTHERS, Philadelphia, Pa. Application filed September 17, 1875.
"words 'Golden City' and the circles."

3,056.—Perfumeries.—C. B. WOODWORTH & SON, Rochester, N. Y. Application filed February 27, 1873.
"word 'CENTENNIAL.'"

3,057.—Shirts.—ALBERT O. BEARD, Philadelphia, Pa. Application filed September 10, 1875.
"words 'Shirter. Fit guaranteed where others fail.'"

3,058.—Washing-Fluid.—BODKIN & MCKINNEY, Hoboken, N. J. Application filed August 2, 1875.
"words 'MAGIC CLEANSER.'"

3,059.—Cigars.—G. H. BOLENIUS & Co., Baltimore, Md. Application filed August 7, 1875.
"monogram formed by our initials and the ornamental border."

3,060.—Linen and Cotton Fabrics.—J. BULLOCKE & J. B. LOCKE, New York, N. Y. Application filed September 11, 1875.
"representation of a number of battle-axes, converging toward a heraldic bar, and being looped by a loose-knotted cord passing around the handles of the axes."

3,061.—Whisky.—JOHN E. CASSIDY, Watertown, Mass.—Case A. Application filed July 31, 1875.
"an outer and inner border, of semicircular shape, above the word 'Bourbon,' the word 'Whiskey' being placed in the space formed by the interior border."

3,062.—Cigars and Tobacco.—A. L'CHTENSTEIN & BROTHER, New York, N. Y.—Case A. Application filed September 16, 1875.
"word 'Onward,' in connection with the representation of an agle and shield."

3,063.—Cigars and Tobacco.—A. LICHTENSTEIN & BROTHER, New York, N. Y.—Case B. Application filed September 16, 1875.
"representation of a female figure, with flowing robe, with a star on the forehead."

3,064.—Medicine.—A. F. MERRELL, Philadelphia, Pa. Application filed September 6, 1875.
"the monogram, as set forth and described, and the words 'Anti-Bilious Prescription' and 'Hepatine.'"

3,065.—Cloth-Faced Paper Collars.—METROPOLITAN COLLAR COMPANY, New York, N. Y. Application filed September 3, 1875.
"words 'American Team,' with the representation of a ride."

3,066.—Plows.—MONITOR PLOW-WORKS, Minneapolis, Minn. Application filed August 23, 1875.
"the name 'S. T. Ferguson' and the word 'Monitor.'"

3,067.—Lard.—EMILIO PING & Co., New York, N. Y. Application filed September 11, 1875.
"words 'Llart Superior de la Llumanera,' coupled with a lamp of antique pattern."

3,068.—Plant-Fly and Grasshopper Exterminator.—GEORGE W. POWELL, Meadville, Va. Application filed August 12, 1875.
"words and letters 'G. W. Powell's Plant-Fly and Grasshopper Exterminator,' and the letters 'P. F. G. H. E.' on the body of a grasshopper."

3,069.—Whisky.—REIS & BECHERER, Philadelphia, Pa. Application filed September 6, 1875.
"words 'OLD LIFE.'"

3,070.—Liquid Tonic.—JOHN F. SARLE, New York, N. Y. Application filed August 26, 1875.
"figure of an ox, with the words 'Liebig's Liquid Extract.'"

3,071.—Medical Preparation.—JOHN H. SLATER, Portsmouth, N. H. Application filed February 5, 1875.
"word 'ASTHMAINE.'"

3,072.—Axle-Grease.—GEORGE B. SWIFT & Co., Chicago, Ill. Application filed September 8, 1874.
"words 'IMPERIAL AXLE-GREASE.'"

3,073.—Billiard-Cue Racks.—THE J. M. BRUNSWICK & BALKE COMPANY, Chicago, Ill., and Cincinnati, Ohio. Application filed September 24, 1875.
"word 'BANNER.'"

3,074.—Whisky.—H. K. THURBER & Co., New York, N. Y. (Re-registration.) Application filed October 1, 1875.
"representation of a sheaf of wheat with the words 'Century White Wheat Bourbon.'"

3,075.—Lubricating-Oil.—H. C. VAN TINE & Co., Pittsburg, Pa. Application filed July 24, 1875.
"words 'PINE TAR.'"

3,076.—Confectionery.—STEPHEN F. WHITMAN & SON, Philadelphia, Pa. Application filed January 26, 1874.
"word 'MALLOW.'"

3,077.—Church and Parlor Reed-Organs.—WHITNEY & CURRIER, Toledo, Ohio. Application filed June 3, 1875.
"word 'PALACE.'"

3,078.—Baking-Powder.—AMAZON BAKING-POWDER COMPANY, Louisville, Ky. Application filed July 15, 1875.
"words 'AMAZON BAKING-POWDER.'"

3,079.—Billiard-Tables.—HUGH W. COLLENDER, Darien, Conn. Application filed September 17, 1875.
"word 'Standard.'"

3,080.—Fancy Knit Woolen Goods.—H. E. DILLINGHAM, New York, N. Y. Application filed June 30, 1875.
"words 'KNICKERBOCKER KNITTING WORKS.'"

3,081.—Medicine.—J. N. HARRIS & Co., Cincinnati, Ohio. (Re-registration.) Application filed July 25, 1871.
"'Lung Balsam.'"

3,082.—Composition for use in Sizing Warps.—JOSEPH W. WATTLES & SON, Canton, Mass. Application filed September 23, 1875.
"word 'DRESSINE.'"

3,083.—Hermetically-Sealed Goods.—JOHN WINSLOW JONES, Portland, Me. Application filed August 13, 1875.
"the representation of an artificial globe, or the map of a hemisphere with meridian and parallel lines thereon."

357.—Title: **"Drink' mich aus und leg' mich nieder; steh' ich auf dann füll mich wieder."**—AUGUST LAEMMRICH, New York, N. Y. Application filed September 30, 1875.

358.—Title: **"Dr. Stewart's Teething Plasters for Children."**—HAMILTON P. STEWART, Franklin, Mass. Application filed October 11, 1875.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

The OFFICIAL GAZETTE of the United States Patent Office is published weekly by the Patent Office. It is printed by authority of an act of Congress, which provides for its gratuitous distribution to libraries at the rate of eight for each congressional district.

The GAZETTE contains the decisions of the Commissioner of Patents, and such decisions of the courts in patent causes as are believed to possess general interest to inventors and patentees.

During the past year a complete synopsis of foreign patent laws, prepared by members of the British Legation in foreign countries, has been printed in the GAZETTE. Also an epitome of the proceedings of the Vienna International Patent Congress, with the action of that body to perpetuate itself. Matters of this character will receive further attention in the GAZETTE.

The claims of all patents granted are printed in the GAZETTE, bearing the same date as the issue of the patent, accompanied by a brief synopsis of the invention and a portion of the drawing.

The illustrations are photographic reproductions on a reduced scale of the drawings accompanying the original application, and preserve their fidelity, which was sometimes lost under the old plan of drawing or tracing and engraving.

Application for extension of patents, and the action of the Office in such cases, have their earliest publication in the GAZETTE. Disclaimers filed in the Office are nowhere else published.

Changes in the rules of practice of the Office are announced in the GAZETTE, which affords a much readier mode of communication with parties interested than to await a new edition of the Rules of Practice.

Finally, any matter believed to be of interest to inventors in their official intercourse with the Office, will receive in the GAZETTE the attention the subject warrants.

INDEX OF INVENTIONS PATENTED OCTOBER 19, 1875.

	Class No.	No. of Patent.
Alarm for prisons, &c., Cook and Heath	24	168,971
Anchor, T. J. Whitecar	128	169,069
Apple paring machine, W. M. Griscom	63	168,985
Apple paring machine, A. Rippien	63	169,040
Bars, machine for drawing and polishing, D. I. Farmer	125	168,975
Bedstead, invalid, Watson and Kelso	62	169 067
Bedstead, sofa, J. L. Closterman	62	168,877
Bilge protector for vessels, B. Edgar	137	168,974
Blasting, &c., detonating cap for, J. Goldmark	124	168,895
Boiler for steam fire engines, J. N. Dennison	148	169 973
Boiler indicator, steam, A. Moon	148	168 913
Boot, A. A. Cuming	16	168,882
Boot and shoe, E. S. Justh	16	169,006
Boring machine, Wilder, McNeil, and Tyler	173	168,862
Bottle stopper, E. H. Hunt	1	169 000
Bottles, mold for manufacturing, P. W. Reid	68	169 038
Bracelet, J. L. Thomson	86	168,855
Brick machine, S. Martin	20	168,911
Bridle bit, J. Thornton	72	168,857
Burner, Argand, Voltair and Ball	64	168,946
Buttons, studs, &c., setting instrument for attaching, D. Heaton	23	168 994
Calendar, C. Z. O'Neill	146	168,916
Candlestick, A. Albertson	90	168,822
Caoutchouc, artificial, A. G. Day, (reissue)	84	6,707
Caoutchouc, forming artificial, A. G. Day, (reissue)	84	6 708
Car coupling, D. A. Newsom	122	168 915
Car refrigerator, J. E. Aoklom	121	168,953
Car spring, D. R. Pratt	122	168,845
Car spring, D. R. Pratt	122	168,846
Car starter, M. Toulmin	122	168 940
Car ventilator, A. Hance	166	168,897
Cars, air spring for, P. Giffard	122	168,980
Carbureter, L. Marks	27	168,910
Carbureter, J. M. Pollard	27	168,074
Chair, A. H. Brick	62	168,428
Chair, T. Tostevin	62	169,065
Chair bottom, T. Tostevin	62	169,064
Chair, folding, Bean and Box	62	168,865
Chair, folding, I. N. Dann	62	168,880
Chair, folding, G. McAleer	62	169,015
Chair, folding, G. McAleer	62	169,016
Chair, folding, A. D. Whitmore, (reissue)	62	6,711
Chair, nursery, A. E. Barnes	62	168,960
Chair, opera, Chase and Ball	62	168,874
Chuck, H. A. Kimball	100	169,007
Chuck for rock drills, H. Thomas	124	168,938
Churn, reciprocating, E. A. Firby	45	168,976
Cigar lighter, glass, W. A. Gorby	160	168,981
Cigar lighters, machine for making, N. Fuller	173	168,835
Clamp, joiner's, G. A. Neumann	29	169,027
Clock, electric, D. F. Sweet	36	169 057
Clothes drier, G. Myers	91	168 843
Coffee roaster, F. Thomas	154	169 059
Coke ovens, scraper for, P. M. Buttermore	61	168,968
Colter, G. C. Lyons	114	168,840
Composition for destroying gophers, squirrels, &c., poisonous, J. G. Steele	35	168,835
Compound, anti-friction, C. C. F. Otto	87	169,031
Cradle, F. Voit	62	168,945
Curtain fixture, R. J. Pospisel	62	168,921
Dental engines, hand piece for, W. A. Johnston	46	169,003

	Class No.	No. of Patent.
Desk and baggage check box, combined, G. E. Nichols	62	169,028
Disinfecter and inhaler, pocket, H. G. Dayton	156	168,973
Ditching machine, M. E. Burtless	51	168,967
Dock, floating, Clark and Standfield	82	169,040
Door knob, A. Rankin	93	169,036
Door knobs, manufacturing porcelain, N. Boch	115	168,826
Drawing and polishing bars, machine for, D. I. Farmer	125	168,975
Drilling machines, tripod for rock, J. B. Waring, (reissue)	124	6,705
Drills, chuck for rock, H. Thomas	124	168,939
Duet pan, E. Kramm	62	168,899
Dyeing and calico printing, J. Harley	11	168,991
Eaves trough, O. W. Stearns	126	168,934
Egg turning device, R. Tyler	116	168,942
Electric machine, magneto, J. B. Fuller	50	168,893
Engine governor, steam, N. E. Nash	69	168,914
Engine, rotary, G. D. Harwood	150	168,837
Engines, compound condensing apparatus for marine steam, J. Houpt	150	168,901
Engines, differential gear for traction, J. B. Annin	94	168,955
Fats, purifying and preserving animal, J. P. Kinney	26	169,008
Faucet, C. A. Douglas, (reissue)	167	6,701
Faucet, J. M. Hopkins	167	168,997
Fence barb, wire, L. M. Devore	52	168,886
Fence, farm, J. P. Monnett	52	169,023
Fender, O. W. Hoyt	114	168,999
Filter and sprinkler combined, Batchelor and Warren	167	168,825
Fire arm, breech loading, A. Burgess	18	168,829
Fire arm, magazine, A. Burgess	18	168,966
Fire arms, detachable pistol grip for, F. W. Freund	55	168,834
Fire arms, implement for, A. E. Barthel	55	168,823
Fire extinguisher, E. A. Maginness	118	169,013
Flask, W. H. Stroup	68	169,055
Fine scraper, A. Fisher	149	168,891
Fluting machine, H. Albrecht	91	168,954
Furnace for locomotives, H. F. Hayden	94	168,899
Furnace, glue pot, T. C. Howes	29	168,998
Furnace, inclined revolving puddling, C. Pernot	85	169,033
Furnace, puddling, C. J. Schofield	85	169,047
Gaiter, button, W. H. Miller	16	169,022
Garments, implement for notching patterns for, A. Warth	38	169,066
Gas apparatus, Lord and McCabe	66	168,909
Gas for burning and lighting, manufacture of, T. B. Redwood	66	169,037
Gas, process and apparatus for manufacture of illuminating, M. W. Kidder	66	168,904
Gas retorts, forming a tight joint between the mouth piece and lid of, N. Jamin	66	169,001
Gas washing machinery, T. K. Lees	66	168,906
Generator, steam, D. Renshaw	148	168,923
Glue pot furnace, T. C. Howes	29	168,998
Grain binder, F. P. Rosback	74	169,043
Grain drill, Patric and Boyle	133	168,918
Grist alarm, N. Bruner	57	168,965
Gun sight, W. M. Treadway	55	168,941
Hair dressing machine, Brown and Vaughan	161	168,964
Halter and bridle, J. McKibben	73	168,841
Harmonicon, key board, G. Rimbach	102	168,847
Harvester gearing, J. F. Selberling	74	168,930
Harvester rake, J. Barnes	74	168,959
Harvester reel, J. F. Selberling	74	169,048
Hatchway guard, W. Muir	30	169,025
Hatchway, self-closing, W. Muir	30	169,026
Hats, composition for stiffening and pressing straw, E. Torlotin	76	169,063
Health lift apparatus, F. G. Johnson	143	169,002
Horseshoe, E. M. Bampus	60	168,872
Horseshoe nail machine, J. Roy	60	169,044
Horseshoe nails, art of finishing, H. A. Wills, (reissue)	60	6,713
Horseshoe nails, machine for finishing, H. A. Wills, (reissue)	60	6,712
Hose coupling, W. A. Caswell	61	168,970
Husking glove and mitten, H. L. Hall	50	168,836
Jails, construction of, Seeber and Croxton	4	168,929
Journal box, J. F. Selberling	87	169,049
Key ring, Denio and Neer	93	168,832
Knitting machines, landing wheel for, R. W. Gormly	89	168,983
Ladder, firemen's, C. Ward	30	168,947
Ladder, firemen's folding, J. C. Christinger	30	168,875
Lamp chimney, G. M. Bull	90	168,871
Lamp chimneys, mold for pressing glass, T. B. Atterbury	68	168,863
Lamp, pocket, J. Kendall	65	168,903
Lamp, street, J. S. Hagerty	90	168,987
Latch, reversible, W. M. Griscom	93	168,996
Lathe for turning ovals, L. K. Scotford	172	168,928
Lock, combination, F. J. Chapman	93	168,873
Locomotive ash pans, apparatus for cleaning, P. K. Dealy	94	168,884
Locomotive smoke stack, P. Reilly	94	169,039
Loom shuttle motion, C. L. Kane, (reissue)	95	6,702
Lubricator, Gould and Hayden	87	168,984
Mail bag catch, A. B. Whipple	121	168,860
Mail bag catch, A. B. Whipple	121	168,861
Malt kiln floor, P. Weinig	19	168 948
Measure, speed, E. Brown	42	168,870
Mill, three high rolling, J. L. Williams	125	169,071
Mills, fore plate for rolling, J. L. Williams	125	169,070
Moss, curing, P. Unsworth	48	168,944
Mowing machine, Wood, Bowhay, and Rosebrooks	74	168 951
Muff block former, E. Sirret	38	168,849
Nails, machine for forging, J. Roy	60	169,045
Neck tie retainer, W. H. Hart, Jr	38	168,993
Needle case, O. Nauen	38	169,029
Nest for fowls, S. S. and C. R. Jackson	116	168,838
Nut lock, S. G. and A. Barker	14	168,958
Nut lock, L. Chapman	14	168,830
Oil cloth and matting, binding for, A. and E. A. Underwood	56	168,943
Ordnance, breech loading, G. P. Harding	105	168,990
Ornaments, composition for, J. G. W. Steffens	35	169,053
Paper cutting machine, S. W. Soule, (reissue)	109	6,710
Paper dampling machine, J. L. Firm	117	168 978
Paper trimming machine, D. T. Broughton	109	168,963
Patterns for garments, implement for notching, A. Warth	38	169,066
Pavement, W. H. Jones	110	169,005
Pegging jack attachment, F. Guild	16	168 896
Pen and pencil case, W. A. Ludden	146	169,012
Penmanship, copy slip for teaching, C. Allen, (reissue)	146	6,706
Picket pin, J. D. Field	52	168,890
Plaiting device, W. Walker, (reissue)	134	6 704
Planter, corn, Rittenhouse and Lewis	133	169,041
Pliers, parallel, H. R. Russell	170	168 934
Poet, wrought iron, L. Soulerin	21	168,851
Press, baling, C. C. Campbell	7	168,969
Pump, J. Bean, (reissue)	118	6 703
Pump, W. Young	118	168,952
Pump, air, J. H. Ellis	12	168,8-8
Pump, air, Moll and Altheide	12	168 842
Pump, chain, W. Cooper, (reissue)	118	6,700
Pump, force, W. C. Libengood	118	168,907
Purifier, middlings, A. P. Teachout	57	169,061
Railroad crossing, W. J. Stillman	120	168,853
Railroad rail joint, J. G. Holliday	120	168,900
Railroad switch, Middleton and Cary	120	169,021
Railroad switch, street, C. R. Evans	120	168,889
Rake and loader, hay, J. G. Krouse	77	169,009
Refrigerator, J. F. Ebert	58	168,833
Refrigerator and water cooler, W. Hammel	58	168,988
Relishing machine, E. F. Bohn	173	168,867
Sad iron, T. D. West	91	168,859
Sad iron shoe, V. C. Theband	91	168,937
Saddle tree, gig, A. Ortmayer	73	168,844
Sash fastener, G. G. Nodle	24	169,030
Sash holder, S. Lewis	24	169,011
Sawing machine, band, P. Pryibil	130	169,035
Sawing machine, scroll, E. Hersig	130	168,995
Sawing machine, scroll, J. H. Plummer	130	168,920
Saws, rest for hardening and tempering circular, A. Schulte	131	168,927
Scales, platform, A. W. Hess	132	168 996
Scarf retainer, W. H. Hart, Jr	38	168,992
Seed dropper, J. T. Wright	133	169,072
Sewing machine, Gilnes and Stiles	134	168,894
Sewing machine, G. Hancock	134	168,989
Sewing machine dress protector, E. F. Shaw	134	168,848
Shafts and strap couplings, guard strap for, J. Weatherhead	73	169,069
Shears, metal, Livesay and Black	119	168,908
Ship's log, R. T. Moore	138	168,924
Show cases, cracker, C. and W. Kroeger	54	168,905
Shutter worker, blind slat adjuster, and sash fastener, combined, H. J. Dickerson	24	168,887
Sleigh, B. F. Sweet	31	169 056
Sole fastening, F. O. Tobey	16	169,062
Speed, device for changing, J. W. Mead	67	168,912
Spinning mule or jack, M. A. Furbush	142	168,979
Spinning rings, device for securing and adjusting, J. E. and E. Atwood	142	168 956
Starching machine, L. Sternberger	91	169,054
Stereotype block, J. L. Firm	164	168,977
Stove, R. S. Bostwick	154	168,868
Stove, I. A. Sheppard	154	169,050
Stove and furnace, E. Smith	154	169,052
Stove, base burning, L. F. Betts	154	168,962
Stove, coal, Z. Hunt, (reissue)	154	6,709
Stove door knob, P. E. Washburne	154	168 858
Stove, heating, Ravenud and Marty	154	168,922
Sugar machine, cube, G. D. Jones	155	169,004
Tablet holder, erasive, D. M. Somers	146	168,850
Tacks, machine for driving, J. E. Coffin	103	168,878
Tailor's drafting apparatus, M. C. Ten Eyck	38	168,936
Target, T. H. Mead	143	169,019
Telegraph, printing, G. M. Phelps	158	168,919
Telegraph, printing, C. J. Wiley	158	168,949
Thrashing machines, separator shoe for, A. D. Thomas	159	168,939
Tin vessel, T. Schmitz	62	169,046
Tire tightener, J. W. Marks	31	169,014
Tire tightener, S. W. McOmber	31	169,017
Tires, machine for shrinking, H. W. Roland	60	169,042
Tool handle, T. J. Close	29	168,876
Toy, J. P. Michaels	143	169,020
Trace carrier, J. Thornton	72	168,856
Traction wheel, W. O. M. Berry	31	168,866
Truss, S. Ayres	156	168,957

	Class No.	No. of Patent.
Tubes, handle for boring, H. Stanley	29	168,933
Type writing machine, R. M. J. Hansen	117	168,896
Umbrella runner, H. S. Frost	165	168,892
Valve for water mains, R. Barton	167	168,824
Vault cover, C. H. Gordon	8	168,982
Vehicle seat, E. A. Cooper	31	168,831
Vehicle top, F. H. Jury	31	168,902
Vehicles, torsional spring for, D. E. Paris	31	169,032
Ventilating apparatus, J. C. Bates	166	168,864
Ventilating cap, L. F. Betts	166	168,961
Vermin exterminator, V. Schmidt	63	168,926
Vessels, bilge protector for, B. Edgar	137	168,974
Wagon, dumping, W. M. Thompson	31	169,060
Wardrobe, folding, L. A. Colbert	62	168,879
Washing machine, J. A. Bowyer	91	168,827
Washing machine, J. H. Conaway	91	168,880
Washing machine, A. Delamater	91	168,895
Washing machine, I. A. Shaw	91	168 931
Water mains, valve for, R. Barton	167	168,824
Water meter, D. C. Taylor	167	168,854
Water wheel, centrifugal, J. H. Meacham	168	169,018
Water wheels, governor for, E. Wright	168	169,073
Weather strip, F. A. Bradshaw	30	168,869
Weed turner, Thornton, McDonel, and Hale	114	169,058
Wells, bull wheel for oil, J. Schellkopf	124	168,925
Windmill, J. Cook	118	168,881
Wludmill, Ormiston and Seger	118	168,917
Windmill, A. Willson	118	168,950
Windmill power, W. E. Short	118	169,051
Wrench, pipe, W. K. Stevens	100	168,852
Yarn printing machine, J. Short	11	168,938

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED OCTOBER 19, 1875.

	Patent No.
Acklom, J. E., Refrigerator car	168,953
Albertson, A., Candlestick	168,822
Albrecht, H., Fluting machine	168,954
Allen, C., Copy slip for teaching penmanship, (reissue)	6,706
Altheide and Moll	168,842
Annid, J. B., Differential gear for traction engines	168,955
Ashcroft, C. E., assignee	168,963
Atterbury, T. B., Mold for pressing glass lamp chimneys	168,863
Atwood, J. E. and E., Device for securing and adjusting spinning rings	168,956
Ayers, S., Truss	168,957
Babcock, C. A., assignee	168,858
Babcock, N., assignee	168,977, 168,978
Baker, J. H., assignee	168,837
Ball and Chase	168,874
Ball and Voltair	168,946
Barker, S. G. and A., Nut lock	168,958
Barnes, A. E., Nursery chair	168,960
Barnes, J., Harvester rake	168,959
Barthel, A. E., Implement for fire arms	168,823
Barton, R., Valve for water mains	168,824
Barton, W. W., assignee	169,034
Batchelor, J., and A. J. Warren, Filter and sprinkler combined	168,825
Bates, J. C., Ventilating apparatus	168,864
Bean, J., Pump, (reissue)	6,703
Bean, J. H., and R. W. Box, Folding chair	168,865
Berry, W. O. M., Traction wheel	168,866
Betts, L. F., Ventilating cap	168,961
Betts, L. F., Base burning stove	168,962
Black and Livesay	168,908
Bock, N., Manufacturing porcelain door knobs	168,826
Bogle and Patrie	168,918
Bohn, E. F., Relishing machine	168,867
Bostwick, R. S., Stove	168,868
Bowhay, Rosebrooks, and Wood	168,951
Bowker, G. W., assignee	168,835
Bowyer, J. A., Washing machine	168,827
Box and Bean	168,865
Bradshaw, F. A., Weather strip	168,869
Brick, A. H., Chair	168,828
Broughton, D. T., Paper trimming machine	168,963
Brown, E., Speed measure	168,870
Brown, O. M., and W. R. Vaughan, Hair dressing machine	168,964
Bruner, N., Grist alarm	168,965
Bull, G. M., Lamp chimney	168,871
Bumpus, E. M., Horseshoe	168,872
Burgess, A., Breech loading fire arm	168,829
Burgess, A., Magazine fire arm	168,966
Burtless, M. E., Ditching machine	168,967
Buttermore, P. M., Scraper for coke ovens	168,968
Campbell, C. C., Baling press	168,969
Carson, J. W., assignee	168,946
Cary and Middleton	169,021
Caswell, W. A., Hose coupling	168,970
Chapman, F. J., Combination lock	168,873
Chapman, L., Nut lock	168,830
Chase, I., and G. M. Ball, Opera chair	168,874
Christinger, J. C., Folding ladder for firemen	168,875
Clark, J. L., and J. Standfield, Floating dock	169,010
Cleveland, O., assignee	168,850
Close, T. J., Tool handle	168,876
Closterman, J. L., Sofa bedstead	168,877
Coffin, J. E., Machine for driving tacks	168,878
Colbert, L. A., Folding wararobe	168,879
Conaway, J. H., Washing machine	168,880
Cook, J., Windmill	168,881
Cook, J. B., and J. W. Heath, Alarm for prisons, &c	168,971
Cooper, E. A., Vehicle seat	168,831
Cooper, W., Chain pump, (reissue)	6,700
Cottrell, C. B., assignee	168,977, 168,978
Croxton and Seeber	168,929
Cuming, A. A., Boot	168,832
Dana, L. N., Folding chair	168,883
Day, A. G., Artificial caoutchouc, (reissue)	6,707
Day, A. G., Forming artificial caoutchouc	6,708
Dayton, H. G., Pocket disinfecter and inhaler	168,972
Dealy, P. K., Apparatus for cleaning locomotive ash pans	168,884
Delamater, A., Washing machine	168 895
Denio, W. L., and W. E. Neer, Key ring	168,832
De La Montagnie, A., assignee	168,904
Dennison, J. N., Boiler for steam fire engines	168,972

TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED OCT. 19, 1875.

168,893. CANDLESTICK. Alva Albertson, Jersey City, N. J. [Filed Mar. 31, 1875.]

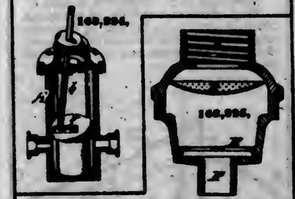
Brief.—The spring-wire, loose at its lower end, passes through an aperture in the thumb-piece.

1. The internal longitudinal springs C, constructed with the outwardly-curved or flaring upper ends *c*, in combination with the socket A, whereby the said springs are caused to automatically receive the candle when thrust into the socket, and to hold the same in an upright position, whatever the diameter of the candle, substantially as herein set forth.

2. The combination of the external supplemental springs D with the internal springs C, having their lower portions *b* narrower and more yielding than their upper portions *c*, the whole arranged in relation with the socket A, substantially as and for the purpose set forth.

3. The combination of the elastic guide stem or spring *g*, with the thumb-piece F, of the bottom slide E, whereby provision is made for the arrangement of the springs C within the socket A, without interference with the vertical movement of the slide, substantially as herein set forth.

168,895. IMPLEMENTS FOR FIRE-ARMS. A. B. Barthel, Detroit, Mich. [Filed Mar. 23, 1875.]

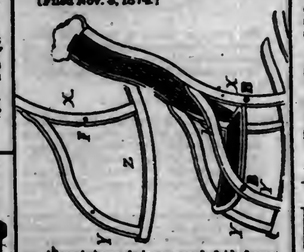


The combined dog-whistle, screw-driver, nipple-wrench, and priming-needle, constructed substantially as represented and described.

168,896. VALVES FOR WATER-MAINS. R. Barton, Philadelphia, Pa., assignor of one-half his right to W. Johnston, same place. [Filed Feb. 24, 1875.]

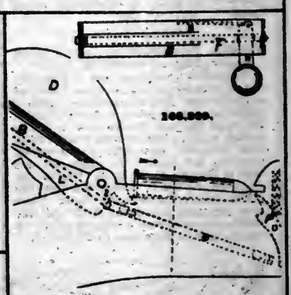
Brief.—To remove the nut in which the valve-spindle works, the follower of the stuffing-box is withdrawn, and the spindle moved to the point where the nut is free from the V-shaped projections.

The combination of the screw-spindle *b*, nut *d*, and its V-shaped grooves with the recess *f* in the valve, the said recess having edges partly V-shaped and partly straight, all as and for the purpose set forth.



In testimony whereof I have signed my name to this specification in the presence of two subscribing witnesses.

168,897. WASHING-MACHINES. John A. Bowyer, Huntsburg, assignor of one-half his right to J. R. Quinn, Montville, Ohio. [Filed Mar. 6, 1875.]



A washing-machine, composed of the body A, having the transverse ribs U and journals *a*, the automatically-adjustable roller D, frame B, having bearings *d* for journals *a*, and the split handle R, constructed, arranged, and operating as shown and described.

168,898. CHAIRS. Alfred E. Brick, Winchendon, Mass., assignor of one-half his right to Francis Brick, Keene, N. H. [Filed Nov. 3, 1874.]

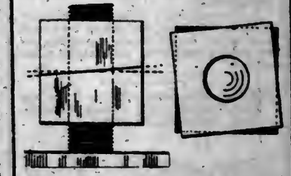
A knock-down chair composed of side frames, each consisting of a high back post, X, front post Y, and connecting-bars V and Z, firmly united, a seat, and a back, said side frames being detachably connected with the seat by screws E and nuts A, the back being supported by the high posts X, substantially as and for the purposes described.

168,899. BREECH-LOADING FIRE-ARMS. A. Burgess, Hartford, Conn. [Filed June 30, 1875.]

168,900. CHUCK. Nicholas Bush, Brooklyn, N. Y. [Filed May 20, 1875.]

The mode or process of manufacturing porcelain door-knobs, substantially as described, by forming or molding the knob and its shank separately, and uniting or cementing them together in the process of enameling by the fusing of the material used for enameling.

168,901. DOOR-KNOBS. Nicholas Bush, Brooklyn, N. Y. [Filed May 20, 1875.]

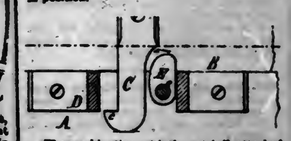


168,902. BREECH-LOADING FIRE-ARMS. A. Burgess, Hartford, Conn. [Filed June 30, 1875.]

1. The breech-block B, pivoted at the rear, and having a circular or eccentric part, D, operating upon and forcing the cartridge into the chamber of the barrel by the act of closing the breech, substantially as described.

2. The breech-block B, pivoted at the rear, and so arranged with and in relation to the hammer that the act of opening the breech cocks it by the rear of the breech-block coming in contact with the face of the hammer and forcing it back, substantially as specified.

3. The locking-lever D, which, by its backward or unlocking motion, engages a shoulder in the firing-pin F, forcing it rearward by direct contact, so that the point of the firing-pin shall be then cleared of the indentation in the head of the cartridge, substantially as described.



168,903. NUT-LOCKS. Lake Chapman, Collinsville, assignor of two-thirds his right to Wm. J. Wood and Wm. H. Simonds, Hartford, Conn. [Filed Jan. 26, 1875.]

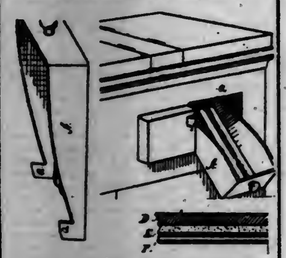
The combination of two nuts, having their opposed or meeting faces composed each of a single inclined plane, substantially as shown and set forth.

168,904. VEHICLE-SEATS. E. A. Cooper, Lancaster, assignor of one-half his right to Josiah Letchworth, Buffalo, N. Y. [Filed Aug. 6, 1875.]

Brief.—Fastening device for retaining seat in position.

The combination, with the catch G, attached to the seat A, of the strap or bearing D, secured to the body of the vehicle, and provided with locking-cam E *e*, thumb-piece *f*, and incline A *h*, substantially as and for the purpose hereinabove set forth.

168,905. KEY-RINGS. Wm. L. Denio and William B. Neer, Rochester, N. Y. [Filed Feb. 1, 1875.]



166,822.

A metal key-ring, consisting of the flat annular part A, provided with the overlapping bevel-joint *a*, and adapted to be closed by means of the button *b*, substantially as set forth.

166,823. REFRIGERATORS. Jacob F. Ebert, Dayton, Ohio. [Filed Jan. 23, 1875.]

Brief.—The ice-drawer tilts downwardly, and, hanging by catches, covers the door-space of the ice-box. Two valves close openings in partitions when the lowest door is opened. The upper door and the ice-drawer door each operate valves. Wall consists of outer wood, inner perforated zinc, light porous wooden partition, and between the woods salt, and back of the zinc an air-space. The salt impregnates the inner wooden partition and purifies the air of each compartment. There is an air-space corresponding to and communicating with each cooling-chamber. A ventilating-tube dives through the ice-box.

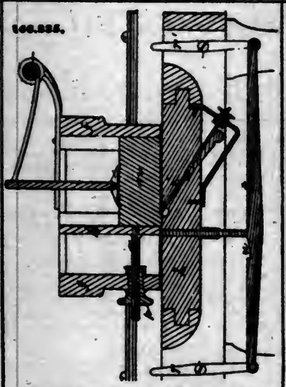
1. In the sliding tilting ice-drawer A, the catches *a*, arranged and constructed as described, and for the purpose specified.

2. The combination and arrangement of the valves C, connecting-lever *d*, and rod *e*, hinged to the door of a refrigerator near its pivotal axis, in the manner and for the purpose specified.

3. The combination of the outer wall D, partition B, sait filling, and lowest perforated zinc lining F, for the purpose of purifying the air within a refrigerator, substantially as described.

166,824. DETACHABLE PISTOL-GRIPS FOR FIRE-ARMS. Frank W. Freund, Cheyenne, Wyo. [Filed Mar. 19, 1875.]

1. A separate or detachable grip, made in the form of the lower part of the stock of a pistol, and adapted for attachment to the stock of a gun, substantially as described.

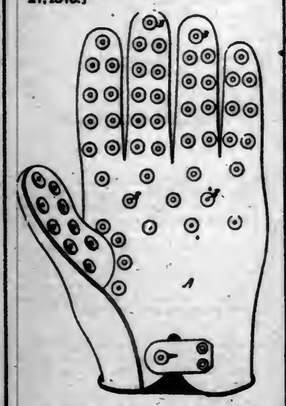


2. A grip made separate from the stock of a gun, and adapted to be applied to the outside of the stock by suitable means of attachment without cutting away the stock, substantially as described.

3. A pistol-grip, trigger-guard, and trigger-plate combined, and made of a single piece, substantially as described.

166,825. MACHINES FOR MAKING CIGAR-LIGHTERS. Nathan. Fuller, Boston, Mass., assignor of one-half his right to George W. Bowker, same place. [Filed June 14, 1875.]

Brief.—Tapering cigar-lighters are formed by means of stationary knives, a reciprocating carriage provided with an adjustable partition for holding blocks of different sizes, and an automatic apparatus for relieving the block during the return stroke. Beneath each knife is attached a guard-plate for delivering the lighters, when cut, with their small ends pointing in one direction.

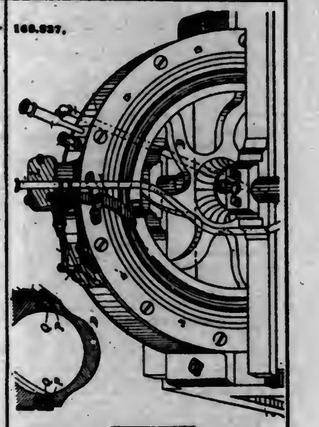


166,826.

1. The combination, with the reciprocating carriage *f* and the stationary planes *h h*, of the levers *r r'*, rod *t*, with its incline *u*, and the vertically-adjustable pin *v*, as and for the purpose set forth and described.

2. The combination, with the reciprocating carriage *f*, and the planes *h h*, of the guard-plates *7 7*, as and for the purpose set forth.

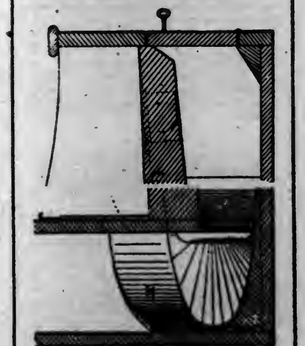
166,826. HUSKING GLOVES AND MITTENS. Henry L. Hall, Chicago, Ill. [Filed Apr. 27, 1875.]



The glove or mitten A, having its palm, fingers, and thumb each armed and protected with several metal plates or disks, B, to adapt it for use without impairing its flexibility, as set forth.

166,827. ROTARY ENGINES. Geo. D. Harwood, Andrew County, Mo., assignor of three-fourths his right to Saml. L. Wilmer, Jessup, Iowa, David C. Stotts and Jas. M. Baker, Savannah, and George H. Sigh and William S. Leach, St. Joseph, Mo. [Filed Mar. 6, 1875.]

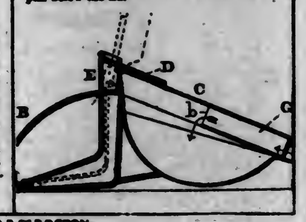
1. The combination of an annular stationary cam, having its inner face concave in semicircular form, with a revolving wheel, having its periphery or outer face similarly concave, the two, when placed together with an interposed packing between these two faces, composing an annular hollow steam-cylinder, the inner or wheel half of which is adapted to revolve within the stationary part.



2. In combination with the described stationary wheel-cam B and with the wheel D, the separating-rings Q, provided each with a rib or projection to fit the grooves P in the wheel, and the packing-ring R and its packing, as and for the purpose set forth.

166,827.

166,828. NESTS FOR FOWLS. Samuel S. Jackson, Bloomfield, and Charles E. Jackson, Newark, N. J. [Filed Apr. 30, 1875.]

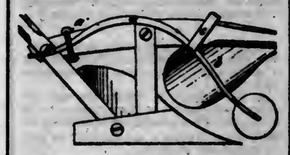


Brief.—The bottom of the nest is inclined, leading to an aperture in the rear of the nest proper, through which the egg passes to a curved incline leading to the receptacle under the nest. A nest-egg is set in the bottom of the nest under a glass plate.

A nest for fowls, consisting of a box provided with an inclined false bottom, leading to an aperture through the partition in the rear portion of the box, and a curved inclined plane leading from the aperture in the partition to the receptacle under the false bottom, substantially as shown and described.

166,829. DUST-PANS. Ephraim Kramm, New York, N. Y. [Filed Feb. 6, 1875.]

Brief.—Connected with the lid is a spring, which is operated by the foot, so as to raise the lid. The lid is constructed with a passage for conducting insects into the space in the pan below the lid.



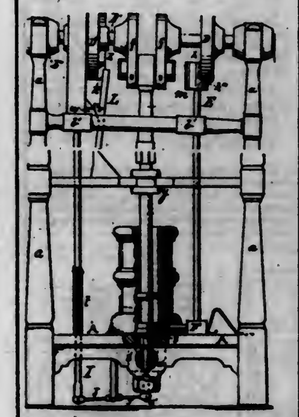
1. The combination, with the dust-pan lid, of the spring E, jointed to the rear of the lid, projecting into the handle B, and formed with a foot-piece, *e*, substantially as and for the purposes set forth.

2. The dust-pan lid C, provided with a trap-channel, G, substantially as and for the purpose set forth.

166,830. COLTERS. Gilbert C. Lyon, Clarinda, Iowa. [Filed June 12, 1875.]

Brief.—A rolling colter with a spring-arm from the rear.

A plow attachment consisting of the combination of the rolling colter *c* and the adjustable spring bar *c*, with oblong guide-loop *e*, clamp *d'*, and plow-beam, substantially as shown and described.



166,831. HALTERS AND BRIDLES. John McKibben, Lima, Ohio. [Filed Dec. 20, 1874.]

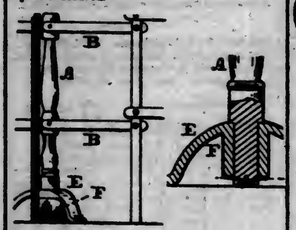
A fastening for halters consisting of the side bars A' B', cross-bars *f e*, and end bar *b'*, and having the loop *m* at right angles to the plane of the frame, substantially as shown and described.

166,832. AIR-PUMPS. Charles F. Moll and Jos. H. Althelde, Quincy, Ill. [Filed June 26, 1875.]

Brief.—The valves are operated by mechanical means.

1. In an air-pump, the sliding-wheel D, provided with the ovall A, having the inclines *b''* and *b'''*, for the purpose of operating the lever E, in combination with the admission-valve F, substantially as set forth.

2. The combination of the wheel D', spring-bar L, having stop *n*, frame H, having stop *n'*, rod I, lever J, and cam *r*, substantially as set forth.



3. The lever J, in combination with the rod I, valve K, part *s*, and plunger N, substantially as set forth.

4. The slot *o'*, in combination with the part N, substantially for the purpose set forth.

5. The wheels D D', having the cranks *b M*, in combination with the cam *r*, lever E, spring-bar L, frame H, rod I, lever J, and valves F and K, substantially as set forth.

166,833. CLOTHES-DRIERS. George Myers, Philadelphia, Pa. [Filed Sept. 20, 1875.]

Brief.—The metallic base has a heavy depending socket or boss, in which the central post is secured.

The frames B, central beam A, and metallic base E, in combination with the boss F, depending or projecting downward from the central portion of the base, substantially as and for the purpose set forth.

166,834. GLOVE-FASTENING. Daniel R. Pratt, New York, N. Y. [Filed Aug. 26, 1875.]

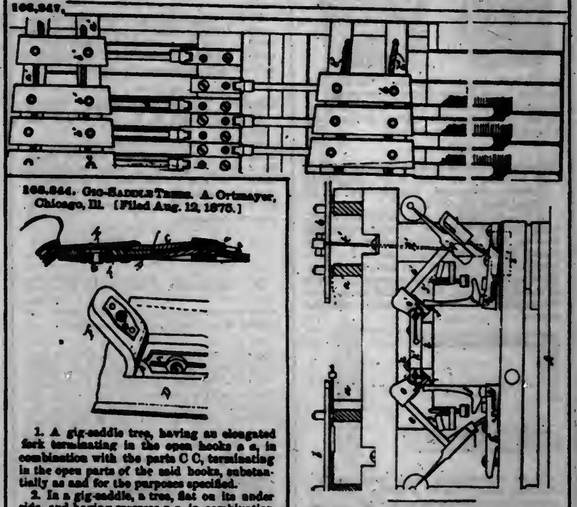
A railway-car spring the external and internal surfaces of which are recessed in globe-shaped form, so that when compressed each globe in the series may rest and impinge upon the other, as and for the purpose herein set forth.

166,835. GAS-STOVES. Daniel R. Pratt, New York, N. Y. [Filed Aug. 26, 1875.]

1. A car-spring, constructed of india-rubber, and of spiral form externally and internally, substantially as and for the purpose set forth.

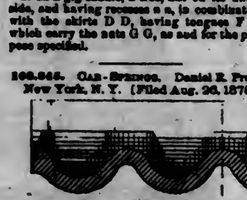
2. A railway-car spring, constructed of india-rubber, and having the external and internal spirals to conform one with the other its entire length, as set forth.

166,836.



166,837. KEY-BOARD HARMONICONS. Geo. Rimbach, Boston, Mass. [Filed Dec. 28, 1874.]

Brief.—The hammers and their plates are arranged in two opposite series; the second key-plates next adjacent in pitch being alternated from one series to the other, to give space in the key-board.

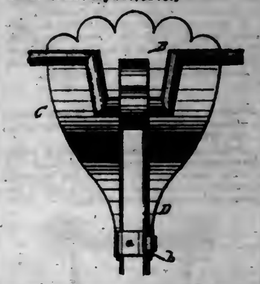


1. The combination of the perforated plates held in position by covered pins *c*, and resting on a non-concussive support, *b''*, with hammers and the softener adapted to be interposed between the hammers and plates, as and for the purpose set forth.

2. The two series of plates, arranged as described, in combination with key-levers *i f*, jacks *f' f''*, hammer-levers *e e'*, and hammers *d d'*, substantially as described.

166,837.

166,844. GIG-SADDLE TREES. A. Ortmayer, Chicago, Ill. [Filed Aug. 12, 1875.]



1. A gig-saddle tree, having an elongated fork terminating in the open hooks *a a*, in combination with the parts C C, terminating in the open parts of the said hooks, substantially as and for the purposes specified.

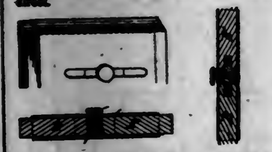
2. In a gig-saddle, a tree, flat on its under side, and having recesses *a a*, in combination with the skirts D D, having tongues F F, which carry the nuts G G, as and for the purpose specified.

166,845. CAR-SPRINGS. Daniel R. Pratt, New York, N. Y. [Filed Aug. 26, 1875.]

166,846. DASH-PROTECTORS FOR SEWING-MACHINES. Elizabeth F. Shaw, Brooklyn, N. Y. [Filed Sept. 17, 1875.]

1. The shield or protector C, adjustably secured to the pitman A, substantially as and for the purpose set forth.

2. The improved fastening, consisting of the part *a*, having perforation *b*, and the part *a'*, in combination with the shaft D and protector C, substantially as and for the purpose herein specified.

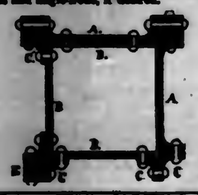


168,849. MUFF-BLOCK FORMER. R. Sirrot, Buffalo, N. Y. [Filed June 26, 1875.]

The muff-former composed of the blocks c, having strips B, the blocks D, screw-rod G, and central handles F F, all constructed, combined, and arranged to operate substantially as and for the purpose set forth.

168,850. BRACKET-TABLET HOLDERS. Daniel M. Sommers, New York, N. Y., assignor to Overton Cleveland, Jersey City, N. J. [Filed Sept. 16, 1875.]

Brief.—The tablets or blocks of creative material may be projected from or withdrawn into the tube or case by means of a reciprocating block, or combined block and tube, to which they are attached. An actuating thumb-piece passes down through a longitudinal slot in the outer tube, to connect with the reciprocating block, or with the creative material direct.

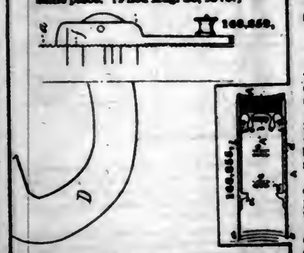


1. An creative-tablet holder consisting of a flat tube provided with a sliding base-block armed with a sleeve, substantially as described.

2. An creative-tablet holder having an interior sliding block, an actuating thumb-piece, and a roughened exterior surface, substantially as and for the purposes described.

3. An creative-tablet holder having an open-ended slot, in which the thumb-piece slides, whereby it is adapted to receive a tablet provided with a permanently-attached actuating thumb-piece, substantially as described.

168,851. WROUGHT-IRON POSTS. Leon Sanderin, Milwaukee, Wis. [Filed Mar. 26, 1875.]



Brief.—A metal column consisting of rolled plates and angle-irons with square metal bars at the outer corners, all riveted together. Channel-bars may be used in place of the plates and angle-irons, if desired.

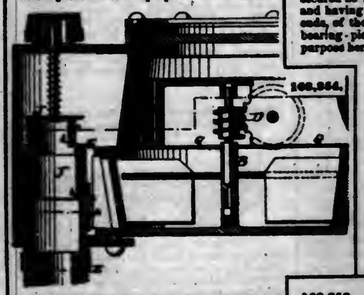
1. A metal post consisting of plates B, angle-irons C, and metal bars E at the corners, riveted together with rivets D, substantially as set forth.

2. A metal post consisting of channel-irons A and metal bars E, substantially as described.

168,852. PIPE-WRENCHES. W. K. Stevens, Mansfield, Ohio, assignor of two-thirds his right to Jos. A. Niman and John B. Niman, same place. [Filed Aug. 26, 1875.]

The handle A, provided with the toothed surface *f*, biting-plate E, and stud *h*, in combination with the pivoted adjustable hook D, slotted toothed plate B, and clamp-screw *c*, substantially as shown and described.

168,853. RAILROAD-CROSSINGS. Walt J. Stillman, Troy, N. Y. [Filed July 30, 1875.]



Brief.—A railway-crossing in which the flange-space between rail and crossing-planking is filled by a yielding plate of sufficient rigidity to sustain the weight of ordinary passing vehicles, but which will be depressed by the car-wheel flanges, and allow them to pass unobstructed.

The combination of the feeder B, or its equivalent, with the plank bed of a railroad-crossing and springs or elastic plates, arranged as and for the purpose set forth.

168,854. WATER-METERS. De Witt C. Taylor, Brooklyn, N. Y. [Filed July 19, 1875.]

Brief.—The water is admitted by a double tubular valve, as constructed as to divide the current in a fixed proportion, whatever the pressure, so that a small part of the current registers for the whole. Slotted rings, one inside the valve and one outside its case, enable adjustment of the proportion to be made.

1. In a water-meter, the valve *J*, fitted into the inlet-pipe B, to be affected by the entire stream of water, and to regulate the sizes of two openings, *a d*, one of said openings allowing water to enter the registering part of the meter, while through the other opening water passes through or past the meter without affecting the registering mechanism, substantially as specified.

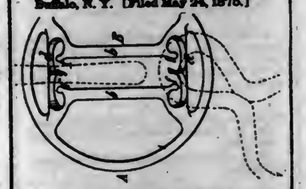
2. The combination of the regulator *f* with the inlet-pipe B, which has an opening, *a*, into the meter, and with the valve *J*, substantially as herein shown and described.

3. The combination of the regulator *h* with the valve *J*, having the opening *d*, and with the inlet-pipe B of a water-meter, substantially as and for the purpose specified.

4. In combination with a water-meter containing the diaphragm G, the curtain or guard H, substantially as herein shown and described.

5. The tubular vertically-movable valve *J*, constructed with the opening *d*, and combined with the inlet-pipe B, which has the opening *a*, all substantially as specified.

168,855. BRACELETS. John N. Thornton, Providence, R. I. [Filed Nov. 9, 1874.]



1. A bracelet provided with fastening device, and all made from a single piece or strip of metal, substantially as and for the purpose set forth.

2. The bracelet A, having the ends A' formed with guides *d* and projections or bands *c*, and the end A', having an indentation or head, *b*, and notches *a*, substantially as and for the purpose set forth.

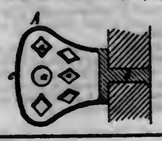
3. The bracelet A, having shoulders or steps *a* and heads or indentions *b'* on one end, and projections or steps *b'* on the other, substantially as and for the purposes set forth.

4. In a bracelet made from one piece or strip of metal, the combination of the guides *d*, indentations or heads *c* and *b*, and notches *a* with the steps *a b'* and heads *b'*, substantially as and for the purposes specified.

168,856. TRACE-CARRIERS. Jas. Thornton, Wellerville, assignor to Josiah Letchworth, Buffalo, N. Y. [Filed May 24, 1875.]

The combination, with the base-ring A, of the elevated frame B, provided with opening *a*, cross-bar *d*, and projecting steps *f f g*, substantially as and for the purpose herein before set forth.

168,857. BUBBLE-EYES. James Thornton, Wellerville, assignor of one-fourth his right to Pratt & Letchworth, Buffalo, N. Y. [Filed May 24, 1875.]



The combination, with the boring-pieces *c*, secured at their upper ends to the headstall, and having the reins attached to their lower ends, of the bit E and arms *a*, pivoted to the bearing-piece *c*, substantially as and for the purpose herein before set forth.

168,854.

168,857.

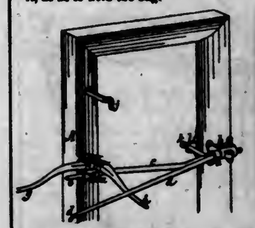
168,858. STOVE-DOOR KNOBS. Pliny B. Washburne, Buffalo, N. Y., assignor of one-half his right to Charles A. Babcock, same place. [Filed June 15, 1875.]

1. A ventilated metallic knob for doors of stoves, consisting of a hollow perforated head, A, and shank *b*, cast in one piece, substantially as and for the purpose hereinbefore set forth.

2. The combination, with the hollow perforated head A and shank *b*, of the hole *c*, to receive the end of a riveting-tool, substantially as hereinbefore set forth.

168,859. SAD-IRONS. Thomas D. West, Cleveland, Ohio. [Filed Apr. 22, 1875.]

Brief.—The iron has polishing-surfaces of different forms, and a handle held in sockets on the standards.



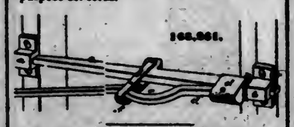
1. A combined end and polishing iron, provided with the ironing-surface D and polishing or burnishing points *a b'* upon its under face, substantially as shown.

2. The combined end and polishing iron herein described, having its bottom face provided both with ironing and polishing surfaces, the ironing-surface D being formed on a plane at an angle to the plane of the burnishing-points *a b'*.

3. The removable handle consisting of the combination of one arm provided with a ring-formation, the other arm flat at the top, and provided with a recess for embracing the handle, and a screw, *b*, with the wooden handle B, all arranged substantially as described.

168,860. MAIL-BAG CATCHERS. Alfred B. Whipple, Auburn, N. Y. [Filed Sept. 27, 1875.]

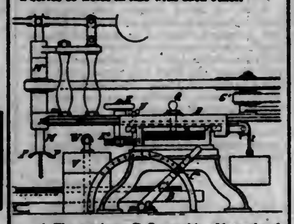
Brief.—Two arms are rigidly attached at right angles, and pivoted where they join. The bag-strap, entering the catch, strikes against one, bringing the other round behind it, so as to hold the bag.



In a mail-bag catcher and holder, the combination of pivoted rods *g d* and arms *g h*, substantially as and for the purpose set forth.

168,861. MAIL-BAG CATCHERS. Alfred B. Whipple, Auburn, N. Y. [Filed Sept. 27, 1875.]

Brief.—The bag slips between the fixed and movable arms, and strikes the sliding link, which operates so as to draw in the movable arm, grasping the bag.



In a mail-bag catcher and holder, the combination of fixed bar *a*, movable bar *d'*, and swinging link *f*, substantially as and for the purpose set forth.

168,861.

168,862. BORING-MACHINES. Moses G. Wilder, Meriden, Conn., Wm. H. McNeil, Lancaster, Mass., and H. C. Tyler, Deep River, assignors to Pratt, Read & Co., Deep River, Conn. [Filed Apr. 6, 1875.]

Brief.—The material is held upon a vertically-adjustable table, while the tool moves longitudinally, enabling the operator to bore a series of holes in line with each other.

1. The carriages D G, capable of lateral and longitudinal movement, boring-arbor M, supporting means O', depressing means O, sleeve M', and train of belt and pulley gearing, for communicating power thereto in all positions, combined and arranged for joint operation, substantially as and for the purposes herein set forth.

2. The guide-pin Q and guide-groove *r*, in combination with the carriages D G, boring-arbor M, weight O', lever Q, sleeve M', and means for communicating power thereto in all positions, combined and arranged for joint operation, as and for the purposes herein set forth.

3. In combination with the carriages D G, capable of moving upon each other, as shown, the boring mechanism M' M' P, the adjustment O O' therefor, and the pulley G', the confining device U, adapted for fixing the carriages D and G rigidly together for the boring of the line of straight holes, as specified.

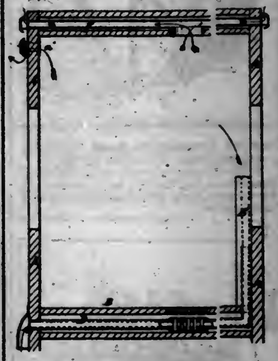
4. The hinged tilting table B *b*, and adjusting-lever and cam-shaft C C', in combination with the boring-arbor M and means for operating it in its several required positions, as herein specified.

5. The bar V and screw W, in combination with the tilting table B, and boring-tool M, as herein specified.

6. The weight L and connected hook-wire X, in combination with the carriages D G, guide-pin Q, and guiding groove or slot *r*, as and for the purposes herein specified.

168,863. MOLDS FOR PRESSING GLASS LAMP-CHIMNEYS. Thomas B. Atterbury, Pittsburg, Pa., assignor of one-half his right to Jas. S. Atterbury, same place. [Filed Oct. 6, 1875.]

1. The mold for making seamless lamp-chimneys, composed of the bottom section A, bolted and hinged together vertically, so as to open and close the intermediate section B and the top section C, the several sections being separated horizontally, so as to be lifted from off one another vertically, substantially as described.



2. The cut-off knife-edge or bead *a* at the upper edge of the reservoir A' in the base-section A, constructed and arranged substantially as and for the purposes described.

3. Mold-base A, having the reservoir A', and supplied with the cut-off *a*, substantially as and for the purposes set forth.

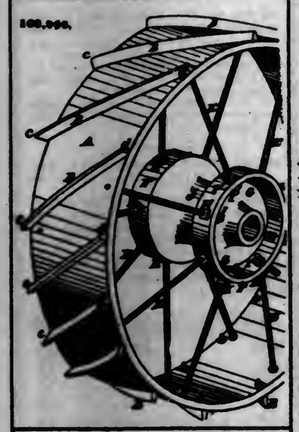
4. As a new article of manufacture, a seamless pressed-glass lamp-chimney, substantially as described.

168,864. VENTILATING APPARATUS. John C. Estes, Cold Spring, N. Y. [Filed June 5, 1875.]

Brief.—The pipe conveying the cold air from the outside passes through a drum, thereby causing the air in the pipe to become heated before entering the room. The air enters the room high enough to prevent any draft upon the occupants. The foul air escapes from the upper part of the room, as shown.

The inlet-pipe D, having a drum, S, pierced with flues, and located between the register and the hot-air flue, in combination with the vertical pipe E, which delivers its air into the room vertically and above the heads of the occupants, substantially as described.

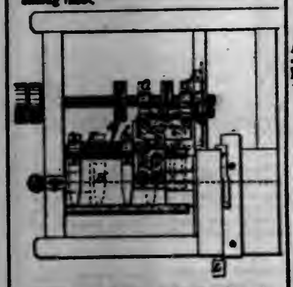
168,865. FOLDING CHAIRS. James H. Bean and Richd. W. Box, Painted, N. Y. [Filed May 1, 1875.]



The folding chair composed of the swinging seat A, the front and rear legs B and C, provided, respectively, with the pins or rounds *c* and *b*, for holding the legs locked when intersected, as shown and described.

168,866. TRACTION-WHEELS. William O. M. Berry, San Francisco, Cal. [Filed July 29, 1874.]

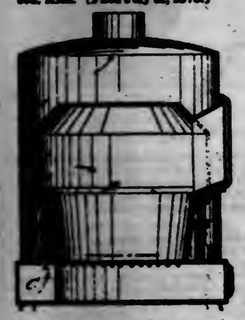
Brief.—Spokes provided with contracting nut, and rim obliquely ridged, so that one ridge shall not leave the ground until the next reaches it.



The hub F F, depressed at J, and having the grooves O, in combination with the spokes E, nuts H and I, and the rim A, having ribs B, all substantially as and for the purpose set forth.

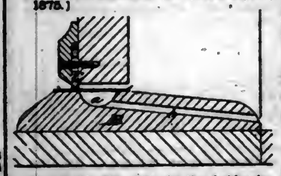
168,866.

168,867. Ribbening-Machines. H. F. Bohn, Clinton, Iowa. [Filed Mar. 26, 1875.]



Brief.—The tenon is split by an oscillating circular saw, and the part to be removed cut out by a revolving boring-tool carried upon a sliding table.

1. The combination of the slide H, having the rotating mandrel F, with the oscillating saw-carrying standard G, substantially as and for the purposes set forth.

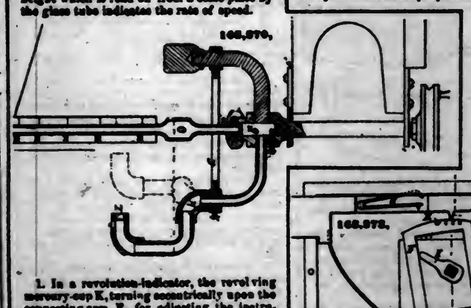


2. The combination of the slide H, gage-plate Q, and oscillating standard G, substantially as and for the purpose set forth.

168,868. Stoves. Robt. S. Bostwick, Jackson, Mich. [Filed July 22, 1875.]

The combination, with ash-pit having air-inlet, bottom grated fire-pot and cooling, of the vertical flange E and the channel C, having inlets b and outlets a, as and for the purpose specified

168,869. Weather-Strips. Francis A. Bradshaw, Lebanon, Mo. [Filed Sept. 4, 1875.]



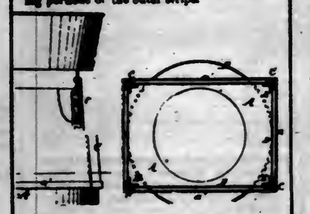
The combination, with the threshold-strip, of a perforated plate, covering draining-groove for preventing the entrance of dirt, substantially as specified.

168,870. Speed-Measures. Edwd. Brown, Philadelphia, Pa. [Filed Apr. 16, 1875.]

Brief.—A speed-measure consisting of a central glass tube, having at its base a bellows-arm extension, which is so arranged that it may be placed eccentrically to the central tube. Both the central tube and bellow-arm extension are partially filled with mercury, the central tube also being filled with a colored liquid. When the device is made to revolve, the mercury in the arm is caused to rise by centrifugal force, and that in the central tube to fall, thus causing the colored liquid also to fall. The height which is read off from a scale-plate by the glass tube indicates the rate of speed.

168,870.

1. In a revolution-indicator, the revolving mercury-cup K, turning eccentrically upon the connecting-arm E, for adjusting the instrument to the scale, substantially as described.

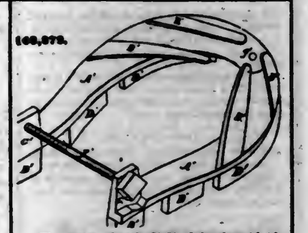


2. In a revolution-indicator, the combination of the revolving mercury-cup K with the turn L, pointing radially to the central glass tube.

3. In a revolution-indicator, the combination of the revolving mercury-cup K, the connecting-arm E, the strap G, and adjusting-screw b', substantially as herein described.

4. In a revolution-indicator, the combination of the revolving mercury-cup K, the connecting-arm E, and the enlargement O of the central glass indicating-tube, substantially as herein described.

168,871. Lamp-Chimneys. G. M. Ball, New Baltimore, N. Y. [Filed Sept. 17, 1875.]

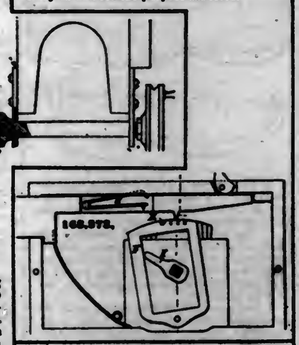


Brief.—The inner strips are rounded at their upper ends, to enter apertures formed by bending portions of the outer strips.

The combination, with flanged plate A and angle-strips C, of the angle-strips E, rounded at the upper ends, as and for the purpose specified.

168,872. Horseshoes. Minha M. Bemgan, Rochester, Mass. [Filed May 11, 1875.]

168,873.

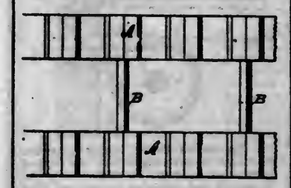


The upturned ends C' C' of the shoe A' A', the holders B' B' B' B', the long-fixed calks D' D', all constructed as set forth, for the purpose specified.

168,872. Combination-Locks. Friend J. Chapman, McLeansborough, Ill., assignor to himself and Jos. R. Beddall, same place. [Filed May 1, 1875.]

In a combination-lock, the pivoted notched tumblers, constructed as described, the notch in the tumbler operated by the longest arm having an incline on one side, in combination with the arms I, of different lengths, working in the hollow spaces in the tumblers, substantially as and for the purpose set forth.

168,872.



168,874. Opera-Chairs. Irah Chase, New York, and Geo. M. Bell, Green Point, N. Y. [Filed Aug. 14, 1875.]

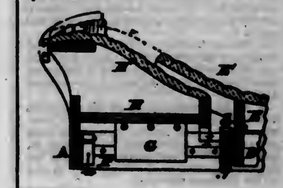
In combination with the seat B, pivoted at *c*, the telescopic braces having their lower ends curved backward and pivoted to the lower part of the frames A A and to the front of the seat, as shown and described, for the purpose specified.

168,876. Folding Ladders for Firemen. John C. Christinger, Bristol, Conn. [Filed Apr. 8, 1875.]

Brief.—A hinge-jointed folding ladder, wherein the pieces of the joints form also the rounds of the ladder.

The hinge-joint rails A A, having pieces of the joints, extending from rail to rail, to form the rounds B, in the particular manner shown and described, and for the purpose set forth.

168,876. Tool-Handles. Thos J. Close, Philadelphia, Pa. [Filed Jan. 28, 1875.]



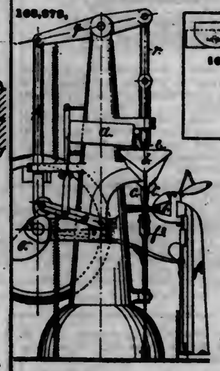
Brief.—The blade is attached to the handle by means of two clamping-plates, one of which is provided with hooks, and the other with eyes. The blade is fastened in place by passing the hooks through suitable openings in the handle and blade, and placing the eyes upon the other plate in line to receive the longitudinal part of the hooks, when, by striking the bottom of the eye-plate with a suitable implement, the plates will be drawn together. The blade can be readily detached by a blow upon the top of said plate.

The tool-handle and blade herein described, secured by clamping-plates having a drawing connection, substantially as and for the purpose set forth.

168,877. Sofa-Bedsteads. Jos. L. Closterman, Cincinnati, Ohio. [Filed Aug. 10, 1875.]

Brief.—The inner part of the sectional head-rest is movable longitudinally, to bring it in line with the other half. It is also provided with a stud, which slides under the pivoted portion of the mattress-frame, and holds it in position.

168,877.



1. In combination with the fixed frame A and folding frames D, *d d'*, and E of a bed-lounge, the longitudinally-shifting head or bolster frame H, substantially as herein described and illustrated.

2. The combination of fixed frame A *f f*, frames D, *d d'*, and E, shiftable bolster-frame H, and stop I, when the latter is so located as to prevent rotation of the inner frame D, as explained.

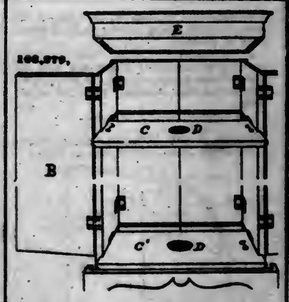
168,878. Machines for Driving Tacks. John B. Cobb, Mystic River, assignor of one-half his right to L. W. Morse, Jr., Groton, Conn. [Filed Sept. 10, 1875.]

Brief.—The tacks, in bulk, are placed in a hopper or receptacle, out of which they pass singly into an inclined channel, at the lower end of which they are removed by a reciprocating magnet, and deposited in an elastic tube beneath the plunger.

168,878.

1. The combination, with the elastic fingers C C, of the reciprocating magnet *d*, for delivering and supporting the tacks under the plunger, substantially as described.

2. In combination with the reciprocating magnet *d* and elastic fingers C C, the vertically-reciprocating plunger B, arranged to operate together, substantially as and for the purpose set forth.



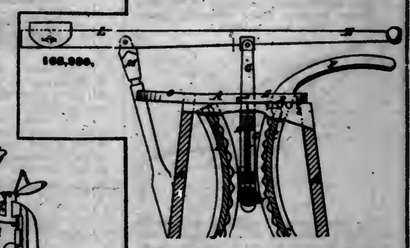
3. The sliding clamp *f*, in combination with the reciprocating spring-pawl h and rest *f'*, constructed to support the article to be tacked, and to automatically feed the same to the driving device, substantially as described.

4. In combination with the driving-wheel *i*, the cam K, arranged to impart reciprocating motion to the magnet *d*, the feeding device, and hopper A, substantially as and for the purpose specified.

5. In a tack-driving machine, the combination of the following elements, viz: a receptacle from which the tacks are automatically delivered to the driving device, a reciprocating magnet by which the tack is placed under the plunger, a plunger for driving the tacks home, and an automatic feeding device, the whole operating in succession, substantially as herein described.

168,879. Folding Washstands. Lewis A. Colbert, Baltimore, Md. [Filed Mar. 29, 1875.]

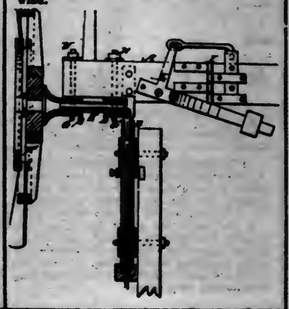
168,879.



A wardrobe composed of the back pieces A A, end pieces F F, top E, bottom C', shelf C, and doors B B, all constructed, arranged, and operating substantially as described, for the purposes set forth.

168,880. Washing-Machines. John Henry Conaway, Nelsonville, Ohio. [Filed Oct. 2, 1875.]

Brief.—A curved stationary rubber; a curved adjustable pivoted rubber, provided with a lever; and a cash having a rubber roller and a clamping-bar, reciprocated between the curved rubbers by a lever having an adjustable balancing-weight.



168,880.

The combination of the curved stationary rubber B, the curved adjustable pivoted rubber C, provided with the lever F, the cash G, provided with the rubber roller H and the clamping-bar I, and the lever L, provided with the adjustable weight N, with each other and with the cash-bar A, substantially as herein shown and described.

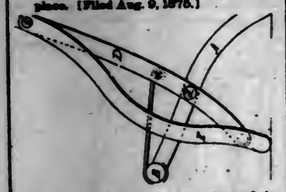
168,881. Windmills. John Cook, Harlem, Ohio. [Filed Aug. 26, 1875.]

Brief.—The crank-shaft bearing is connected to the horizontal beam which supports the machine in a simple way, by means of stirrups or yokes. There is also a joint in the beam for the tail-vane to swing around out of the wind when it blows too strong, in combination with a weighted lever for keeping the vane in the wind.

1. The shaft-bearings D, secured to the beam A by the straps C and nuts H, substantially as specified.

2. The combination of the weighted elbow-lever I, and connecting arm or link with the pivoted beam A, vane J, and the wheel F, all constructed and relatively arranged as set forth.

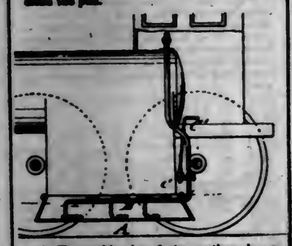
168,889. BOOTS. Alfred A. Canning, South Bingham, Mass. [Filed May 11, 1875.]



1. As an improved manufacture, a boot-leg provided with pulling-pockets B B, substantially as described.

2. The pocket-piece C, inserted at one end within the side seam, and connected therewith, as set forth.

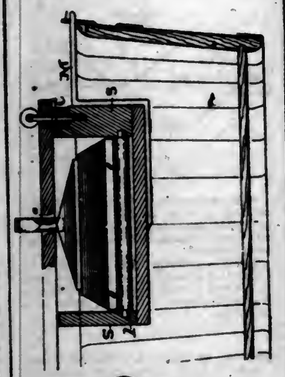
3. The pocket-piece C, inserted at one end within the side seam, in combination with the welt c, terminating at its upper end at the lower edge of the pocket-piece, all being as represented and described, whereby the part of the pocket-piece within the seam becomes a welt thereto, as well as a connection of the pocket-piece with the boot-leg.



168,890. FOLDING CHAIRS. Isaac N. Dean, New Haven, Conn., assignor to the New Haven Folding-Chair Company, same place. [Filed Aug. 9, 1875.]

The combination, in a folding chair, of the rear leg A, extending up and forward to support the front of the seat C, the back D, extending down and pivoted to the rear leg, and the front leg E, rigidly attached to the back piece below the pivot, and extending up and backward, and rigidly attached to the back above the seat, substantially as described.

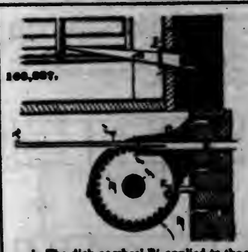
168,891. APPARATUS FOR CLEANING LOCOMOTIVE ASH-PANS. Paul K. Dealy, St. John, Canada. [Filed Sept. 17, 1875.]



Brief.—Water is allowed to flow on the ashes, after which steam-jets are applied to clean the pan.

1. The combination of a locomotive ash-pan, by water and steam conveying pipes, with the boiler, to throw water or steam on the pan for heating and cleaning the same, substantially in the manner and for the purpose set forth.

2. The water and steam conveying pipes, passing longitudinally through the ash-pan, and being provided with hook-yard-hose branch pipes, extending to the bottom to throw the water and steam on different points of the pan, substantially as specified.

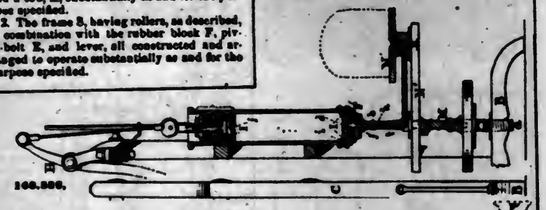


168,892. WASHING-MACHINES. Almon Delamater, Townville, Pa. [Filed July 6, 1875.]

1. The frame S, having ends H and the bar M, in combination with the pivoted staple m and a tub, A, substantially as and for the purpose specified.

2. The frame S, having rollers, as described, in combination with the rubber block F, pivot-bolt E, and lever, all constructed and arranged to operate substantially as and for the purpose specified.

168,893.



1. The disk or wheel B', applied to the shutter-hinge, in combination with the friction strap or spring b' and the sliding bar or rod H, applied and operating to open and close and fasten the shutter from the inside, as described.

2. The combination with the sliding bar H, operating substantially as described, of the forked lever h, for operating the pivoted slats of the blind, the combination and arrangement operating substantially as shown and described.

3. The combination with the sliding bar H, by means of which the shutter is opened, closed, and fastened, as described, of the sash lock or arm I, having spur i, arranged and operating to lock the window-sash, as specified.

168,894. AIR-PUMPS. John H. Hills, Peoria, Ill. [Filed Mar. 10, 1875.]

Brief.—Valves in piston and barrel are made reversible for purposes of exhausting or compressing. A ball-and-socket connection, adjustable by means of a spindle and screw, makes it easy to attach and detach, to and from the barrel the usual receivers, &c. Common fruit-jars and lamp-chimneys are fitted thereto by means of suitable plugs and packings and hose-connections, for purposes of scientific illustration.

168,895. WIRE-FENCE RAILS. Levi M. Devore, Yellow Creek, Ill. [Filed Aug. 18, 1875.]

A wire-fence barb made from a single piece of wire, bent so as to form loops to embrace the fence-wire and retain the barb thereon, substantially as described.

168,896. COMBINED SHUTTER-WORKING, BLIND-SLAT ADJUSTING, AND SASH-FASTENING. Henry J. Diedrichsen, Appleton, Wis. [Filed Feb. 12, 1875.]

Brief.—A sliding bar or rod, having an operating-knob, and with two or three cogged teeth near the middle, engages with a cogged wheel or disk in a suitable housing, the larger part of the disk being surrounded by a friction band or spring, on which the bar works with a sliding movement, to open, close, and fasten the shutter from inside the room. A bifurcated lever, attached at one end to the sliding rod, and at the other to the blind-slat rod, adjusts and operates the pivoted slats of the blind, while a suitable arm, provided with an inwardly-projecting spur, is likewise attached to the sliding bar, and serves to lock the window-sash in desired position.

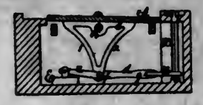
168,897. COMBINED SHUTTER-WORKING, BLIND-SLAT ADJUSTING, AND SASH-FASTENING. Henry J. Diedrichsen, Appleton, Wis. [Filed Feb. 12, 1875.]

Brief.—A sliding bar or rod, having an operating-knob, and with two or three cogged teeth near the middle, engages with a cogged wheel or disk in a suitable housing, the larger part of the disk being surrounded by a friction band or spring, on which the bar works with a sliding movement, to open, close, and fasten the shutter from inside the room. A bifurcated lever, attached at one end to the sliding rod, and at the other to the blind-slat rod, adjusts and operates the pivoted slats of the blind, while a suitable arm, provided with an inwardly-projecting spur, is likewise attached to the sliding bar, and serves to lock the window-sash in desired position.

1. In combination with the nozzle F', the reversible valve-box I and the piston G, with its reversible valve-box I, substantially as and for the purposes described.

2. The valve-box I in the nozzle, when provided with a screw-cap or valve-cover, d, and inclosed valve, as constructed so as to be reversible, for exhausting or condensing, in connection with a corresponding valve-box in the piston, substantially as and for the purposes described.

3. The combination, by means of the bulb b of the nozzle F', with the socket h of the pipe f of the pneumatic receiver-plate F', with its table F'', by which the receiver-plate is readily attachable to and detachable from said nozzle F.



4. The combination, by means of bulb b and socket h, of the nozzle F', the pipe f, the metal disk of the ordinary air-pump, and the rotary table R, substantially as and for the purposes described.

5. As an attachment to an air-pump, the fruit-jar L, of a well-known form—i. e., having a screw-thread around its neck, an outer screw-cap, c, in combination with a cover, a, provided with a screw-socket to receive the cap-neck connection c, substantially as and for the purposes described.

6. The combination, with the nozzle F', of the hose e, pipe f, provided with thread to receive the disk g, cork K, provided with the rubber packing p, glass Q, and disk g.

168,898. STREET-RAILWAY SWITCHES. C. B. Evans, New Orleans, La. [Filed Apr. 23, 1875.]

Brief.—An improvement in that class of street-railway switches in which the rails are shifted by a vibrating platform operated by weight of horse. The cast-iron platform is detached from the working mechanism in the pit, to permit of ready access to the same, being merely placed upon the central rod and retained by saddles. An anchor-block is attached to the lower end of the vibrating arm, which operates by its weight and friction to hold the switch in the position to which it is shifted.

1. The table or platform A, having lugs a a', shaft B, and journals b b', the same being combined and arranged to operate substantially as described.

2. The cross-bar c, with brackets 1 2, shaft B, with journals b b', the trip-lever d, arm C, vertical shaft D, all in combination with the platform A, as and for the purpose specified.

3. The platform A, cross-bar c, having brackets 1 2, shaft B, having journals b b', trip-lever d, arm C, vertical shaft d, lever e, and anchor-block E, the same being combined and arranged to operate substantially as described.

168,899. PICKET-PINS. Jos. D. Field, Nine Rapids, assignor to himself and J. D. Edmond, Leavenworth, Kans. [Filed Aug. 26, 1875.]

A picket or tent pin having the spiral shank A and eye E, as shown and described.

168,900. STREET-RAILWAY SWITCHES. C. B. Evans, New Orleans, La. [Filed Apr. 23, 1875.]

Brief.—An improvement in that class of street-railway switches in which the rails are shifted by a vibrating platform operated by weight of horse. The cast-iron platform is detached from the working mechanism in the pit, to permit of ready access to the same, being merely placed upon the central rod and retained by saddles. An anchor-block is attached to the lower end of the vibrating arm, which operates by its weight and friction to hold the switch in the position to which it is shifted.

1. The table or platform A, having lugs a a', shaft B, and journals b b', the same being combined and arranged to operate substantially as described.

2. The cross-bar c, with brackets 1 2, shaft B, with journals b b', the trip-lever d, arm C, vertical shaft D, all in combination with the platform A, as and for the purpose specified.

3. The platform A, cross-bar c, having brackets 1 2, shaft B, having journals b b', trip-lever d, arm C, vertical shaft d, lever e, and anchor-block E, the same being combined and arranged to operate substantially as described.

168,901. FLUE-SCRAPERS. Albert Fisher, Cleveland, Ohio, assignor to himself and John Faulkner, same place. [Filed Sept. 8, 1875.]

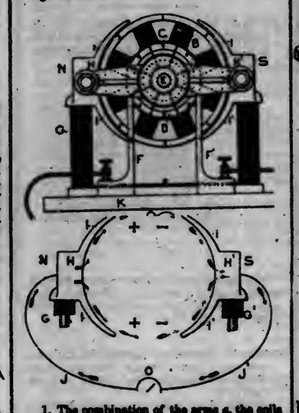
1. The scraping-blade C formed in the segment of a circle, provided with the arm c and slots c', substantially as and for the purpose shown.

2. The combination of segmental scraping-blade C, arm c, and slotted hub B B' b, substantially as and for the purpose shown.

3. The combination of the slotted hub B B' b, segmental scraping-blade C, guides D, lug or tent d, and spring E, substantially as and for the purpose shown.

4. In combination with three or more scraping-blades, C, of a flue-scraper, the spring E, constructed of a single piece of material, and provided with a number of wings or arms corresponding to the number of scraping-blades, substantially as and for the purpose shown.

5. The combination of shaft A, slotted hub B B' b, slotted arm c c', pin or stop F, two or more segmental blades, C, guides D, lugs or tents d, and spring E, substantially as and for the purpose shown.

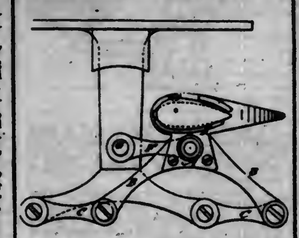


168,902. UMBRELLA-RUNNERS. Henry S. Frost, Watertown, Conn., assignor to A. N. Woolson, same place. [Filed Sept. 17, 1875.]

The runner described, provided with the cap B, arranged upon its end, so as to form the outwardly-flaring ring c, substantially as described, and for the purpose set forth.

168,903. MAGNETO-ELECTRIC MACHINES. Jim Billings Fuller, Brooklyn, N.Y. [Filed July 30, 1875.]

Brief.—The currents induced must and combine at the commutator-spring, pass through the external circuit to the other commutator-spring, and thence back through the intermediate coils. The tapering poles are designed to prevent abrupt falling off of the magnetic force.

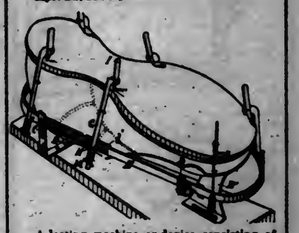


1. The combination of the arms c, the coils A, and the sectional commutator d, when the ends of the wire forming said coils are connected together, and to the commutator, substantially as set forth, said coils being caused to revolve between or near alternately opposite magnetic poles, developing electric waves or currents in said coils, and the currents developed being received and discharged continuously at the points in the wire forming said coils nearest said poles, or where the magnetic force is strongest.

2. The magnetic poles h and h', having points or angles tapering toward the neutral magnetic point, substantially as and for the purpose specified.

168,904. SEWING-MACHINES. Josiah Glines and H. W. Stiles, Fostoville, Iowa. [Filed Aug. 31, 1875.]

Brief.—The shuttle-carrier is combined with mechanism that produces parallel motion, whereby the shuttle is prevented from revolving on its own axis and twisting the thread.

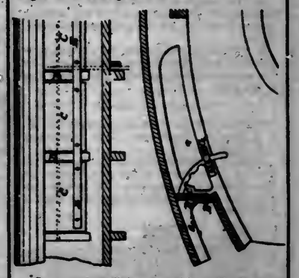


The combination, with a shuttle-carrier, of bar B, cranks C C, and the crank F, and shaft O, as and for the purpose specified.

168,905. DETONATING-CAPS FOR BLASTING, &c. Joseph Goldmark, Brooklyn, N. Y. [Filed July 14, 1875.]

1. The detonating-cap or exploder made with a perforated cover pressed upon the fulminate, for the purposes, and substantially as set forth.

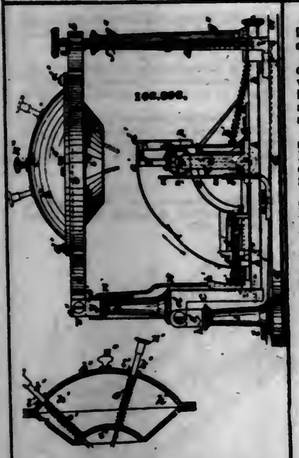
2. The detonating-cap made with a fulminate space and a contracted neck of a size to receive and hold the fuse or exploder in its proper position relatively to the fulminate, substantially as set forth.



168,906. PIECING-JACK ATTACHMENTS. Frederic Guild, Brockton, Mass. [Filed Apr. 23, 1875.]

A lasting machine or device consisting of the combination of a series of spring-levers, G, supported in guideways or loops H, carried by an adjustable truss, K, and provided with pivoted clamping-hooks I, capable of being automatically disengaged from the sole, substantially as shown, and for the purpose set forth.

168,907. CAR-VENTILATORS. A. Hamm, New York, N. Y. [Filed Jan. 20, 1875.]



Brief.—The valves are pivoted centrally and horizontally, and are joined rigidly together by a bar secured to their outside lower edges, which bar also, engaging with the projecting roof when they are open, prevents their closing in a reversed position.

In a car-ventilator, the valves C, pivoted centrally on a horizontal axis between the vertical posts D and the strip or bar B, attached to their lower edges, in combination with the car-roof having the construction shown, whereby said strip or bar acts as a stop, and holds the valves horizontal, or nearly so, when open, as shown and described.

168,908. TYPE-WRITING MACHINES. R. M. J. Hansen, Copenhagen, Denmark. [Filed Sept. 17, 1875.]

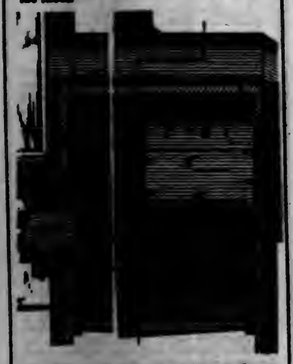
Brief.—The key-board is pivoted, the free end resting on the pivoted frame supporting the paper-carrying devices, said frame being supported by a spring. Depressing a key makes the impression on the paper over the anvil, and also depresses the paper-carrying frame, while the pawl on the base of the machine operates the ratchet, which drives a spur-wheel gearing with the center, and moves the paper the space of one letter. An indenter is provided, and when the line is full the pawls are released. The paper-carrying center falls by its own weight, and in so doing one of the spokes on the feed-wheel strikes a projecting arm, and feeds the paper the space of one line.

No. 168,899.

1. The writing-ball formed of a thin outer shell, b', and inner shell b'', united together, in combination with the keys or type-pistons b' and springs c', as and for the purposes set forth.

2. The plate b, sustained by and swinging upon the centers a, and carrying the type-writing and paper-moving mechanism, in combination with stationary spring-pawls, that operate the paper-moving mechanism.

3. The paper-holders d and centers e', swinging upon the spindle f, in combination with the center e, pinion e', ratchet-wheel e, and spring-pawls g f, as and forth.



4. The lever i' and pusher i', in combination with the spring-pawls e g and paper-holder, for the purposes set forth.

5. The rollers f' f'' and spokes f', in combination with the paper-holders d and inclined tongue or horn h', for the purposes and as set forth.

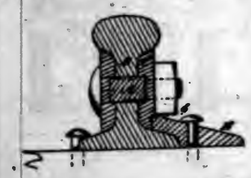
6. The index-hand s upon the shaft n, connected with the spindle f, in combination with the paper-holder d, ratchet e, and pawls e f, as set forth.

168,899. Furnaces for Locomotives. H. F. Hayden, Washington, D. C. [Filed Oct. 9, 1875.]

Brief.—Air is supplied to the front of the fire-box by means of funnel-pipes located on the outside of the fire-box. Air is also supplied to a double-walled fire placed in front of the tubes.

1. The combination, with the annular or double-walled door-casing, of the transverse air duct or tube B, arranged inside the fire-pot, and provided with the distributing-branches, substantially as described.

2. The annular or double-walled door-casing, in combination with the supply-tubes D, substantially as and for the purpose described.

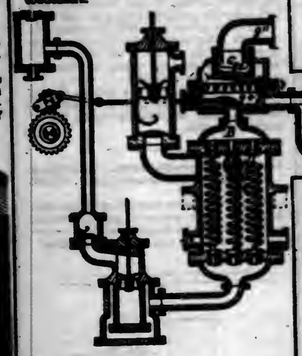


3. The air-supply tubes D, arranged and operating, in connection with the double-walled door-casing, substantially as described, in combination with the valves for regulating and controlling the admission of air, as described.

4. The perforated annular or double-walled air-duct G, forming the combustion-chamber H in advance of and around the mouths of the exit-tubes or openings, substantially as and for the purpose set forth.

5. The annular or double-walled air-duct G, in combination with the supply-pipes F, connecting it with the double-walled door-casing, as described.

6. The double-walled air-duct and combustion-chamber, in combination with the supply-pipes or tubes F and D, arranged and operating substantially as and for the purpose set forth.

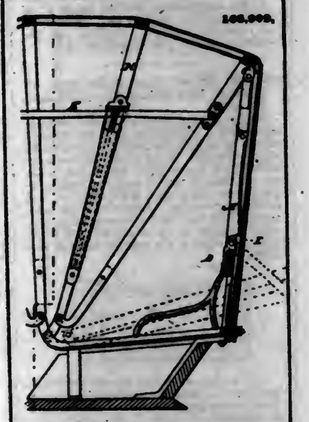


168,900. Railroad-Rail Joints. Jos. G. Holliday, Pittsburg, Pa., assignor to himself and Frank B. Hutchinson, same place. [Filed Sept. 4, 1875.]

The plate E for binding the rails on the ties, arranged under a shoulder, O, of the fish-plate, and contrived to form a lock for the nuts, substantially as specified.

168,901. Compound Condensing Apparatus for Marine Steam-Engines. John Hoyt, Springtown, Pa. [Filed July 29, 1875.]

Brief.—Steam from the engine-cylinder is divided in its passage through the chamber above the primary condenser, part of it passing into said primary condenser, and the remainder to the secondary and tertiary surface-condensers.



1. The thin spring flap-valve f', of steel, constructed as described, in combination with the valve-seat f' and guard f', substantially as and for the purpose hereinbefore set forth and described.

2. The primary surface-condenser B, in combination with the dividing-valves in the chamber G G and the secondary and tertiary surface-condensers B E and S, substantially as set forth and described.

168,902. Vehicle-Top. Fredrick H. Jury, New York, N. Y. (Filed June 12, 1875.)

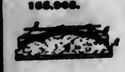
168,902.

1. The combination, with seat-hook B and hook bow C, of pivoted standards A, made each in two parts, and connected by the rule-joint, as shown and described, whereby said standards are made self-sustaining when the top is extended or raised, and will fold backward to secure the top when lowered, as set forth.

2. The projected I of standard A, arranged in combination with the seat-hook B to enable the standard to grasp the bows when folded down, substantially as specified.

168,903. Pocket-Lamps. James Kendall, Boston, assignor to Charles E. Ashcroft, Lynn, Mass. [Filed Sept. 21, 1875.]

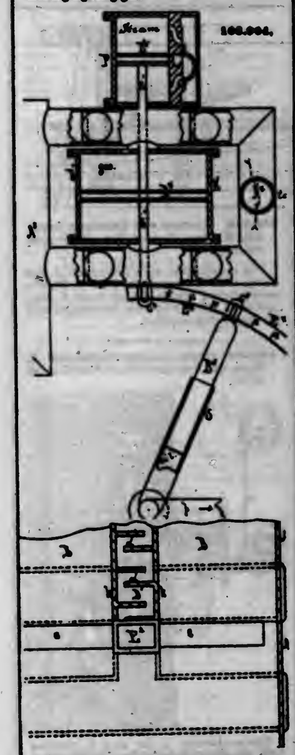
Brief.—The size of the flame can be regulated by the horizontally-swinging two-part cap.



1. The combination of the flame-gage B B', substantially as described, with a lamp, A, essentially as specified.

168,903.

168,903.



2. The combination of a flame-gage, B B', with an annular cap, C, to fit upon or be applied to a lamp, A, as set forth.

3. The combination of the lamp A, annular cap C, and flame-gage B B', all arranged and constructed substantially as specified.

168,904. Processes and Apparatus for the Manufacture of Illuminating-Gas. Moses W. Kidder, Boston, assignor to himself and Parson Noyes, Lowell, Mass. [Filed May 17, 1875.]

Brief.—Fires coal by aid of air and steam under front grate. Takes coke from front grate onto middle platform, and thence rakes it onto rear grate, in order to reduce quantity of heating-gas in generator, and at same time utilize heat of coke at firing-retorts. May strengthen draft in generator by closing damper of chimney, and using the exhaust to suck air and gases of combustion from rear furnaces into bottom of and upward through generator, and through mixing-chamber and firing-retorts. Pumps into mixing-chamber a quantity of liquid hydrocarbons proportionate to the gas produced by attaching gradatedly the piston-rod of the oil-pump to the piston-rod of the steam-cylinder, which operates the gas-exhaust pump. To stop oil-feed disconnects these piston-rods. Runs coal-stirrer through a ball resting in a concave socket. When stirrer is withdrawn, openings are closed by turning ball sideways in socket. Detachable stand-pipes at the hydraulic main have a ball, which rests in a socket on the main, and at lower ends have caps, which inclose and entirely support the rear ends of firing-retorts. Thus expansion and contraction of the parts is permitted. The outlet from generators has a valve closed by its own weight, and opened from the outside of the furnaces, and also operating automatically to relieve generators from excessive gas-pressure. General operation: Introduces steam and air at bottom of burning coal, passes resultant gases downward through mixing-chamber, where liquid hydrocarbons are admitted, and finally forces in highly-heated retorts. Mixing-chambers are shown between, at rear of, or central to and connected with generators, and may have dividing-partitions, shelves, chains, or incandescent coal. Withdraws heating-gas while making lighting-gas.

No. 168,904.

1. One or more coal-chambers, B, having grates f, and leading to longitudinal apertures e, in combination with one or more gas-mixing chambers D', having shelves d, or gas-diverting obstructions, and bottom parts B' leading to trunks D, and all covered by a trunk, E, provided with coal-feeding hoppers D', substantially as described.

2. The dividing-partitions f, having gas-passages h and externally-squeezed valves i, in combination with the trunk E, coal-chamber B, and gas-mixing chambers D', substantially as described.

3. One or more coal-chambers, B, having grates f, and leading to longitudinal apertures e, in combination with one or more gas-mixing chambers D', provided with shelves d, or gas-diverting obstructions, and bottom parts B', leading to inclined retorts D', and with a trunk, E, provided with coal-feeding hoppers D', substantially as described.

4. The combination, in a gas apparatus, of one or more trunk-covered coal-chambers, B, having grates f and apertures e, and one or more gas-mixing chambers, D', the vertical trunk or trunks D, and longitudinal gas-flue I and flue L, the inclined retorts D', the rear coke-chamber B', having grates f', and a table or bed-plate, A', between the front and rear grates, substantially as described.

5. The combination, in a gas apparatus, of one or more trunk-covered coal-chambers, B, having grates f and apertures e, and one or more gas-mixing chambers, D', the inclined retorts D', the rear coke-chamber B', having grates f', and a table or bed-plate, A', between the front and rear grates, substantially as described.

6. The combination, in a gas apparatus, of one or more trunk-covered coal-chambers, B, having grates f and apertures e, and one or more gas-mixing chambers, D', the rear coke-chamber or furnace B', having grates f' and a table or bed-plate, A', between the front and rear grates, substantially as and for the purpose described.

7. The open-bottom socket c', and the ball-H and bar b', constructed as described, with a hole in the ball for the bar B', in combination with the coal-chamber, and capable of turning to close the aperture e, and to expose the latter to the hole in the ball, and to permit the insertion of the bar to the coal-chamber, substantially as described.

8. The combination, with the stand-pipes B', of the caps or heads P, connecting and supporting the retorts D', and the balls R and sockets c', for adjustably and removably connecting the stand-pipes with the retorts and with the hydraulic main, substantially as described.

9. The combination, in a gas apparatus, of an adjustable hydrocarbon or oil-feeding device, a gas-exhausting device, and a fuel and a single mechanism, operating both the fuel and exhaust, substantially as described.

10. The valve-box B', and its valve f and seat c', in combination with the cock-plug X and Y, and with the trunk E and coal-chamber B, substantially as described.

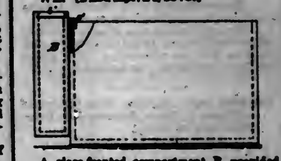
11. The combination of the hydrocarbon-feeding device and the gas-exhausting device, whereby the feed and exhaust of the retorts are proportionately regulated, substantially as described.

12. The gas-exhausting device and its steam-operating mechanism, in combination with the trunk E, coal-chamber B, gas-mixing chamber D', retorts D', stand-pipes B', and the hydraulic main H, substantially as described.

13. The combination, in a gas apparatus, of a coal-chamber, B, having grates, as set forth, a gas-mixing chamber, provided with shelves or gas-diverting obstructions, as specified, and covered or connected by a trunk, E, having coal-feeding hoppers, all substantially as described.

14. The longitudinal flues e, leading from the coal-chambers B to the rear chamber B', for the passage of coke from the front grates f to the bed-plate A', and to the rear grates f', and also as a passage for gas from the front to the rear chamber, substantially as described.

15. The process of producing illuminating-gas by distilling and vaporizing at a low temperature the oils from bituminous coal, mixing these oil vapors with the gases rising from the resultant hot coke in contact with steam and air, at or near the base of the coal-burning retort, further mixing and heating these mingled vapors, by passing them downward through heated chambers, and finally by fixing the heated mixture in highly-heated retorts, substantially as and for the purpose described.

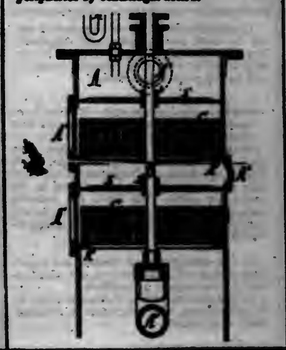


16. The process of producing illuminating-gas by distilling and vaporizing at a low temperature the oils from bituminous coal, mixing these oil vapors with the gases rising from the resultant hot coke in contact with steam and air, at or near the base of the coal-burning retort, adding to these commingled vapors and gases, the vapors of a liquid hydrocarbon, further mixing and heating these mingled vapors by passing them downward through heated chambers, and finally by fixing the heated mixture in highly-heated retorts, substantially as and for the purpose described.

17. The process of producing illuminating-gas by the partial combustion of anthracite coal or coke in contact with steam and air, at or near the base of the coal-burning retort, adding to these, commingled vapors of a liquid hydrocarbon, further mixing and heating these mingled vapors by passing them downward through heated chambers, and finally by fixing the heated mixture in highly-heated retorts, substantially as set forth.

18. A gas apparatus, constructed substantially as described, viz: with trunk-covered coal-chambers B, having grates f, a rear coke-chamber or furnace, B', leading to the chimney, with aperture e leading from one chamber to the other, with gas-mixing chambers D', and retorts D', and steam-pipes B' S, and openings or doors c' c', to supply steam and air to the fire on the grates f, and an operating gas-exhausting device, or this and a hydrocarbon-feeding device, whereby non-illuminating gas and illuminating gas are both produced simultaneously, substantially as described.

19. The process, substantially as herein described, of producing non-illuminating gas and illuminating-gas simultaneously in the same gas apparatus, and of delivering each said kind of gas in a different direction and for different purposes, which consists in producing, first, non-illuminating gas from the partial combustion of anthracite coal or coke in contact with steam and air introduced and combined therewith near the base of a coal-burning retort, and drawing off such gas for consumption in an adjoining furnace, as specified, and which further, and secondly, consists in simultaneously producing illuminating-gas from the remaining portion of the gases resulting from the partial combustion of anthracite coal or coke, and the steam and air drawn upward from the upper stratum of such incandescent coal or coke, and permanently combining such gases with the vapors of hydrocarbons, or producing illuminating-gas from the oily vapors distilled from bituminous coal at a low temperature, and vaporized and exhausted or drawn from an upper stratum of unignited coal, thence passed downward through highly-heated gas-mixing chambers, or through them and highly-heated retorts, all substantially as described.

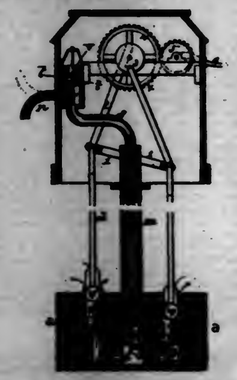


168,905. Cracker Show-Cases. Casper Kroeger and Werner Kroeger, Milwaukee, Wis. [Filed Apr. 24, 1875.]

A glass-fronted compartment, B, provided with rods b', and hooks c', for attachment to a cracker drawer or box, as shown and described.

168,906. Gas-Washing Machinery. Thos. K. Loss, Brooklyn, N. Y. [Filed Sept. 15, 1875.]

Brief.—A revolving vertical shaft, provided with horizontal perforated disks, is mounted centrally within a cylindrical case. Below each disk is a grating of wood. Water enters at the top of the case, and is showered down through it, while the gas passes up from below. The disks are corrugated concentrically, to prevent the water being thrown off at their peripheries by centrifugal action.

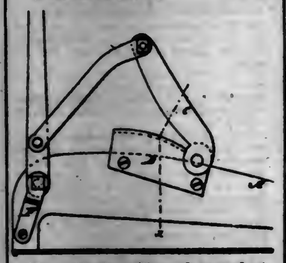


HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.

A, the series of perforated disks b', mounted on the shaft B, and revolving within a casing, A', in combination with gas-passages A' A' and water-passages A' A', as and for the purposes herein specified.

2. The gratings G, in combination with the casing A, water-distributing revolving plates b', and with gas-connections A' A' and water-connections A' A', as and for the purposes herein specified.

168,907. Force-Pumps. W. G. Lilbourgood, Bradenville, Pa. [Filed Sept. 13, 1875.]

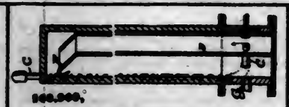


Brief.—Instead of the common air-chamber is used a chamber closed above by a weighted and vertically-reciprocating valve.

1. The combination of the reservoir e, valve f, and weight e, substantially as set forth.

2. The combination of a suitable operating mechanism, pistons, cylinders, block c, and stock a with the reservoir e, valve f, and weight e, substantially as described.

168,908. Metal-Shears. Thos. C. Livesay and Henry H. Black, Montana City, Kans. [Filed June 26, 1875.]

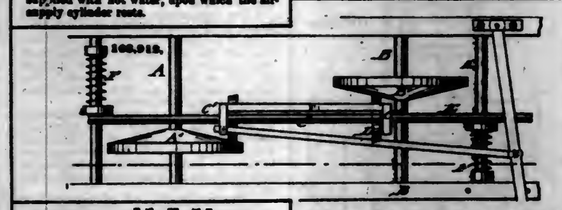


The combination, with an edge-curved cutter B, made fast to and raised diagonally above the bed A, of the lever-cutter C, pivoted to bed at one end of stationary cutter, as and for the purpose described.

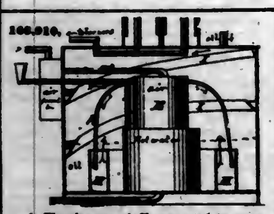
168,909. Gas Apparatus. Charles Lord and Bernard J. McCabe, Shelbyville, Ind. [Filed Aug. 26, 1875.]

Brief.—For crude oils, fats, or resins. The gas material is heated in the lead-pipe, which coils in the furnace, is vaporized in the inner iron retort, and the vapors are fixed in the outer clay retort. The liquid gas material cannot touch and penetrate the clay retort, and the iron retort is protected from the severest heat.

1. The combination of heating and vaporizing lead-pipe C, clay retort A, and metal retort B, substantially as specified.



2. The elevated portion F of metal retort B, in combination with clay retort A, substantially as specified.



168,909.

168,910. Carburetors. Louis Marks, San Francisco, Cal. [Filed Mar. 11, 1875.]

Brief.—The oil enters by a pipe at the top, and passes down the V-shaped troughs, descending spirally on the sides of the chamber, until the level of the oil is above the perforated air-chamber. The dams in the troughs retain some of the oil. Air enters a central cylindrical air-chamber, from which it passes by pipes to the perforated annular air-chamber below. Some air from the external blast-box passes through a contiguous chamber, in which hydrogen is generated, so as to convey that gas into the carbureting-chamber. The oil is kept heated by a cylinder continually supplied with hot water, upon which the air-supply cylinder rests.

168,910.

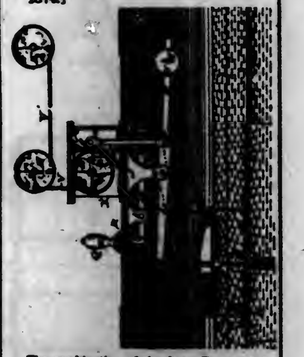
1. The air-reservoir B, connected, by means of pipes b b, with the hollow foraminous concentric wall H, substantially as and for the purpose described.

2. In a carbureting-vessel, the descending spiral channel J, with its partitions e e, substantially as and for the purpose described.

168,911. Brick-Machines. Saml. Martin, Rochester, Mo. [Filed Oct. 2, 1875.]

1. In a brick-machine an endless chain composed of molds pivoted together, and each mold having a movable follower, in combination with pressure-rollers arranged in pairs above and below the molds, substantially as and for the purpose set forth.

2. In a brick-machine, having an endless revolving chain of molds, the combination of the force-wheel G, supporting-wheel I, and the compress and counter-compress rollers G' I', constructed and arranged substantially as and for the purposes herein set forth.



3. The grooved counter-compressing rollers I and I', in combination with the molds C, pressure-rollers G and G', and sections D', D', and D', all constructed and arranged as and for the purpose set forth.

4. The spring wheel or roller P, arranged to operate on the followers in the molds, for the purposes set forth.

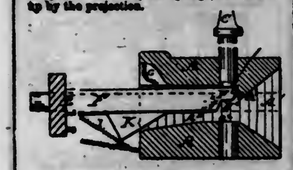
168,912. Devices for Changing Speed. Jos. W. Mead, Dupont, Ind. [Filed Aug. 28, 1875.]

The combination, with drive-shaft A and driven shaft B, having cone-disks A' B', of a corresponding double-disked shaft, C, supported in spring-held slide-bearings, as and for the purpose specified.

168,913. Steam-Boiler Deflectors. A. Moon, San Francisco, Cal. [Filed Dec. 20, 1874.]

The combination of the lever B, provided with the adjustable attachment Y, and valve-plug c with the whistle Q and balanced lever L, attached to the float A, and provided with rod b for actuating the spindle a, projecting arm X, connecting-rod V, and weights on the float-lever B, substantially as and for the purposes herein set forth and specified.

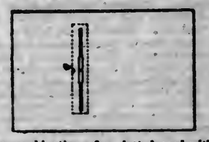
168,914. Governors for Steam-Engines. Nathan R. Nash, Westerly, R. I. [Filed Mar. 26, 1875.]



Brief.—The valve-seat is provided with small projections, which keep the valve from sticking.

The combination of the steam-pipe A, valve-chamber B, having a seat, b, provided with the projections c, weighted or spring-valve C and stem D, all constructed and arranged substantially as herein specified.

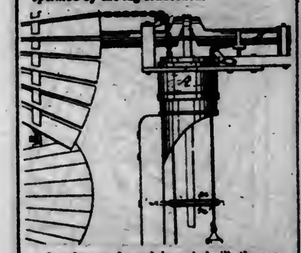
168,916. Car-Couplings. Daniel A. Mowcom, Hatcher's Station, Ga. [Filed July 27, 1875.]



Brief.—The retaining-piece, which supports the pin, is worked by the springs, and thrown up by the projection.

In a car-coupling, the combination, with the bumper A, having the projection A' and guides D, of the springs G H I, and the retaining-piece F, having the projection F', arm-piece E, and inclined projection K, substantially as and for the purpose set forth.

168,918. Calendars. Charles E. O'Neill, Boston, Mass. [Filed July 24, 1875.]

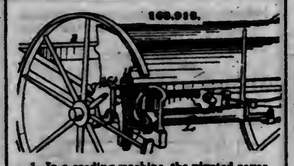


Brief.—The leaves of the calendar-sheets are inserted through suitable slots in the stiff board back, and secured firmly thereto by a bend metal clip.

The combination of a slotted card with a fastener, f, and a series of sheets or slips of paper, substantially as set forth.

168,917. Windmills. John C. Ormiston, Geneseo, and Edmund S. Sager, Erie, Ill. [Filed Feb. 19, 1874.]

Brief.—A balanced revolving windmill, in combination with a crank-axle and a bent having arms, and a double pivot-box held by brasses and bolts, also cross-head and sails, all operated by the lag-connection.

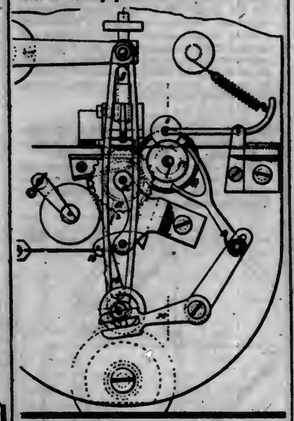


In a balanced revolving windmill, the combination of the crank-axle B with the bent F, having arms f, the yoke R, having its ears pivoted to the double pivot-box s, and held by brasses H and bolts, with the joint cross-head G, having the sails I revolved and operated by the lag d, connection d', and lag on crank E, all operating substantially as herein set forth.

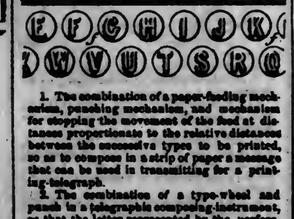
168,919. Grain-Drills. Charles B. Fabris and J. S. Bogle, Springfield, Ohio. [Filed May 18, 1875.]

Brief.—A pivoted cover allows different-sized gears to be interchanged upon the feed-wheel shaft, to increase or diminish the amount of seed sown, and also to cover the gear and keep the dirt out. The traveling rocker-bar, upon which the lever that carries the pinions is adjusted, is supplied with fine teeth, allowing an adjustment for any size of wheel or inequality of make.

168,920. Reaping-Machines. Jas. Appleby, Jr., Chicago, Ill. [Filed Aug. 14, 1875.]



1. In a reaping-machine, the pivoted cover-plate H, in combination with the removable pinion P on the distributer-wheel shaft, for protecting said pinion and holding it in place on its shaft, substantially as described.



2. The divided cover H H', partly fixed and partly pivoted and movable, for protecting the gearing and permitting the removal of the pinion on the distributer-wheel shaft, as described.

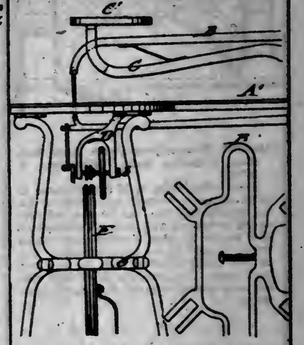
3. The ratchet-bar F, constructed as described, in combination with the shipping-lever E, for permitting the change of pinions and for holding said lever E at any desired point of adjustment, as described.

168,919. Printing-Telegraphs. George M. Phelps, Brooklyn, N. Y. [Filed Mar. 25, 1875.]

Brief.—Type-printer controlled by a perforated slip of paper.

1. The combination of a paper-feeding mechanism, punching mechanism, and mechanism for stopping the movement of the feed at distances proportionate to the relative distances between the successive types to be printed, so as to compose in a strip of paper a message that can be used in transmitting for a printing-telegraph.

2. The combination of a type-wheel and punch in a telegraphic composing-instrument, so that the letter represented by the perforation is printed simultaneously with the perforations, as set forth.

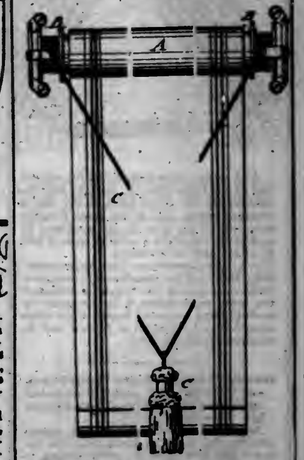


3. The range of pins f, operated by keys, the revolving type-wheel c, shaft c', and arm e, in combination with the paper-feeding mechanism, punch, and punch-actuating devices, brought into operation when the type-wheel is stopped, substantially as set forth.

4. The combination, with a type-wheel and punching, feeding, and stopping mechanism, of an additional paper-feed, actuated independently of the motion of the type-wheel, substantially as and for the purposes set forth.

5. A telegraphic transmitting-strip of paper, perforated with holes at distances apart proportionate to the relative distances of the characters required on a type-wheel, and with additional length between the perforations, to allow for the time during which the type-wheel is detained in printing, substantially as set forth.

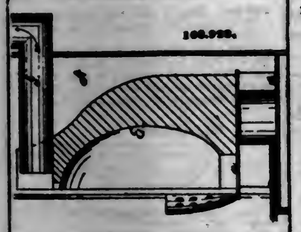
168,922. Scroll-Sawing Machines. J. E. Plummer, Bryceldyn, N. Y. [Filed Aug. 14, 1875.]



Brief.—The rear table-extension, to which the saw-frame is pivoted, is provided with a curved arm, which supports a shelf for the oilers, wrench, &c., and also with slotted arms, which form a guide above and below the table.

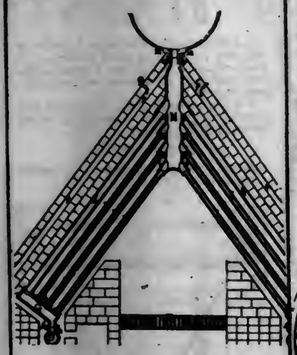
1. A reciprocating saw-frame, B, combined with and pivoted to a table-extension, A', whose slotted arms C D form a guide therefor above and below the table, as and for the purpose set forth.

2. A rear table-extension, A', provided with a curved arm, C, supporting a shelf, C', as and for the purpose specified.



168,921. Curtain-Fixtures. R. J. Pospisil, Chicago, Ill. [Filed Sept. 11, 1875.]

The combination of the curtain-roller, having pulley-shaped roller-ends, with a cord arranged to be wound in opposite direction on the roller-ends, and guided in front hooks of the spring-brackets, for raising or lowering the curtain, substantially in the manner and for the purpose set forth.

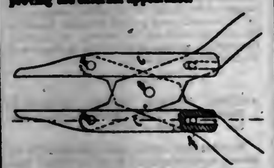


168,923. Heating-Stoves. Louis M. B. Bevenot and Vincent Marty, New Orleans, La. [Filed Feb. 9, 1875.]

In a fire-place stove, the combination of the casing A, fire-clay back B, and a narrow open passage, F, between the back and the front casing, and extending down to the horizontal line of the grate, substantially as and for the purpose specified.

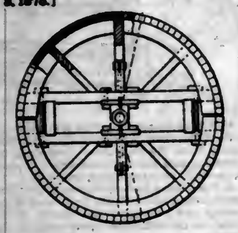
166,926. STEAM-GENERATOR. David Renshaw, Cohasset, Mass. [Filed Mar. 9, 1875.]

Brief.—The boiler is of conical shape in cross-section, a vertical water-chamber being immediately over the furnace, and connected at each end with lower water-chambers by a number of tubes, the aggregate area of which is equal to the water-chamber. Circulation is maintained through the lower and outer tubes. The generator is provided with the usual steam-drum and blowing-off apparatus.



1. A section for a sectional boiler, consisting of an upper pipe, H, opening into the steam-drum, two lower pipes, G, the pipe H arranged above, and at the same distance from, each of the pipes G, and connected to each of the pipes G by a series of pipes, J and K, substantially as described.

2. A boiler, consisting of an upper water-body, H H, and the steam-drum I, the upper water-body opening into the steam-drum, and two lower water-bodies, G G, the upper water-body being connected to each of the lower water-bodies by a series of pipes, J and K, substantially as described.

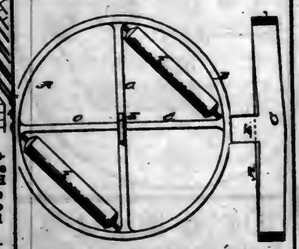


166,946. PARALLEL PLIERS. Henry B. Russell, Woodbury, N. J., assignor of one-half his right to Isaac S. Russell, New Market, Md. [Filed Sept. 4, 1875.]

Brief.—The slots in the jaws, that engage with the pins upon the levers, extend to the end of said levers, and but partly through, to facilitate the assembling of the parts, and improving the external appearance.

Pliers having pins D F equally distant from fulcrum B and jaws C, pivoted on the pins D, and provided with open-slotted rear ends, as and for the purpose specified.

166,966. BULL-WHEELS FOR OIL-WELLS. John Schollhopf, Titusville, Pa. [Filed Apr. 8, 1875.]



The wheel made of sections attachable and detachable from each other and the hub or shaft by means of fastening-bolts, as shown and described.

166,986. VERMIN-EXTERMINATORS. Valentine Schmidt, San Francisco, Cal. [Filed Aug. 31, 1875.]

The process herein described of coating grain with a poisonous mixture, consisting of mixing the poison to be used with pulverized sugar and washing the grain in water, then pouring the dry mixture on the wet grain and stirring until the grains are coated with the poisonous mixture, and then coating the poison on each grain with flour, and, lastly, drying by natural evaporation or artificial means, substantially as set forth.

166,967. REMEDY FOR HARDENING AND TEMPERING CIRCULAR SAWS. Anthy. Schmitz, St. Louis, Mo. [Filed July 6, 1875.]

Brief.—The saw is placed on the frame and run into the furnace. The frame or support turns upon its pivot, and the saw is equally heated above and below.

1. The combination of the rim B, arms C C C C, post E, and pivot D, substantially as described.

2. The combination of the arms C C C C, post E, and pivot D, substantially as described.

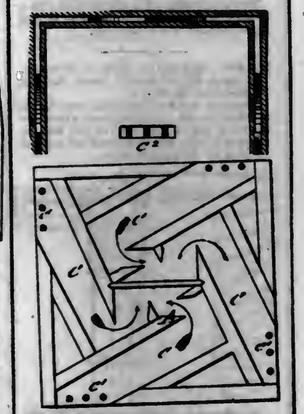
3. The combination of the arms C C C C, rim B, and post E, substantially as described.

4. The combination of the arms C C C C, pivot D, and rollers F F, substantially as described.

5. The combination of the rim B and rollers F F, substantially as described.

6. The combination of the arms C C C C and rollers F F, substantially as described.

7. The combination of the rim B, arms C C C C, rollers F F, pivot D, and post E, substantially as described.



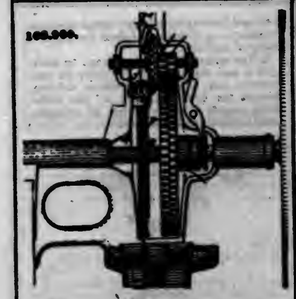
166,968. LATHES FOR TURNING OVALS. L. K. Scotford, Burlingame, Kans. [Filed Sept. 28, 1875.]

Brief.—The movements of the sliding templates can be varied, for producing ovals of different forms, by means of an adjustable stud projecting from a stationary center through a longitudinal slot in the face-plate, in connection with the rotating cone-pulleys, by which it is turned upon the stationary center.

The combination of the adjustable stud F with the stationary center E, rotating cone-pulleys A A, and sliding plate C, substantially in the manner described.

166,969. COMBUSTION OF JAMS. John A. Seaber and James C. Croxton, Rockwell, Tex. [Filed June 12, 1875.]

Brief.—The jail is constructed with double floors and walls. The air entering at the bottom is carried by the channels shown to the center, and passes upward and out by ventilating flues, then ventilating the building and the space between walls. As constructed, no communication is possible with the outside; the escape of prisoners is prevented.

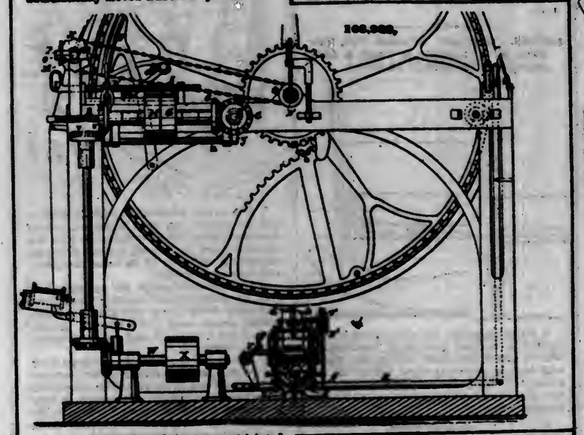


The combination, with ventilating double walls, of double floors having channels O running from walls to center of building, and grated openings O' O', as and for the purpose specified.

166,970. HARVESTER-GEARING. John F. Silberling, Akron, Ohio. [Filed Apr. 7, 1875.]

The combination of the spur-wheel, with its two sets of teeth alternately and intermittently arranged on its periphery with respect each to the other, the correspondingly-constructed spur-pinion, the bevel-wheel on the same shaft, and turning with the pinion, and the bevel-wheel on the crank-shaft, crossing the line of the main axle, these several members being arranged, as described, within the inclosing case, and operating in combination, substantially as set forth, to drive harvester-cutters.

166,969.



166,981. WASHING-MACHINE. Irvin A. Shaw, Grand Meadow, Minn., assignor to himself and John H. Jordyn, same place. [Filed Aug. 6, 1875.]

The combination of the rollers C C D, the springs E, and the endless aprons G, provided with stretchers f' and hooks f^2, with the semi-cylindrical side-box A, substantially as herein shown and described.

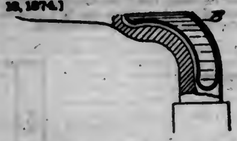
166,982. YARN-FEEDING MACHINES. Jos. Short, New Brunswick, N. J. [Filed Mar. 18, 1875.]

Brief.—The yarn is wound upon the drum, when the car carrying the printing-wheel is automatically moved transversely to it.

1. The combination of the two-part jointed rod O P, connected with the pulley X, and rod L M, the hole of the pulley being adapted to slide the rod in and out of it, substantially as specified.

2. The counter-shaft W, pulley X, belts a a, pulleys f f^1, shipper s, arm t, rod u, arms r, and the curved bars p on the car, in combination with the car-driving pulley f^2, substantially as specified.

3. The rails e and cross-tie e', formed together in one piece, and combined with the supporting-cleats f', fastening-screws g, and adjusting-screws g', substantially as specified.



4. The bearings f^3, for the driving-pulley shaft i, arranged in vertical slots i', and its adjusting-screws f^4, in combination with the vertically adjustable rails, substantially as specified.

5. The jointed and hinged supporting-bar A^1, and the fastening-bar a^2, in combination with the cylinder A, substantially as specified.

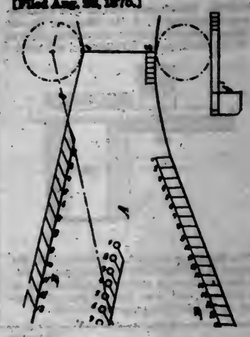
6. The hand-lever F, link F', and hook G', combined with the extension D' of the cylinder-shaft, substantially as specified.

7. The weighted vibrating lever f^5, the cylinder-brake f^6, belt-shipper l, and its sliding rod, all combined, as shown and described, to operate as specified.

166,983. HANDLES FOR BORING-TOOLS. H. Stanley, St. Johnsbury, Vt. [Filed Apr. 29, 1874.]

The combination, with handle A, of the arc-shaped spirit-level B, having a graduated scale thereon, and located within a correspondingly-curved part of the handle, as and for the purpose specified.

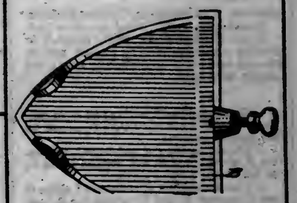
166,984. HAY-TROUGH. O. W. Stearns Johnson, Vt. [Filed Sept. 11, 1875.]



The curve-trough formed of the semi-cylindrical sections A, made with half-ring tenons upon their end or ends, and the semi-cylindrical couplings B, made with half-ring sockets in their edges, and provided with spikes C, substantially as herein shown and described.

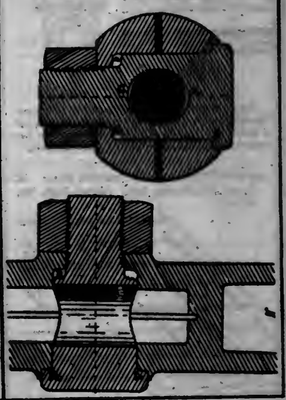
166,985.

166,986. PROCESSES OF MAKING PERMANENT COMPOSITIONS FOR DESTROYING GOPHERS, SQUIRRELS, &c. Jas. G. Steele, San Francisco, Cal. [Filed Aug. 6, 1875.]



The process, without soaking, of partially softening the wheat in a hot-water bath, apparatus, by means of a limited quantity of water and heat, as that, without bursting or destroying the grain, the germinating principle within it is destroyed, and at the same time the grain does not become soaked but rendered slightly absorbent of the solutions to be presented to it; and then charging or saturating the wheat so prepared and while warm with solutions of sulphate of strychnine and corrosive sublimate, and then incorporating with it and covering it by the aid of heat, with a mixture of granulated sugar and flour, all substantially as described.

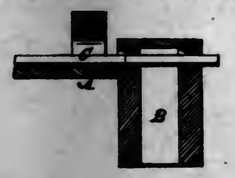
166,986. TAILORS' DRAFTING APPARATUS. Matthew C. Van Eyck, St. Paul, Minn. [Filed Aug. 28, 1875.]



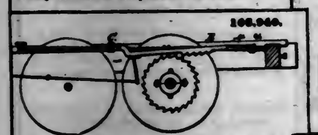
The confronter and transfer or scarf A, constructed as described, provided with the scales B C D, arranged in the manner shown, substantially as herein shown and specified.

166,987. MAD-IRON STOVE. V. C. Thebaud, Buffalo, N. Y. [Filed Sept. 28, 1875.]

A shoe for mad-irons, made with external flange, having curved side extensions at the front and a fastening-screw at the rear part to be readily applied to the iron, substantially as and for the purpose set forth.



166,988. CRUSHER FOR ROCK-DRILLS. Hugh Thomas, New York, N. Y. [Filed Oct. 7, 1875.]



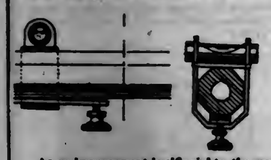
1. The chuck-bolt B D, with an oval or elongated hole embracing the drill-chuck, and securing the same with one nut, substantially as set forth and described.

2. The combination of the chuck A and the chuck-bolt B D, substantially as and for the purpose described.

168,939. Separator-Shoes for Threshing-Machines. A. D. Thomas, Mount Ulna, Iowa, assignor of one-half his right to W. D. Thompson. (Filed Mar. 27, 1875.)

The discharge-spout A, delivering into the elevator B, and provided with a screen or riddle passing through and beyond the casing of the elevator, and over the elevator, substantially as and for the purpose set forth.

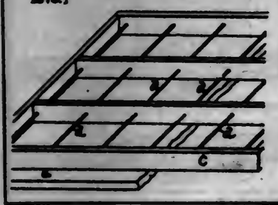
168,940. Car-Starters. Morten Toulmin, Washington, D. C. (Filed Apr. 8, 1875.)



Brief.—Notched-wheel rigidly attached to running-wheel operated by ratchet-bar, ordinarily held out of connection by spring, but drawn in by draft.

1. The ratchet-bar B, having arm B', in combination with bar H and spring D, as and for the purpose set forth.

2. The combination of slide-bars I, ratchet-bar B, slides C and G, and springs A and D, as and for the purpose set forth.

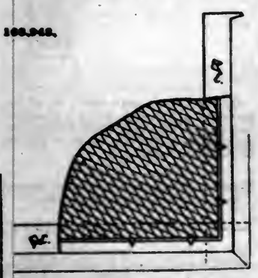


3. The combination of slide-bars I, slides G and C, springs A' and D, ratchet-bar E, having arm B', and bar H, as and for the purpose set forth.

168,941. Gun-Sights. Wm. M. Treadway, Port Henry, N. Y. (Filed Oct. 2, 1875.)

As an improvement in rifle-sights, the combination, with the barrel of a rifle or gun, of a spirit or other level, adjustable thereon between the sights, substantially as specified.

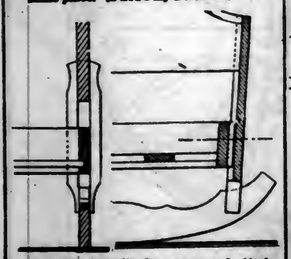
168,942. Devices for Turning Eggs. R. Tyler, Ellsworth, Me. (Filed Sept. 13, 1875.)



The device for turning eggs herein described, consisting of a horizontal frame, *c*, provided with cross-wires *d*, operating to turn or roll the eggs when the frame is moved horizontally, in combination with a flat surface, *a*, upon which both frame and eggs rest, substantially as set forth.

168,943. Bridging for Oil-Cloth and Matting. Alex. Underwood and Eddy A. Underwood, Newark, N. J. (Filed Nov. 27, 1874.)

Brief.—The lower part of the folded strip is the wider, and is provided with points to engage with the oil-cloth.



The strips for an oil-cloth binding, folded with the lower fold C the broadest, and the points E struck up from this fold, substantially as and for the purposes specified.

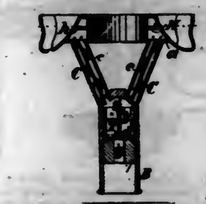
168,944. Mosses or Curing Moss. Peter Unsworth, Algiers, La. (Filed July 17, 1875.)

The process of curing moss by immersing and boiling the same in a solution of caustic soda to which stannah, fustic, japonica, burnt amber, and copperas have been added, as set forth.

168,945. Cradles. Fredrick Voth, New York, N. Y., assignor to Faust & Rice, same place. (Filed July 24, 1875.)

A bedstead, cradle, &c., constructed of bed-posts with inclined grooves, in combination with a connecting-frame having end pieces with inclined projecting edges, fitting into the posts, to be firmly retained by the wedge action of the same, substantially as and for the purpose set forth.

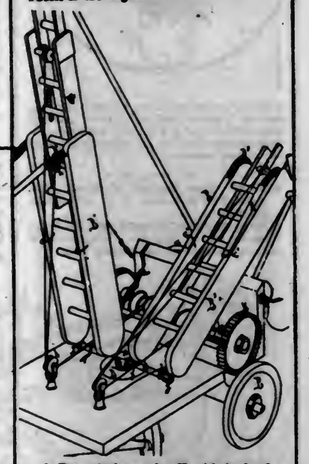
168,946. Ashand Bushings. Alex. Voltaire, New York, N. Y., and Chas. H. Ball, Philadelphia, assignors to James W. Queen, Philadelphia, Pa. (Filed Sept. 28, 1875.)



1. The shell A, bent or struck to make the flange *a*, ring *a'*, lip *a''*, and skirt A', containing the chamber A², substantially as shown and described.

2. A burner and chimney-holder formed in one piece, substantially as set forth.

3. The flutter-wheel B, or chuck and distributer, arranged in the tube B, above the cover C, substantially as shown and described.



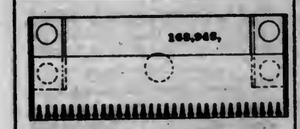
4. The spiral blades *c*, located in the arms C C, and forming in each two spiral channels or passages to divide and deflect the gas-currents, as set forth.

5. The collar E, having openings or passages *b*, and employed to distribute the gas-currents and provide a uniform delivery through the burner-openings *c'*, said collar being located in the chamber A², substantially as shown and described.

168,947. Firemen's Ladders. C. Ward, Boston, Mass. (Filed June 8, 1875.)

Brief.—The ladders are pivoted at their lower ends to a swiveled cross-bar, and are elevated by means of ropes on differential drums, said drums being operated by cog-wheels which mesh into cog-wheels on the wheels of the wagon.

1. The swivel cross-bar F, with its head *e*, and its spindle and stop D, constructed as shown and described, in combination with the end eyes *g* and the ladder, and carrying and supporting the latter by its lower ends, substantially as described.

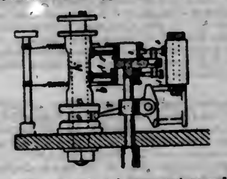


2. In combination with the extension-ladders, the elevating and hoisting mechanism, consisting of the larger and smaller proportionate drums *a* and *b*, the gears K and H, cords *d* and *f*, wheels *h*, and rolls *n*, substantially as described.

3. Hoisting-drums *a* and *b*, and their shaft and gears K and movable end-rive to connect with the driving-gears H, and to disconnect therefrom, substantially as described, in combination with the rear wheels B, and with the extension-ladders, by cords *d* and *f*, and wheels *h* and *n*, or connecting mechanisms.

4. The spring-connected strain K, in combination with the section B' of the ladder, substantially as described.

168,948. Male-Kiln Floors. Paul Wehrig, Hazen, Prussia, assignor to Frederick W. Wolf, Chicago, Ill. (Filed July 17, 1875.)



A malt-kiln floor constructed in sections and consisting of the frame A, cross-ties a a, and blade-shaped rods or wires *b b* secured by swaging down upon them the metal of the cross-ties, substantially as and for the purpose set forth.

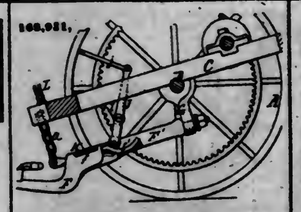
168,949. Printing-Telegraphs. Charles J. Wiley, New York, N. Y. (Filed Apr. 6, 1875.)

Brief.—For shifting the printing from one to the other of the type-wheels, and vice versa.

1. The type-wheel *d*, connected to and revolving upon a circular bearing upon the lever *b*, and the second type-wheel *a*, similarly connected to the lever *a*, in combination with the shifting-cam *k*, that acts upon the levers, and the means for raising the type-wheel that is not in action off the paper, as set forth.

2. The two type-wheels independent of the shaft by which they receive a step-by-step movement, and sustained by levers, in combination with the mechanism for printing and for moving the levers by the motion of the printing-lever, substantially as set forth.

168,950. Windmills. Abner Wilcox, Cascade, Minn. (Filed Jan. 26, 1875.)

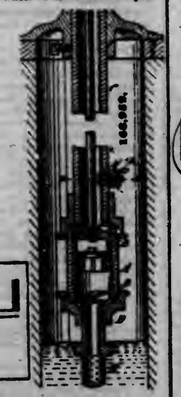


Brief.—The trough for holding the water is provided with suitable journals, applied to the pedestals or blocks on the base. The journals of the trough are located at such distance from the center that the preponderance of weight of the trough is at its front end. There is a box or receptacle, with a weight or counterpoise, combined with the trough.

The combination, with the trough or water-reservoir, having the rod F for connecting it with the windmill, of the adjustable bearings G and H, for regulating the pitch of the reservoir, substantially as and for the object specified.

168,951. Mowing-Machines. Walter A. Wood, Robert Bowhay, and John M. Rosebrooks, Hoosick Falls, N. Y., assignors to Walter A. Wood Mowing and Reaping Machine Company, same place. (Filed June 12, 1875.)

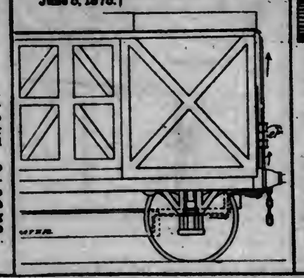
Brief.—The hand-lever which raises the frame, and with it the inner end of the finger-bar, is connected to a lever pivoted on the frame, and acting through a friction-roll on its lower end upon a concave eccentric-head, lug on the inner side of the rolling shoe, so as to raise the outer end of the finger-bar simultaneously with the inner.



1. The pivoted shoe F, provided with the heel, spur, or projection *f'*, having the curved eccentric surface, in combination with the lever J, arranged and operating substantially as and for the purpose described.

2. The combination of the lifting-segment K for raising the inner end of the cutting apparatus with the lever J connected therewith, and the heel projection *f'* on the pivoted shoe for raising the outer end of the cutting apparatus, the combination being and operating substantially as described.

168,952. Pumps. William Young, Easton, Pa. (Filed Aug. 9, 1875.)

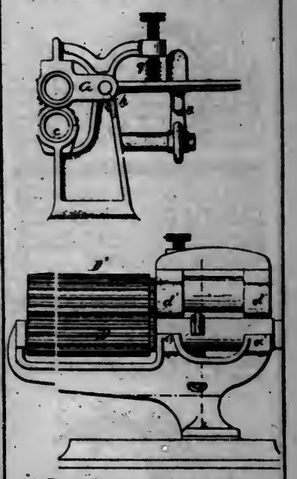


Brief.—The base is made adjustable upon the connecting-pipe by collar projecting downward and set-screw. A waste-valve is employed, which is actuated by a spring of such tension that when the pump is forcing the valve will close, but under the pressure only of the column of water in the tube will open.

1. The base-plate I, connected to the tube O, and made adjustable by the socket J and set-screw K, and the said socket being projected below the plate, substantially as specified.

2. The waste-valve N, case-piece O, perforated nut R, and spring P, combined with the tube O, substantially as specified.

168,953. Refrigerator-Cars. John Pratt Ashdown, Cheltenham, England. (Filed June 5, 1875.)



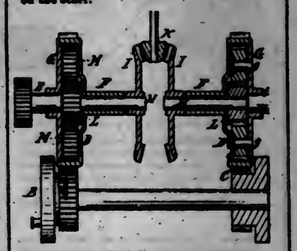
1. The carriage-body constructed, substantially as hereinbefore set forth, with layers of felt secured between inner and outer trellis-work extending around its sides and ends.

2. The combination, substantially as hereinbefore set forth, with the frame of the carriage-body, of the inner and outer trellis-work, a layer of felt secured between the trellis-work, and the perforated water-pipe to moisten the center layer of felt.

3. The combination, substantially as hereinbefore set forth, of the carriage-body frame, the trellis-work, the layers of felt, the perforated water-pipe, the pump, and the water-tank.

4. The combination, as hereinbefore set forth, of the carriage-body surrounded by layers of felt, and the roof, having an opening between it and the top of the body of the carriage, for the purpose specified.

168,954. Fleshing-Machines. H. Albrecht, Philadelphia, Pa. (Filed Sept. 7, 1875.)

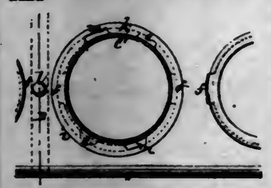


1. The combination in a fleshing-machine, of a lower fleshing-roller, supported at both ends by bearings, with an upper fleshing-roller, having bearings at one end only.

2. The combination of the upper fleshing-roller D', with the pivoted frame G, and its two bearings, *d' d'*, adapted to the journal of the said roller, as set forth.

168,955. Differential Gears for Traction-Engines. Jas. B. Annin, Rochester, N. Y. (Filed Dec. 10, 1872.)

Brief.—Decrease of speed on one side, in turning corners for instance, accelerates speed on the other.



1. In combination with two sets of gearing, connected by an intermediate pinion, the two sets of cog and pinion gears L M M and L M M, in order that the retarding of one of said gears L may accelerate the corresponding gear L on the other side, substantially as and for the purpose specified.

2. In combination with the wheels C C, which impart an equal motion to both sets of gearing, the box-gears D D, which engage therewith, and the heads or disks G G, which rest within the box-gears, when said box-gear and heads are so arranged as to run free of each other, and are connected by internal gears, which impart a motion from one to the other, as herein shown and described, for the purpose specified.

168,956. DEVICES FOR SECURING AND ADJUSTING SPRINGS-RINGS. J. B. Atwood, Mansfield, and H. Atwood, Willimantic, Conn. [Filed Jan. 12, 1875.]

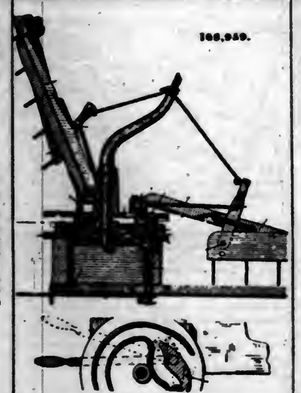
Brief.—The ears on the rings are passed through the openings in the rail, and the ring is then turned so that as the ears pass along beneath the rail the rings will be clamped to place; the eccentric washers, which rest in recesses on top of the rail and against the neck of the ring, serving to adjust the ring into concentricity with the spindle of the frame.

The combination, with the rings constructed with the ears *a*, and the ring-rail having the openings *f*, the concentric recesses or seats *i* and the inclines *h* of the eccentric washers *k*, having openings or notches *m*, substantially as and for the purpose described.

168,957. TRUSSES. Samuel Ayres, Richmond, Va. [Filed Nov. 28, 1874.]

Brief.—An open metallic securing-loop has a projecting annular center, through which it is secured upon a bearing-plate, with corresponding depression. A screw secures these two parts to the pad proper.

The combination, with a trap-pad, of a loop, K, having an annular projection, *b*, a bearing, *l*, plate L, and screw *m*, all constructed and operating substantially as described.



168,958. LOCK-NUTS. Samuel O. Barber, Scranton, and Abel Barber, Wyoming, Pa.; said Samuel O. Barber assignor to said Abel Barber. [Filed Aug. 4, 1875.]

In combination with a bolt, B, and nut, *b*, the washer A, provided within its outer face with the right-angled grooves *a'* and *a''*, and the key C, having a right-angled form longitudinally, and arranged to fit into said grooves substantially as and for the purpose specified.

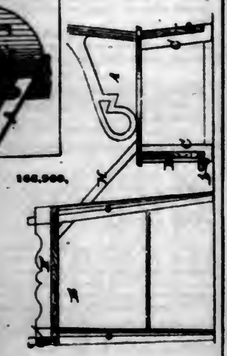
168,959. HARVESTER-RAKES. John Barnes, Rockford, Ill., assignor of one-half his right to Ralph Emerson and William A. Talcott, same place. [Filed July 10, 1875.]

Brief.—A rest of rubber is carried upon a vertical rake-post, and actuated, by means of a switch and spring, to rest alternately or successively.

168,959.

1. The combination, substantially as herein before set forth, of the fixed cam-plate, the rake-post, the crown-plate revolving around the rake-post, a rake-arm pivoted on the crown-plate, the swinging arm pivoted on the crown-plate, a swiveling pitman-head and friction-rollers carried thereby, the link-connection between the swiveling head, the rake-head, and the rake-post, and the switch, for the purposes specified.

2. The combination, substantially as herein before set forth, of the cam-plate, the switch pivoted thereon, the revolving crown-plate, and friction-rollers mounted on swinging arms carried thereby, whereby the switch is automatically reset in alternately opposite positions by the passage of the rollers.

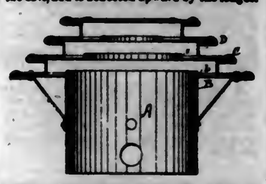


3. The combination, substantially as herein before set forth, of the cam-plate, the switch pivoted thereon, the revolving crown-plate, friction-rollers mounted on swinging arms carried thereby, the switch-lever, and the spring thereon, whereby the switch, although alternately moved in opposite directions by the passage of the rollers, is immediately reset by the spring into proper position.

4. The combination, substantially as herein before set forth, of the cam-plate, switch, rake-post, crown-plate, rake-arms, swinging arms carrying the friction-rollers and swiveling pitman-heads, and the detachable link-connections between the pitman-head and rake-head, whereby the latter may be thrown out of operation as rakes when desired.

168,960. NURSERY-CHAIRS. A. H. Barnes, New York, N. Y. [Filed Sept. 28, 1875.]

A child's high chair constructed of the seat A, stand E, links H, and locking device *a b*, all combined and operating substantially as described.



168,960.

168,960.

168,961. VENTILATING-CAPS. Lewis F. Botts, Chicago, Ill. [Filed Sept. 28, 1875.]

Brief.—The wind passes horizontally over the exit, and is deflected upward by the ledges.

1. The combination of a series of flat parallel annular flanges, B C D E, provided with ledges *e e* and disposed perpendicularly to the axis of the pipe A, for the purpose specified.

2. The combination of a series of flat parallel annular flanges, B C D E, constructed according to the formula of relative proportions herein specified, to form a ventilating-cap.

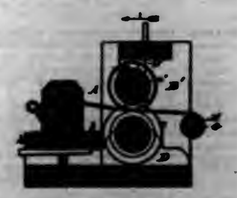
3. In combination with the annular plates B C D E, the strips F, fashioned as set forth, and secured as described.

168,962. BARN-BURNING STOVES. Lewis F. Botts, Chicago, Ill. [Filed Sept. 28, 1875.]

Brief.—Air is supplied to the combustion-chamber through the tubular bars composing the fire-pot, and the draft is downward. A direct or indirect draft in the base is effected by means of the gate.

1. A fire-pot composed of tubular bars C, open at each end, and at the upper end communicating with the outer atmosphere through orifices *e*, substantially as shown.

2. The fire-pot composed of bars converging downward toward the center, combined with a close plate, E, supported at a little distance below said fire-pot, and draft-inlets above said fire-pot, as and for the purposes set forth.



3. The conical fire-basket, composed of bars converging downward toward the center, with draft-inlets above and conical below said fire-basket, and with its close bottom plate E, combined with the funnel-plate G, open at its center and below said close plate, as set forth.

4. The box H, with the outlet-flue I at its back, combined with the gate J, arranged as described, to close direct draft and cause the same to circulate, as set forth.

5. The funnel G, box H, and gate J, combined with the cinder-shell *i*, for the purpose set forth.

6. In a single stove, the combination of a magazine, with draft-inlets at or near its base, a conical fire-pot or basket open at the center, a close plate below said opening to support the fuel, a funnel-plate below, with an opening at its center, to concentrate the products of combustion as they pass to the base of the stove.

168,963. PAPER-TENSIONING MACHINES. D. T. Broughton, Parkersburg, W. Va. [Filed Mar. 27, 1875.]

1. In a paper-trimming machine, the frame A, consisting of the base A^1, the top A^2, and the standards B B', with cleat D and pendent arm D^1, in combination with the feeding and guiding rolls O O', journaled and supported in the manner described.

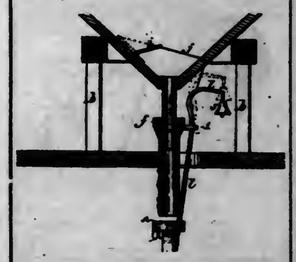
2. The roll O', in combination with the pendent bracket D^1 and the adjustable spring-brace E, substantially as and for the purpose set forth.

3. The square receiving-shaft G, provided with a metallic cap or half-sleeve, H, substantially as and for the purpose set forth.

4. The parallel rails *k k* forming a raised track for the carriage *h* of the paper roll, the latter provided with longitudinal recess *i*, adapted to slide in groove *l* in the inside faces of the rails *k*, said carriage *h* being provided with standards h^1 h^2, substantially as described.

168,964. HAIR-DRESSING MACHINES. O. M. Brown and W. R. Vaughan, Council Bluffs, Iowa. [Filed July 22, 1875.]

Brief.—The device is clamped to a barber-top or other convenient place, and hair-switches, curls, frizettes, &c., secured to the upright in different ways while being combed and dressed.

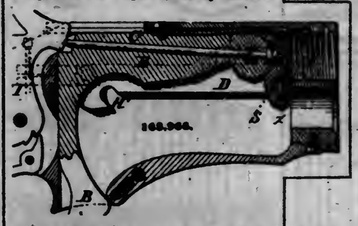


1. The combination of the clamp A and the detachable piece C, having strap D and screw-tenon *y*, substantially as set forth.

2. The combination of the clamp C, having groove *f*, and the piece C, having groove E, strap D, and hooks *d d d*, all substantially as set forth.

168,965. GRAIN-ALARMS. Noah Brenner, Mechanicsburg, Pa. [Filed July 10, 1875.]

Brief.—As grain runs low in hopper, the pressure is lightened from yielding plate, and weight of falling rod draws plate forward, and is itself lowered till it strikes against projection in eye of shoe, and bell is rung.



1. The combination of the hopper *c*, hinged plate *i*, cord *j*, falling rod *l*, and bell *k* with the lever *f*, perforated arm 1, and set-screw *s*, whereby both the feed from the hopper and the distance the rod *l* shall fall are regulated, substantially as shown.

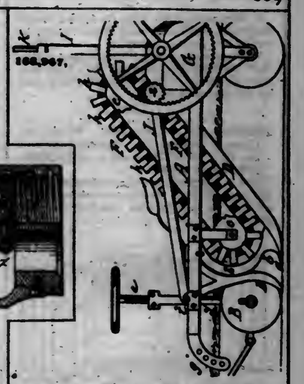
2. The combination of the lever *f*, adjustable supporting-arm 1, and rod *l*, substantially as set forth.

168,966. MAGAZINE FIRE-ARMS. A. Iverson, Owego, N. Y. [Filed Oct. 15, 1875.]

1. The combination, in a magazine fire-arm, of a cartridge-carrier, a breech-block, and a receiver, the parts being constructed and combined substantially as described, whereby the carrier is caused to remain up parallel with the bore of the barrel when the breech is closed, and is operated downward by the last part of the movement of opening the breech, when its upper surface fails to receive a cartridge from the magazine, and by the first part of the movement of closing, the breech is raised to a position to allow the cartridge to be inserted into the barrel by the closing breech.

168,966.

2. In a magazine-gun, a cartridge-carrier bifurcated and pivoted at the rear end, in combination with a breech-block whose forward end moves in a horizontal plane, and whose rear end passes down between the two arms of the carrier in the act of opening the breech, substantially as described.



3. The cartridge-stop S, constructed substantially as described, when carried by and sliding in the breech-block B', and stopped by the rear of the opening in the receiver, as set forth.

4. The stop T, in combination with the carrier-block, so arranged that when in engagement with the latter it will prevent its backward movement and allow it to be operated by the breech-block, but when out of engagement the carrier is allowed longitudinal movement, by which it is thrown out of operative relation with the magazine.

5. In a magazine fire-arm, the combination of the sliding cover O', the rearwardly-extending lip on the upper side of the barrel, and the vibrating carrier D, to prevent the cartridge from being thrown out of the receiver by the sudden movement of the carrier, as set forth.

168,967. DITCHING-MACHINES. Martin B. Durham, Season Falls, N. Y. [Filed Mar. 26, 1875.]

Brief.—The endless belt is provided with lugs, cross-bars, fenders, and lifters, and is combined with an inclined scoop under the bottom. The main frame, with draft-bars and the driving-wheels, is combined with an axle-frame sliding upon the standard, for allowing vertical adjustment of the ditcher. The rear supporting-wheel runs in the ditch, and is adjustable by an arm, brace, and bearing sliding on an upright way, to stay the wheel. The front wheel is divided and adjustable by a screw and horizontal bearing and swivel. Two self-adjusting coupling-shafts, provided with ratchets and pawls, are connected to the driving-gearing on opposite sides of the machine, in compensate for different inclines.

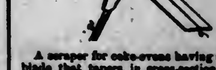
168,967.

1. The endless belt F, constructed with the lugs *d d*, cross-bars *g g*, fenders *h h*, and lifters *i i*, in combination with the inclined scoop D, as and for the purpose specified.

2. The combination, with the main frame A and driving-wheels C C', of the draft-bars J J, connecting the driving-wheel with the front end of the frame, and the axle-frame I I' sliding upon the standard K, for the purpose of allowing the vertical adjustment of the ditcher, as shown and described.

3. The combination, with the axle-frame I I' and rear ditcher-wheel B', of the central standard and way K K', extending from the axle of the ditcher-wheel loosely up through the frame, for the purpose of retaining said parts in proper parallel position at different inclines, and preventing undue strain, as herein shown and described.

4. The combination, with the driving-wheel C' and rear supporting-wheel B', of the arm *r*, brace *s*, and bearing *q*, resting upon the way K', for the purpose of forming a connection between said wheels to stay the supporting-wheel, as herein described.

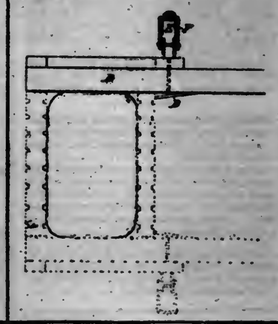


5. The combination, with the outside frame and ditcher, of the two self-adjusting coupling-shafts H H, provided with the ratchets *m* and pawls *n*, and connecting the driving-gearing with the endless-belt pulley on opposite sides of the machine, the whole arranged to operate in the manner and for the purpose set forth.

6. The combination, with the divided supporting-wheel B, of the axle-frame I, provided with the vertical standard *y*, for connecting with the elevating-screw and the horizontal bearing *f'*, for the attachment of the tongue H and scraper *v*, as shown and described.

7. The combination of standard *y* and screw *a*, provided with the heads *d' d'*, fastened by the swivel *a*, for allowing independent movements of said parts, as described.

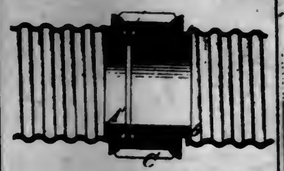
168,968. SCRAPERS FOR COKE-OVENS. P. M. Reitzenstein, Connellsville, Pa. [Filed July 31, 1875.]



Brief.—The scraper, while in use, lies on one of its parallel edges, and is built to resist strain while in that position.

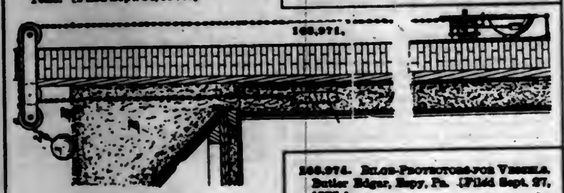
A scraper for coke-ovens having a cast-iron blade that tapers, in cross-section, from the heel *c* to the point *g*, and that has a flange, *e*, on the rear side of the blade, that tapers from the center to the edges, in combination with the wrought-iron rod *a*, roughened or made crooked on its end, as shown and described.

168,969. BALING-PRESSES. Christopher C. Campbell, East Chatham, N. Y. [Filed Sept. 20, 1875.]

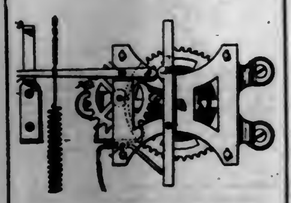


Brief.—The follower is held in the rear of the compressed bale, ready for tying, by means of the hinged leaf projecting inwardly, and operated by springs upon the outside of the press-box.

1. The combination, with the sides of a cotton-press, of hinged spring-arched leaves, as and for the purpose described.
2. The combination, with the hinged leaves D, of the springs E, carrying bolt b, pivoted links F, and adjusting-cycloids G G, as and for the purpose described.



168,970. Hose-Couplings. William A. Caswell, Chicago, Ill., assignor of one-half his right to R. B. Preston, same place. [Filed Aug. 6, 1875.]

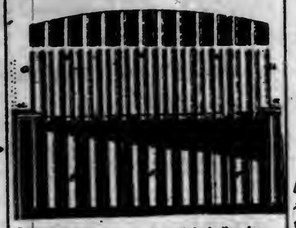


Brief.—Secured upon the contracted end of the male tail-piece is a screw-threaded sleeve, adapted to engage with the screw of the swivel.

The male part of a hose-coupling, composed of a tail-piece or its equivalent, and a screw-threaded sleeve, secured upon a contracted end of the tail-piece, substantially as for the purpose specified.

168,971. Alarms for Fences, &c. James B. Cook and James W. Heath, Memphis, Tenn. [Filed Sept. 14, 1875.]

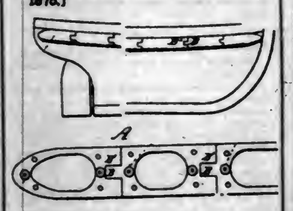
1. An alarm or tell-tale apparatus for prisons or other structures, having one or more weights, which control the alarm mechanism, supported upon or within sand or similar gravitating mobile substance, said substance filling the hollow walls or wall-lining of said structure, and so arranged that when the wall or lining is penetrated the gravitating substance moves downward, the weight follows, and the alarm is started.
2. The combination, with the weight 1 and chain or wire 2, of the trigger 5, lever 10, and alarm mechanism, substantially as set forth.



168,972. Pocket Disinfecting and Inhaling Apparatus. Henry G. Dayton, Maysville, Ky., assignor to R. P. Gleason, same place. [Filed July 24, 1875.]

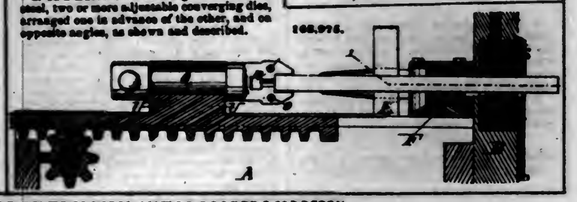
Brief.—The metal case which carries the medicament is perforated, and has a hollow stem to its suspending-ring. This stem serves as an inhaler. The carbolic acid or other material used is poured upon an inclosed disk of porous substance.

The sectional inhaling and disinfecting apparatus, consisting of the perforated case A A', inhaling-stem B, ring C, and porous disks D, substantially as specified.



168,973. Boilers for Steam Fire-Engines. John N. Dennisson, Newark, N. J. [Filed Dec. 10, 1874.]

The combination, in an upright boiler, having tubes D, of the offset a and the drop-tubes F, whereby the water is displaced above the drop-tubes, thereby increasing the fire-surface in relation to the quantity of water in the boiler, as set forth.



168,974. Bilge-Protectors for Vessels. Butler Edgar, Bayy, Pa. [Filed Sept. 27, 1875.]

The metallic bilge-protector A, Fig. 1, substantially as constructed, as and for the purpose specified.

168,975. Machines for Drawing and Polishing Rabs. David J. Farmer, Penn Yan, N. Y. [Filed May 7, 1875.]

1. In a machine for drawing iron and steel bars, the divided converging dies, the parts of which are capable of being brought together by means of screws, as and for the purpose set forth.
2. In a machine for drawing bars of iron or steel, two or more adjustable converging dies, arranged one in advance of the other, and on opposite sides, as shown and described.

3. In a machine for drawing iron and steel bars, the combination of base-frame A, die-blocks B, griping-jaws M, and intermediate die-blocks E, as and for the purpose set forth.
4. In a machine for drawing iron and steel bars, the combination of die-blocks E, operating-arm I, and vertically-adjustable stock K, carrying spring-catch J, as and for the purpose set forth.
5. In a machine for drawing iron and steel bars, the box U, jaws M N, having journal Q and collars q q', in combination with adjustable rotating and longitudinally-adjusting mechanism, as and for the purposes set forth.

168,976. Reciprocating Churns. Edwin A. Firby, Jr., Norwalk, Ohio. [Filed Mar. 13, 1875.]

Brief.—Slide-bars are placed between and firmly fixed to the semi-cylindrical dashers, to prevent them from interlocking while in motion.

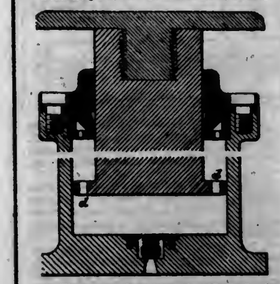
In a churn, the slide-bars J, rigidly secured to the contiguous edges of the semicircular dashers, as and for the purpose herein set forth.

168,977. Stereotype-Blocks. Joseph L. Firm, New York, N. Y., assignor of one-half his right to C. B. Cottrell and N. Babcock, Westerly, R. I. [Filed Sept. 7, 1875.]

Brief.—The block is adjustable on the retaining-screws by means of its slots or notches.

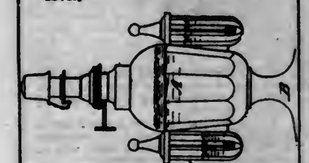
A block, B, designed to carry a curved printing-plate, provided with slots b and notches d along its opposite marginal portions or edges, substantially as and for the purpose herein set forth.

168,978. Machine for Damping Paper. Joseph L. Firm, New York, N. Y., assignor of one-half his right to C. B. Cottrell and N. Babcock, Westerly, R. I. [Filed Aug. 12, 1875.]



1. The combination of a sprinkler, C, with the damping-roll B, arranged to rest on the paper as it is being rolled, substantially as and for the purposes herein set forth.
2. The combination of the hinged or rocking frame A with the damping-roll B and its sprinkler C, essentially as described.
3. The combination of the spout G with the rocking frame A, the damping-roll B, and sprinkler C, substantially as and for the purpose specified.

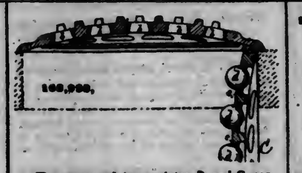
168,979. Spinning Mules or Jacks. M. A. Furbush, Philadelphia, Pa., assignor to himself and C. A. Furbush, same place. [Filed May 22, 1874.]



The combination of the thin slotted projection m of the frame A and the long self-adjusting bearing-block n, adapted to the said projection and to the journal p, common to two sections of the tin cylinder, as set forth.

168,980. Air-Springs for Cars. P. Giffard, Paris, France, assignor to C. J. A. Dick, Philadelphia, Pa. [Filed June 9, 1875.]

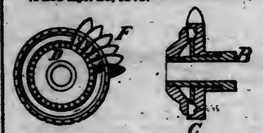
1. The recessed packing-ring H, confined to the vessel A, between the head B and center perforated plate E, and adapted to the plunger, all substantially as set forth.
2. The combination of the plunger D and its perforated guiding-flange d with the vessel A and its packing.
3. The combination of the vessel A, plunger D, and opening a in the latter, for the purpose specified.



168,981. Glass Cigar-Lighters. William A. Gerby, Bellaire, Ohio. [Filed Sept. 21, 1875.]

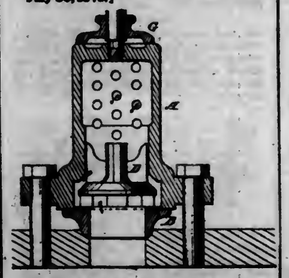
The glass cigar-lighter, consisting of the lamp-body A, its foot B, and the side dips-suppressor C, integral with said body A, as set forth.

168,982. Vault-Covers. G. H. Gordon, Brooklyn, N. Y. [Filed Sept. 28, 1875.]



Brief.—A vault-cover composed of upper and lower perforated plates hinged together, the lower plate carrying the lenses, and arranged to drop down at pleasure, leaving the perforations in the upper plate open for ventilation.

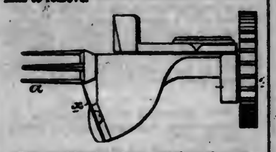
168,983.



The upper and lower plates B and C, constructed with a series of perforations, b and c, substantially as described, in combination with the lenses d fixed within the recesses e of the lower plate, substantially as and for the purpose described.

168,984. Landing-Wheels for Knitting-Machines. Robt. W. Gormly, Troy, N. Y. [Filed Apr. 28, 1875.]

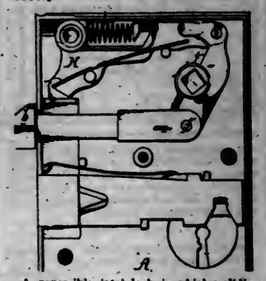
The combination of the bushing B and blades F with the slotted detachable plates C and D and cap-piece, constructed substantially as and for the purpose set forth.



168,985. Lubricators. Amos Gould and W. M. Hayden, Rochester, N. Y. [Filed July 30, 1875.]

1. The combination of the perforated oil-cup A, conical ring B, and valve D, constructed and operating substantially as and for the purposes herein set forth.
2. The combination of the oil-cup A, having inlet-hole b, the guide-rod F, and removable cap C, substantially as and for the purposes herein set forth.

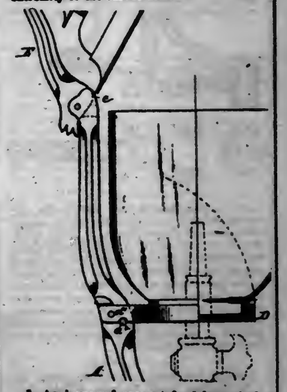
168,986. Apple-Paring Machines. Wm. M. Grierson, Reading, Pa., assignor to himself, Mathan Harbster, and Wm. Harbster, same place. [Filed June 16, 1875.]



Brief.—A supplementary fixed blade is combined with the frame and pronged spindle of the machine in such a manner that the said blade will remove from the apple that portion of the skin which the ordinary paring-blade fails to remove.

The combination, in an apple-paring machine, of a blade, a, attached to the frame, with the pronged spindle A, substantially as specified.

In testimony whereof I have signed my name to this specification in the presence of two subscribing witnesses.

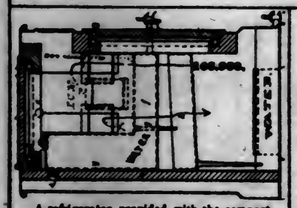


168,987. Reversible Latches. Wm. M. Griscom, Reading, Pa. [Filed July 27, 1875.]

A reversible latch-lock, in which a sliding spring-plate E, carrying a spring, b, and having a tubular projection, m, arranged as described, in respect to the screw-openings in the lock-case, is combined with a lever, F, and a swiveled latch-spindle, all substantially as and for the purpose set forth.

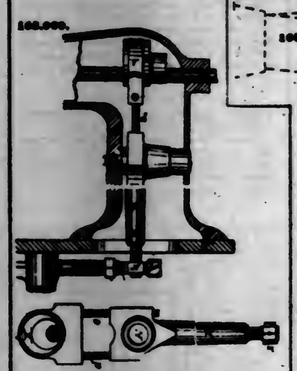
168,988. Street-Lamps. Jas. S. Hagerty, Baltimore, Md. [Filed Oct. 11, 1875.]

Brief.—The cap can be swung back to permit removal of globe. Its backward movement is limited by the projection on the lower extremity of the curved arm.



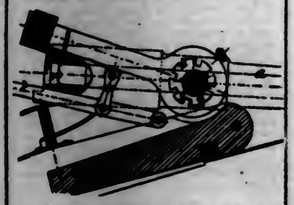
1. An improved support for a lamp shade or globe, consisting of a curved arm or standard, the annular seat D, and the cap or cover F, secured to the bent arm E, hinged or pivoted to the upper end of the standard A, and adapted to set over and secure the globe or shade to its seat, substantially as described.
2. In combination with the standard A, the hinged or pivoted arm E, which carries the cap or cover, provided with a flat horizontal bearing-surface at its lower end, adapted to set against a similar bearing-surface at the bottom of the slot in the standard A, with a projection extending to the rear of said arm A, to limit the motion of said arm E, and hold it in proper position, substantially as described.

168,989. Refrigerators and Water-Coolers. William Hammel, Baltimore, Md. [Filed Sept. 8, 1875.]



Brief.—Ice rests on inclined slats, some higher than others. Openings between slats communicate with an inferior feed-chamber; also, vertical openings in ice-box connect air of ice-chamber with a lateral feed-chamber. Against one side of ice-box rests upright part of water-cooler; its lower part, triangular in cross-section, passes under ice-box. Drip-tube from ice passes in a pipe through water-cooler into a trough, (which also collects condensation from ice-chamber,) and thence into water-chamber under the lateral feed-chamber.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.



A refrigerator provided with the compartments *c* and *f*, inclined ice-tray D, thimble *g*, trough *h*, pipe *i*, and a water-bottom having a cock, *k*, the said parts being constructed and combined and operating as substantially as and for the purposes specified.

168,989. Sewing-Machines. G. Hancock, Providence, R. I. (Filed June 10, 1874.)

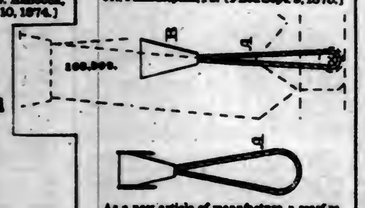
In a sewing-machine, the combination and arrangement of the universal joint, consisting of the pivot L, clasping-socket N, having a V-shaped bearing which grasps the said pivot, and adjustable thereto through the medium of the set-screw I, pivot a adapted to be adjusted in the sleeve m on the end of the horizontal lever H, said sleeve m being split and provided with a nut, *b*, the several parts being constructed and arranged to operate in connection with each other, substantially in the manner as and for the purpose specified.

168,990. Breech-Loading Ordnance. G. P. Harding, Paris, France. (Filed Aug. 27, 1875.)

1. The described method of mounting the trunnions of cannon, consisting in making them of two diameters, and inserting the larger diameter in a bush in the eye of the breech, and resting the smaller diameter on its bearing on the carriage.

2. The described mode of adjusting the breech-piece by means of the eccentric bushes *g*, constructed, applied, and operated as described.

3. The combination, with the breech-piece, of the lever *h*, pivoted at its forward end to the carriage at *n*, and connected, by a rigid link, *o*, to the under part of the breech-piece, as and for the purpose set forth.

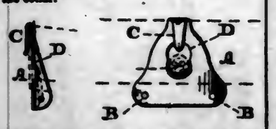


168,991. Dyeing and Calico-Printing. James Harley, Lowell, Mass. (Filed Sept. 30, 1875.)

1. The improved process herein described for dyeing in madder and indigo styles, in combination with sallies greens, consisting in first fixing the green upon the cloth with the mordants, and then passing the cloth through the dye-bath, whereby it is then dyed up in madder and indigo styles, substantially as specified.

2. The new fabric herein described, having as sallies green, substantially such as described, in combination with one or more madder or alizarine colors.

3. The combination of sallies greens upon fabrics with mordants suitable for dyeing, with garancine, alizarine, and similar dye-stuffs, substantially as set forth.



168,992. Scarf-Retainers. W. H. Hart, Jr., Philadelphia, Pa. (Filed Sept. 9, 1875.)

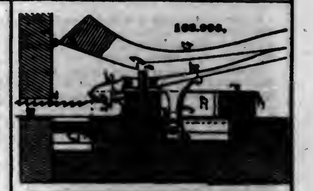
As a new article of manufacture, a scarf-retainer, the same consisting of the elastic cord A and the pin or pins B, combined and arranged to operate substantially as and for the purpose set forth.

168,993. Neck-Tie Retainers. W. H. Hart, Jr., Philadelphia, Pa. (Filed Sept. 9, 1875.)

Brief.—The elastic cord keeps the collar-button within the countersunk bearing, and the hook prevents the neck-tie riding up over the collar.

1. The retaining-plate A, with downwardly-projecting hook or pin C at the upper end, an attaching elastic cord, B, at the lower end, and a button-bearing, D, all combined substantially as and for the purpose set forth.

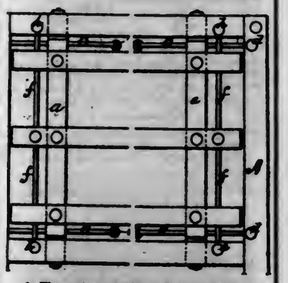
2. The plate A, with countersunk bearing D, in combination with the hook or pin C and elastic cord B, substantially as and for the purpose set forth.



168,994. Shutting-Instruments for Attaching Buttons to Wearing Apparel, &c. D. Heaton, Providence, R. I. (Filed Sept. 20, 1875.)

In a cutting-instrument for attaching buttons to wearing apparel, the upper jaw A, constructed with a slotted recess, E, having an inclined or wedge-shaped bottom, and the lower jaw B, provided with the dies *b* and *b'*, when combined, arranged, and operating in relation to each other, substantially in the manner as and for the purpose described.

168,995. Scroll-Sawing Machines. R. Herring, Jersey City Heights, N. J. (Filed Sept. 9, 1875.)

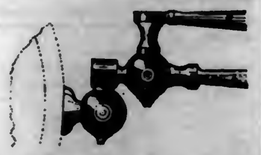


Brief.—The lower end of the saw can be instantaneously disconnected from the reciprocating holder, and automatically raised by means of a self-acting clamp applied to the reciprocating slide of the holder, in connection with a reciprocating spring-lever attached to the slide, and a stationary lever pivoted to the under side of the table.

The combination of the jaws D D and toggle-joint F F with the reciprocating spring-lever E, sliding block *i*, projecting pin I, and stationary lever G, provided with the stop *j*, constructed as shown and described.

168,996. Platform-Scales. A. W. Hall, Chicago, Ill. (Filed Feb. 20, 1875.)

Brief.—Check-rods prevent lateral movement of platform.

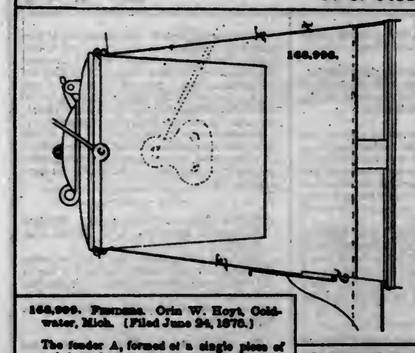


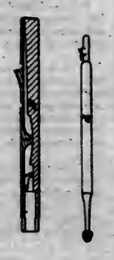
1. The weigh-platform C, in combination with the check-rods *e e* and beams A, whereby longitudinal movement of the weigh-platform is prevented, substantially as described.

2. The weigh-platform C, provided with the slots *c c'*, in combination with the check-rods *f f* and side beams A, whereby lateral movement of the weigh-platform is prevented, substantially as described.

3. The weigh-platform C and stationary frame A A', both constructed as set forth, in combination with the check-rods *e e f f*, substantially as described, and for the purpose set forth.

168,997. Faucets. James M. Hopkins, Louisville, Ky. (Filed Aug. 21, 1875.)

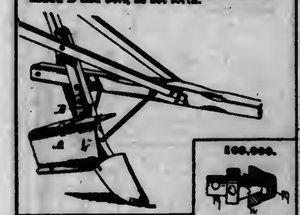




1. The combination, with the handle of the main plug of a device for filling liquid-packages, of an auxiliary plug or cock, substantially as described.

2. The combination of two separate and independent cocks, one of which will sweep vertically through a portion of a circle, with an air-vent, substantially as set forth.

168,998. Glue-Pot Furnaces. Thomas C. Howes, Osborn, assignor to himself and Graham & Holmes, New York, N.Y. (Filed Aug. 6, 1875.)

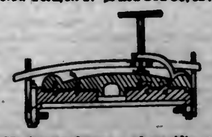


In a glue-pot furnace having a grate, draft-openings, and ash-pan, substantially as shown, the combination of the frusto-conic shell, provided with recesses on opposite sides of its upper edge, with the glue-pot, provided with lugs adapted to fit into said recesses, as and for the purposes set forth.

168,999. Fenders. Orin W. Hoyt, Goldwater, Mich. (Filed June 24, 1875.)

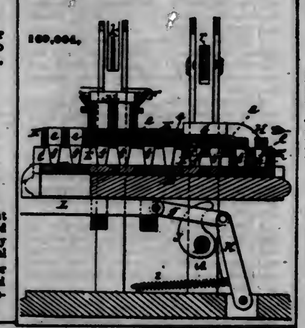
The fender A, formed of a single piece of metal, bent into three angles, *a*, *b*, and *c*, as shown and described, and adjustably connected to the plow-standard by the angular sheet B and bolt, as set forth.

169,000. Hand-Pieces for Dental Engines. William A. Johnston, New York, N.Y., assignor to Johnston Brothers, same place. (Filed Apr. 6, 1875.)



In the hand-piece of a dental engine, the combination, with a rotating tool-holder and an inclosing sheath or sleeve capable of longitudinal movement with respect to one another, as described, of a vibratory spring lock or catch on the holder, and a rib or projection on the interior of the sleeve, for joint operation, substantially as shown and set forth.

169,001. Bottle-Stoppers. R. H. Hunt, Warren, Ohio. (Filed June 26, 1875.)



Brief.—The lower portion of the inverted conical body of the stopper is enveloped by a rubber nipple, held in place as shown.

The combination of the inverted cone A, with knob B at its lower end, and the flange C and stem D at its upper end, and the rubber nipple G, enveloping the cone and button, substantially as and for the purposes herein set forth.

169,002. Processes of Forming a Tight Joint Between the Mouth-Piece and Lid of Gas-Retorts. Nicolaus Jamin, New York, N. Y. (Filed Oct. 30, 1874.)

The improved process of providing a tight joint between the mouth of a gas-retort and the lid thereof, by means of lead liquefied by the heat generated during or by the normal use of the retort, and confined in grooves or receptacles provided between the mouth and lid aforesaid, substantially in the manner described.

169,003.

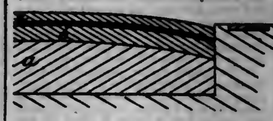
1. The combination of the molds or mold-frames E with the plunger-frames D or their plungers *f* and the platen G, whereby the molds and platen descend in concert for the purpose of compressing the sugar, and said molds afterward farther descend, without the platen, to effect the discharge of the sugar, substantially as specified.

2. The combination of the intermittently-traveling mold-frames E and plunger-frames D with the bed B, rails C C, and a filling-box or hopper, F, essentially as described.

3. The combination of the intermittently-operating slide or driver L with the series of mold-frames E and plunger-frames D, the surface or bed B, on which the plunger-frames travel, and the rails C, on which the mold-frames slide, substantially as specified.

4. The mold-frame E, constructed or provided with ears or lateral projections, b b, in combination with the rails C C having steps *c d* in them, essentially as described.

5. The combination of the platen G with the rising and falling mold-frame E, the rails C having a step, *c*, in them, and the plunger-frames D, substantially as specified.



6. The combination of the discharger H with the mold-frame E, the rails C having a step, *d*, in them, and the plunger-frame D, essentially as described.

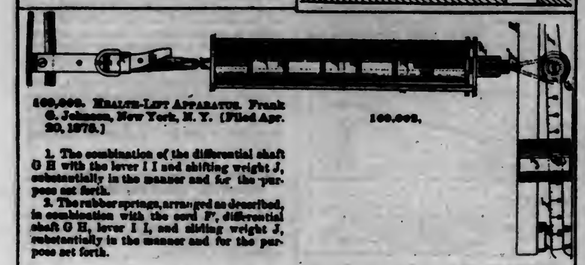
7. The platen G, having the discharger H attached to it for simultaneous operation on successive or adjacent mold-frames E in a like direction, and in opposition to the plunger-frames D, as herein set forth.

8. The combination of the filler M, the filling-hopper F, the platen G, the discharger H, the mold-frame E, the plunger-frame D, the bed B, the stepped rails C C, and the intermittent slide or driver L, substantially as specified.

169,004. Pavements. William H. Jones, Rochester, N. Y. (Filed May 26, 1875.)

Brief.—The road-bed is excavated to the depth of eighteen inches. A ten-inch layer of broken stone is then put down, with a layer of smaller stone to fill the interstices, and properly rolled. Another layer of coarse macadam or small broken stone to the depth of five inches is then applied. A layer of stone-dust or sand to the depth of one inch is next put on, which forms a dam or cut-off, to prevent the coal-tar from passing down to the lower stratum. Another layer of macadam or broken stone is next put on top of the sand, and the whole thoroughly rolled. Over all is spread a thin coat of coal-tar, with twenty-five per cent. of its volatile elements driven off.

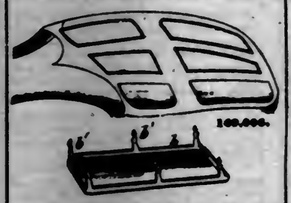
1. A cement covering for a street-pavement, consisting of the residuum of coal-tar distilled in a close vessel till twenty-five per cent., or approximately that amount, of its bulk is removed, as herein described.



2. A street-pavement, consisting of a foundation-layer of small stone or coarse stone chips, a body-layer of coarse macadam, a dam or cut-off layer of sand or fine stone-dust, a surface-layer of fine macadam, and a cement covering of coal-tar with twenty-five per cent. of its bulk removed by distilling in a closed vessel, the whole combined, as described, so that the cement in a thin body permeates the upper layer, but is prevented from passing through to the substructure by the dam or cut-off layer of sand, as set forth.

169,005. Boots and Shoes. R. S. Jeath, Washington, D. C. (Filed Sept. 24, 1875.)

Brief.—The bottom of the sole of the shoe is channeled or grooved, to receive the flanged edge of the plate, which is made of sheet-metal.

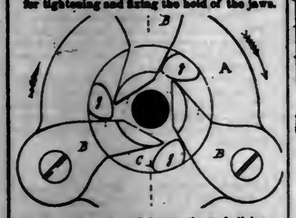


1. As a new article of manufacture for sewing the soles of boots and shoes, a sheet-metal plate having a raised rib, *b*, around the edges, and holding-prongs *b'*, substantially as specified.

169,006. Hemlock-Left Apparatus. Frank C. Johnson, New York, N.Y. (Filed Apr. 20, 1875.)

1. The combination of the differential shaft G H with the lever I I and shifting weight J, substantially in the manner and for the purpose set forth.

2. The rubber springs, arranged as described, in combination with the cord F', differential shaft G H, lever I I, and shifting weight J, substantially in the manner and for the purpose set forth.

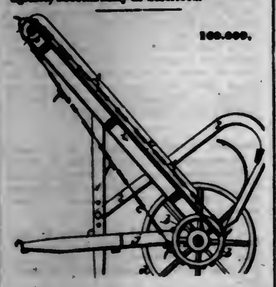


160,006.

2. The lower surface of soles of boots and shoes provided with thin sheet-metal plates having an inwardly-raised rib, *b*, around the edges, entering corresponding channels *a* in the sole, and barbed prongs *b'*, in the manner and for the purpose herein described.

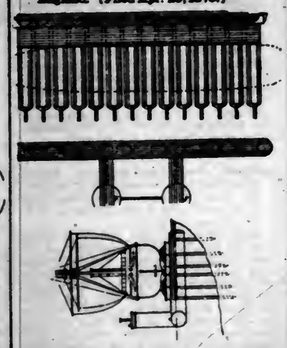
160,007. CRUSHER. Hiram A. Kimball, Philadelphia, Pa. [Filed June 1, 1875.]

Brief.—Clamping-levers pivoted on carrier-plate, to be opened or closed by cams upon the stock. The carrier is also provided with forcing-screw, to engage the rock upon the stock, for tightening and fixing the hold of the jaws.



The combination of the stock-stock C, having lugs *g* and rock E, with the carrier-plate A, having clamping-levers B and the forcing-screw D, substantially as and for the purpose set forth.

160,008. PROCESSES FOR PURIFYING AND PRESERVING ANIMAL FATS. J. P. Kinney, Brooklyn, N. Y. [Filed Sept. 24, 1875.]



1. The process herein described for purifying and preserving animal fats, which consists in first purifying the fat by subjecting it to a heated solution of soda-ash and common salt in water, in about the proportions specified; then drawing the oil off and filtering it into cold water, and then subjecting the oil to a second solution, consisting of bicarbonate of potash and common salt in water; then boiling the mass, and finally filtering the oil off into cold water, substantially as described.

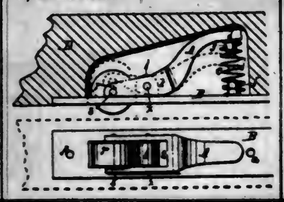
2. The process herein described for manufacturing a suitable product for culinary purposes, consisting in first purifying the fat by subjecting it to a heated solution of soda-ash and common salt in water, in about the proportions specified; then drawing the oil off and filtering it into cold water; then subjecting the oil to a second solution, consisting of bicarbonate of potash and common salt in water, heating the mass, and finally filtering the oil off into cold water, agitating said oil in a churn until it assumes an entire foamy mass, to which add cream and continue to agitate, substantially as described.

160,009.

160,010. FLOATING DOCKS. Josiah Latimer Clark and John Standfield, Westminster, England. [Filed Apr. 29, 1876.]

1. The floating dock and ponton constructed, substantially as herein before described, with open-ended slots or comb-shaped openings in the bottom, for the purpose of raising vessels and depositing them on corresponding stages.

2. The stage constructed, as herein before described, of a series of rows of piles, each row connected at top by a longitudinal timber, and having spaces between them, for the purpose specified.



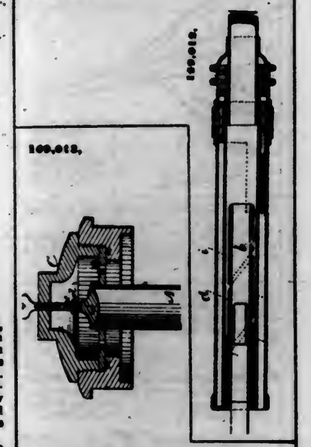
3. The combination of the dock or ponton having slots or comb-shaped openings in its bottom, and the fixed stage of piles having corresponding openings, whereby the vessel may be lowered upon or raised from the stage, as set forth.

4. The floating dock constructed, substantially as herein before set forth, of separate portions, and with one or both of its sides removable.

5. The herein before-described method of depositing vessels high and dry upon fixed stages, and removing them therefrom, by means of the comb-shaped dock or ponton and the correspondingly-shaped stage, both constructed substantially as set forth.

160,011. SASH-HOLDERS. Sylvester Lewis, Rochester, N. Y. [Filed Aug. 27, 1875.]

Brief.—A friction-roller journaled in the forked end of a rocking lever is adjustably held against, or engages in suitable notches of, the sash-frame.



An improved sash-holder, consisting of the slotted face-plate B, having lugs *l* and *l'*, the bent and bifurcated rocking lever A, having the projecting end *d* and leg *g*, and rocking on the pivot or axle *e*, passing through the leg *l* of the face-plate, the roller *r*, rotating on its axle *s*, and journaled in the forked end of the lever, and the coil-spring C, kept in position by lugs *g* and *l'*—one on the projecting end of the lever, the other on the inside of the face-plate—all constructed, arranged, and operating substantially as described and shown, for the purpose set forth.

160,012. PEN AND PENCIL CASES. William A. Ludden, Brooklyn, N. Y. [Filed Aug. 6, 1875.]

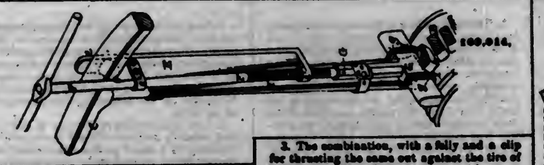
Brief.—A tube within the case, inclosing the screw-tube, and extending to the top of the case, terminating as a collar, by which the inclosing-tube and screw-tube are revolved to project or retract the pencil, regardless of the extension-tube.

The tube *i*, connected at one end to the screw-tube *d*, and at the other end to the collar *l*, by which it and the screw-tube *d* are revolved, in combination with the pencil *a* and the case inclosing the pen-slide, substantially as set forth.

160,013.

160,014. PIPE-EXTINGUISHERS. Edmund A. Magimness, New Albany, Ind. [Filed July 19, 1875.]

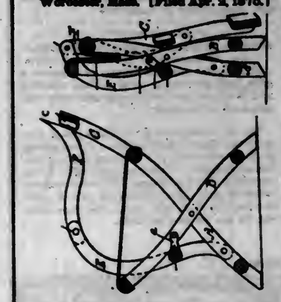
Brief.—The said-bottle is supported by a perforated diaphragm, resting in a seat in the mouth of the tank, and secured by the screw-cap. The cover of the said-bottle is made conical, so that a slight turn of the binding-screw will freely release it. A flange on said screw, with packing, makes tight the joint of the screw with the cover, when the screw is turned sufficiently for back.



1. The perforated diaphragm D, attached to the bottle A, and suspended on the shoulder *a* in the top B of the tank, substantially as herein set forth.

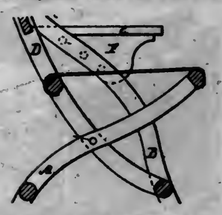
2. In a fire-extinguisher, the combination of the said-bottle A and the hinged valve G, made in conical shape, or raised in the center, and screw *h*, for holding the valve down, substantially as and for the purposes herein set forth.

3. The combination of the top B, with shoulder *a*, perforated diaphragm D, said-bottle *e*, valve G, cover C, and screw *h*, with flange *d* and packing *c*, all constructed substantially as and for the purposes herein set forth.



160,015. TIME-TELEPHONES. J. W. Marks, Sumner, Ill. [Filed May 10, 1875.]

The combination, with jack B, screw F, and socket G, of the rope-ring I, for keeping around the spoke and cross-feet *g* of the socket, substantially as set forth.



160,014.

160,016. FOLDING CHAIRS. Geo. McAleer, Worcester, Mass. [Filed Apr. 2, 1875.]

A folding chair, composed of the cross-legs A B, back-frame C, pivoted to the front legs A, arm-rests E and F, jointed together, and pivoted to the lower ends of the front legs, and to the back C, all substantially as shown and described.

160,016. FOLDING CHAIRS. Geo. McAleer, Worcester, Mass. [Filed Mar. 26, 1875.]

1. The combination, with the front and rear leg sections of a folding chair, of a back-frame attached to the front-leg section at or near its upper end, and extending to and connected with the lower portion of said front-leg section, substantially as described.

2. The combination, with the back-legs A and back-frame D, extending to and connected with the lower portion of the front-leg section B, of the arm-rests F, constructed of brackets *b* attached to the portion of the front-leg sections which project above the seat, and the whole being otherwise constructed substantially as and for the object specified.

160,017. TIME-TELEPHONES. Stanford W. McOmber, North Manchester, Ind., assignor of one-half his right to O. H. Winton, same place. [Filed July 31, 1875.]

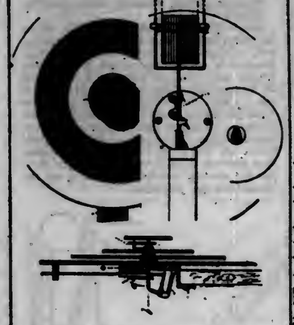
1. The H-shaped clip having lateral flanges *e*, and the annular flange *f* embracing the felly and rod D, substantially as shown and described.

2. The H-shaped clip having the flanges *e f*, the rubbered rod D, the ferrule C with screw-threaded portion *c*, the washer *w*, and packing *r*, all constructed and combined substantially as shown and described.

3. The combination, with a felly and a clip for thrusting the same out against the tire of an elastic rubber plate, *p*, interposed between the clip and felly, substantially as specified.

160,018. CENTRIFUGAL WATER-WHEELS. Jas. H. Meacham, Petersburg, Va. [Filed Aug. 10, 1875.]

Brief.—A conical water-wheel, preferably so made that the incline shall be at an angle to the base, while only a sufficient space is left on top from which to start the grooves, that begin on each radius of two crossing diameters, and are gradually curved around, so as to issue at corresponding points of the base. The wheel is inclosed by a case, that forms part of the wheel, and has inner or discharge-holes, one for each of the grooves, and also a tube or neck, that couples in a corresponding tube of the water-reservoir.



1. A water-wheel having a conical form, and curved grooves D running from apex to periphery of base, as and for the purpose described.

2. The combination of wheel-case and water-reservoir, the former having a tube, *c*, that revolves in a tube, *f*, of the latter, as and for the purpose specified.

160,019. TARGETS. Theodore H. Mead, New York, N. Y. [Filed Sept. 10, 1875.]

Brief.—The tens of each disk, being peculiar, serves to indicate the distance of the bullet's impact from the center of the target.

1. A target composed of a series of isolated concrete plates, each of a different pitch or tone, combined with a suitable support, substantially as herein described.

2. In combination with the reciprocating bull's-eye bolt, the hollow supporting-mandrel, and a bell at the rear thereof, substantially as described.

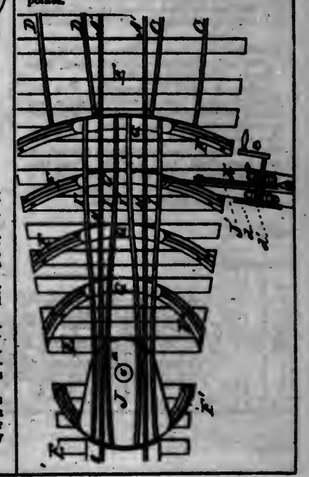
3. The combination of the reciprocating bull's-eye bolt, lever *h*, and gravitating-signal F, substantially as described.

4. A target provided with a signal arranged to be projected and displayed by means actuated from a reciprocating bull's-eye bolt, which signal gravitates into its operative or normal position, substantially as shown and described.

5. In a target composed of sounding plates or disks, a supporting-mandrel, provided with a bearing for said plates at a single point or angular edge of said mandrel, substantially as shown and described.

160,020. TOYS. Joseph Porter Michaels, New York, N. Y. [Filed Aug. 16, 1875.]

1. The combination, with a screw-wheel, or vanes, or other devices adapted to be rotated on its axis by currents of air, of a suitable stand, to hold said screw-wheel centrally over a lamp or gas-burner, and a hanging gallery for supporting figures, the whole arranged to operate substantially as described.



2. In combination with a screw-wheel or vanes, adapted to be rotated by currents of air, and a means for properly supporting said screw-wheel over a lamp or gas-burner, the series of pendent wires *c'*, for separately supporting the figures or pictures to be caused to travel around the light.

3. In combination with the wheel A and a gallery, *d*, the flexible connections *c*, the whole arranged and operating in the manner and for the purposes set forth.

4. A rotary wheel, A', with points *f*, adapted to the attachment of hanging wires *c'*, substantially as shown and described.

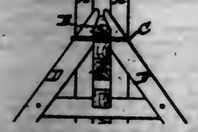
160,021. RAILROAD-SWITCHES. Leonard Middleton and Jas. B. Gary, Victor, Iowa. [Filed Sept. 25, 1874.]

Brief.—The rails of the main track and the rails of the right and left hand side tracks are secured at one end to a strong metallic plate, pivoted in the manner of a turn-table. The rails are secured at their free ends to curved plates, which are supported and slide on segmental rails secured to the cross-ties. The switch is operated by a rack-and-pinion gearing, and a notched bar locks it at the desired points.

1. In a raised switch the combination, with the rails A, A', C, and D of the switch-rails H I F, segmental guide-rails F F', turn-table J, and slides G, substantially as specified.

2. The combination, with the rails H I F, of the guide-rails F, and plates G, substantially as specified.

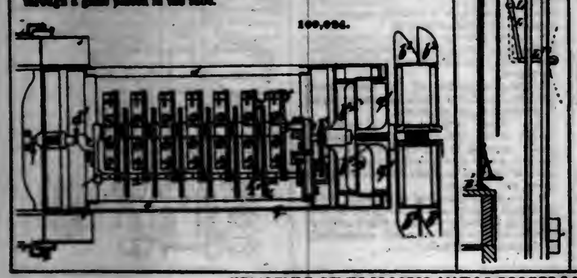
3. The combination, with the pivoted switch H I F, rock-bar F', and their operating mechanism, of a lock-bar, K, pivoted to the said rock-bar, substantially as specified.



169,003. Button-Gaiters. William H. Miller, New York, N. Y., assignor of part of his right to Kenny & McFarland and Joseph B. Miller, same place. [Filed Oct. 7, 1875.]

1. As a new article of manufacture, the herein-described button-gaiter, having the inside quarter, vamp, button-piece from toe to ankle-joint, and facing of outside quarter formed in one piece, and the outside quarter formed from another piece, and having a piece attached to the button-piece at the ankle-joint to complete the same, substantially as set forth.

2. The pattern or piece forming the inside quarter, vamp, facing of outside quarter, and part of the button-piece of a button-gaiter, substantially as described.



169,005. Farm-Fences. John P. Mennett, Bunyan, Ohio. [Filed Mar. 9, 1875.]

The combination, substantially as shown and described, of the posts A A, rings C C, braces D D, and rider E, wedged between the upper ends of the braces, thereby firmly locking the rings in place around the said braces and posts, as and for the purpose set forth.

169,004. Stove-Lock. Benjamin T. Moore, Elm Lodge, Spring Grove, Isleworth, England. [Filed Feb. 20, 1875.]

Brief.—A stove-lug consisting of an oblique cylindrical tube of suitable length, and having propelling-blades attached. The tube is suspended from eastern pinned in a frame. The rotation of the tube communicates motion to a shaft running centrally through it, and upon which is set a screw. From this shaft is hung a pendulous frame carrying a train of counting-wheels, which can be seen through a glass placed in the tube.

169,006.

1. The combination of the removable pendulous frame, the train of counting-wheels and dials, all carried by said frame, the water-tight case, in which the frame is suspended, and the blades for rotating the base and setting the wheels in motion, these members being constructed and operating substantially as set forth, whereby all the wheels and dials of the train remain, while in operation, in a correspondingly close of equilibrium relatively to the revolving case, and may readily be removed from, or placed in, the case without disturbing their relative positions in the frame.

2. The combination, substantially as hereinbefore set forth, of the non-rotating frame or case, the revolving water-tight case, the counting-wheels, and their supporting-frame, suspended within the revolving case.

3. The combination, substantially as hereinbefore set forth, of the water-tight revolving case, the suspended counting-wheels, the non-rotating frame as outer case, and the balancing suspending-support, for the purpose specified.

169,006. Hatchway-Guards. Wm. Muir, Montreal, Canada. [Filed Mar. 10, 1875.]

Brief.—A double-inclined cam is attached to the car, which impinges against a lever-arm on a rock-shaft. A long lever on said rock-shaft is attached to the doors. Said doors travel on inclined ways, and are forced back by the nearest of the car, and close after the car has passed by their own weight.

169,006.

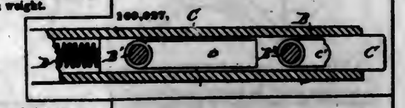
1. In combination with any hoistway provided with sliding doors, the rock-shaft C, carrying lever E, engaging with stops K, and arm F, with or without roller G, acted upon by inclined planes I, substantially as and for the purposes set forth.

2. The combination of the rock-shaft C with arm F and lever E, acted upon by the traveling platform H, and imparting motion to the doors A of the hoistway, as and for the purpose specified.

169,006. Self-Closing Hatchways. Wm. Muir, Montreal, Canada. [Filed Mar. 19, 1875.]

Brief.—The doors are raised by the car in its ascent by a projection on the car engaging with a hinged catch on the door, and when the door is raised to its proper position the hinged catch is forced down by a projection on the hoistway, which disengages it from the car. A stop for holding the door in an elevated position is operated by a cam-groove on the car. As the car descends, projections on the car engage with projections on the weights, which are connected to the doors by ropes, then drawing them down to the proper position for opening the door, when they are released by a cam projection.

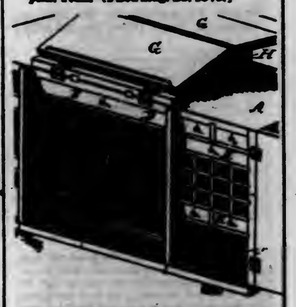
169,006.



1. In combination with the rising doors of a hoistway, hinged stops C, acted upon by projections formed on the traveling platform in its upward movement, and yielding to the same as it descends, the stops being disengaged from the platform, as it rises, by the projection F, formed on the hoistway, all substantially as set forth.

2. The combination of the rest K and pivoted levers L with arms L', for the purpose of retaining in a raised position the doors (sliding upward) of any hoistway, and the inclined planes M, secured to the traveling platform H, to reverse this action and allow the doors to fall, substantially as described.

169,007. Journal-Clamps. Gustav A. Nordmann, St. Louis, Mo. [Filed Sept. 6, 1875.]



Brief.—The movable hollow jaw carries a slide, adjusted by a spiral spring, allowing said jaw to be positioned instantaneously with reference to the fixed jaw.

The combination of the movable jaw B, carrying the slide C, having slots *c c'*, the spring D, the hand-screws B' F', having bearing-surfaces of threads reversed, all said parts being constructed and arranged to operate with relation to each other and a fixed jaw, A, substantially as in herein shown and described, and for the purpose set forth.

169,007.

169,008. Corrugated Dishes and Baggage-Check Boxes. George R. Nichols, Memphis, Tenn. [Filed Aug. 28, 1875.]

The case A, provided with the sectional door G, hinged at the top, so that it can be thrown back and rest on the supports E E, and form a desk-top, substantially as shown and described.

169,009. Needle-Cases. Otto Kamm, New York, N. Y. [Filed Apr. 17, 1875.]

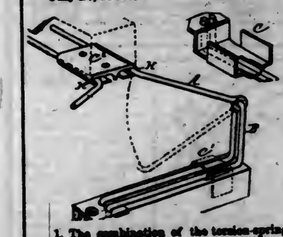
Brief.—The spring holds the cap down so that its protuberances rest in the ends of the eyes. The cap can be rotated so as to bring the recess over any one eye for withdrawing the needles, the protuberances springing from one eye to another.

1. The needle-case, having a series of eyes, B, in combination with the pins C, spring J, and perforated cap O, having flanges overlapping the body of the needle-case, and constructed with one or more rounded or inclined protuberances, E, substantially as described, for the object specified.

2. The combination, with the needle-case, having a series of eyes, B, and a perforated cap, having one or more protuberances, E, of the ring H, pin G passing through the cap and ring, and having an enlarged bottom head, and the spring J' applied to said pin between the lower end of the same and the ring, substantially as described.

169,010. Gas-Fastenings. Geo. G. Nodle, New Berlin, Ohio. [Filed Sept. 15, 1875.]

Brief.—A weighted lever serves to throw the bolt, and the tumbler to operate it has its face end slotted, so that it may be retained in position by friction. The heel end of the weighted lever is so shaped that in turning in the side of the case no opening is left for dirt to fall into the working parts of the lock.



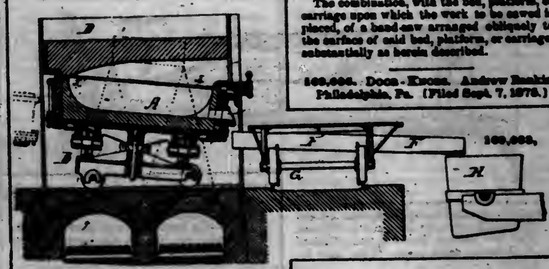
1. The combination of the weighted lever A A', the bolt B, and the tumbler C, having its face end slotted, whereby it is retained in position by friction, substantially as set forth.

2. The combination of the heel end of the weighted lever A A', formed in the arc of a circle, with the side *b'* of the shell and the spur *d* of the thumb-piece D, substantially as set forth.

169,011. Anti-Friction Compounds. Carl G. P. Otto, Syracuse, N. Y., assignor of one-half his right to R. D. Monon, same place. [Filed Sept. 20, 1875.]

A compound consisting of bone and glycerine, plumbago, asbestos, manila-pulp, soapstone, glue, and condensed linseed-oil, treated in the manner described.

169,012. Torsional Springs for Vehicles. Daniel B. Paris, Troy, N. Y. [Filed July 27, 1875.]



1. The combination of the torsion-springs A A, secured to the wagon body or seat at their ends by means of a clamp, C, and at their sides by the clamp C', and the double flexible springs B B, secured to the trunk of the carriage at their ends by bending and inserting the same therein, and at their sides by a clamp, C', the whole adapted to operate together, substantially as described.

2. In combination with the springs A A, secured rigidly to the carriage body or seat, the clamps C' for securing them loosely at the sides, and the friction-rollers H H, to facilitate their operation, substantially as described.

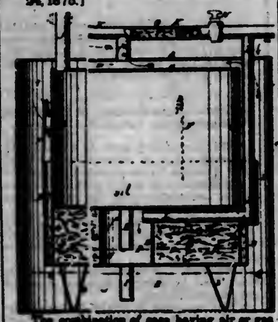
169,013. Inclined Revolving Puddling-Furnaces. Charles Pernot, St. Chamond, France. [Filed June 29, 1874.]

Brief.—The inclined revolving hearth is run into the Siemens furnace on rails, and, by revolving, mechanically puddles the iron. The joint is kept open, the internal pressure of the gases, caused by their expansion in the regenerators, and additional expansion or burning into flame in the hearth, being sufficient to exclude the air.

169,013.

The combination, with the bed, platform, or carriage upon which the work to be carved is placed, of a hand-saw arranged obliquely to the surface of said bed, platform, or carriage, substantially as herein described.

169,014. Door-Knobs. Andrew Rankin, Philadelphia, Pa. [Filed Sept. 7, 1875.]

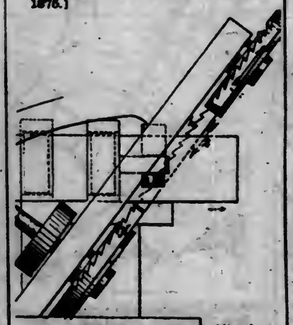


169,014.

The within-described cast-metal handle, consisting of the concave-convex head *a* and stem *b* cast in one piece, as set forth.

169,014.

169,015. Furnaces. James M. Pollard, New Orleans, La., assignor to himself and W. W. Barton, Galveston, Tex. [Filed July 24, 1875.]



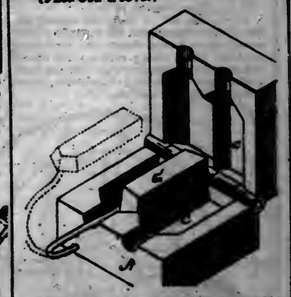
1. A furnace in which are combined an inclined rotating and removable hearth, arranged to leave an open joint, *a*, between the hearth and the body of the furnace, and a regenerator from which heated gases are passed to the furnace under a pressure greater than that of the external atmosphere, for the purpose specified.

2. The combination of the furnace D, inclined rotary hearth A, series of ladles E, and spout F, mounted on a truck, G, to conduct the molten metal to any one of the ladles, as set forth.

169,016. Carburetters. James M. Pollard, New Orleans, La., assignor to himself and W. W. Barton, Galveston, Tex. [Filed July 24, 1875.]

The combination of cans having air or gas induction pipes K L and ejection-pipe M, the vessel B *b'*, having overflow-pipe I, and the gasoline-holder C, having flanges D E, oil-feed pipe H, and gasoline-pipe J, as and for the purposes specified.

169,017. Band Sawing-Machines. Paul Frydill, New York, N. Y. [Filed Sept. 15, 1875.]

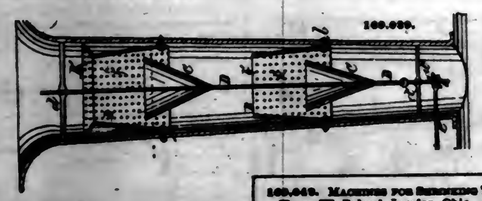


Brief.—The saw is arranged obliquely to the surface of the bed or carriage upon which the work is placed, at an angle of from thirty to sixty degrees with relation to the bed or carriage, for the purpose of cutting against the grain of the material being operated upon.

169,017. Manufacture of Gas for Burning and Lighting. Thomas B. Redwood, Fairlawn Finchley, England. [Filed Apr. 24, 1875.]

The herein-before-described improvement in the manufacture of permanent gas rich in carbon, which consists in bringing hydrocarbon vapor, together with water-gas, into contact with a largely-extended and highly-heated surface of copper or an alloy of copper.

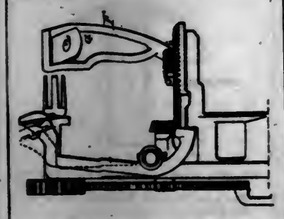
169,018. Moulds for Manufacturing Bottles. Peter W. Reid, Pittsburg, Pa., assignor to McKee & Brothers, same place. [Filed Oct. 4, 1875.]



The desk A B, formed with the two moulds C D, having an aperture, *a*, between them, and a swinging partition, G, to close or open said aperture, substantially as and for the purpose herein set forth.

169,019. Locomotive Smoke-Stacks. P. Reilly, Burlington, Iowa. [Filed Aug. 31, 1875.]

Brief.—The unconsumed products of combustion, in their ascent, are deflected outward by the cones, and the sparks driven through perforations in the plates to the annular spaces between them and the stack, where they are retarded and brought in contact with steam emitted to extinguish them.

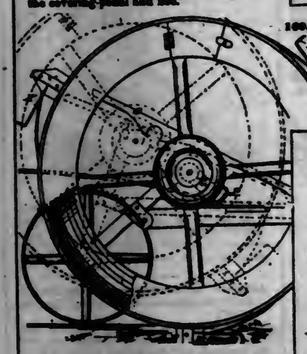


The perforated plates E E, secured within the smoke-stack so as to leave annular openings or passages *a b*, and operating in combination with the cones C C, the latter being secured to the rod D and adjustable vertically, substantially as and for the purpose specified.

160,039.

160,040. APPLE-PARING MACHINE. Adolph Bippian, Reading, Pa., assignor to William Harbster, Mathias Harbster, and William M. Grimson, same place. [Filed May 31, 1875.]

Brief.—A supplementary knife is combined with the knocking-off lever of an apple-paring machine, in such a manner that the portion of the skin which remains on the fruit, after being subjected to the ordinary machine, will be pared off.

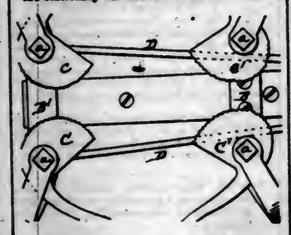


1. The combination, in an apple-paring machine, of a supplementary blade, I, with the knocking-off lever, substantially as and for the purpose herein set forth.

2. The combination of the knocking-off lever of an apple-paring machine and its supplementary knife, the rib *n*, and projection *o* on the wheel F.

160,041. CORN-PLANTER. Thos. L. Ellmakerer and J. Vance Lewis, Washington, D. C. [Filed Sept. 9, 1875.]

Brief.—The folly of the wheel is made hollow for holding seed, and has "planting-bills," one of which is fixed thereto, the other being provided with a spring seed-cup and cut-off, and is forced inward by contact with the earth, and outward by a spring, which also depresses the covering-pedal and hoe.



1. The wheel A, having spokes and a hollow folly, in combination with the planting-bills, substantially as set forth.

2. The spring seed-carrying cup I, in the sliding bill F, in combination with the stationary bill H, and cup H, substantially as set forth.

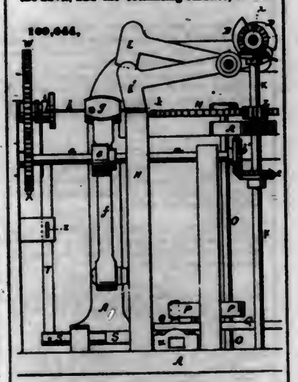
3. The bar L, and pedal K, in combination with the sliding bill F, substantially as set forth.

160,042. MACHINES FOR SHEARING TIRES. Henry W. Roland, London, Ohio. [Filed Sept. 13, 1875.]

Brief.—The head-lever, with its rods, brings the movable bar, with its cam-levers, toward the stationary bar and its levers.

The bars B B', the one movable and the other stationary, their ends turned over to embrace and hold the cam-levers C C', in combination with the rods D D and the divided lever E, as for the purpose set forth.

160,043. GRAIN-BINDERS. F. P. Roebuck, Springfield, Mo. [Filed Sept. 14, 1875.]



1. The compressor-arms A A', pinion Q, stationary rack R, in combination with cam-wheel T, as and for the purpose set forth.

2. The knot-tying hook C, provided with the slot, in combination with the nippers D, as and for the purpose described.

3. The arm A, having tightener F and knife E, and the arm A', having nippers D, in combination with the knot-tier C, substantially as described.

4. The fork G, in combination with the stationary cam for operating the same, as and for the purpose set forth.

5. The separator B, pivoted on the vibrating arm A, as and for the purpose described.

160,044.

160,045. CORN-PLANTER. Thos. L. Ellmakerer and J. Vance Lewis, Washington, D. C. [Filed Sept. 9, 1875.]

Brief.—The folly of the wheel is made hollow for holding seed, and has "planting-bills," one of which is fixed thereto, the other being provided with a spring seed-cup and cut-off, and is forced inward by contact with the earth, and outward by a spring, which also depresses the covering-pedal and hoe.

1. The wheel A, having spokes and a hollow folly, in combination with the planting-bills, substantially as set forth.

2. The spring seed-carrying cup I, in the sliding bill F, in combination with the stationary bill H, and cup H, substantially as set forth.

3. The bar L, and pedal K, in combination with the sliding bill F, substantially as set forth.

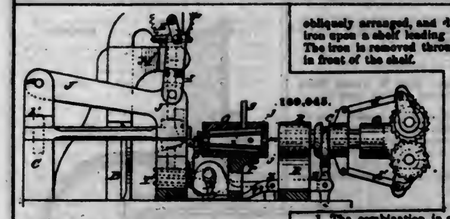
160,046. HORSESHOE-NAIL MACHINES. Jos. Roy, Chicago, Ill. [Filed Apr. 9, 1875.]

Brief.—Two hammers operate alternately to forge the nail. The rod is coiled on a reel carried in a revolving frame, and passes between two straightening-rolls, out through one of the arms of the frame. A head provided with two pivoted jaws is fitted to the axis of the revolving frame and turns therewith, and is intermittently reciprocated by means of a lever, to feed the rod forward. The rod passes through a laterally-oscillating furnace, that presents it alternately to the two hammers as the rod is turned a quarter around. A cutter, fixed to a wheel or a vertical shaft, acts in conjunction with a stationary knife, to sever the finished nail from the rod, the hammer being held up by a catch.

1. In a nail-machine, the combination of the rod V, spool U, and rollers *x y* with mechanism for feeding the nail-rod to the furnace and hammers, for the purpose of securing an uninterrupted feed, as specified.

2. The combination of the furnace or forge *g*, the lever *f*, and mechanism for imparting to it a lateral oscillating movement, with the hammers E E' and anvil H, as and for the purpose set forth.

3. The apparatus for feeding the nail-rod to the hammers, consisting of the lever T, with its fulcrum *z*, rod S, slide R, lever Q, cam P, with its stud, and the revolving cloth *i*, all constructed and operating as described.



4. The combination, with the hammers E E', anvil H, and laterally-oscillating furnace *g*, of the stationary cutter *n* and revolving cutter *l*, substantially as and for the purpose set forth.

5. The combination, with the two hammers, the anvil, and the oscillating furnace, of the continuously-revolving and longitudinally-reciprocating cloth *i*, for turning and feeding forward the rod, as and for the purpose described.

6. The combination, substantially as described, of the sliding step *c*, hammer E, arm S, and cam *n*, as and for the purpose described.

160,047. MACHINES FOR FORMING NAILS. Joseph Roy, Philadelphia, Pa. [Filed Apr. 20, 1870.]

Brief.—A pair of lateral hammers; a vertical hammer actuated by cranks that are indirectly connected to their heads; feed-rolls rotated by pawls that are actuated through the medium of levers, grooved collar, and shifting device, by a tappet, X, on a transverse shaft; a gas-furnace through which the nail-rod passes; and a device for cutting off the nails—viz., a cutter attached to the vertical hammer, and another attached to the anvil.

160,048.

1. The feeding device, consisting of the combination of the worm F, pinion U, shaft V, cam X, rod W, slide R, lever *a*, collar O', arms *d d'*, pawls *g g'*, ratchets *e e*, feed-rollers *f f*, and guide Q, all constructed and operating substantially in the manner described.

2. The combination and arrangement of the male crank-shaft E, gears F F G G', crank-shafts H H', pitmen I K K', and hammers J L L', hung to standard O', all constructed and operating substantially in the manner and for the purpose specified.

3. The nail-severing device, consisting of the combination of the cutter *k*, attached to the side of the hammer J, and a lip placed below it and projecting from the side of the anvil, as and for the purpose stated.

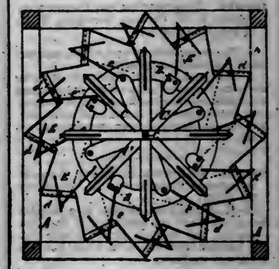
4. The gas-furnace O, constructed and located as described, having the end openings *m n*, and provided with inner chamber *i*, air-jacket *j*, gas-pipe *h h*, and air-tube *p*, all as and for the purpose set forth.

160,049. TIN VESSELS. Theodore Schmitz, New York, N. Y. [Filed Sept. 9, 1875.]

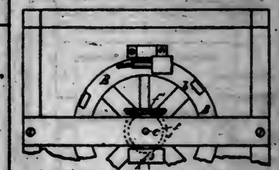
As a new article of manufacture, a measuring-cup for malt, spirituous, or other liquors, consisting of a body, A, bottom D, foot-flange C, and lip B, formed of a single piece of block-tin, or britannia metal, and having a handle, E, of the same metal attached thereto, substantially as described.

160,050. PUDDLING-FURNACES. Christopher J. Schofield, Clayton, near Manchester, Great Britain. [Filed Apr. 17, 1875.]

Brief.—The annular chamber contains water, in which the annular hearth revolves on friction-rollers, &c. Flame and products of combustion enter the annular chamber from the fire at one side, and, dividing into two streams, find exit at the other, impinging on the metal in the revolving annular hearth. A mechanical tool puddles the iron, and a slide let down through the top of the chamber dips into the revolving hearth, across which it is obliquely arranged, and diverts the puddled iron upon a shelf leading out of the furnace. The iron is removed through a door opening in front of the shelf.



160,048.



1. The combination, in a puddling-furnace, having a rotating annular bed, of an opening, *c'*, in the side of the furnace, with a vertically-adjustable and tangentially-arranged deflector, *c*, as set forth, for the purpose specified.

2. The combination of the chamber *i*, containing water, and having an inlet and outlet for the same, with the rotating annular bed *a a'*, substantially as shown and described.

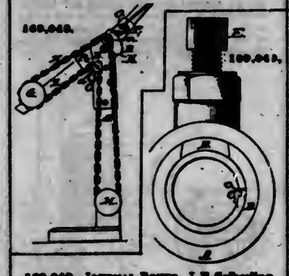
160,051. WINDMILL-POWER. W. H. Short, Talbot, Ill. [Filed July 26, 1875.]

Brief.—When the wind is very high the shutters close, and in doing so turn the turn-table partially to one side from its original position. This movement of the turn-table raises a weight, which is suspended from below, passing over a pulley, and, reacting on the platform, restores it to its original position, and also returns the shutters again to position to freely admit the wind.

1. The gearing *f f'*, holes *f''*, in combination with wind-wheel C, to operate as and for the purpose set forth.

2. The gearing *f f' f''*, in combination with wind-wheel C, to operate as and for the purpose set forth.

3. The combination of the fixed shutters D, movable shutters E, connected to turn-table B, carrying weight F, the wind-wheel C, its shaft *c*, gearing *f f' f''*, all constructed and arranged to operate in the manner and for the purpose herein shown and described.



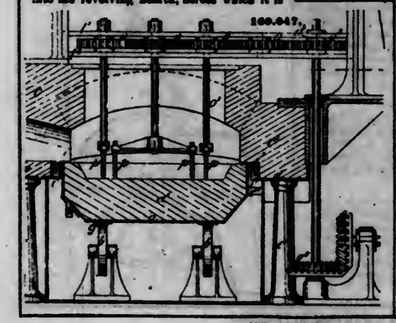
160,052. HARVESTER-RIBBER. J. P. Sherman, Akron, Ohio. [Filed Apr. 14, 1876.]

1. The hinge-piece B, with the ratchet D cast thereon, in combination with the hinge-piece F, pivot K, and pawl O, substantially as set forth.

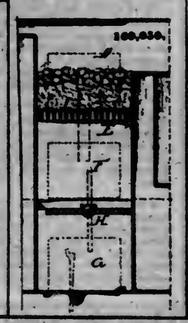
2. The hinge-piece B, with the cut-off support O upon the front edge thereof, in the manner and for the purpose set forth.

3. The hinge-piece B, having the fixed pulley-supports *a* and *a'*, one above the pivot K and the other below said pivot, in combination with the chain N, and pulleys H and *i*, and swinging arm E, substantially as and for the purpose set forth.

160,053. JOURNAL-BOXES. J. P. Sellentine, Akron, Ohio. [Filed Apr. 14, 1876.]



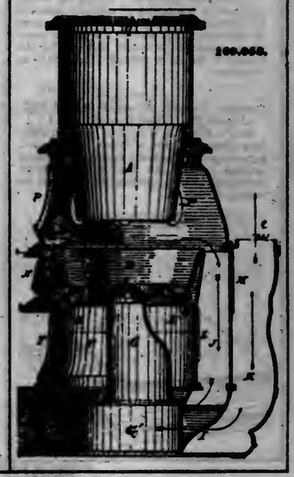
160,053.



The combination of the split sleeve or thimble C, the frame A, the plate D, screw E, and fusible-metal filling B, substantially as set forth.

160,054. STOVES. Isaac A. Sheppard, Philadelphia, Pa. [Filed Sept. 17, 1875.]

Brief.—The ashes and cinders can be dumped onto a sifting-grate, and being sifted, the ashes can be deposited below by means of the tilting door, and the cinders removed from the tilting sifting-grate.



160,047.

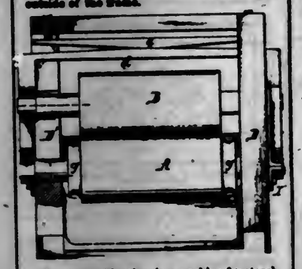
160,054.

The combination, in a cooking-stove, of the fire-piece D, its grate E, the compartments F and G, the tilting-sifter between the compartments, and the tilting-door *a* in the bottom of the said compartment G, all substantially as set forth.

160,053.

169,049. STOVES AND FURNACES. Hiles Smith, Albany, N. Y., assignor to Samuel E. Rasmus, trustee, same place. [Filed Mar. 20, 1876.]

In a central-fire heating-stove, the combination of the following elements, viz: a central flue extending through the base and ash-pit constructed and adapted to deliver currents of heated air to the center of the grate; a shallow fire-pot and convex grate, contained in a flaring illuminated fire-pot section: an unobstructed flaring illuminated combustion-chamber entirely above the fire-pot section, and an open-top rear descending flue entering directly into the bottom of the combustion-chamber, on a line with the top of the fire-pot, all substantially as described and shown.



169,050. COMPOSITIONS FOR ORNAMENTS. Johann G. W. Steffens, Brooklyn, N. Y. [Filed Oct. 6, 1876.]

1. The composition of curd, alkali, and resinous substances, as described.

2. The process herein described, of fixing the composition of curd, alkali, and resinous substances specified, by subjecting it in whey or milk before pressing, and in cold water containing oil of vitriol after pressure, as set forth.

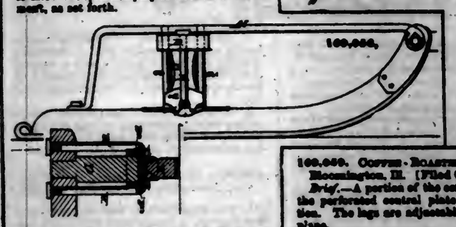
169,051. STARCHING-MACHINES. Leopold Sternberger, Philadelphia, Pa. [Filed July 10, 1876.]

Brief.—Two rollers revolve in a suitable frame, the lower one being longer than the upper one, and having a groove at each end. The journals of the rollers have their bearings outside of the frame.

1. The combination, in a machine for starching fabrics, of two pressure-rollers, A and B, arranged one above the other, the lower roll being provided at the ends with grooved collars *f*, as and for the purpose herein set forth.

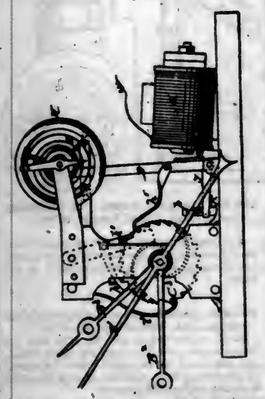
2. The bearing-blocks I I, adapted for attachment to the outside of the side frames D D' of the machine, and provided with arms for the vertical guidance of the journal-box J of the upper roll, and with bearings for the journal of the lower roll, all substantially as described.

169,052. PLANES. Wesley H. Strong, Philadelphia, Pa. [Filed Apr. 15, 1876.]



Brief.—The flask is inclosed within a bookform cover, one part of which is connected with one side of the flask; the other has leaves inserted between the flask and the cover, the object being to protect the flask and for writing directions.

A flask consisting of the part *a*, and cover *b*, and leaves *c*, combined together as and for the purpose described.



169,053. SLEIGH. Benj. F. Sweet, Fond du Lac, Wis. [Filed Apr. 13, 1876.]

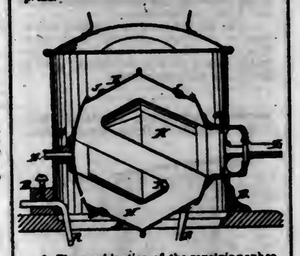
The combination, with the wooden knee C, gutter or clip E, beam D, the runner, and upright a *a*, of the metallic socket, having lugs or projections on its sides and under surface, and loosely fitted to the runner and upright, to allow the specified play or freedom of movement, as set forth.

169,054. ELECTRIC CLOCKS. D. F. Sweet, Hastings, Mich., assignor of one-half his right to Homer Mosl and J. Lee Reed, same place. [Filed Sept. 14, 1876.]

Brief.—Circuit is closed to the electro-magnet through an elbow-lever swung into contact with a set-screw by means of a pin projecting from the balance-wheel, which pin, in the motion of the armature, toward the magnet, takes against a spring attached to elbow-lever. As the armature nears the magnet, the pin escapes from the spring and the circuit is broken. The tension given to the spring of the balance-wheel in the forward motion of the armature carries the armature back to the other limit of its swing.

In an electric clock, the combination of the toothed wheels C', C², and C³, cams *f*, *f'*, bands B' B² B³, armature-lever D, arms I I' and pawls I' I² I³, balance-wheel H, having spring *l*, pin *m*, springs *o*, arm J, and set-screw *p*, all constructed and arranged substantially as and for the purposes herein set forth.

169,055. WEED-TURNERS. John B. Thornton, George H. McDonel, and Allen Hale, Fostoria, Ohio. [Filed Sept. 10, 1876.]

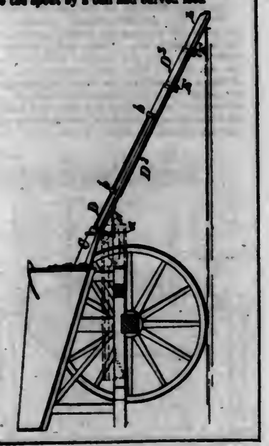


Brief.—The attachment is both pivoted and swiveled to the plow-beam, allowing two motions.

A weed-turner extending at a right angle beneath the plow-beam, to which it is both pivoted and swiveled, with its shorter arm operating a spiral spring in a plane parallel to the vertical of the plow-beam, while it is laterally adjustable by the clamp-washer G, all constructed and operating substantially as shown.

169,056. COFFEE-ROASTERS. F. Thomas, Bloomington, Ill. [Filed Oct. 1, 1875.]

Brief.—A portion of the coffee falls through the perforated central plate at each revolution. The legs are adjustable in a horizontal plane.

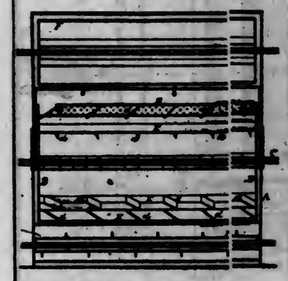


1. The combination of the revolving spheroid E and the partition-plate H, made with openings K, as specified and shown.

2. The combination of the revolving spheroid E, the partition-plate H, with openings K, the vent N, and hollow journal G, the opening K in the partition H being opposite the journal and vent, as specified and shown.

3. The combination of the ring B and adjustable legs B, in the coffee-roaster, as and for the purpose specified.

169,057. DUMPING-WAGONS. William M. Thompson, Carlisle, Pa. [Filed Sept. 9, 1876.]



Brief.—The sheets is formed in sections, sliding together on flanges, the whole connected to the apron by a bail and curved feet.

The combination of the apron C, with ball *a*, sliding-chute section: D¹ D², the section D² having curved feet *d*, and the flanged pieces *b b*, on the sections D¹ D², and the hinged sections D² D³, with hinges E E, all constructed substantially as and for the purposes herein set forth.

169,058. MIDDLINGS-PURIFIERS. Albert P. Tuckhorn, Montezuma, assignor of one-half his right to Joseph Hayward, Cleveland, Ohio. [Filed July 28, 1876.]

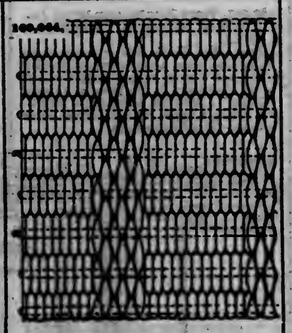
Brief.—A middlings-purifier provided with agitating-reel underneath a bolting-reel and directly over conveyor, whereby middlings are first purified by sifting through bolting-cloth, and then beaten and stirred up in agitating-reel, through which currents of air pass, thereby further purifying the middlings.

The agitating-reel herein described, consisting of the shaft C, centers D, plain or perforated bars B secured thereto, and provided with fights *d*, in combination with the sheet A and arranged in relation to the bolting-reel F and carrier H, to co-operate therewith, substantially as described, and for the purpose specified.

169,059. SOLE-FASTENINGS. F. O. Tobey, Boston, Mass. [Filed May 16, 1876.]

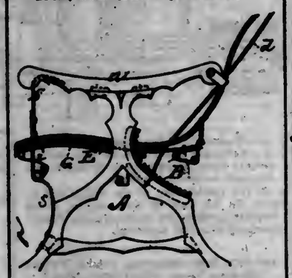
A shoe-nail, substantially as described, composed of a series of connected conic frustums of varying diameter, forming a tapering nail and with an elongated point-forming apex, substantially as set forth.

169,060. COMPOSITIONS FOR STUFFINGS AND DRESSINGS STRAW HATS. R. Turletin, Paris, France. [Filed Sept. 14, 1876.]



Brief.—Consists of gelatine, dextrine, glycerine, sulphate of magnesia, and sulphate of zinc.

The described new product or composition of matter, which I denominate "parmentine," consisting of the before-mentioned ingredients, taken in the proportions substantially as herein set forth.



169,061. CHAIR-BOTTOMS. Thomas Tuttevin, Council Bluffs, Iowa. [Filed Sept. 11, 1876.]

169,062. CHAIRS. Thos. Tuttevin, Council Bluffs, Iowa. [Filed Sept. 11, 1876.]

As a new and improved article of manufacture, a fabric for chair-seats and other purposes, composed of a spring-wire warp, *a*, and fibrous weft, woven together as described.

1. The combination, with a seat-frame, of a back-supporting frame, having elastic side pieces *d d*, substantially as described.

2. The combination, with a seat-frame and a spring-back frame attached thereto, of a spring-sectional suspended seat-bottom, substantially as specified.

3. The combination, with a seat-frame, of the vertically-adjustable suspended seat B', substantially as specified.

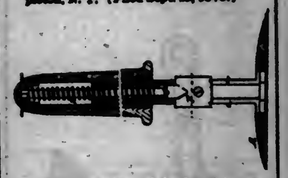
4. The combination, with the suspended seat B' and a flexible back covering said seat, and attached thereto at the lower edge, of an adjusting-roller, D, adapted to be locked against backward rotation, substantially as specified.

5. The combination, with the flexible and adjustable seat-back B, of the end vice-movable sectional springs F, substantially as specified.

6. The combination, with the suspended swaying seat B', of a stay, G, for holding it stationary, substantially as specified.

7. The combination, with the suspended seat-bottom B and flexible seat-back B', of the springs *i* and angular rear supporting-springs F, substantially as specified.

8. The combination, with a flexible seat-bottom and back, of the springs F', connecting the same, substantially as specified.

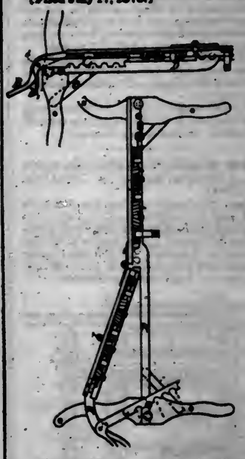


9. The combination, with a flexible vertically-adjustable seat-bottom, B, of the concave central brace *e'* between uprights A, substantially as specified.

10. The central suspension-spring S, consisting of a locked section, S', and a bent and perforated section, K, the latter being arranged in a recess in the chair-arm, and secured in position by the stop-bolt J, substantially as described and shown, and for the purpose specified.

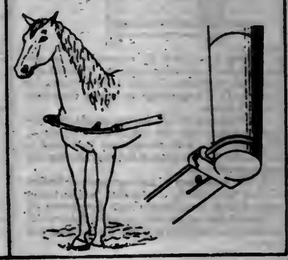
11. The combination, with the seat-frame, of the back-support, having elastic side pieces, the flexible web constituting said back, and connected with the seat B', said seat being suspended by springs from the arm-pieces.

12. A chair-seat suspended within the seat-frame by springs, and by a flexible webbing, the latter forming the back-support, as specified, by means of which universal horizontal motion is secured, substantially as described.



169,063. IMPLEMENTS FOR NOTCHING PARTITIONS FOR GARMENTS. Alida Worth, Stapleton, N. Y. [Filed Sept. 10, 1876.]

1. The combination of the foot-plate, supporting a hollow slotted standard, with a plunger vertically reciprocating within the standard, provided with a knife projecting beyond and through the slotted standard, all substantially as above, for the purpose described.



2. The combination of an index with the handle of the plunger that carries the knife, and with the slotted standard and foot-plate, all constructed and operating substantially as shown and described.

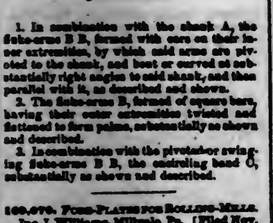
169,064. INVALID-BEDSTEADS. Thos. Watson and Robert Kalee, Philadelphia, Pa. [Filed July 17, 1876.]

The combination, with the handles B, of adjustable section b, of the vertically-vibrating and gravitating supports C, having handles *i*, substantially as specified.

169,065. GUARD-STRAPS FOR SHAFTS AND STRAP-COUPLINGS. James Weatherhead, San Jose, Cal. [Filed Feb. 12, 1876.]

The leather strap B, having the slot *o* enlarged at one end into a circular opening, and provided with the slide *p* for application to the thills, substantially as and for the purpose set forth.

169,069. ANCHORS. Thomas J. Whitesar, Philadelphia, Pa. [Filed Sept. 18, 1875.]



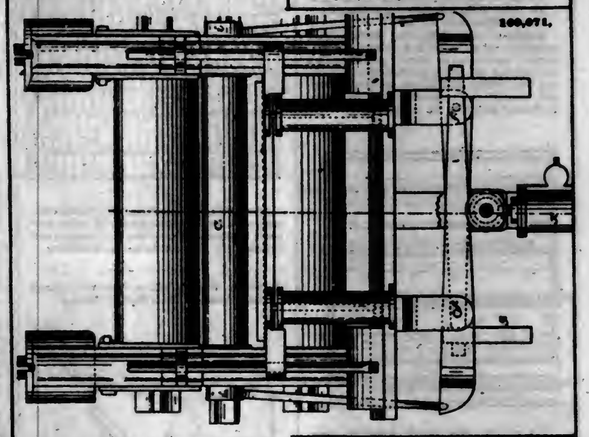
1. In combination with the shank A, the fishe-arms B B, formed with cars on their inner extremities, by which said arms are pivoted to the shank, and bent or curved at substantially right angles to said shank, and then parallel with it, as described and shown.

2. The fishe-arms B, formed of square bars, having their outer extremities twisted and flattened to form palms, substantially as shown and described.

3. In combination with the pivoted or swinging fishe-arms B B, the encircling band C, substantially as shown and described.

169,070. PUMP-PLATES FOR ROLLING-MILLS. Jno. I. Williams, Millvale, Pa. [Filed Nov. 10, 1874.]

Brief.—The fire-plate B has attached to its under side three cylinders, C, C, and J, the two former steam-cylinders, into which steam is admitted through hollow pistons D, to raise or lower the fire-plate, and the latter acting in conjunction with piston K as an air-cushion. The rods *e e f f* are simply guide-rods.



1. The fire-plate B, constructed as described, in combination with its attached cylinder or cylinders C, and hollow piston or pistons D, substantially as herein described and set forth.

2. The fire-plate B, the under side of it being provided with the cylinders C, C, and J, in combination with the pistons D, D, and K, substantially as herein described, and for the purpose set forth.

3. The fire-plate B, having steam-cylinders C and air-cylinder J attached to the under side of it, in combination with the pistons D, D, and K, and stops and guides, substantially as herein described, and for the purpose set forth.

169,071. TUBE-MILL ROLLING-MILLS. Jno. I. Williams, Millvale, Pa. [Filed Nov. 10, 1874.]

Brief.—The middle roll is balanced by weights and levers, to the last-named of which is attached a cross-head, connected to and raised and lowered by the piston of a steam-cylinder. Attached to the bearing of the middle roll is a small fire-plate, which moves with the roll and its bearings.

169,071.

1. The rolls C, balanced through the medium of weights and levers, and elevated and depressed through the agency of steam, substantially as herein described.

2. The combination of the middle roll C, with the fire-plate or rest attached to its bearings, guide *g*, and steam-cylinder J, substantially as herein described.

169,072. STEAM-DECOPPERS. John T. Wright, Columbia, Tenn. [Filed July 1, 1875.]

Brief.—Adjustably secured in brackets at the front end of the beam is a bearing-wheel having a removable tire, by which the circumference of the wheel and the corresponding width of row can be increased or diminished. A reciprocating movement is imparted to the sand-slide by a pitman extending forward to the bearing-wheel. The slide being provided with two sets of holes, the sand is dropped into the sheets at each vibration of the slide.

The combination, with the beam A, of the adjustable brace D, wheel C provided with the removable tire or rim E, the pitman *f*, slide J, and tubes I I, constructed and arranged to operate substantially as and for the purpose set forth.

169,073. GOVERNORS FOR WATER-WHEELS. Edward Wright, Worcester, Mass. [Filed May 12, 1875.]

169,073.

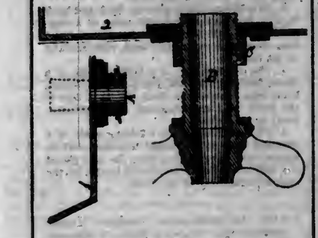
1. The combination of the ratchet-wheel G, shaft C, screw-sleeve H and its head *a*, transverse-rod R and its radial pin *q*, rod P, and their respective steps *s*, *t*, *u*, and *v*, with arm *o* of lever S, rod U, and slide-collar F of the governor, as and for the purposes substantially as set forth.

2. The combination of rod U, lever S, and its arm *n*, with screw H and its head C, transverse-rod R and its radial pin *q*, rod P, and their respective steps *s*, *t*, *u*, and *v*, main shaft C, and ratchet-gear G, sleeve H', ratchet-shield H, rod I, forked piece J, and slide-collar F of the governor, the whole being arranged, constructed, and operated in the manner and for the purposes substantially as set forth.

REISSUES.

6,700. CHAIN-PUMPS. Wm. Cooper, Ypsilanti, Mich. Patent No. 127,576, dated June 4, 1872. [Filed Aug. 14, 1876.]

Brief.—The bucket is provided with a notch at its side to allow the water above the bucket to pass off, and thus prevent its flooding around the edges of the bucket. When the rubber wears so that it does not fill the tube, a piece of leather is inserted between the metal disk and the rubber.



1. In a chain-pump bucket, the rubber collar B, provided with a notch, *a*, in the edge, for the purposes herein set forth.

2. The head A, having groove *c*, flanges *b b'*, and wire C, and provided between the flanges with the rubber collar B, having notch *a*, substantially as herein set forth.

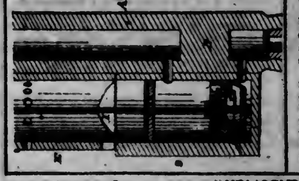
3. In combination with the head A and rubber B, the leather or other material *f* inserted between the rubber and head, substantially as and for the purposes herein set forth.

6,701. FAUCETS. Chas. A. Douglas, Franklin, N. Y. Patent No. 109,191, dated Nov. 15, 1870. [Filed Oct. 1, 1875.]

Brief.—Faucet adapted to empty an inner and outer vessel.

1. The tube A, connecting with the bottom of the inner vessel 1, and the tube B, connecting by a screw-thread with said tube A, and terminating below the lower vessel 2, when combined to operate substantially in the manner set forth.

2. The tubes A and B, connecting with each other by screw-threads, with tube A fixed to the bottom of the inner vessel 1, and the tube C attached to the bottom of the lower vessel 2, with the tube B bearing against the lower end of said tube C, when combined to operate substantially as and for the purposes set forth.



6,702. SHUTTLE-MOTIONS FOR LOOMS. C. I. Kase, Milford, Conn. Patent No. 167,170, dated Aug. 31, 1875. [Filed Sept. 28, 1875.]

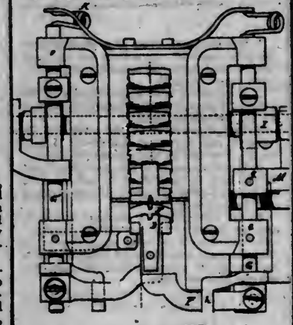
1. The raceway composed of or provided, both on its front and back edges, with flanged or grooved guide-rollers, in combination with a shuttle having its bearing-edges constructed to correspond, whereby said shuttle is not only directed but supported by the rollers, substantially as specified.

2. The combination, with the shuttle operating in a circular or curved raceway, of the oscillating and longitudinally-sliding shuttle-driving fingers *D D*, occupying an inclined position relative to the plane of the raceway, the driver or carrier E oscillating about an axis perpendicular to the plane of the raceway, and the stationary conical cam G, substantially as described.

6,703. PUMPS. John Sass, Hudson, Mich. Patent No. 60,804, dated Feb. 9, 1860. [Filed Sept. 2, 1875.]

Brief.—Two buckets—a lift and a force, operating in the same cylinder, the latter above the former, the discharge being between the two—are connected by separate rods to the lever, on the same side of the fulcrum, at different distances therefrom, therefore giving one bucket longer stroke than the other, and discharging water at both strokes.

1. In a pump, the two rods I I', when attached to the handle or lever of the pump on the same side of its fulcrum, one operating as a suction-rod and the other as a force-rod, in combination with buckets or plungers, operating in one and the same cylinder, substantially as set forth.



2. The perforated ventilating-cap E, in combination with the pump-cylinder D and stock A, for the purposes herein set forth.

3. The combination of the pump stock A with side cylinder D, having a ventilating-cap, E, rods I I', and buckets H and L, constructed and operating substantially in the manner and for the purpose herein set forth.

4. In a pump, the combination of two plungers, working within one cylinder in the same direction, but at different rates of speed, for the purposes herein set forth.

6,704. PLAITING DEVICES. Wm. Walker, Brooklyn, N. Y., assignor to George H. Wooster. Patent No. 108,655, dated Nov. 1, 1870. [Filed Aug. 30, 1876.]

Brief.—Box-plaiting is produced by two independent plaiting-knives, arranged to work one against the other, combined with operating mechanism. The knives, placed one over the other, are attached to arms which are at right angles to the direction of the feed. These arms are secured to carriers on opposite sides of the table, and are provided with toes, against which cams mounted on a secondary shaft act, producing alternate reciprocating motion. The reverse motion of the carriers is caused by the action of springs. The cams are so shaped that the knives at first act alternately, but toward the finish move simultaneously, thereby carrying the plaited material under the presser-foot, and into contact with the feed. The knives are pressed toward each other during their forward movement by springs, which act upon secondary arms pivoted to the carriers, one extremity of each arm bearing upon the adjacent knife-arm, and the other resting upon a cam. The cam relieves the knives of the spring-pressure upon their back stroke.

1. In a plaiting device, the combination of two independently-acting blades, one adapted to close and operate on one, and the other on the opposite side of, and to move the fabric to be plaited.

2. The combination of two independent blades, adapted to operate on opposite sides of the fabric to be plaited, with mechanism adapted to operate the blades alternately, substantially as described.

3. The combination, with two blades arranged to grasp opposite sides of the fabric, of mechanism adapted to close or shut one blade toward the other, to move the blades forward simultaneously, and carry with them the material, and to release from pressure one blade from the other on returning, substantially as described.

4. The combination of a blade, arranged on one side of the fabric to be folded, with a blade arranged in opposition to it on the other side, one blade being adapted to engage the fabric resting against and to move it over the surface of the other blade, substantially as described.

5. The combination, with two independent reciprocating blades, arranged one below the other, and adapted to grasp and release the fabric, of a feeding mechanism to move the folded material, substantially as described.

6. The combination of two independent acting blades, adapted to operate against opposite sides of the fabric, with a presser or holder, substantially as described.

7. The combination of two independent acting blades arranged on opposite sides of the fabric to be folded, with a sewing mechanism to secure the folds by stitches, substantially as described.

8. The combination of two independently-acting blades, arranged to engage the material between them substantially as described, with sewing mechanism, adapted to form two or more stitches to each fold or plait, essentially as set forth.

9. The combination, with two independent blades, adapted to engage the upper and under side of the material to be folded, with mechanism adapted to operate the blades, as follows, viz: to move toward and grasp the material to carry the material forward, to release the blades from pressure on the material, and to move backward over the material for a new fold or gather.

10. The combination of the rocking frame M, the carrier G, the cams I and N, the springs K and L, and the arm P, of the plaiter D, substantially as specified.

11. The blades D D', combined with the carriers G G', arranged and reciprocating at opposite sides of the line of stitching, substantially as described.

12. In a plaiting mechanism two independent blades arranged on opposite sides of the fabric, and adapted to alternately engage and move the fabric resting against a surface opposed to the acting blade, to form plaits.

13. In a plaiting mechanism two independently-acting blades, one acting on an opposing surface above its acting edge, and the other acting on an opposing surface below its acting edge, in combination with a feeding mechanism.

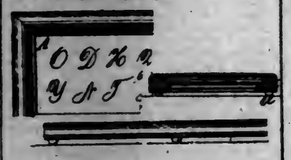
14. The combination, with two independent blades attached to a sewing-machine, of a secondary shaft, operated by the main shaft of the machine, and made to run at a slower velocity than said secondary shaft, essentially as and for the purpose set forth.

6,705. TRIPODS FOR ROCK-DRILLING MACHINES. Jno. B. Wering, New York, N. Y., assignor to the Wering Rock-Drill Company, same place. Patent No. 152,712, dated June 30, 1874. [Filed July 6, 1875.]

1. A tripod in which an adjustable shell, D, is combined with three legs, all hinged to the said shell, substantially in the manner described.

2. A drill-supporting tripod, two legs of which are connected to the tripod-frame by ball-and-socket joints, and the third by an ordinary joint, as herein set forth.

3. The combination of the undercut recess or socket *p* on the under side of a shell or frame, D, for supporting the drilling-machine with the clamps O, the beveled projections *g*, and the cylindrical portion *e* of the frame E.



4. The top E of the tripod, having arms *f*, for connection to the legs A and A' by ball-and-socket joints, and a cylindrical portion, *e*, adapted to the forked end of the leg B, all substantially as set forth.

5. The combination, with the adjustable rods *d*, of the legs with spurs I, as and for the purpose specified.

6. The weight M, having a recess and groove adapted to the leg *t* of the tripod, and to a hook, *c*, on the leg, as described, for the purpose specified.

6,706. COPY-SLIPS FOR TEACHING PENMANSHIP. Campbell Allen, Albany, N. Y. Patent No. 161,102, dated Mar. 23, 1875. [Filed Sept. 7, 1875.]

Brief.—The copy is painted or depicted upon a transparent material, and framed to raise it slightly. It is used to place over the imitation copy of the pupil, for comparison with the original copy-slip.

1. The improvement in devices for teaching penmanship, consisting of a transparent copy-slip, having the copy to be imitated delineated upon it, and constructed and arranged to operate substantially as specified.

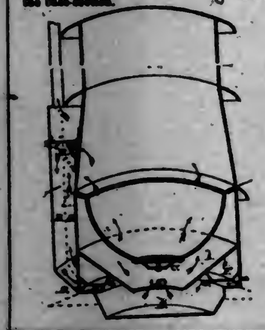
2. A transparent copy-slip, composed of sheet-gelatine, with the copy to be imitated printed or delineated upon it, and varnished, essentially as and for the purpose herein described.

3. A transparent copy-slip, combined with a raised frame or holder, substantially as herein described.

6,707. ARTIFICIAL CAOUTCHOUC. A. G. Day, New York, N. Y. Patent No. 86,615, dated Oct. 9, 1866; antedated Sept. 29, 1866. [Filed Sept. 6, 1875.]

1. The herein-described new product, formed by a combination of vegetable or mineral oils, gum-resins, or other resinous bodies, and sulphur.

2. The herein-described new product, formed by a combination of vegetable or mineral oils, gum-resins, or other resinous bodies, and sulphur, with india-rubber or gutta-percha, substantially as specified.



6,708. PROCESSES OF FORMING ARTIFICIAL CAOUTCHOUC. A. G. Day, New York, N. Y. Patent No. 86,615, dated Oct. 9, 1866; antedated Sept. 29, 1866. [Filed Sept. 6, 1875.]

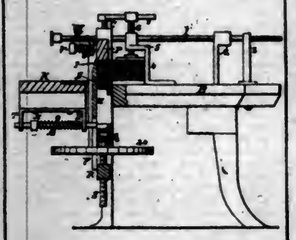
1. The herein-described process of forming a new product adapted to be used as a substitute for india-rubber, the same consisting in mixing and treating by means of heat, vegetable, or mineral oils, gum resins, or other resinous bodies, and sulphur, substantially as set forth.

2. The herein-described process of combining vegetable or mineral oils, gum resins, or other resinous bodies, and sulphur, with india-rubber or gutta-percha, substantially in the manner and for the purpose described.

6,709. COAL-STOVES. Solomon Hunt, Hudson, N. Y., assignor, by mesne assignments, to Perry & Co. Patent No. 80,073, dated Sept. 19, 1865. [Filed Oct. 11, 1875.]

Brief.—The descending flue connects with an annular flue in the base. The vertical flues placed together in the rear of the stove do not obstruct the light from the windows in the base-section.

1. The adjoining ascending and descending flues D and D' at the rear of the stove, in combination with the flue or chamber F in the base-section, all being constructed substantially in the manner and for the purpose described.



2. The bridge-flue H, in combination with the circular flue G, substantially as specified.

3. The adjoining flues D and D', situated at the rear of the stove, and having walls built on the casing of the same, in combination with the illuminating doors or windows in the draft-chamber base-section.

4. A heating-stove constructed with ascending and descending flues, placed on the rear side thereof, in combination with illuminating doors and windows in the draft-chamber base-section.

6,710. PAPER-CUTTING MACHINES. Betsey C. Soule, Brooklyn, N. Y., administratrix of Saml. W. Soule, deceased. Patent No. 140,690, dated Apr. 14, 1874. [Filed Aug. 24, 1875.]

Brief.—Paper is clamped on the table and cut by rising knife, the trimmings falling on a table, which accommodates itself to the position of the knife.

1. The table and clamp of a paper-cutting machine combined with a knife and knife-bar beneath said table, and operating with an upward cut, as set forth.

2. The yielding table K, combined with the knife of a paper-cutter, substantially as and for the purpose set forth.

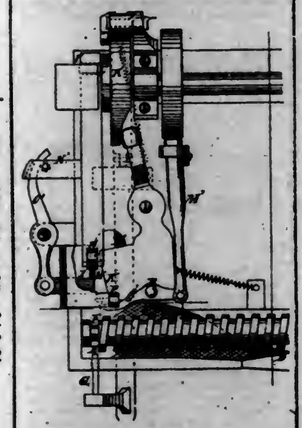
3. The combination of the knife-bar H, roller F, rack J, shaft C, and pinion D, substantially as and for the purpose set forth.

4. The combination of the cross-bars P and R, side rods Q, hand-wheel 24, and screw S, knife I, and yielding plate U, substantially as and for the purpose set forth.

5. The combination of the gage *a*, rod Y, and set-screw *b*, the rod sliding longitudinally and capable of being partly rotated, so that the gage may be moved along the table, and turned off and away from the table, for the purposes set forth.

6,711. FOLDING CHAIRS. A. D. Whitmore, Mountsole, Mass., assignor to E. W. Vaill. Patent No. 40,526, dated Nov. 3, 1863. [Filed Apr. 14, 1875.]

1. The folding chair made with the back and back legs forming one frame, in combination with a seat-frame that passes in between the back legs, and is pivoted directly to such legs, substantially as set forth.



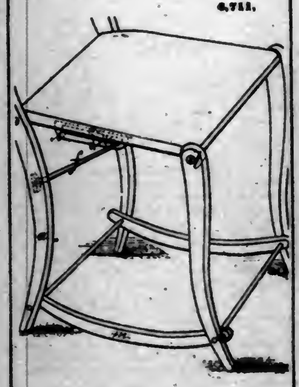
2. In a folding chair with the back and back legs in one frame, the combination of a diagonal brace, rigid seat or seat-frame, and front legs connected with such seat, substantially as set forth.

3. The combination, in a folding chair, of a frame forming the back and back legs, a seat, front legs, connections from the back legs to the front legs, and diagonal braces, substantially as set forth.

4. The combination, in a folding chair, of a seat and back frame hinged together, and diagonal braces, extending from the side pieces *a a*, and connected with slotted guides at the seat, substantially as set forth.

6,712. MACHINES FOR FINISHING HORSESHOE-NAILS. Harry A. Wills, Vergennes, Vt., assignor to Julia A. Wills and Lucy S. Kingsland. Patent No. 122,876, dated Jan. 16, 1872; reissue No. 5,240, dated Jan. 21, 1873. [Filed Aug. 11, 1874.]

Brief.—The nail is fed along by means of a screw, and is turned to a horizontal position by passing over a curved plate. A pusher feeds the nail horizontally into a pair of dies, where it rests, while a roll runs over its upper surface from the head toward the point, to give the finished shape.



1. The combination, as herein described and shown, of the scroll-shaped guide B C and feed-screw, substantially as specified.

2. The combination of the pusher C with the roller and bed-dies, the said pusher and roller-die and the operating devices therefor being arranged in such relation that the nail will be pushed forward when the roller-die is over the bed-die, substantially in the manner herein described.

3. The combination of the head-holder with the bed-die and roller-die, substantially as specified.

6,713. ART OF FINISHING HORSESHOE-NAILS. Harry A. Wills, Vergennes, Vt., assignor to Julia A. Wills and Lucy S. Kingsland. Patent No. 122,876, dated Jan. 16, 1872; reissue No. 5,240, dated Jan. 21, 1873. [Filed Aug. 11, 1874.]

6,711.

The improvement in the art of finishing horseshoe-nails, which consists in rolling one surface of the nail while cold, the opposite surface being supported its entire length upon an anvil.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 17. TUESDAY, OCTOBER 26, 1875. PRICE { $5,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

UNITED STATES PATENT OFFICE,
Washington, D. C., October 5, 1875.

The COMMISSIONER OF PATENTS respectfully requests manufacturers of and dealers in engines, machines, apparatus, tools, and appliances of whatever kind, to send to this Office duplicate copies of all catalogues and circulars which they have issued or may issue from time to time.

R. H. DUELL, *Commissioner.*

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, EASTERN DISTRICT OF MICHIGAN.

CHARLES L. HAWES *vs.* WILLIAM W. ANTISDEL.

[*In equity.—Before* LONGYEAR, *J.—February*, 1875.]

In order to defeat a patent on the ground of want of novelty, the proof of prior use or previous knowledge must be such as to establish the fact clearly and satisfactorily, and beyond a reasonable doubt.

Where the proofs are contradictory, *mere* preponderance is not sufficient to sustain the allegation. The preponderance in such case must be such as to remove all reasonable doubt. * * *

To doubt in such a case is to solve the question in the negative.

Letters Patent No. 63,889, for a new and useful "Hotel Register," granted to Charles L. Hawes, April 16, 1867, sustained.

[*J. J. Allen, W. W. Taylor,* and *E. C. Walker,* for complainant. *Moore* and *Griffin,* for defendant.]

LONGYEAR, *J.:*

The patent carries with it a presumption of novelty of the thing patented, and the burden of rebutting that presumption is upon the defendant. In order to defeat the patent on the ground of want of novelty, the proof of prior use or previous knowledge must be such as to establish the fact clearly and satisfactorily, and beyond a reasonable doubt. Where the proofs are contradictory, *mere* preponderance is not sufficient to sustain the allegation. The preponderance in such case must be such as to remove all reasonable doubt.

In *Wood* vs. *Cleveland Rolling Mills Company,* (4 Fish. Pat. Cases, 550, 560,) Mr. Justice Swayne said:

When the defense is made out it is the duty of courts and juries to give it effect. But such testimony should be weighed with care, and the defense allowed to prevail only when the evidence is such as to leave no room for a reasonable doubt upon the subject.

In *Perham* vs. *American Button Hole Company, &c.,* (4 Fish. Pat. Cas., 468, 482,) heard before Mr. Justice Strong and Circuit Judge McKennan, the latter, in delivering the opinion of the court, said:

The evidence must establish clearly the priority of a completed and useful machine over that of the patentee, or it is unavailing. To doubt upon this point is to resolve it in the negative.

In *Sayles* vs. *Chicago and Northwestern Railroad Company,* (4 Fish. Pat. Cases, 584, 590,) Drummond J., in a case nicely balanced on the evidence, sustained the patent. In *Crouch* vs. *Speer,* (6 OFFICIAL GAZETTE of the Patent Office, 187,) Nixon, J., held that the defendant not only assumed the burden of proof of his allegation of want of novelty, but that his undertaking was to show affirmatively prior knowledge and use under such circumstances as to give the public the right of a continued use as against the patentee, and that he fails to do this when his evidence is frequently contradicted, and is inconsistent with itself. These doctrines I believe to be well grounded in principle, as well as established by repeated and uniform adjudications.

The invention in question is what is commonly known as the "advertising hotel-register," the book being constructed so as to have inserted advertisements at the top and bottom and on the margin of each page, with a blank space for the registering of names of guests, or on each alternate page, leaving the opposite page blank for registering of such names, or on both pages of each alternate leaf, such leaf being sometimes made of bibulous or blotting paper.

The proofs showed that the complainant perfected his invention and put it into practical use as early as in May, 1866, and it was to that date the proofs as to prior use and previous knowledge related.

No advertising hotel-register book purporting to antedate complainant's invention was put in evidence. Such a book, duly verified, would be the best evidence possible. Each page would be an intelligent speaking unimpeachable witness to its own chronology, and the book itself the best evidence of the date of its use. The case is left to stand exclusively upon the recollections of witnesses, and at a distance in time from eight to twenty years, and unaided in any single instance by

any cotemporaneous memorandum or writing whatever. I shall recur to this peculiar aspect of the case in another part of this opinion.

The places where and the persons by whom such prior use and previous knowledge are alleged to have taken place, and as to which proofs have been made, will be taken up in the order in which they were alleged in the amended answer.

1. Prior use in the Exchange Hotel at Sturgis, in the State of Michigan, by E. W. Pendleton.

Pendleton, with five others, testify to the use of an advertising-register in the hotel named prior to May, 1866, viz., in 1864 and 1865, and nine witnesses testify to the contrary. That registers of some kind were used in that hotel during the years 1864 and 1865, and that advertising-registers were used in it after May, 1866, the testimony on both sides is entirely agreed. The vital question is whether the registers used in 1864 and 1865 were advertising-registers, or, what is the same thing, whether the conceded use of advertising-registers commenced in that hotel before May, 1866. As to this question the testimony is in direct and irreconcilable conflict. The testimony was taken at a distance of time of from eight to ten years. The witnesses on both sides testify from memory alone, unaided by any memorandum or writing whatever of the fact itself, or of concurrent facts. The uncertainty of memory as to dates under such circumstances is well understood; and where, as in this case, the event in question was one not calculated to fix itself in the memory of the persons called to testify, except Pendleton, on account of any interest it was to them, and those persons have equal means of knowledge, are of equal credibility and apparently of equally sound memory, and they positively disagree, it may well be said in a case like the present, that prior use is not made out in that clear and satisfactory manner requisite, as we have seen, in such cases.

Again, Pendleton was subpœnaed by complainant to produce all the hotel-registers used in that hotel during the period in question. In response he produced a plain register commencing in April, 1861, and ending April 1, 1864, and also a portion of another, which he testified commenced, according to his best impression, December, 20, 1866, and ended in July, 1867; but for the period between April, 1864, and December, 1866, he produced no register of any kind; and of the register which he says he thinks, it is his impression, commenced December 20, 1866, there is, according to his judgment, about one-third missing. Now these are certainly very suspicious circumstances, especially in view of the fact, as appears by his testimony, that he was a defendant in one of the numerous suits then pending, in behalf of this same complainant, for an infringement of the patent here in question. It is true, he attempts to explain the absence of the register which he says he used (and which he says was an advertising-register) during the period between the first register produced and the mutilated one, April 1, 1864, to December 20, 1866; but his explanations appear to the court to be mere guess-work, and are far from satisfactory. He speaks of its having been given to a boy, or, perhaps, used up in the house to clean lamps with, but nothing with that degree of certainty requisite in such cases. And as to the missing portion of the register ending July, 1867, he is still more indefinite and unsatisfactory, and, in fact, offers no explanation whatever which can be considered as such in a case like the present. The importance of requiring strict proof that there was used in that hotel a register between the two produced becomes the more apparent when we consider that the hiatus from April 1, 1864, the close of the register he does produce, to December 20, 1866, when he thinks the one produced (the mutilated one) commenced, is only two years and a little over seven months, and the length of time the latter register continued after the latter date is only about six months, making in all just about three years, which is just the length of time the first register produced lasted, and he says they were just about of equal size, thus affording a strong presumption that if the missing portion of the mutilated register had been produced it would have covered the entire time it is pretended an advertising-register was used. It is true, he says he thinks the last named register was not entirely filled up; but the first and last leaves from which Pendleton says he took his dates are both missing, and his statement as to the book not being filled up to any considerable extent, especially in view of his interest in the controversy, must be taken with many grains of allowance. The time an advertising-register was pretended to have been used (1864 and 1865) may be further accounted for by the use between the first register produced and the mutilated one, of one of those small registers of one to three quires of paper, he says he sometimes used between regular register-books, probably while waiting for a new one.

Considering all the circumstances, the proofs fall far short of convincing my mind that there was a use of an advertising hotel-register at the Exchange Hotel in Sturgis, in the State of Michigan, as alleged prior to the complainant's invention.

2. Prior use in the Michigan House, at Tecumseh, in the State of Michigan, by Mrs. W. H. Hoeg.

Four witnesses testify to the use of an advertising-register at the place named in 1855, and five, including the then clerk or manager for the proprietor, George R. Southworth, testify to the contrary. Southworth certainly had better means of knowledge and would be more likely to remember what the fact was than any of the witnesses testifying to such use at the date mentioned, except perhaps the witness Spafford, who testified that he, being a binder, procured the printing done and himself bound the book and put it into use there while he was in charge of the hotel during a temporary absence of Southworth. But Southworth was absent only two or three months, and Spafford testifies that the register so put there by him continued to be used there after Southworth's return. So that if there ever was such a register at the time specified it was there when Southworth returned and resumed the management of the hotel; and he testifies positively that there was no such thing there. He describes what he says was the only book used in the office to his knowledge, and that was not an advertising-register, or, in fact, a register at all as commonly understood. He describes it as simply a book in which the names of guests were entered by the clerk and a minute kept of what they had at the hotel. The other four of complainant's witnesses corroborate Southworth both as to the fact that no advertising-register was used there during the time mentioned by Spafford and as to the description of the book that was used.

In such a conflict of testimony perhaps nothing more need be said than that the case is such that there is such a want of clear and satisfactory proof of prior use and, to say the least, that it is involved in so much doubt that under the rules laid down it must be held that the allegation of prior use at Tecumseh is not made out. But perhaps the testimony of defendant's witness Spafford, and that of the others tending to corroborate him ought to receive particular notice, because Spafford testifies that he got up and bound the book, and it is therefore not a mere matter of memory with him so far as the fact of such a book having been used there at some time is concerned; and for the further reason that if Spafford is to be believed in preference to Southworth and the witnesses tending to corroborate him, then it must be conceded that the allegation of prior use at Tecumseh is made out.

Spafford was first examined as a witness at Grand Rapids in a suit pending there involving the same issue, and subsequently at Detroit in this suit. His testimony at Grand Rapids was stipulated into this suit; and on a comparison of the two, and, in fact, of certain portions of each with other portions of the same, especially that taken at Detroit, I find his testimony in many respects inconsistent with itself, exceedingly uncertain, and in many instances palpably erroneous in respect to dates and events, so much so that the impression has been produced upon my mind, amounting almost to a conviction, that his testimony is wholly unreliable; and I am of the opinion that even if it had not been contradicted, it would, to say the least, have constituted a very unsatisfactory basis upon which to take away the complainant's property in his invention. Were it not for extending this opinion to unpardonable length I would detail some of the most glaring of these inconsistencies, uncertainties, and errors; but what has been already said must suffice.

When we add to the infirmities inherent in Spafford's testimony the direct contradiction of Southworth, who had full means of knowledge as to the main fact, and a greater interest than Spafford in the existence of that fact at the time, if it existed, Spafford's testimony becomes in my estimation utterly worthless. Spafford says Southworth paid him for getting up the book, and that the tailor and liveryman whose advertisements were inserted paid Southworth for the same. He thereby shows that if the fact existed at all Southworth was an actor in it equally with himself, and with a greater interest. In view of this, and of the additional fact already alluded to, that if used there it must have been under Southworth's immediate notice and supervision, and also that he describes the book that was used, Southworth's testimony is, to say the least, of as high a character and entitled to as much weight as that of Spafford. These two witnesses also stand before the court on an equality as to character and credibility. The character or reputation for truth and veracity of neither was impugned, and if the old adage that "a man may be known by the company he keeps" be true in this instance, they stand on a perfect equality as to general character by Spafford's own testimony, because he says they have been intimate friends and associates from schoolboys up.

As to the witnesses introduced by defendant to corroborate Spafford, Mrs. Hoeg, now Mrs. Stinson, who kept the house, was seldom in the office, and her recollection of such a book having been used there at any time during the few months she kept the house is, as it might be supposed to be, quite dim, shadowy, and uncertain; and it may be problematical, at least, whether her present interest in defeating complainant's alleged invention (her present husband having been sued for infringement) has not had something to do in quickening the slight recollection to which she testified. And Gonzolus, who kept the house after Mrs. Hoeg, says in his testimony that at first his recollection of the fact was faint, but his memory was afterward revived—by what means he does not state. The testimony of the remaining witness for defendant is of a similarly uncertain and unsatisfactory character.

The proofs showed that the hotel building in question was consumed by fire in 1858 with its contents. The absence of the register or book used there at the time specified (1855) is therefore satisfactorily accounted for, and has no influence in the conclusion arrived at any further than hereafter noticed.

It results that the allegation of prior use in the Michigan House at Tecumseh, in the State of Michigan, is not sustained.

3. Prior use in the Bentley House, at Dexter, in the State of Michigan, by Nelson J. Alport.

Alport, with eight others, testify to the use of advertising hotel-registers in the place named prior to 1866, viz., in 1863, 1864, and 1865, and eight witnesses testify to the contrary. As in the instance of the alleged use at Tecumseh, so here, the hotel was destroyed by fire after the alleged prior use, and the two register-books claimed to have been so used there are represented to have been destroyed with the hotel. So that here, as in both the preceding instances, the case is left to stand exclusively upon the recollections of witnesses as to both the fact and the dates, and in this instance at ten and eleven years distance of time.

Alport kept the Bentley House first as tenant and then as purchaser under one Hayes, the former owner and occupant, from the summer or fall of 1863 to January, 1866, when he sold out to one Porter, who kept the house for a time, and it was finally destroyed by fire on Christmas night, 1866. Alport testified that when he went into the house in 1863 he found an advertising-register there about half filled up, and that he used it for the purpose of a register till in 1864 or in 1865, when a man left another advertising-register at the house, and that he used that one till he sold out to Porter in January, 1866, and left it in the house, there then being only about forty pages filled. Alport testified that Hayes, of whom he took and purchased the house, was dead, but it does not appear but that Porter, Alport's successor, was still living and within reach. Porter's testimony was not taken; but one Fenn, a person who was in the employ of Hayes at the hotel up to the time Alport took possession, and also of Bentley before Hayes, was called by complainant and testified that no such register was in use there by Hayes or Bentley, and he describes the register which was used as a plain register. It is true, Alport had the better means of knowledge as to his finding a register there and its character; but both these witnesses are about equally corroborated by others, and it must be borne in mind that Alport was directly interested to defeat complainant in this suit, for the reason that there was another suit pending against him for a like infringement. To say the most that can be said in its favor, the evidence of the existence of this supposed register of 1863 is still so contradictory and unsatisfactory that it seems to me an exceedingly unsafe basis upon which to defeat complainant's patent.

The evidence of the existence of the pretended second register used by Alport in the Bentley House is, if possible, still more contradictory and unsatisfactory. When Alport sold out to Porter, he or his wife bought a lot near the Bentley House on the same street, and in the summer of 1866 built a new hotel, called at first the Grant House, and afterward the Dexter Exchange. In 1867 or 1868 a man left an advertising-register with Alport, and it was used by him at that new house, and another one was so left in 1870 or 1871. Both Alport and his wife describe the advertisements and the advertisers in the register of 1867 as almost identical with those described by Alport as contained in the pretended register of 1864. As to the existence of the register of 1867 there is an entire agreement in the testimony; and it must be regarded as established. There is much room for speculation, to say the least, as to whether the fact of the existence of the register of 1867 has not been made use of in connection with the uncertainty of the recollections of witnesses at so distant a period of time, and in regard to a matter in which most of them had no particular interest to impress their memories, to make out the existence of an advertising-register in the Bentley House in 1864 and in 1865, and thus make the register of 1867 do double duty.

Alport testified that the man who left the register of 1864 said he lived in Tecumseh, and that the man who left the register of 1867 said he lived in Adrian. In a subsequent part of his testimony he seems to testify that the man who left the 1864 register said he lived in Adrian instead of Tecumseh. He also testified to a conversation with one Soulier about the man who got up and left the register of 1864, Soulier being somewhat acquainted with him; and Soulier when put upon the stand testifies that the man Alport talked with him about was the man who got up and left the register in 1867, and that he lived in Adrian. The man himself was not called.

Alport testified that one Lutz and Harning, butchers, advertised in both registers of 1864 and 1867. But Lutz testified and other proofs corroborate him, that he did not come to Dexter, and was not in business there until the latter part of 1866, and of course could not have advertised in the register of 1864 as testified by Alport.

On his cross examination Alport described the register of 1867, and the advertisements in it, giving the same descriptions he had in both respects of the register of 1864, and then, seeming to have noticed the identity of description, said it was the latter he supposed he was describing; and in a subsequent part of his testimony he attempted to give a different description of the register of 1867 and its contents, but in this he is not corroborated, he is, in fact, contradicted by other testimony in the case. These facts, when considered in connection with the circumstances next stated, tend to cast suspicion on his testimony. Alport having testified that he kept the Grant House and Dexter Exchange in the name of his wife, Mrs. Sarah B. Alport, the latter was served with a subpœna *duces tecum*, on behalf of complainant, to bring with her all the hotel-registers in her possession. She appeared in obedience to the subpœna, and was sworn and examined as a witness, but produced no reg-

isters, giving as a reason that *Mr. Alport would not allow her to bring them.* It is true, she testified that the register of 1867, the one particularly desired, was not then in existence; but whether it was destroyed before or after Mr. Alport had given his testimony and it had come out that it would be important and material to have the register of 1867 in court for the purpose of comparison with the description given by him of the one alleged to have existed in 1864, does not appear. All Mrs. Alport can say is that it was put in the kitchen "long ago" to be used for kindling.

The witnesses produced by defendant to corroborate Alport as to the existence of those alleged prior advertising-registers all testify from recollection, without any memoranda or writing whatever to aid their memory. Those called by complainant to prove the contrary, it is true, testify equally from memory alone, and are equally liable to be mistaken; but that does not help the defendant's case, because the burden was on him to make out his defense by clear and satisfactory evidence, and beyond a reasonable doubt; and, as we shall presently show, the testimony tending to prove the non-existence of those alleged registers is entitled to equal weight with that tending to prove their existence.

It must therefore be held that the allegation of the answer of prior use of the alleged invention in the Bentley House at Dexter by N. J. Alport is not sustained.

4. Previous knowledge of the alleged invention by Spafford at Tecumseh, and Stiles at Jackson, both in the State of Michigan. Spafford's testimony as to alleged prior knowledge has been already considered and disposed of in connection with the alleged prior use at Tecumseh. Previous knowledge of Stiles remains to be considered, and this rests on Stiles' testimony alone.

This person, when on the witness-stand, manifested, especially on his cross-examination, a degree of recklessness and want of appreciation of his duty as a witness, and of the obligation of the oath he had taken, frequently expressed in exhibitions of contumely and of contempt for the party against whom he was called to testify such as is seldom witnessed in a court of justice, and as destroys, in my estimation, all confidence in his honesty and truth as a witness. At all events, when these infirmities in his testimony are considered in connection with his acknowledged exceedingly bad memory as to dates, where dates alone were important, and the absence of memoranda which he said he had and could produce, showing the correct dates, I should feel far from justified in allowing the unsupported testimony of this man to outweigh the evidence of the patent of the novelty of the invention.

5. In addition to what has been already said, there are considerations of a general character which would have a tendency to force upon the mind, almost irresistibly, serious doubts of the truth of the defense set up, even if the evidence in support were uncontradicted and of a stronger character.

In the first place the defense was predicated upon an alleged prior public and common use of the thing patented, and six different hotels and places were specified, while testimony was adduced as to only three hotels and places, and those were the register or registers in use at the times specified, of whatever description, had been destroyed or could not be found.

In the next place, defendant's testimony tends to show as strongly as it shows anything, that if these registers were in use at all prior to complainant's invention they must have been in quite common use in this and other States, having been ordered by a single person a dozen at a time, and not less than a hundred having been manufactured by one person, and put afloat prior to the date of complainant's invention. And yet not a book used or manufactured before that date was produced; and, considering the efforts made by this defendant to procure one, and the interest hotel-keepers generally, or at least the large number of them against whom suits were pending for infringements, had to aid him in those efforts, it must be presumed that none could be found. The door was opened wide for the introduction of such a book in evidence if one could be found, and it was expressly left open by complainant's counsel at the hearing, and has remained open during the several months the case has been held under advisement by the court. This defendant and those in the same interest with him—and their number and influence were not small—have not been wanting in their efforts to meet the challenge. They sent circulars and made inquiries far and wide, and offered a handsome reward for the production of a single advertising hotel-register used or manufactured prior to the date of complainant's invention, and still no such book has been forthcoming. Plenty of old plain registers covering such prior dates could be found, but no advertising-register; and plenty of advertising-registers covering subsequent dates could be found, but none prior. The bare statement of these facts suggests to my mind a doubt, to say the least, whether there could have been a prior use or prior knowledge of the invention in question as is alleged. To doubt in such a case, as has been well said, is to solve the question in the negative.

Another consideration, and to which allusion has already been made, is that a mere matter of dates is left to rest wholly upon the unaided memory of witnesses, who, for the most part, had no interest or motive in regard to the fact to impress their memory at a distance of time of from eight to twenty years, and involving in most instances a difference of only one, two, or three years, whether it was before or after the date in question. A remark by Mr. Justice Swayne in his opinion in the case of *Wood* vs. *Cleveland Rolling Mills Company* (4 Fish. Pat. Cases, 559) is quite applicable here. In speaking of the proof required to sustain the defense of want of novelty, and which he speaks of as a defense usually set up in patent cases, he says—

> The confidence of the attacking witnesses is often in proportion to the distance of time that one is removed from the other. Their imaginations are wrought upon by the influences to which their minds are subjected, and beguiles their memory.

When we add to this the fact that in every instance defendant's testimony as to prior use, as weak as it is when standing alone, was contradicted by testimony entitled to equal consideration in every respect, there is really nothing left to sustain the defense.

The rule of presumptions, that ordinarily a witness who testifies to an affirmation is to be preferred to one who testifies to a negative, recognized by the Supreme Court in *Stitt* vs. *Huidekopers*, (17 Wall., 384,) insisted on by defendant's counsel, is, of course, recognized by this court as binding upon it in cases to which it applies; but in this case I think it has no application. This is quite apparent when we look at the reason for the rule as stated by the Supreme Court in the case last cited, (page 391,) which is as follows:

> Because he who testifies to a negative may have forgotten. It is possible to forget a thing that did happen. It is not possible to remember a thing that never existed.

The conflict of testimony is not whether there was or was not a register or book of some kind used at each of the hotels in question during the periods of time covered by defendant's testimony, for the witnesses on both sides are all agreed that there was; neither is it as to some of the places, as at Sturgis and Dexter, that there was or was not an advertising register used at some time by the person named in a hotel kept by him, for as to this the witnesses are also all agreed that there was. The conflict is simply as to the description or kind of register so in use at such prior periods of time, and in respect to Sturgis and Dexter, as to the time when they saw an advertising register in use there in a hotel kept by the persons named—whether in 1867 or from one to three years earlier. One set of witnesses testify in the one case that the register so used was an advertising-register, and in the other case that it was at the earlier date the advertising-register was used; and the other set describes the former as a plain register, and that the latter was used at the later date. Each set testify to an affirmative equally with the other, and neither has any advantage over the other under the rule laid down in *Stitt* vs. *Huidekopers*.

Upon the whole consideration it results that there must be a decree for the complainant according to the prayer of his bill.

Decree accordingly.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date October 26, 1875.]

8,747.—Carpets.—JOSEPH BARRETT, New York, N. Y., assignor to THE ROXBURY CARPET COMPANY, Boston, Mass. Application filed October 12, 1875. Term of patent 3½ years.

8,748.—Gasaliers.—CHRISTIAN HERTER, New York, N. Y. Application filed September 27, 1875. Term of patent 3½ years.

8,749 to 8,753, inclusive.—Embroidery Patterns.—WILLIAM STEINHAUS, New York, N. Y., assignor of one-half his right to OTTO FRICKENHAUS, same place. Applications filed September 20, 1875. Term of patents 3½ years.

8,753 and 8,754.—Crochet Patterns.—WILLIAM STEINHAUS, New York, N. Y., assignor of one-half his right to OTTO FRICKENHAUS, same place. Applications filed September 20, 1875. Term of patents 3½ years.

8,755.—Inkstands.—SAMUEL J. VAN STAVOREN, Philadelphia, Pa. Application filed July 14, 1875. Term of patent 3½ years.

8,756 to 8,758, inclusive.—Shirt-Studs.—LEONARD S. BEALS, Astoria, N. Y.—Cases A, B, and C. Applications filed September 15, 1875. Term of patents 3½ years.

8,759.—Door-Plate.—JACOB CAPRON, New York, N. Y. Application filed September 14, 1875. Term of patent 7 years.

8,760.—Boot and Shoe Webbing.—JAMES A. GREENE, North Kingstown, R. I. Application filed August 2, 1875. Term of patent 7 years.

8,761.—Shoe-Upper Fronts.—CHARLES MERRITT, South Weymouth, Mass. Application filed July 27, 1875. Term of patent 7 years.

8,762.—Shelf-Brackets.—EDBRIDGE J. STEELE, Westville, assignor to THE BLAKE BROTHERS HARDWARE COMPANY, New Haven, Conn. Application filed September 28, 1875. Term of patent 7 years.

8,763.—Cover of Autograph-Album.—WILLY WALLACH, New York, N. Y. Application filed August 5, 1875. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date October 26, 1875.]

3,084.—Fertilizers.—ATLANTIC AND VIRGINIA FERTILIZING COMPANY, New York, N. Y.—Case B. Application filed June 12, 1875.

"word 'Eureka.'"

3,085.—Manufactured Tobacco and Cigars.—CONSOLIDATED TOBACCO COMPANY, San Francisco and Gilroy, Cal. Application filed October 2, 1875.

"words 'Bohemian Club,' and the letters 'C. T. Co.,' and the figure of a horned owl having a cigar in its beak.'"

3,086.—Cigars.—FREDERICK GLAHN, Green Bay, Wis. Application filed September 10, 1875.

"words and letters 'Fred'k Glahn, Bay City Light Guards,' 'B. C. L. G.'"

3,087.—Lead-Pencils.—GEORGE HAAS, New York, N. Y. Application filed September 25, 1875.

"In the center of the design is a circle, within which is a star. Upon the opposite sides of, and at a little distance from, the central star, are two stars, which side stars are placed between the points of two pairs of acute-angled pointers, which radiate from the said central star. In connection with this design is used the word 'Polar.'"

3,088.—Boots and Shoes.—CHARLES H. HOWARD, Randolph, Mass. Application filed October 5, 1875.

"word 'GOSSAMER.'"

3,089.—Finger-Rings.—H. MUHR'S SONS, Philadelphia, Pa. Case A. Application filed September 22, 1875.

"representation of a crown and a lion."

3,090.—Lubricating-Oil.—LESTER OIL COMPANY, New York, N. Y. Application filed September 18, 1875.

"word 'SYNOVIAL.'"

3,091.—Writing and Copying Inks.—LOCKWOOD, BROOKS & Co., Boston, Mass. Application filed September 9, 1875.

"word 'Irving,' and the cut or representation of Washington Irving."

3,092.—Stove-Polish.—SIMON S. MYERS, Philadelphia, Pa. Application filed September 24, 1875.

"word 'Anchor,' and the representations of an anchor."

3,093.—Medical Composition.—BENJAMIN F. NUNNS, New York, N. Y. Application filed September 16, 1875.

"words 'Wang-a-dang,' in connection with the words 'Nunns' Pulmonic Syrup.'"

3,094.—Teas.—LEE PING & PON JIR, San Francisco, Cal. Application filed September 29, 1875.

"letters 'X X,' arranged in the diamond-shaped figure."

3,095.—Sewing-Machines.—E. REMINGTON & SONS, Ilion, N. Y. Application filed September 20, 1875.

"letter 'R' and the words 'The Remington Sewing-Machine.'"

3,096.—Combs, Druggists' Articles, &c., made of Hard Rubber.—THE INDIA-RUBBER COMB COMPANY, New York and College Point, N. Y. Application filed September 28, 1875.

"letters and characters 'I. R. C. Co.'"

3,097.—Spectacles, Eyeglasses, and other Optical Instruments made of Hard Rubber.—VULCANITE OPTICAL INSTRUMENT COMPANY, New York and College Point, N. Y. Application filed September 28, 1875.

"letters and characters 'V. O. I. Co.'"

3,098.—Plows, Agricultural Implements, and Castings for the same.—WATT & CALL, Richmond, Va. Application filed September 25, 1875.

"a crescent, with the horns pointing upward, said crescent being of the proportion or shape of a quarter-moon."

3,099.—Buttons.—A. & E. WALLACH, New York, N. Y. Application filed September 10, 1875.

"a picture illustrative of one or more of the buildings of the Philadelphia Centennial Exhibition, coupled with the sign or symbol '1876.'"

3,100.—Fruit Butters.—J. O. SCHIMMEL & Co., Philadelphia, Pa. Application filed October 8, 1875.

"a representation of fruits, consisting of peaches, apples, pears, cherries, quinces, strawberries, plums, currants, and raspberries, interspersed with rose-buds, or other flowers and leaves in natural colors."

3,101.—Cottonades and other Heavy Cotton and Cotton-and-Wool Goods.—ALFRED B. TAYLOR, New York, N. Y. Application filed October 8, 1875.

"words 'MECHANICS AND PLANTERS.'"

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date October 26, 1875.]

359.—Title: **"Teinture Francaise or French Dye and Finish."**—ARTHUR K. BROWN & Co., Boston, Mass. Application filed October 19, 1875.

360.—Title: **"Dr. J. Blackman's Genuine Healing-Balsam."**—M. L. FILKINS BRO., Albany, N. Y. Application filed October 14, 1875.

361.—Title: **"Hollon's Headache Remedy."**—HENRY W. HOLLON, Skaneateles, N. Y. Application filed October 19, 1875.

362.—Title: **"Stainless Wool and Spindle Oil."**—E. H. KELLOGG, New York, N. Y. Application filed October 20, 1875.

INDEX OF INVENTIONS PATENTED OCTOBER 26, 1875.

	Class No.	No. of Patent.
Alarm and annunciator, electric burglar, J. T. Bedford	24	169,077
Alarm and door fastener, combined burglar, J. J. Woolsey	24	169,220
Alarm, burglar, C. and J. Bohanon	24	169,137
Alarm, burglar, J. A. Weed	24	169,214
Album, photograph, C. D. Mosher	146	169,186
Anchor tripper, E. Robbins	138	169,193
Annealing metals, J. H. Warrington	85	169,220
Antiseptic composition, H. Gahn	35	169,094
Auger, earth, J. Minick	51	169,115

	Class No.	No. of Patent.
Basket bottom, S. H. Wheeler	109	169,217
Bath, portable vapor, G. W. Brosius	8	169,142
Bedstead fastening, S. D. Butler	62	169,235
Beadstead, invalid, A. J. Goodwin	62	169,099
Billiard and other table levelers, A. J. Michel	143	169 231
Binder, temporary, W. H. Bennett	15	169,136
Bird cage, D. F. Burns	170	169,145
Bit gage, A. B. Bateon	29	169,075
Blind, inside, T. Fetherston	62	169 247
Blind slat operator, W. Strunk	24	169,127
Boiler incrustations, compound for removing, J. M. Wishart	148	169,219
Boiler, tubular, I. Barton	148	169,225
Bottle opener, knife, ice pick, grater, and corkscrew, combined, Kiehl and Kohler	88	169,175
Box, Wooden, Roeborg and Kawan	174	169,297
Brick machine, H. Sea	20	169,197
Buckle, harness, J. C. Smither	23	169,200
Building, metallic frame for, E. Gruwe	4	169,101
Bung and vent, H. B Cornish	40	169,150
Burner, lamp, J. H. Fouch	90	169,161
Butter package, A. Robinson	45	169,292
Buttons, Mechanism for ornamenting, K. H. Isbell	21	169,268
Caddy for holding tea, coffee, &c., R. Mainer	88	169,113
Calcium lights, apparatus for producing, N. H. Edgerton	90	169,244
Can, oil, Kuesener and Breuer	107	169,109
Can opener, R. Smith	88	169,202
Car axle lubricator, J. D. Stark	122	169,203
Car coupling, J. Harris	122	169,169
Car coupling, F. L. Small	122	169,304
Car coupling, J. R. Smith	122	169,201
Car wheel chill, W. Wilmington	122	169,325
Car window, railroad, A. Brandon	121	169,140
Cars apparatus for lighting railway, J. Story	90	169,126
Carburetor, H. J. Hyams	27	169,105
Carriage jack, Z. McDonald	79	169,279
Carriage painter's jack, G. A. Brice	79	169,082
Carriage seat, S. Gilsinger	31	169,256
Carriage wheel, I. Kester	31	169,272
Casting door plates, mold for, Dodge and Smith	33	169,154
Castings, making patterns for, W. E. Craig	33	169,151
Castings from wrought and cast iron, manufacture of, W. Harnsworth	85	169,261
Cement, composition for, R. Warwick	153	169,212
Chair, rocking, A. Best	62	169,228
Chair, rocking, J. H. Travis	62	169,314
Cigar mold, H. Volts	160	169,207
Cigar mouth piece, C. Reinisch	160	169,119
Cistern filter and water separator, W. B. Wilson	167	166,139
Clasp for wearing apparel, E. Osgood	21	169,285
Cloth winding machine, S. C. Dickinson	7	169,240
Compress, hydraulic, E. D. Meier	37	169,280
Concrete articles, mold for, R. B. Lanum	151	169,179
Cooler, lard, J. G. C. Lee	26	169,180
Cooler, milk, W. R. Scofield	45	169,196
Corn marker, T. B. Kirkwood	133	169,177
Cornstalk cutter, S. Bean	73	169,134
Corset, J. W. Askie	80	169,131
Corset, S. B. Ferris	80	169,159
Cotton chopper, McMeekin and Hunt	43	169,185
Cotton ginning, &c., machine, portable J. L. Toole	41	169,206
Cradle, E. F. Gazzam	62	169,253
Cradle, J. Sprengard	62	169,123
Curtain fixture, H. L. De Zeng	62	169,080
Curtain fixture, W. H. Sparks	62	169,309
Cuspadores, &c., machine for ornamenting, C. M. Lyon	54	169,278
Cutter bit, A. Streit	173	169,204
Cutter head, S. P. Randolph, (reissue)	173	6,717
Door hanger, E. U. and W. L. Scoville, (reissue)	24	6,718
Door spring, D. R. Lewis	24	169,110
Double tree clip, W. Beckert	31	169,135
Doubling machine, T. Unsworth	143	169,315
Dovetailing machine, L. Atwood	173	169,132
Dredging bucket, C. J. Sands	51	169,299
Drill, ratchet, G. Hayden	100	169,262
Drill, rock, W. R. King, (reissue)	124	6,716
Drill, rock, Sedden and McFaul	124	169,121
Drying apparatus, J. S. Rogers	48	169,194
Eggs, machinery for desiccating, W. O. Stoddard	116	169,311
Elevator, water, J. H. Van Dyck	118	169,316
Embossing machine, S. Rogerson	54	169,295
Engine governor, marine, Briggs and De Peu	69	168,141
Engine, rotary steam, J. C. Johnson	150	169,269
Engine, steam, S. B. Frank	150	169,249
Faucet, W. C. North	167	169,284
Feather duster, J. L. Little	62	169,276
Feed cutter, R. J. Wylie	59	169,221
Fire arm, magazine, A. Burgess	18	169,083
Fire arms, tortoise shell handle for, A. Trenkmann	55	169,312
Fire dog, D. S. Hale	154	169,166
Fire escapes, folding stair for, T. Garrick	30	169 096
Fishing rod, H. L. Leonard	143	169,181
Fluting machine, C. Schneider	38	169,301
Furnace grate, H. W. Granger	149	169,259
Gaiters, manufacture of button, A. Kenny	16	169,271
Game apparatus, revolving, J. W. Cameron	143	169,085
Game counter, Fey and Pein	143	169,160
Garter, Blakesley and Wright	38	169,229
Gas apparatus, portable and stationary, R. H. Ramsey	66	169,291
Gas, manufacture of illuminating, J. W. Beatley	66	169 326
Glassware, manufacture of, J. H. Hobbs	68	169,103
Grain binder, J. Garrard	74	169,251
Grain binder, J. Garrard	74	169,252
Grain binder, J. F. Gordon	74	169,258
Grain drills, feeding mechanism for, E. Morgan	133	169,283
Harness mountings with leather, covering, J. Feder	72	169,158
Harrow teeth, H. M. Williams	73	169,344
Harvester, J. M. Chritton	74	169 088
Harvester, C. W. Levalley	74	169 275
Heater and boiler, combined air, T. H. Harrington	154	169,167
Heater for steam generators, feed water, Andrus and Wallace	148	169,074
Heating apparatus, smoke stack, T. B. Field	149	169,093
Heel trimming machine, L. G. Clook	16	169,149
Hook and eye for wearing apparel, J. C. Howells	23	169,267
Hook, snap, C. B. Bristol	23	169 234
Horse power, W. I. Grant	159	169,164
Horseshoes, ice nail for, H. M. Patterson	60	169 286
Hose, preparing animal, E. Bauer	81	169,076
Hydrant, Pease and Campbell	167	169,288
Indicator, revolution, C. H. Phinney	42	169,117
Inkstand, S. Darling	146	169,152
Iron, manufacture of castings from wrought and cast, W. Hainsworth	85	169,261
Ironing apparatus, R. H. Gardner	91	169,250
Jack for pressing, &c., M. J. Walsh	79	169,319
Journal box, P. Durns	87	169,243
Key hole guard, Le Blanc and St. Pierre	93	169,178
Kiln, drying, D. Bonnell	20	169,230
Ladder, Case and Read	30	169,256
Lamp, G. W. Vernon	90	169,318
Lamp extinguisher, automatic, J. G. Hehr	90	169,263
Lamp lighting apparatus, H. Iden	90	169,173
Lamp trimmer, H. L. De Zeng	90	169,091
Lock, seal, A. T. Boon	93	169 231
Loom, hand, J. E. Gillespie	95	169,098
Loom stop motion, Kent and Moore	95	169,108
Loom, swivel shuttle, J. Fish	95	169 246
Lounge, folding, N. H. Borgfeldt	62	169,138
Lubricator, W. P. Stephenson	87	169,124
Marble, manufacture of artificial, W. C. A. Roettger	153	169 294
Marking wheel, H. Holt, (reissue)	146	6,714
Mashing and cooling, process and apparatus for, G. E. Ellenberger	99	169,156
Match safe, E. H. Whitney	90	169,129
Match sticks, machine for cutting, J. S. Fagley	174	169,246
Millstone spindles, trammer for, A. Eshelman	57	169,157
Mop and brush holder, A. P. Seymour, (reissue)	22	6,719
Mowing machine, D. H. Gage	74	169 162
Oar, W. Lyman	13	169,277
Oil, apparatus for reducing crude, W. C. Parker	47	169 189
Oiler, S. S. Newton	87	169,187
Ore, treating quicksilver, J. P. Sieveking	99	169,198
Organs, &c., octave coupler for, S. J. Crockett	106	169 089
Packing box and crate, H. M. Simons	63	169,303
Packing, piston, C. R. James	151	169,174
Padlock, B. Wallmann	93	169,211
Pan, cake, F. G. High	154	169 264
Paper tube machine, N. Keely	109	169,107
Pencil, colored copying, G. Schwanhausser	146	169,195
Planter, corn, B. King	133	169,176
Planter, corn, A. M. Southard	133	169,307
Planter, seed, J. W. Simpson	133	169,122
Plastering safety plate, G. A. Thurston	4	169,128
Plow attachment, G. M. Todd	114	169,313
Plowshares and blanks therefor, die for upsetting the ends of, W. M. Watson	114	169,213
Postage stamp, C. F. Steel	54	169,125
Power, motive, Brettel and Lindsey	67	169,233
Press, cotton, D. S. McBryde	7	169,183
Press, cotton, McMeekin and Hunt	7	169,184
Printing press, C. Wells	117	169,321
Printing presses, bearing for distributing rollers of, Potter and Hubbard	117	169,191
Propeller wheel, N. A. Patterson	139	169 287
Pulley or gear wheel, J. B. Mason	87	169,114
Pump box, J. Dillon	118	169,092
Pump bucket, E. J. Dunbar	118	169,155
Purifier, middlings, M. Sower	57	169,308
Quicksilver ore, treating, J. P. Sieveking	99	169,198
Railway, elevated, J. Westcott	120	169,322
Railway joint fastening, L. Chilson	120	169,237
Railway rail joint, G. E. Dering	120	169,219
Railway rail joint, W. H. Hornum	120	169,266
Railway rail joint, W. H. Robinson	120	169,293
Railway switch, W. L. Lamborn	120	169,274
Ratchet wheels, click for, E. H. Perry	36	169,190
Refrigerator, E. S. Bitner	58	169,078
Refrigerator, E. B. Smith	58	169,305
Refrigerator, E. B. Smith	58	169,306
Revolvers, safety catch for, C. W. Hopkins, (reissue)	123	6,715
Saddles, stirrup for riding, J. C. Wagstaff	72	169,209
Sash fastener, C. L. Alexander	24	169,222
Saw set, W. Burgess	131	169,144
Sawing machine, N. M. Miller	130	169,282
Scaffold, traversing, D. R. Kelly	30	169,270
Screw taps, machine for cutting, H. E. Boyd	100	169,080
Scythe snaths, machine for bending, Russell and Birner	74	169,120
Seed and guano distributer, A. H. Simms	133	169,199

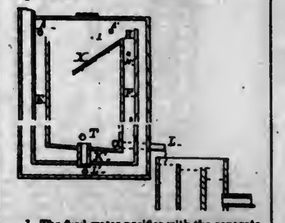
	Class No.	No. of Patent.
Sewing machine button hole attachment, J. T. Jones	134	169,106
Sewing machine caster, T. B. Garretson	134	169,097
Sewing machine for sewing bags, &c., H. P. Garland	134	169,163
Sewing machine extension table, R. H. St. John	134	169,310
Sewing machine shuttle carrier or driver, J. Bolton	134	169,079
Shirt, C. M. and J. C. Ball	38	169,133
Skins, dressing, R. Hart	92	169,102
Smoke stack heating apparatus, T. B. Field	149	169,093
Smut machine, D. Pease	57	169,289
Socket coupling, A. S. Wadleigh	64	169,208
Soldering process, M. A. Richardson	136	169,192
Sole fastenings, nail for, L. Goddu	16	169,257
Spinning machine, J. F. Hillard	142	169,170
Spirit levels and straight edges, connecting, J. G. Ralph	29	169,290
Spoon holder, Babbitt and Beach	88	169,224
Stair for fire escapes, folding, T. Garrick	30	169,096
Stamp, perforating, W. G. Brown	146	169,143
Stench trap, dry, J. H. Boschen	8	169,232
Stone, compound for artificial, W. H. Whittemore	153	169,218
Stove, H. E. Spurrier	154	169,205
Stove and furnace, P. Klots	154	169,273
Stove bracket, wire, Randall and Newton	88	169,118
Stove, heating, Z. Hunt	154	169,172
Stove, heating, W. F. Ross	154	169,298
Stove, heating, J. Van	154	169,317
Stove pipe shelf, J. Christy	88	169,147
Stove, reservoir cooking, E. Card	154	169,086
Sugar cooling and draining apparatus, J. G. Angell	155	169,223
Suspender, S. K. Ellis	38	169,245
Syringe, W. P. Clotworthy	156	169,238
Telegraph, fire alarm, S. Chester	158	169,087
Tire upsetting machine, W. Holdsworth	60	169,265
Tobacco hanger, T. B. Garr	160	169,095
Track clearer, J. Doman	122	169,241
Tray for beer glasses, &c., J. Novinsky	88	169,188
Trunk, A. V. Romadka	168	169,296
Turbine wheel, T. H. Clark	168	169,148
Type casting and setting machine, C. S. Westcott	164	169,215
Type casting and setting machine, C. S. Westcott	164	169,216
Umbrella runner, J. M. Burkert	65	169,094
Vehicle axle, G. Beck	31	169,296
Vehicle runner, attachable, I. and W. G. Pettis	31	169,116
Vehicle spring, S. Gilsinger	31	169,254
Vehicle spring, S. Gilsinger	31	169 255
Vehicle wheels, rubber tire for, G. A. Greene	31	169,100
Velocipede, F. S. Seagrave	31	169,302
Ventilating buildings, L. R. Satterlee	166	169 300
Wagon, dumping, D. E. Davis	31	169,153
Wagon, dumping, A. A. Hoch	31	169,171
Wagon, infant's parlor, B. J. Harrison	31	169,168
Wagon spring, W. F. Whitney	31	169,323
Wash tubs, wringer attachment to, A. W. Caldwell	91	169,146
Washer, steam, M. Howe	91	169,104
Washers, machine for making spring, J. W. Grover	14	169,260
Washing machine, P. A. Downer	91	169,242
Washing machine, P. Lieber	91	169,111
Water wheel, A. W. Haag	168	169,165
Water wheel, reversible, A. W. Lindley	168	169,112
Wind wheel, A. J. Beckley	118	169,227
Windlass, J. P. Manton	79	169,182
Window screen, H. B. Walbridge	30	169,210
Wire feeding mechanism, R. L. Brewer	170	169 081
Wringer attachment to wash tube, A. W. Caldwell	91	169,146
Yarns, manufacturing tufted, H. Bottomley	142	169,139

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED OCTOBER 26, 1875.

	Patent No.
Alexander, C. L., Sash fastener	169,222
Am Ende, C. G., assignee	169,094
American Cable Screw Wire Company, assignee	169,257
Andrus, W., and S. J. Wallace, Feed water heater for steam generators	169,074
Angell, J. G., Sugar cooling and draining apparatus	169,223
Arnold, S., assignee	169,237
Askie, J. W., Corsets	169,131
Atwood, L., Dovetailing machine	169,132
Babbitt, S. W., and H. B. Beach, Spoon holder	169 224
Ball, C. M. and J. C., Shirt	169,133
Bannen, P. L., assignee	169,105
Barton, I., Tubular boiler	169,225
Bateon, A. B., Bit gage	169 075
Bauer, E., Preparing animal hose	169 076
Beach and Babbett	169,224
Bean, S., Cornstalk cutter	169,134
Beatley, J. W., Manufacture of illuminating gas	169,326
Beck, G., Vehicle axle	169,226
Beckert, W., Double tree clip	169,135
Beckley, A. J., Wind wheel	169 227
Bedford, J. T., Electric burglar alarm and annunciator	169,077
Bennett, W. H., Temporary binder	169,136
Best, A., Rocking chair	169,228
Bibb, B. C., assignee	169,273
Birner and Russell	169,120
Bitner, E. S., Refrigerator	169 078
Blakesley, G. H., and J. Wright, Garter	169,229
Bohanon, C. and J., Burglar alarm	169,137
Bolton, J., Shuttle carrier or driver for sewing machines	169,079
Bonnell, D., Drying kiln	169 230
Boon, A. T., Seal lock	169,231
Borgfeldt, N. H., Folding lounge	169,138
Boschen, J. H., Dry stench trap	169,232
Bottomley, H., Manufacturing tufted yarn	169,139
Boyd, H. E., Machine for cutting screw taps	169 080
Brandon, A., Railroad car window	169,140
Brettell, E., and J. Lindsay, Motive power	169,233
Breuer and Kuesaner	169,109
Brewer, R. L., Wire feeding mechanism	169,081
Brice, G. A., Carriage painter's jack	169,082
Brigham, B. O., assignee	169,147
Briggs, E. W., and A. V. De Peu, Marine engine governor	168,141
Bristol, C. B., Snap hook	169,234
Brosius, G. W., Portable vapor bath	169,142
Brown, W. G., Perforating stamp	169,143
Burgess, A., Magazine fire arm	169,083
Burgess, W., Saw set	169,144
Burkert, J. M., Umbrella runner	169,084
Burns, D. F., Bird cage	169,145
Butler, S. D., Bedstead fastening	169,235
Caldwell, A. W., Wringer attachment to wash tubs	169,146
Cameron, J. W., Revolving game apparatus	169,085
Campbell and Pease	169,288
Card, E., Reservoir cooking stove	169,086
Case, W., and J. H. Read, Jr., Ladder	169,236
Chester, S., Fire alarm telegraph	169,087
Chilson, L., Railroad joint fastening	169,237
Christy, J., Stove pipe shelf	169,147
Chritton, J. M., Harvester	169,088
Clark, T. H., Turbine wheel	169,148
Clarke, Reeves, & Co., assignees	169,270
Clook, L. G., Heel trimming machine	169,149
Clotworthy, W. P., Syringe	169,238
Cornell, L., assignee	169,150
Cornish, H. B., Bung and vent	169,309
Coulston, T. D., assignee	169,151
Craig, W. E., Making patterns for castings	169,089
Crockett, S. J., Octave coupler for organs, &c	169,256
Crosby, A. A., assignee	169,254, 169,255, 169,152
Darling, S., Inkstand	169,153
Davis, D. E., Dumping wagon	169,141
De Peu and Briggs	169,239
Dering, G. E., Railroad rail joint	169,090
De Zeng, H. L., Curtain fixture	169 091
De Zeng, H. L., Lamp trimmer	169,240
Dickinson, S. C., Cloth winding machine	169,092
Dillon, J., Pump box	169,154
Dodge, F. L., and C. E. Smith, Mold for casting door plates	169,098
Dodge, T. A., assignee	169,241
Doman, J., Track clearer	169,094
Donn, W. C., administrator	169,129
Dover Stamping Company, assignee	169,242
Downer, P. A., Washing machine	169,295
Dryfoos, L., assignee	169,155
Dunbar, E. J., Pump bucket	169,243
Dunham, J. N., assignee	169,244
Durns, P., Journal box	169,156
Edgerton, N. H., Apparatus for producing calcium lights	169,245
Ellenberger, G., Process and apparatus for mashing and cooling	169,157
Ellis, S. K., Suspenders	169,246
Eshelman, A., Trammer for millstone spindles	169,204
Fagley, J. S., Machine for cutting match sticks	169,158
Fay, J. A., & Co., assignees	169 159
Feder, J., Covering harness mountings with leather	169,247
Ferris, S. B., Corsets	169,160
Fetherston, T., Inside blind	169,083
Fey, D., and R. H. Pein, Game counter	169 248
Field, T. B., Smoke stack heating apparatus	169,320
Fish J., Swivel shuttle loom	169,161
Flanagin, W. J., assignee	169,162
Fouch, J. H., Lamp burner	169,094
Frank, S. B., Steam engine	169,163
Gage, D. H., Mowing machine	169,250
Gahn, H., Antiseptic composition	169,163
Gardner, R. H., Ironing apparatus	169,095
Garland, H. P., Sewing machine for sewing bags, &c	169,251
Garr, T. B., Tobacco hanger	169,252
Garrard, J., Grain binder	169,253
Garrard, J., Grain binder	169,097
Garretson, T. B., Sewing machine caster	169 096
Garrick, T., Folding stair for fire escapes	169,253
Gazzam, E. F., Cradle	169,102
Gillespie, J., assignee	169,098
Gillespie, J. E., Hand loom	169,254
Gilsinger, S., Vehicle spring	169 255
Gilsinger, S., Vehicle spring	169,256
Gilsinger, S., Carriage seat	169 257
Goddu, L., Nail for sole fastenings	169,099
Goodwin, A. J., Invalid bedstead	169,258
Gordon, J. F., Grain binder	169,259
Granger, H. W., Furnace grate	169,164
Grant, W. I., Horse power	169,100
Greene, J. A., Rubber tire for vehicle wheels	169,227
Gregory, W. and E. H., assignees	169,260
Grover, J. W., Machine for making spring washers	169,101
Gruwe, E., Metallic frame for buildings	169,165
Haag, A. W., Water wheel	169,261
Hainsworth, W., Manufacture of castings from wrought and cast iron	

	Patent No.
Hale, D. S., Fire dog	169,166
Hale, H. A., assignee	169,132
Harrington, T. H., Combined air heater and boiler	169,167
Harris, J., Car coupling	169,169
Harrison, B. J., Infant's parlor wagon	169,168
Hart, R., Dressing skins	169,102
Hayden, G., Ratchet drill	169,262
Hehr, J. G., Automatic lamp extinguisher	169,263
High, F. G., Cake pan	169,264
Hillard, J. P., Spinning machine	169,170
Hobbs, J. H., Manufacture of glassware	169,103
Hoch, A. A., Dumping wagon	169,171
Holdsworth, W., Tire upsetting machine	169,265
Holt, H., Marking wheel, (reissue)	6,714
Hopkins, C. W., Safety catch for revolvers, (reissue)	6,715
Hornum, W. H., Railroad rail joint	169,266
Howe, M., Steam washer	169,104
Howells, J. C., Hook and eye for wearing apparel	169,267
Hubbard and Potter	169,191
Hunt and McMeekin	169,184, 169,185
Hunt, Z., Heating stove	169,172
Hunter, M., assignee	169,147
Hyams, H. J., Carburetor	169,105
Iden, H., Lamp lighting apparatus	169,173
Isbell, R. H., Mechanism for ornamenting buttons	169,268
James, C. R., Piston packing	169,174
Johnson, J. C., Rotary steam engine	169,269
Jones, J. T., Sewing machine button hole attachment	169,106
Kawas and Rosborg	169,297
Keely, N., Paper tube machine	169,107
Kelly, D. R., Traversing scaffold	169,270
Kenny, A., Manufacture of button gaiters	169,271
Kent, H. T., and S. Moore, Loom stop motion	169,108
Keuter, I., Carriage wheel	169,272
Kiehl, G. A., and E. H. Kohler, Combined bottle opener, knife, ice pick, grater, and corkscrew	169,175
King, B., Corn planter	169,176
King, W. R., Rock drill, (reissue)	6,716
Kirkwood, T. B., Corn marker	169,177
Klotz, P., Stove and furnace	169,273
Kohler and Kiehl	169,175
Koeasner, E., and T. Breuer, Oil can	169,109
La Blanc, J., and X. St. Pierre, Keyhole guard	169,178
Lamborn, W. L., Railroad switch	169,274
Lanum, R. B., Mold for concrete articles	169,179
Layton, C. A., assignee	169,324
Lee, J. G. C., Lard cooler	169,180
Leonard, H. L., Fishing rod	169,181
Levalley, C. W., Harvester	169,275
Lewis, D. R., Door spring	169,110
Lisber, P., Washing machine	169,111
Lindley, A. W., Reversible water wheel	169,112
Lindsey and Brettel	169,233
Little, J. L., Feather duster	169,276
Littlefield, C. W., assignee	169,202
Lyman, W., Oar	169,277
Lyon, C. M., Machine for ornamenting cuspadores, &c.	169,278
Mainer, R., Caddy for holding tea, coffee, &c.	169,113
Manton, J. P., Windlass	169,182
Mason, J. B., Pulley or gear wheel	169,114
McBryde, D. S., Cotton press	169,183
McDonald, Z., Carriage jack	169,279
McFaul and Seddon	169,121
McLaughlin, G. T., assignee	169,089
McMahon, M. T., assignee	169,096
McMeekin, T. G. W., and W. W. Hunt, Cotton press	169,184
McMeekin, T. G. W., and W. W. Hunt, Cotton chopper	169,185
Meier, E. D., Hydraulic compress	169,280
Merwin, Hulbert & Co., assignees, (reissue)	6,715
Michel, A. J., Billiard and other table levelers	169,281
Miller, N. M., Sawing machine	169,282
Miller, W. H. and J. E., assignees	169,271
Minick, J., Earth auger	169,115
Moore and Kent	169,108
Morgan, E., Feeding mechanism for grain drills	169,283
Mosher, C. D., Photograph album	169,186
Newton and Randall	169,118
Newton, S. S., Oiler	169,187
North, W. C., Faucet	169,284
Novinsky, J., Tray for beer glasses, &c.	169,188
Osgood, E., Clasp for wearing apparel	169,285
Palmer, A., assignee	169,233
Parker, W. C., Apparatus for reducing crude oil	169,189
Patterson, H. M., Ice nail for horseshoes	169,286
Patterson, N. A., Propeller wheel	169,287
Pease, B. D., and R. Campbell, Hydrant	169,288
Pease, D., Smut machine	169,289
Pein and Fey	169,160
Perry, E. H., Click for ratchet wheels	169,190
Pettis, L and W. G., Attachable vehicle runner	169,116
Phinney, C. H., Revolution indicator	169,117
Pittsburg Steel Casting Company, assignee	169,261
Potter, C., Jr., and J. F. Hubbard, Bearing for distributing rollers of printing presses	169,191
Ralph, J. G., Connecting spirit levels and straight edges	169,290
Ramsay, R. H., Portable and stationary gas apparatus	169,291
Randall, J. M., and D. F. Newton, Wire stove bracket	169,118
Randolph, S. P., Cutter head, (reissue)	6,717
Read and Case	169,236
Reinisch, C., Cigar mouth piece	169,119
Reynolds, W. H., assignee	169,096
Richardson, M. A., Soldering process	169,192
Rilling, J. G., assignee	169,263

	Patent No.
Robbins, E., Anchor tripper	169,193
Robinson, A., Butter package	169,292
Robinson, W. H., Railroad rail joint	169,293
Roettger, W. C. A., Manufacture of artificial marble	169,294
Rogers, J. S., Drying apparatus	169,194
Rogerson, S., Embossing machine	169,295
Romadka, A. V., Trunk	169,296
Rosborg, C., and A. Kawas, Wooden box	169,297
Ross, W. F., Heating stove	169,298
Russell, J. H., and G. Birner, Machine for bending scythe snaths	169,120
Rutherford, R. W., assignee	169,326
Sands, C. J., Dredging bucket	169,299
Satterlee, L. R., Ventilating building	169,300
Scanlan, T. F., assignee	169,089
Schneider, C., Fluting machine	169,301
Schwanhausser, G., Colored copying pencil	169,195
Schweizer and Gruwe, assignees	169,101
Scofield, W. R., Milk cooler	169,196
Scoville, E. U. and W. L., Door hanger, (reissue)	6,718
Sea, H., Brick machine	169,197
Seagrave, F. S., Velocipede	169,302
Seddon, G. B., and W. McFaul, Rock drill	169,121
Seymour, A. P., Mop and brush holder, (reissue)	6,719
Sieveking, J. P., Treating quicksilver ore	169,198
Simms, A. H., Seed and guano distributer	169,199
Simons, H. M., Packing box and crate	169,303
Simpson, J. W., Seed planter	169,122
Singer Manufacturing Company, assignee	169,079
Slater, G. B., assignee	169,233
Slosson, E., assignee	169,242
Small, F. L., Car coupling	169,304
Smith and Dodge	169,154
Smith, D., assignee	169,209
Smith, E. B., Refrigerator	169,305
Smith, E. B., Refrigerator	169,306
Smith, E. K., assignee	169,246
Smith, J. B., Car coupling	169,201
Smith, R., Can opener	169,204
Smith, W. H. L., assignee	169,114
Smither, J. C., Harness buckle	169,200
Southard, A. M., corn planter	168,307
Sower Brothers, assignees	169,308
Sower, M., Middlings purifier	169,308
Sparks, W. H., Curtain fixture	169,309
Speck, A. A., assignee	169,247
Sprengard, J., Cradle	169,123
Spurrier, H. E., Stove	169,205
Stark, J. D., Car axle lubricator	169,203
Steel, C. F., Postage stamp	169,125
Stephenson, W. P., Lubricator	169,124
St. John, E. H., Extension table for sewing machines	169,310
Stoddard, W. O., Machinery for desiccating eggs	169,311
Storrs, E., assignee	169,323
Story, J., Apparatus for lighting railway cars	169,126
St. Pierre and La Blanc	169,178
Streit, A., Cutter bit	169,204
Strunk, W., Blind slat operator	169,127
Swaney, J. S., assignee	169,088
Swehla, M., assignee	169,188
Thompson, H. G., assignee	169,081
Thurston, G. A., Plastering safety plate	169,128
Todd, G. M., Plow attachment	169,313
Toole, J. L., Portable cotton ginning, &c., machine	169,206
Travis, J. H., Rocking chair	169,314
Trenkmann, A., Tortoise shell handle for fire arms	169,312
Unsworth, T., Doubling machine	169,315
Van, J., Heating stove	169,317
Van Dyck, J. H., Water elevator	169,316
Vernon, G. W., Lamp	169,318
Voltz, H., Cigar mold	169,207
Wadleigh, A. S., Socket coupling	169,208
Wagstaff, J. C., Stirrup for riding saddles	169,209
Walbridge, H. B., Window screen	169,210
Wallace and Andrus	169,014
Wallmann, B., Padlock	169,211
Walsh, M. J., Jack for pressing, stowing, &c	169,319
Warrington, J. H., Annealing metals	169,320
Warwick, R., Composition for cement	169,212
Watson, W. M., Die for upsetting the ends of plowshares and blanks therefor	169,213
Wayne Agricultural Company, assignee	169,233
Weed, J. A., Burglar alarm	169,214
Wells, C., Printing press	169,321
Westcott, C. S., Type casting and setting machine	169,215
Westcott, C. S., Type casting and setting machine	169,216
Westcott, J., Elevated railway	169,322
Westcott's Type Setting Company, assignee	169,215, 169,216
Wheeler, S. H., Basket bottom	169,217
Whitney, E. H., Match safe	169,129
Whitney, W. F., Wagon spring	169,323
Whittemore, W. H., Compound for artificial stone	169,218
Wilcox Silver Plate Company, assignee	169,224
Williams, H. M., Harrow teeth	169,324
Williams, J. S., assignee	169,274
Wilmington, W., Car wheel chill	169,325
Wilson, W. B., Cistern filter and water separator	169,130
Wishart, J. M., Compound for removing boiler incrustations	169,219
Wood, J. R., assignee	169,299
Woolsey, J. J., Combined burglar alarm and door fastener	169,220
Wright and Blakesley	169,229
Wylie, R. J., Feed cutter	169,221



TITLES, DRAWINGS, AND CLAIMS

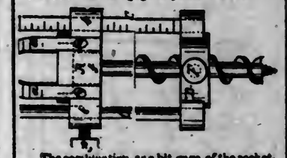
OF

PATENTS GRANTED OCT 26, 1875.

169,076. FEED-WATER HEATING FOR STEAM-GENERATORS. William Andrus and Samuel J. Wallace, Keokuk, Iowa. [Filed Mar. 23, 1875.]

Brief.—A series of chambers are located one within the other. While the steam is circulating within one chamber, the water is circulating in the opposite direction in an adjoining chamber, thus heating the water and condensing the steam without mixture. If desired, the water and steam may be commingled in an inner chamber filled with filtering material.

1. The feed-water purifier with the separate steam and water-passages E V, separated by thin walls, in combination with the inner chamber I, arranged to pass the steam and water through each other, substantially as set forth.



2. The combination, with chamber I, of the passage V with its separate outlet L', arranged substantially as set forth.

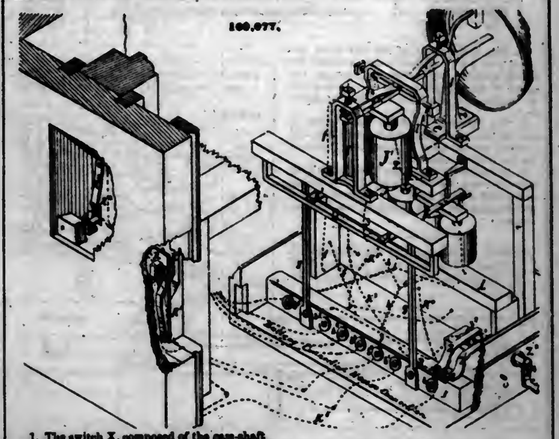
3. The combination, with chamber I, of the passages E V and outlets L L', arranged substantially as set forth.

4. The combination, with chamber I, of the passages E V, inlets T A A', and outlets H' L L', substantially as set forth.

169,077. RIVET-GAGES. Alonzo B. Batson, Newcastle, Ind. [Filed Sept. 27, 1875.]

Brief.—The gage is provided with a set of springs, which clasp the end of a bit-brace, and thus hold the gage in position for use.

The combination, as a bit-gage, of the socket-head A, with its opening *f* and spring-clasps *a*, the legs *b*, and set-screws *c*, the side bars C, and the foot-piece D, as described.



169,078. METHODS OF PREPARING ANIMAL HAIR. Ernst Bauer, Williamsburg, N. Y. [Filed Aug. 9, 1875.]

1. The process herein described of tanning animal hair by steeping it in a mixture of alum, sumac, catechu, gum kino, nut-galls, willow bark, and water, substantially as specified.

2. The animal hair hardened and rendered smooth and impervious, substantially as specified.

169,077. BLOCKING BURGLAR-ALARMS AND ANNUNCIATORS. Joseph T. Bedford, New York, N. Y. [Filed July 9, 1875.]

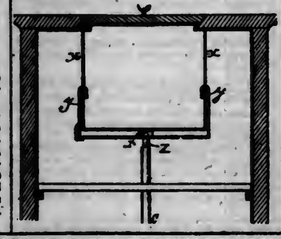
Brief.—Breaking of circuit at door or window releases an armature, which allows a swinging plate, covering an indicator, to fall. Circuit to alarm completed through a spring, which is held out of contact with the armature-lever, through which current passes by the swinging covering-plate when in its normal position. The armature-lever of the alarm and the circuit-breaker are also novel features.

1. The switch X, composed of the cam-shaft Z^1, the cam Z^2, the spring-plate Z, and the wires *x y z*, connected, respectively, with the wires K^1 K^2, and the negative wire of the operating-battery C, constructed and operated as and for the purpose set forth.

2. The combination of the distributing and returning wires of battery C, and the connecting wires of battery C', the binding-screws, the armature-magnet J^1, and the spring I^1, substantially as and for the purpose described.

3. The double-acting spring I^1, in combination with the lever of the alarm-bell, and with the screws *i i'*, constructed and operated substantially as and for the purpose specified.

4. The combination of the cover F^1, having tail-piece *b* and hook *p*, the spring E, the rod E^1, and bar *e'*, constructed and operated substantially as and for the purpose specified.



5. The circuit-breaker, consisting of the plate E^1, the spring E^2, and the plate E^3, substantially as described.

6. The spring E^2 fastened to the plate E^3 which covers it, and bent as shown, so as to avoid much cutting away of the cash, in combination with the plate E^3, substantially as herein described.

7. The combination of the springs N and Q and indicator-covers P, whereby a simultaneous operation of the said indicator-covers and a closing of the circuit for the alarm-magnet is effected, substantially as herein before specified.

169,078. REFRIGERATORS. Eli S. Bitner, Lock Haven, Pa. [Filed Mar. 12, 1875.]

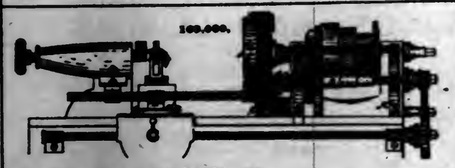
Brief.—The drip-pan is detachably hooked onto the ice-box. A sponge between them and the drip-outlet prevents sediment from choking the drip-pipe and air from entering through the drip-pipe. The drip-pipe is removable.

The combination of the ice-box having openings *m*, the drip-pan having hooks *y* and outlet *z*, and the sponge D, and the drip-pipe C, all these parts save the ice-box being separable from each other and from the refrigerator, as and for the purposes set forth.

169,079. SHUTTLE CARRIERS OR DRIVERS FOR SEWING-MACHINES. James Bolton, Chicago, Ill., assignor to Singer Manufacturing Company, New York, N. Y. [Filed Sept. 11, 1875.]

Brief.—The shuttle-carrier is provided with a latch, pivoted to its forward end. At the rear portion of the latch is formed a guard for preventing the heel of the shuttle from being lifted by the thread, and opposite the guard is formed a finger to facilitate the removal of the shuttle from the carrier. The guard and finger partially inclose the shuttle, and when the latch is swung on its pivot the shuttle is carried with it. A bole in the latch slips over a pin on the carrier, which serves to lock it.

1. The combination, with a shuttle carrier or driver, of a latch, provided with a lifting-finger, whereby the shuttle may be lifted from the carrier, substantially as described.



2. The combination, with the shuttle-carrier and shuttle, of a pivoted latch, provided with a guard and lifter to hold the shuttle down when sewing, and to lift it from the carrier when desired, substantially as described.

169,080. MACHINES FOR CUTTING SCREW-TAPS. Henry R. Boyd, McKeesport, Pa. [Filed July 21, 1875.]

Brief.—To the face-plate of the lathe may be attached a ring by which to hold the work, and the face-plate is revolved slowly through the medium of the spur-gears, or rapidly through the medium of the cone-pulley. The revolving milling-tool is on a slide moved longitudinally by a screw, and reciprocated transversely by a rod, which is journaled eccentrically, and is oscillated by a tappet on the face-plate.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.

160,080.

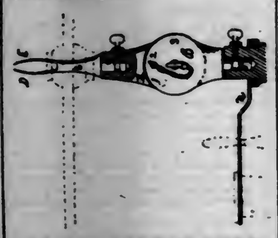
1. The combination of the face-plate, provided with a ring or holder for securing the blank, rotatable mechanism for changing the speed of the face-plate, and the cutting-tool for cutting the blank, substantially as specified.

2. The combination of the loose pulley O, and friction-blocks with the hollow shaft, and tapered central spindle, substantially as and for the purposes specified.

3. The combination of the loose pulley P, or pinion having its hub provided with spring-pawls, the hollow shaft and tapered central spindle, and the loose pulley O, and friction-blocks.

160,081. Wire-Feeding Mechanism. R. L. Brewer, Milford, Conn., assignor to H. G. Thompson, same place. [Filed Aug. 16, 1875.]

1. In combination with the slide D two spring cams or jaws, A, arranged as herein specified, for holding the wire during the forward feed movement and releasing the same on the back movement.



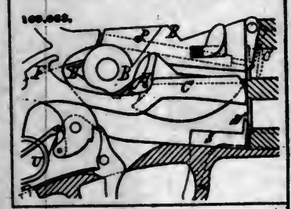
2. In a wire-feeding mechanism, the combination of the slide E, having two spring cams or jaws, *b' b'*, with the pitman C and crank-shaft A, substantially as shown and described.

3. The combination of two reciprocating slides, D and E, operating in opposite directions, and provided upon their adjoining faces with spring cams or jaws, arranged substantially as and for the purpose herein set forth.

4. The combination of the crank-shaft A, pitmen B C, slide D with perforated studs *b*, cams A, and springs *i*, and the grooved slide E with cams *b'* and springs *i'*, all substantially as and for the purposes herein set forth.

160,082. Carriage-Painters' Jacks. G. A. Brice, Townville, Pa. [Filed July 3, 1875.]

Brief.—Consists essentially in the special construction of parts.



1. In a carriage-painter's jack or easel, the adjustable arm S, having spring-fingers D E, substantially as described.

2. In combination with the stand A of a painter's jack, having the adjustable bend B, the adjustable arm S, having spring-fingers D E, all constructed and arranged to operate as described.

3. The standards A X, bend B, arms S and a, when combined and arranged substantially as and for the purposes described.

160,083. Magazine Fire-Arms. A. Burgess, Owego, N. Y. [Filed Oct. 18, 1875.]

1. The carrier C, pivoted at its rear, and operated downward by the shoulder B' rotating upon it by the opening movement of the breech-block, as described.

2. The stud P on the breech-block, in combination with the lug F on the carrier, which, engaging together, raise the carrier by the forward or closing motion of the breech-block, substantially as specified.

3. The combination of the pulling extractor-rod O, provided with a shoulder, D', with a pivoted breech-block, provided with a lug, D, whereby the backward movement of the breech-block serves to operate the rod O, as described.

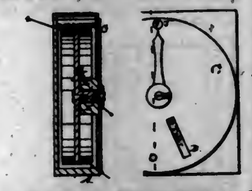
4. The extractor bar O, having a shoulder to pass forward of and pull back the extractor, and so arranged as to first start the extractor back by contact at a point remote from the pivot, and by its continued backward movement to engage the extractor near its pivot, and produce an accelerated motion, as specified.

5. The hand H, pivoted transversely in the receiver, in combination with the carrier, whereby the hand is thrown forward to start the cartridge into the barrel, as described.

6. The hand H, pivoted transversely in the receiver, in combination with the extension B'', whereby said hand is thrown backward to form an inclined guide for the extracted shell, to throw the latter out of the receiver, as set forth.

7. The combination of the breech-block B with the carrier C, spring U, and hand H, the parts being arranged and operating together as described.

8. The L-shaped magazine-stop, provided with the bevelled projection B'', and pivoted to the frame of the gun in front of the mouth of the magazine, and adapted to be held in and out of operative relation with the magazine by the stop S on the guard, all as set forth.



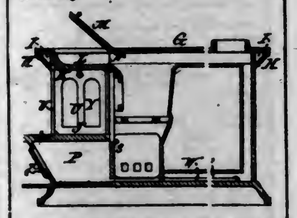
160,084. Umbrella-Runners. John M. Burkett, Savannah, Ga. [Filed Aug. 26, 1875.]

1. The runner B, having bayonet-slots *d e* and stop *g*, and provided with the revolving crown-piece *f*, having a rabbet, h, all combined and arranged substantially as and for the purpose set forth.

2. The described runner-tube, having its upper bayonet-notch re-enforced by a strip or wire brazed or secured to its outer surface, such strip or wire having one of its ends extending downward, as above and described.

160,085. Revolving Game Apparatus. Jos. W. Omerod, New York, N. Y. [Filed Aug. 19, 1875.]

Brief.—A revolving plate having a slot works over a fixed disk provided with a series of radially-arranged answers. Upon the edge of drum or wheel, attached to and revolving with said plate, are also a series of answers to questions, which answers show serially through a magnifying-glass in the edge of the box or frame.



1. The dial-plate C, having the opening J and radiating slot D, in combination with the outer face of the box A, having thereon the circle B, with any required series of numbers numerically indicated, and series of radiating name-spaces, substantially as and for the purposes set forth.

2. The combination of the detachable endless belt or band H, having thereon answers to the series of numbered interrogations with the wheel G and dial-plate C, substantially as and for the purposes set forth.

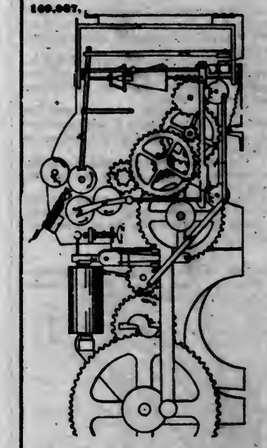
3. The longitudinal magnifying eye-piece, in combination with the top of the box or frame A, detachable belt or band H, and wheel G, substantially as and for the purposes set forth.

160,086. Reservoir Cooking-Stoves. E. Card, Pawtucket, R. I. [Filed Nov. 29, 1874.]

Brief.—The molding contains an air-chamber. The foul-gases can be used for toasting or broiling.

1. The molding H, cast around the top plate G, as described, forming, with the sides and ends, an air-space, I, for the purpose set forth.

2. The combination of the top plate G, constructed with the ordinary kettle-openings, with the plate K, opening N, and hinged cover M.



3. The combination of the water-tank P with the circulating-pipe W and pipe S, for exhausting the steam under the grate, substantially as described.

4. The open fire-grate, forming one side of an oven or hot-closet, in combination with the folding doors U U V V, forming the other three sides.

160,087. Fire-Alarm Telegraph. S. Chester, Elizabeth, N. J. [Filed May 6, 1875.]

Brief.—For use at central station. Each electric impulse from fire-alarm box, through an electro-magnet, releases a clock-work, which gives one rotation to cylinders, causing a circuit to smaller alarm-bells. This clock-work also operates a paper-punching device, from which the paper is fed under transmitting-styles to closing-circuits to other larger alarm-bells, by means of another clock-work, also released by electro-magnet. At the conclusion of every complete signal, a third clock-work is released, by means of which momentary flash of increased battery-current is introduced into signal-box circuit.

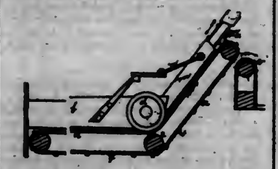
160,087.

1. The combination of a prime motor and train, an electro-magnet controlling the same, a revolving cylinder or cylinders causing on rotation a change or changes in the connections of one or more electric circuits, a perforator, and a train of wheels, giving uniform motion to the strip to be perforated, substantially as and for the purposes set forth.

2. The combination of a perforator, two or more sets of stylets for removing the perforated strip therefrom, and moving at different rates of speed, and two or more electric circuits controlled by the operation thereof, whereby the signals upon one circuit are repeated over other electric circuits at different rates of speed for different circuits, substantially as and for the purposes set forth.

3. The combination, with a prime motor and train, and an electro-magnet controlling the same, of electric circuits, and two or more insulators or circuit-closers rotated by a prime motor, and throwing into circuit at one period during rotation an extra amount of battery, whereby the electro-motive force in the circuits is increased, substantially as and for the purposes set forth.

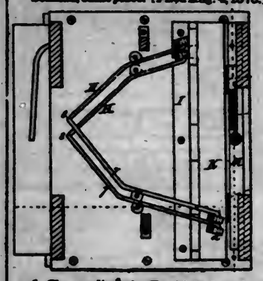
4. The combination, with any instruments carrying several sets of motors designed to cause paper or other material whereon impressions have been made to repeat electric impulses over several circuits, at various rates of speed, of a device connected with any other part of a running gear of said instrument, to momentarily render those several motors inoperative, by removing the pressure of the frictional roller or equivalent at specific periods in such manner that the paper or equivalent will cease to be moved thereby, as soon as the impressed portion has been carried past a fixed point, but that it shall continue to be carried by the succeeding sectors, substantially in the manner and for the purpose hereinbefore described.



5. The combination of a rack and pinion, with the supporting-wheels W' W', having a portion of their periphery cut down to a smaller diameter, and provided with arms for moving the rack in one direction, a connecting-lever and pitman connected to one wheel and train, and imparting a rocking movement to the wheels, whereby, upon their movement in one direction, the rack is allowed to drop away from the pinion, but is held in engagement therewith on their movement in the other direction, substantially as and for the purposes set forth.

6. The combination, with the two independent motive trains, one of which is controlled by an electro-magnet, or a rack and pinion, connected with the trains, and controlling one thereof, whereby the motion of the first causes the release of the second, substantially as and for the purposes set forth.

7. The combination, with two independent motive trains, a rack and pinion connected therewith, and acting to release the second upon the movement of the first, of an extra magnet, and devices operating to allow the continuance of motion of the second train, after the motion of the first train has ceased, substantially as set forth.



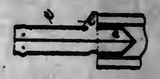
8. The combination, with two or more batteries, or divisions or series of batteries, of the automatic circuit closer or breaker, to change the connections of the batteries, and thereby vary the electro-motive force of the circuits, or any of them, substantially as and for the purposes set forth.

160,088. Harvesters. James M. Chritton, Marengo, Iowa, assignor to himself and J. S. Swaney. [Filed Jan. 15, 1876.]

The combination of the endless apron a, auxiliary apron m, wheel d, back-board b, bracket c, universal-jointed shaft e, toothed roller r, and main frame A D I, constructed, operating, and arranged as and for the purposes set forth.

160,089. Coupve-Couplers for Organs, &c. Samuel J. Crockett, Boston, Mass., assignor to Geo. T. McLaughlin and T. F. Sessions, same place. [Filed Aug. 4, 1875.]

1. The coupling-wire H, with its branches f f bent so as to extend out from each and between the valve-rods, and provided at its outer or middle portion with a vertical offset, S, all constructed and arranged substantially as and for the purposes described.



2. In combination with the coupling-wire H, formed as described, and pivoted at one end to a stationary support, I, the movable bar K, having attached thereto the opposite end of the coupling-wire, and arranged to operate substantially in the manner and for the purpose set forth.

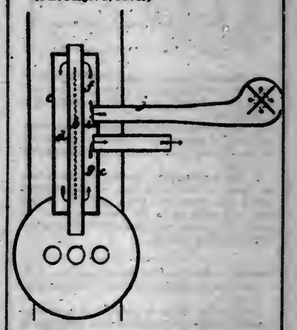
160,090. Curbing-Fixtures. Henry L. De Zeng, Geneva, N. Y. [Filed Feb. 12, 1876.]

The hollow slotted tube a, supported by the compound brackets containing the pulleys e e, in combination with the traveler b within the tube, and connected, through the slot, to the curtain, and the cords for actuating said traveler, substantially as set forth.

160,091. Lamp-Trimmers. Henry L. De Zeng, Geneva, N. Y. [Filed Apr. 10, 1875.]

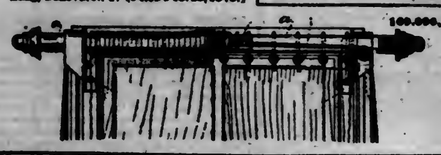
Brief.—A cap for insertion in the air-tube of an Argand burner, with blades for guiding the burnt wick into the same.

The lamp-trimmer made of the stationary blade or scrapers a above the cap a and below the handle c, by which the instrument is manipulated, for the purposes and as specified.



160,092. Pump-Boxes. Jas. Dillon, Lynn, Mass. [Filed Aug. 10, 1875.]

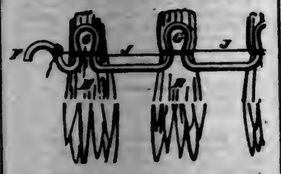
Brief.—Below the opening of the box is fitted a conical strainer of fine wire-cloth. An auxiliary strainer of similar form and coarser material is fitted below it, with large openings at the top, which is designed to retain the matter arrested by the fine strainer.



In combination with a pump-box, A, and a main strainer, B, extended across the inlet of said box, an auxiliary strainer, C, provided with one or more openings, b, all being substantially as represented.

160,093. Smoke-Stack Heating Apparatus. Thomas B. Field, Corning, N. Y., assignor to Mary B. C. Field, same place. [Filed Apr. 5, 1876.]

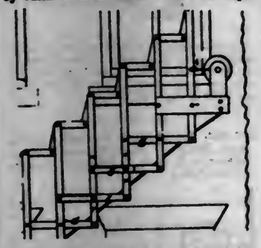
The smoke-stack or chimney-heating drum c, provided with one or more longitudinal pipes, d, and constructed with longitudinal fans d' f, and longitudinal and transverse partitions h i, to form three or more compartments between the inner and outer heating-walls of the drum, and communicating with induction and eduction pipes, as and for purposes set forth.



160,094.

169,094. Antiseptic Compositions. W. G. Dean, Washington, D. C., administrator of H. Gehe, deceased, assignor to C. G. Am Ende, Hoboken, N. J. [Filed Oct. 14, 1874.]

The composition of boracic acid and tannin derived from clover, as described.

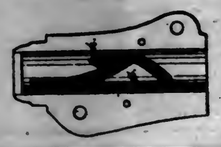


169,095. Tobacco-Hangers. T. B. Carr, Louisville, Ky. [Filed May 14, 1875.]

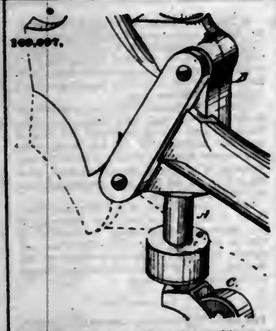
A bifurcate hanger composed of a looped wire, F G, and binding-cord J, substantially as and for the purpose described.

169,096. Folding Stairs for Fire-Escapes. Thos. Garrick, Providence, R. I., assignee of two-thirds his right to Wm. H. Reynolds, same place, and M. T. McMahon, New York, N. Y. [Filed Sept. 2, 1875.]

Brief.—The stairs are composed of a series of lazy-tongs, provided with folding links at their upper ends, which constitute a hand-rail. A rope is secured to the lower end of the stairs, and extends up to a drum on the upper end, and by which the ladder is raised and folded up.



1. The combination, substantially as before set forth, of the steps, the series of levers, and the series of links, the whole constituting a folding stairs.

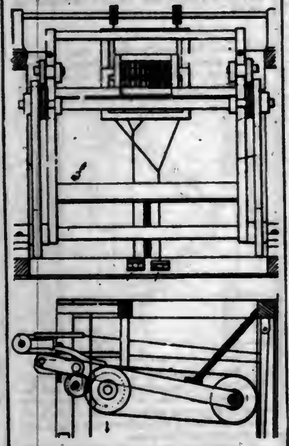


2. The combination, substantially as before set forth, of the steps, the series of levers, the series of links, the windlass, and the connecting-ropes.

3. The combination, substantially as before set forth, of the steps, the levers extended above the steps, the links, and the folding hand-rail connecting the upper arms of the levers, the whole constituting a folding stairs with a folding railing.

169,097. Sewing-Machine Carriers. T. B. Garretson, Cohoes, Iowa. [Filed Apr. 7, 1875.]

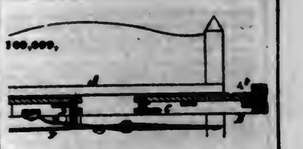
Brief.—The shaft or spindle of a sewing-machine carrier, arranged to slide vertically in a cylindrical casket, is shouldered at one end, and has a laterally-projecting pin near the other end. The casket is formed with an interior between groove or channel, and there is likewise a suitable lock catch; the construction being such that, by engagement of the pin with the groove, the weight of the machine may be readily carried upon the casket, or as readily disconnected and rested upon the foot, only the casket itself always remaining on the foot.



The combination, to a sewing-machine carrier, of the post or shaft A, bearing the roller C, and provided with pin a and the socket B, having upon its inner wall the tortuous groove or channel *g*, and the lock-catch *h*, as described and shown, for the purpose set forth.

169,098. Hand-Looms. James R. Gillespie, Boston, Mass., assignor to Theo. A. Dodge, trustee, same place. [Filed June 24, 1875.]

Brief.—To assist the operator in beating up the lay, a fixed cord, extending from the front to the back of the loom, is carried between two friction-rollers on the lay—one constantly rotated, the other mounted on the hand-rail, which is pivoted to allow of a slight forward and back movement. When the two rollers are brought together, so as to bind the cord, the lay is thrown forward quickly and forcibly.



1. The combination of the lay, its movable friction-pulley, and driven pulley with a band, cord, or rod, whereby the lay may be thrown forward, substantially as described.

2. The combination of the lay, its pivoted hand-rail, and friction-pulley with a stop to meet the hand-rail and disengage the friction-pulley from the band or cord at the forward position of the lay, substantially as described.

169,099. Invalid-Bedsteads. Ansbel J. Goodwin, Brooklyn, Mass. [Filed July 27, 1875.]

Brief.—The bedstead supports two independent mattress-frames, one of which may be moved laterally by means of a toggle-lever, and a sliding commode be placed in grooves in the inner rails of the frames. The outer rail of the movable frame is bevelled interiorly, and the ends of the slats are shaped to fit the bevel, to allow slight lateral movement of the latter when the frames are pushed together.

1. The combination of the slide-frame or bed-supporter B with the bedstead A, provided with means of supporting an additional bed, as stated.

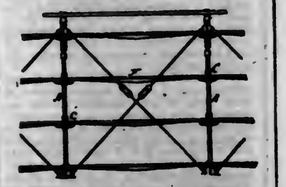
2. The combination of the toggles E E' E E', lever F, and their connections G' G' with the bedstead A and the slide-frame B, all being applied as set forth.

3. The combination of the arm G with the bedstead A, its slide-frame B, and their rails C D, arranged and provided with ledges, as specified.

4. The movable bed-vessel seat H with the bedstead A, the arm G, and the movable frame B.

5. The frame B, bevoled as shown at *g*, for use with the slats, bevoled at their outer ends, as shown at *h*, all being for the purpose specified.

169,100. Rubber Tires for Vehicle-Wheels. John Ashton Greene, Brooklyn, N. Y. [Filed Oct. 9, 1875.]

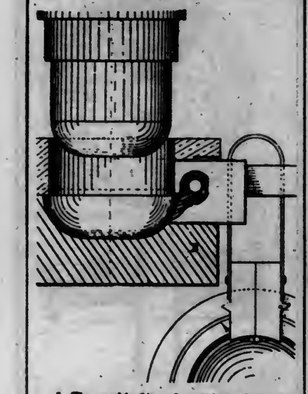


1. The combination, with a rubber tire, of a metallic core, substantially as shown and described.

2. The combination, with a rubber tire and its metallic core, of a flanged tire, substantially as shown and described.

169,101. Metallic Frames for Buildings. Emil Gruwe, Hoboken, N. J., assignor to Schwatzer & Gruwe, New York, N. Y. [Filed Sept. 2, 1875.]

Brief.—The cast-iron blocks, which connect the tubes of the frame-work, are provided with projecting flanges, which support the connecting-beams.



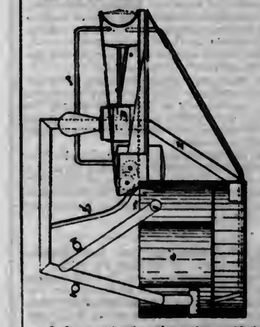
The combination of the tubes A B, with the connecting-blocks C C, which have projecting flanges formed on them for receiving and supporting the connecting-beams F F, substantially as herein shown and described.

169,102. Processes of Dressing Skins. Richard Hart, Gloversville, N. Y., assignor of one-half his right to James Gillespie, same place. [Filed July 24, 1875.]

Brief.—Immerses first in a solution of clam, flour or oatmeal, oil, and water; then in a solution of urine, soap, soda, salt, whiting, flour or oatmeal, and water.

The improved process for dressing skins, consisting in the application to the skins of the two solutions composed of the ingredients named, in about the proportions stated, substantially in the manner and in the order specified.

169,103. Manufacture of Glassware. John H. Hobbs, Wheeling, W. Va. [Filed Sept. 20, 1875.]



1. The combination of an unjointed or solid bowl-mold and a jointed handle-mold, substantially as described, whereby a pressed handle and a pressed bowl free from the usual line or mold-marks shall be produced at one operation.

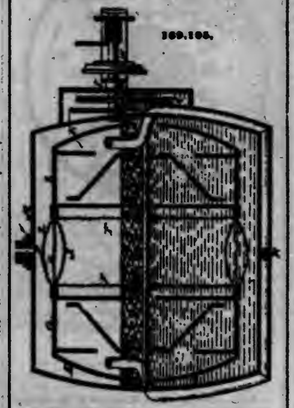
2. A two-part or jointed mold united by a metallic spring-bow, substantially as set forth.

169,104. Steam-Washers. Manley Howe, Boston, Mass. [Filed Feb. 6, 1875.]

Brief.—A steam-generator and pump is connected with a tank by means of pipes, for forcing steam and hot water in and upon the clothes in the tank.

1. In combination, the tank provided with bottom *a*, the feeding-rollers *b*, and the steam-pump and its connected pipes C E, all operating as and for the purpose described.

2. The combination, with the ribbed tank A *b'* and its central partition-*c'*, of the perforated and ribbed bottom inclined with relation to the bottom of the tank, substantially as described.



3. The combination, with the steam-pump and tank, of the perforated or slotted discharge-pipe and sleeve *a*, substantially as described.

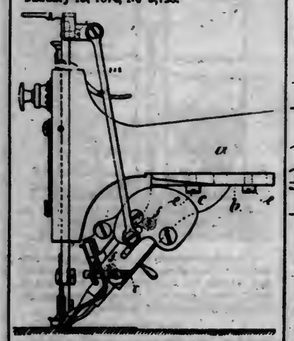
4. The combination, with the tank and the cylinder *f'*, of the perforated discharge-pipe and the exhaust-pipe *e*, arranged to introduce the water in the tank and heat the water, substantially as described.

5. The combination, with the tank, of the supply-pipe C, the generator, and the steam-pipe *g* leading into the supply-pipe, substantially as described.

169,105. Carburetters. Hyam J. Hyams, Pittsburg, Pa., assignor of one-half his right to F. L. Bannen. [Filed Jan. 25, 1875.]

Brief.—The blowers and evaporating-surfaces revolve together in the carbureting fluid. The feed-box, supplying hydrocarbon fluid, is secured to the side of the outside cylinder of the blowers.

1. The hollow revolving drums *a b*, each having a diaphragm, F, of porous material, stretched over its inner end, in combination with the intermediate surrounding cloth bands J K and wire-gauze L, attached to said drums, and revolving therewith around the same axial line, as and for the purposes set forth.

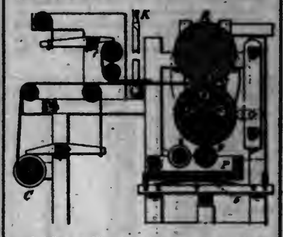


2. The hollow revolving drums *a b*, diaphragms F, intermediate surrounding cloth bands J K, and wire-gauze L, in combination with the concave hoods E, as and for the purposes set forth.

3. The hollow revolving drums *a b*, diaphragms F, intermediate surrounding cloth bands J K, wire-gauze L, and concave hoods E, in combination with the outer case A, air-pipes B, and vapor-pipe H, as and for the purposes set forth.

4. The hollow revolving drums *a b*, diaphragms F, intermediate cloth bands J K, wire-gauze L, and concave hoods E, in combination with the outside case A and elevated reservoir R, as shown and set forth.

169,106. Button-Hole Attachments for Sewing-Machines. John Thomas Jones, Lisbon, N. Y. [Filed Sept. 2, 1875.]



Brief.—The invention is an improvement upon the devices shown in Letters Patent No. 103,745, granted May 31, 1870, and reissued January 13, 1874, No. 5,733.

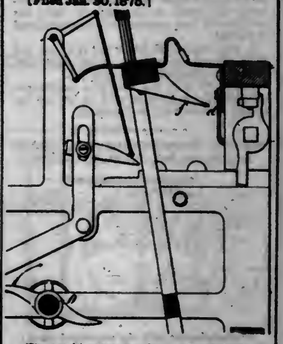
1. The bracket *b a*, provided with holes and slots for the screws *p c*, and adapted to be held by such screws removably to the under side of the arm *a*, in combination with the button-hole attachment and the screws *f f*, for holding and adjusting the same upon the bracket, as set forth.

169,107. Paper-Tube Machines. N. Keely, Lovering ton, Pa. [Filed Oct. 1, 1874.]

Brief.—The paper is wound upon the mandrel, which is made in sections under the pressure-roll, the edges being trimmed as the tube is formed. The paste-box is automatically moved away before the completion of the last layer. The strips to form the bosps are wound in a similar manner, receiving paste from the sectional paste-roll in the spring-supported paste-box.

1. The combination of the co-acting rolls E E', the latter constructed in sections and encircled with series of intaglio threads, as and for the purposes described.

2. In combination with paper-supply rollers C and I, and rolls E E', the cut-off knife K, and adjustable trimmers k.



3. The combination of cam J, lever O, pawls *p p'*, ratchet-rack P, and sliding bar W, provided with piece Z, terminating in catch *b*, playing into slot *r* in upright U, all combining to operate box P, substantially as described.

4. Box P, provided with paste-distributing rollers S T, and springs S.

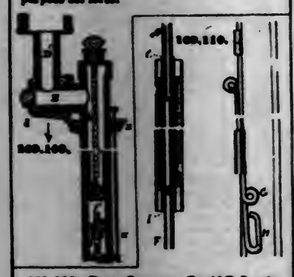
5. The double dovetail keys *c' d c'*, in combination with the respective sections of roll E', substantially as represented, and for the purposes described.

6. Directed hanger G, composed of separable parts *a n'*, lug *w*, and pin *t*, substantially as represented and described.

169,108. Stop-Motions for Looms. Henry T. Kent and Henry Moore, Clifton, Pa. [Filed Jan. 30, 1875.]

The combination, in a loom, of a projection, *f*, on the lathe, and a stop, *d*, arranged upon the frame, connected to the belt-shifting mechanism, and operated by the latter, whereby the stop *d* is brought into line with the projection *f*, and prevents the movement of the lathe when the belt is shifted, all substantially as set forth.

169,109. Oil-Cans. Edward Kussmaul and Theodore Breter, Cincinnati, Ohio. [Filed May 10, 1875.]



Brief.—The discharge-head of the pump is swiveled on a horizontal pipe connecting it with the pump-barrel, so that it is turned

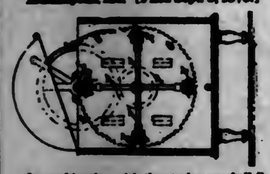
down by the closing of the flat cover hinged to the can. A rod on the outside of the pump-barrel connects with a pivoted lifter, which, resting on a stem extending downward from the lower valve, lifts it, a stem extending upward from said valve lifting the valve in the piston, by which means the pump-barrel is emptied. A kind of bayonet-joint, locked by a spring-rod, connects the pump to the shelf in the can.

1. In the oil-can A the adjustable pump-head D, D', and *d*, fitted to turn on cylinder E, substantially as specified.

2. In a pump for oil-cans, the combination, substantially as described, of check-valve *r*, having stems *l* and *f*, valve-lifter *s*, and link *n'*.

3. The combination of plug L, secured to cylinder G, and having lugs *o o'*, and socket *f*, secured to shelf F, and having hooks *p p'*, and springs *q*, substantially as and for the purposes set forth.

109,110. Dough-Strainer. David B. Lowrie, Minneapolis, Minn. (Filed May 11, 1875.)

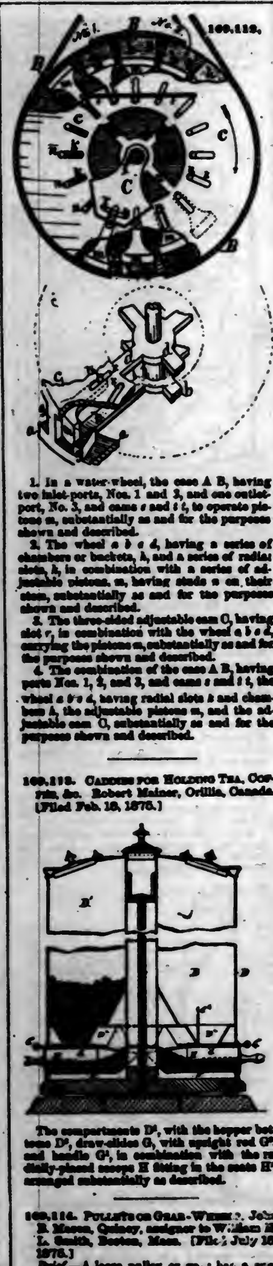


Brief.—A short tubular spring bale-hook to or interposed between the two end pieces of an ordinary tension-spring, the object being to counterbalance tension and torsion, and lessen the tendency of the rods to twist out of line. The lower end of this compound rod is formed into a lengthened oblong eye-piece, which traverses its attaching-screw, and gives vertical adjustability, and there is another eye for inserting a pin or key, to wind or key up the intermediate portion of the spring.

1. The rods A and F, in combination with the eye-pieces C and I, and the intermediate spring J, blunted or fastened to the opposite ends of the rods, to balance tension and torsion, and lessen the tendency to twist the rods out of line, substantially as shown and described.

2. The lengthened eye or slot H in the rod F, to allow it to traverse on the screw that fastens it, substantially as specified.

3. The eye G on the rod F, for inserting a suitable pin or lever to wind or key up the spring, substantially as described.



109,111. Washing-Machine. P. Lieber, Indianapolis, Ind. (Filed Sept. 9, 1875.)

In combination with the stationary shell C, formed of corrugated sections, as set forth, the rotating brushes B, fixed on yielding or adjustable arms F, and the hose tube or covering K on shaft G, all arranged and operating substantially as set forth.

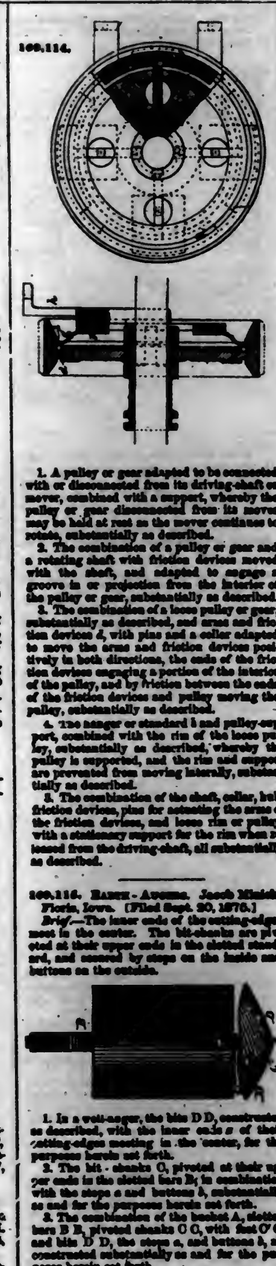
109,112. Reversible Water-Wheels. Alfred W. Lindley, Des Moines, Iowa. (Filed Apr. 20, 1875.)

Brief.—This wheel may be used either in a vertical or horizontal position, making it either a breast or turbine, at pleasure. It has buckets in its periphery, and an adjustable bottom or plates in each chamber, in combination with an adjustable cam and stationary cam, having two kind cams and two inlet and one outlet port.

1. In a water-wheel, the case A B, having two inlet-ports, Nos. 1 and 3, and one outlet-port, No. 3, and cams *r* and *t t*, to operate pistons *m*, substantially as and for the purposes shown and described.

2. The wheel *a b c d*, having a series of chambers or buckets, h, and a series of radial slots, *k*, in combination with a series of adjustable pistons, *m*, having studs *n* on their stems, substantially as and for the purposes shown and described.

3. The three-sided adjustable cam C, having slot *r*, in combination with the wheel *a b c d*, carrying the pistons *m*, substantially as and for the purposes shown and described.



4. The combination of the case A B, having ports Nos. 1, 2, and 3, and cams *r* and *t t*, the wheel *a b c d*, having radial slots *k* and chambers h, the adjustable pistons *m*, and the adjustable cam C, substantially as and for the purposes shown and described.

109,113. Caddies for Holding Tea, Coffee, &c. Robert Meiner, Orillia, Canada. (Filed Feb. 18, 1875.)

The compartments D', with the hopper bottoms D², draw-slides G, with upright rod G', and handle G², in combination with the radially-placed scoops H fitting in the seats H', arranged substantially as described.

109,114. Pulleys or Gear-Wheels. John B. Mason, Quincy, assignor to William H. L. Smith, Boston, Mass. (Filed July 16, 1875.)

Brief.—A loose pulley or gear has a support disconnected from the shaft, about which the pulley or gear moves, and is adapted to sustain the pulley or gear when disconnected from the shaft, and it is desired to have the pulley or gear cease its movement.

1. A pulley or gear adapted to be connected with or disconnected from its driving-shaft or mover, combined with a support, whereby the pulley or gear disconnected from its mover may be held at rest as the mover continues to rotate, substantially as described.

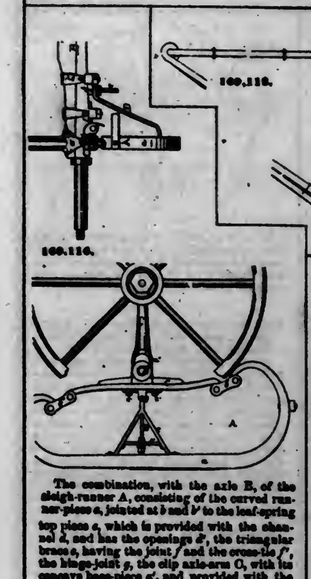
2. The combination of a pulley or gear and a rotating shaft with friction devices moved with the shaft, and adapted to engage a groove in or projection from the interior of the pulley or gear, substantially as described.

3. The combination of a loose pulley or gear, substantially as described, and arms and friction devices *A*, with pins and a collar adapted to move the arms and friction devices positively in both directions, the ends of the friction devices engaging a portion of the interior of the pulley, and by friction between the ends of the friction devices and pulley moving the pulley, substantially as described.

4. The hanger or standard I and pulley-support, combined with the rim of the loose pulley, substantially as described, whereby the pulley is supported, and the rim and support are prevented from moving laterally, substantially as described.

5. The combination of the shaft, collar, hub, friction devices, pins for actuating the arms of the friction devices, and loose rim or pulley, with a stationary support for the rim when released from the driving-shaft, all substantially as described.

109,115. Rabbet-Augers. Jacob Minich, Florin, Iowa. (Filed Sept. 20, 1875.)



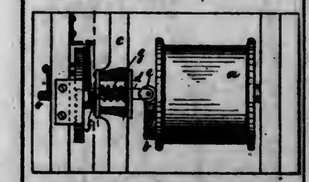
Brief.—The inner ends of the cutting-edges meet in the center. The bit-shanks are pivoted at their upper ends in the slotted shank-rod, and secured by stops on the handle and buttons on the outside.

1. In a bell-auger, the bits D D, constructed as described, with the inner ends *x* of their cutting-edges meeting in the center, for the purposes herein set forth.

2. The bit-shanks C, pivoted at their upper ends in the slotted bars B, in combination with the stops *a* and buttons *b*, substantially as and for the purposes herein set forth.

3. The combination of the basket A, slotted bars B B, pivoted shanks C C, with feet O O and bits D D, the stops *a*, and buttons *b*, all constructed substantially as and for the purposes herein set forth.

109,116. Attachable Vehicle-Bottoms. Isaac Pettis and Wm. G. Pettis, Putnam, Conn. (Filed Mar. 22, 1875.)



The combination, with the axle B, of the sleigh-runner A, consisting of the curved runner-piece *a*, jointed at *b* and *b'* to the leaf-spring top piece *c*, which is provided with the channel *d*, and has the openings *d'*, the triangular brace *e*, having the joint *f* and the cross-tie *f'*, the hinge-joint *g*, the clip axle-arm C, with its concave base-piece *c'*, and provided with the bolts *c'*, the brace-rod D, and the bolt *c'*, as described.

109,117. Revolution-Indicators. Chas. H. Phinney, Boston, Mass. (Filed Nov. 17, 1874.)

Brief.—A revolving body having a cam projection upon its surface, which engages with a rod having a roller at one end, and the other end beveled off. This beveled end acts upon a lever at right angles to it, and carrying a pawl, which engages with a ratcheted wheel, then moving a hand or indicator a certain distance every time it is moved.

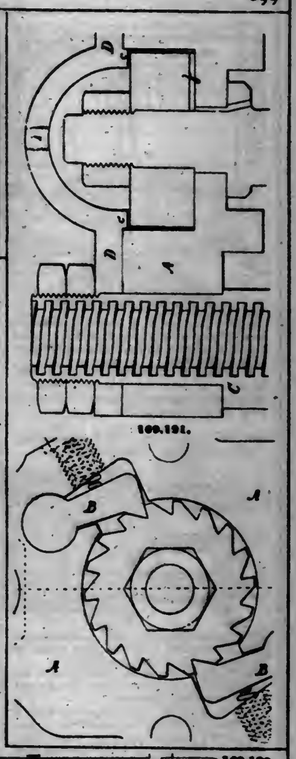
1. The ratchet-wheel *n*, pawl *m*, and its lever *k*, pivoted on the shaft of the wheel, and provided with incline or leg *f*, in combination with and actuated by rod *d*, provided with an incline, all arranged as shown, so that the rod *d* given motion to the lever and pawl in a direction at right angles to itself, substantially as described.

2. The combination, with a revolving body, *a*, having at its end a cam, *b*, of the horizontal rod *d*, provided with the reacting spring *g* and roller *c*, on which the cam operates, and an inclined plane, *f*, and the pawl-carrying lever *k*, having incline *f* and pawl *m*, to actuate the ratchet-wheel *n*, the said lever *k* being provided with a reacting spring, all as herein shown and described.

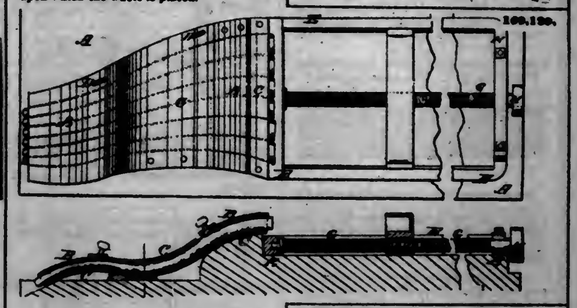
109,118. Wire Stove-Brackets. John H. Randall and Dexter P. Newton, Clyde, Ohio. (Filed Feb. 23, 1875.)

Brief.—In combination with a wire stove-pipe bracket, the fastening device consisting of the pawl provided with a square link and a triangular loop.

In combination with a wire stove-pipe bracket, the fastening device consisting of the head L, provided with a square link, O, and the corrugated head K, provided with a triangular loop, *n*, as and for the purposes described



109,119. Cigar Mouth-Pieces. Charles Reinisch, Newark, N. J. (Filed July 23, 1875.)



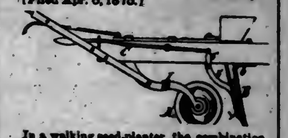
Brief.—The part that fits onto the cigar is made of paper coiled into cone shape, and in the smaller end is glued a goose-quill for the mouth piece.

As a new article of manufacture, a cigar mouth-piece consisting of a conical paper tube, A, and a goose-quill, B, fastened together by a suitable gutinous material, substantially as described.

109,120. Machines for Bending Scythe-Snaths. John H. Russell and Geo. Birner, Milwaukee, Wis. (Filed Feb. 20, 1875.)

Brief.—Scythe-snaths and similar articles can be bent to the desired form by means of a former composed of two parts—one stationary and the other detachable—each part provided with a longitudinal side bar of the shape of the article to be bent, and cross plates which alternate with each other, and form a continuous socket when the plates are put together; and a recessed cross-bar or pusher, into which the butts of the snaths are placed, and which operates between guides by a swiveled screw-rod, to force the blanks into the former, in connection with a suitable bed, upon which the whole is placed.

The snath-bender herein described, consisting of bed A, separable multiple socket B C, and frame E, provided with hollow cross-bar or pusher moved by a swiveled screw, O, as shown and specified.

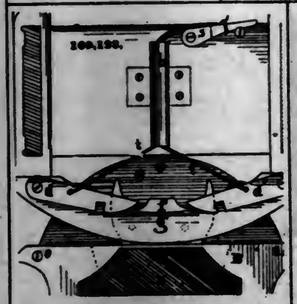


109,121. Rock-Drills. George B. Seddon and William McFaul, New York, N. Y. (Filed Sept. 15, 1875.)

1. The cover D D, provided with an oiling-aperture, I, and a projecting rim, *c c*, substantially as and for the purpose specified.

2. The nut C, having a flat on one side, and covered to the upper head and cover by means of nuts, substantially as shown and described.

3. The combination of the head A A, the gavels B B, the feed-nut C, and the cover D D, constructed and arranged substantially as and for the purpose specified.



109,122. Seed-Planters. J. W. Simpson, Dry Ridge, Ky., assignor of one-half his right to Morgan J. Simpson, same place. (Filed Apr. 6, 1875.)

In a walking seed-planter, the combination of hinged standard B, brace *b'*, link *b''*, and lever C, pivoted to and extending rearward along one side of beam A to a point within reach of the operator, substantially as described.

109,123. Cradles. Jacob Sprengard, Cincinnati, Ohio. (Filed Aug. 14, 1875.)

160,125.

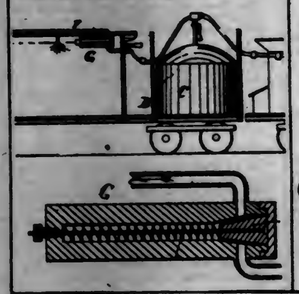
1. The combination of foot E, mortised at h, and having upright piece c, with the rocker f, pronged plate f', and pins r and s, substantially as specified.

2. In a child's cradle, the combination, substantially as described, of notched latches k and k', cords i i, pins o o, cylinder b, and arm a, for the purpose specified.

160,126. Lubricators. W. P. Stephenson, Waverly, Iowa. [Filed Feb. 1, 1875.]

1. The auxiliary reservoir C, in combination with the reservoir A, substantially as and for the purposes shown and described.

2. The plate a a, in combination with the reservoir C, substantially as and for the purposes shown and described.

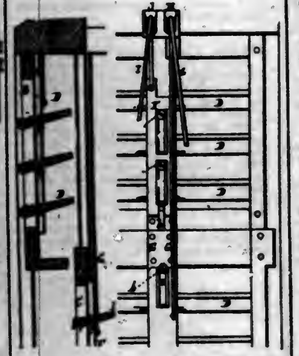


3. The reservoir A, having drain-tube B and frame D, the auxiliary reservoir C, having plate a a, the transparent tubes Nos. 1 and 2, and the receiving and distributing tubes E E, when combined to form a lubricating apparatus, substantially as shown and described.

160,127. Postage-Stamps. Chas. F. Steel, New York, N. Y. [Filed Mar. 15, 1875.]

A postage or revenue stamp formed wholly of water-leaf or other soft and absorbent paper, provided on the back with a filling coating of starch or analogous material, and a superposed coating of the ordinary gum, substantially as and for the purposes set forth.

160,128. Apparatus for Lighting Railway-Cars. Jos. Story, Washington, D. C. [Filed Oct. 1, 1875.]



1. The reservoir C, combined with its chamber or seat B and the several cars of a railway-train, each being provided with suitable service-pipes F, as and for the purpose set forth.

2. Combined with the reservoir C and service-pipes F, the cut-off valve G, provided with a cord, g, extending through the train, as set forth.

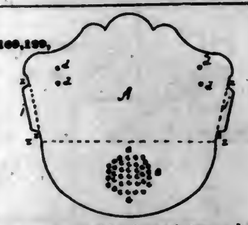
3. Combined with a rigid gas-holder, a pump, I, for the purpose of forcing water into said holder to restore the pressure, substantially as described.

160,129. Blind-Slat Operators. William Stronk, Montgomery, Mich. [Filed Sept. 18, 1875.]

Brief.—A pair of sliding blinds, fitted in a window-frame, carries on each blind, secured to the upright bar, a suitable slotted slide, having laterally projecting pins. To the slide of the lower blind is attached one end of a cord, which extends up and over a channeled guide projecting outwardly from the top of the window-casing, the pulling of the cord actuating the slats, while a rubber or other retracting-spring at the bottom of the slide tends to keep it normally in closed position. The upper blind is fitted with substantially the same devices, and, when necessary to draw up or raise the lower half, a continuous pull on the cord attached thereto, beside opening the slats, will draw up that portion of the blinds to the desired height or position.

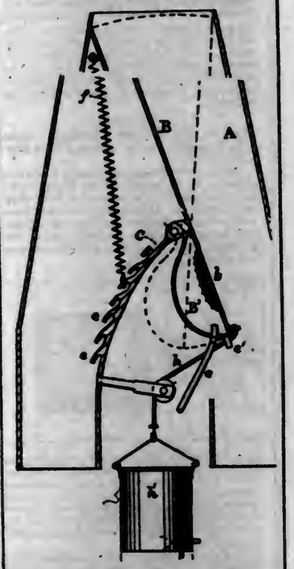
The slides F, pins e, springs A, cords G I, and guides J H in combination with the slats D of the window-blinds B C, in the manner substantially as described, and for the purpose set forth.

160,130. Plastering Safety-Plates. G. A. Thurston, Cambridge, Mass. [Filed Sept. 21, 1875.]



The plastering-guard, substantially as described, consisting of the holed or slotted plate A, and the flanged tubular collar B, arranged essentially in manner and for use as specified.

160,130. Match-Safes. E. H. Whitney, Cambridge, assignor to Dover Stamping Company, Boston, Mass. [Filed Oct. 6, 1875.]



160,129.

As a new article of manufacture, a box whose sides, back, bottom, and top are composed of the pieces A B F, arranged and combined together by slots g g and ears h i, substantially as and for the purpose described.

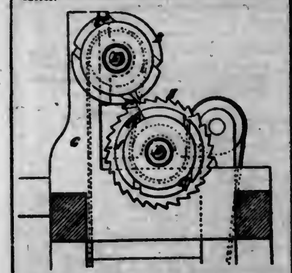
160,130. Cistern-Filters and Water-Separators. Wm. B. Wilson, Jefferson County, Ky. [Filed Aug. 2, 1875.]

Brief.—A portion of the water passing to the waste-pipe is caught in cup-shaped receptacle formed at the lower end of a plate adapted to be moved across the casing. The water passes from the receptacle into a bucket attached to the plate, and when the bucket is filled its weight overcomes the action of a spring attached to the top of the plate, and a rack on a partition of the casing, and causes the plate to be moved across the condenser, and direct the water into the cistern.

1. The casing A, divided by the partition C and leading to the waste-pipe and cistern, as specified, the pivoted plate B, and grate-covered cup D', having the pipes e f, combined with the suspended automatically-emptying receiver D' and reactionary spring f, substantially as and for the purpose set forth.

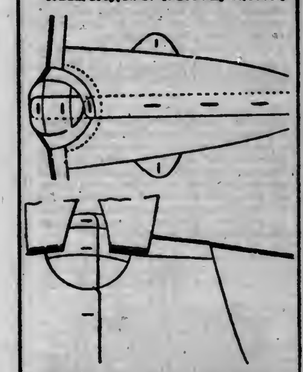
2. In the casing A, the combination of the pivoted plate B, partition C, having the hooks c, and spring f, substantially as described, and for the purpose specified.

160,131. Corsets. John W. Ashis, Melrose, Mass. [Filed Sept. 7, 1875.]



The skirt-supporter herein described, consisting of the rings f h, band or strap m, and supporting-band k, in combination with the corset, provided with slots o, substantially as and for the purpose specified.

160,131.

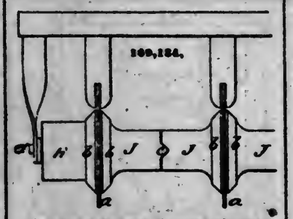


160,132. Dovetailing-Machines. Loring Atwood, Rutland, Vt., assignor of one-half his right to Henry A. Hale, Brooklyn, N. Y. [Filed Aug. 7, 1875.]

Brief.—Cuts dovetail tenon and groove, trims the former with a saw, and planes the latter.

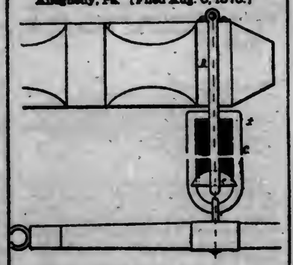
The knives C C', arranged on the shafts D and E, and having their cutting-edges inclined outwardly toward those of the other set to cut two diverging sides, in combination with the chucks A and B and the rotary saw H, arranged on the shaft D between the chuck A and knife C, so that its outer edge works near the inner edges of the knives, and cuts the face of the tenon simultaneously with the cutting of the sides thereof, substantially as described.

160,133. Sewers. Clinton M. Ball and John C. Ball, Troy, N. Y. [Filed July 31, 1875.]



A shirt, having neck-band attached to body only at back of neck-opening, and the bosom attached at upper edge only to front of neck-band and shirt-body, as and for the purpose specified.

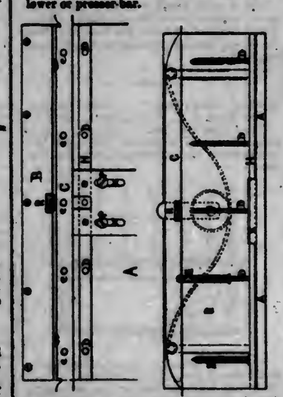
160,134. Corn-Stalk Cutters. Samuel Bunn, Clinton Valley, Ohio. [Filed Mar. 27, 1875.]



Brief.—A rectangular bar has depending from each end hangers, which support a shaft. Upon this shaft is secured at each end a hub, to which is attached a circular disk, and the intermediate space upon the shaft is provided with a series of sleeves, the ends of which are screwed and provided with shoulders, to cause rotating with the shaft; each sleeve being provided with a cutting-disk.

160,134.

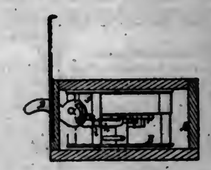
In a corn-stalk cutter, the series of serrated and flanged sleeves J, and the flanged hubs H, applied on each end of the axle O, in combination with circular cutters a, secured substantially as described, and for the purpose set forth.



160,135. Double-Tree Clips. W. Beckert, Allegheny, Pa. [Filed Aug. 6, 1875.]

The swinging clip B, passing at one end around the spring D, and having its ends b b pivoted to the double tree at i, as shown, in combination with the abutments e f and link C, also passing around said spring, all constructed and arranged substantially as shown, and for the purpose set forth.

160,136. Temporary Binders. William H. Bennett, New York, N. Y. [Filed Apr. 14, 1875.]



Brief.—Tubes are placed upon the impaling pins, to receive the matter to be filed or bound. When they and the matter thus bound are ready to be withdrawn from off the pins, the latter, together with their holding-bar and slide, are moved from under the spring-follower or presser-bar.

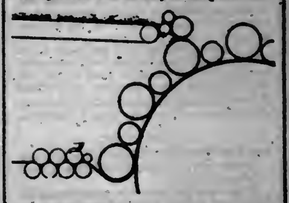
In combination with the bed A, head B and spring-clamp C, the bar H, needles D, slide K, and binding-tubes E, as constructed, to allow for the removal of papers and tubes E combined therewith, substantially in the manner described, as and for the purpose set forth.

160,137. Burglar-Alarms. Clinton Bohanon and John Bohanon, Brookline, N. H. [Filed Sept. 9, 1875.]

Brief.—The trigger is mounted on a rotatable shaft, and may be turned down, so as to be entirely within the case when not in use.

The sliding trigger D and its supporting-shaft, in combination with the alarm mechanism B and the case A thereof, all being arranged, and the cock of the alarm being provided with a stud, g, to engage with the said trigger, as set forth.

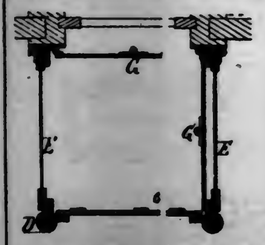
160,138. Folding Lounges. Nicholas E. Borgfeldt, New York, N. Y. [Filed July 14, 1875.]



1. In a lounge, the combination of a frame, composed of supports A A and feet B B, with a flexible web, C, inclosing the supports A A, substantially as described.

2. A folding lounge constructed of supports A A, feet B B, and a web, C, the supports being made to swivel in the feet, substantially as shown and described.

160,139. Methods of Manufacturing Tufted Yarns. Henry Bottomley, Camden, N. J. [Filed Sept. 4, 1875.]

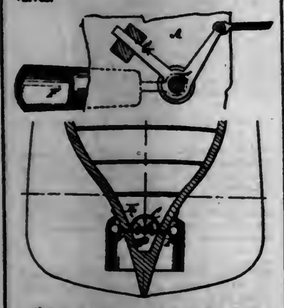


Brief.—The card-drum lays the tufts of yarn upon the roping, and causes them to adhere tenaciously to the said roping without being incorporated into the body of the yarn.

The docks or process heads described of producing the within-described yarn—that is, by causing a card-drum to lay the tufts on, and cause them to adhere to the top of the main card-cylinder of a carding-engine, and subsequently opening the roping, as set forth.

160,140. Railroad-Car Windows. Alex. Brandon, New York, N. Y. (Filed July 14, 1875.)

Brief.—A device for forcing or exhausting the air, at the same time excluding dust, cinders, &c.



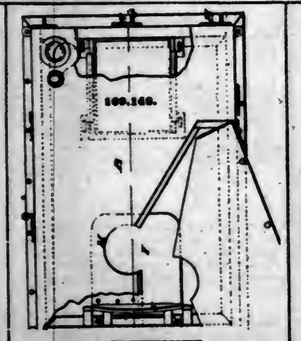
1. In combination with a window, C, held outward from the plane of the side of the car by a framing, D, the transverse screens E, adapted for excluding cinders, as herein specified.

2. The hinged screens G, in combination with the framing D and projected window C, as herein specified.

3. The car-body A, inside blind B, projecting framing D, window C, transverse screens E, and tight screens G, combined and arranged for joint operation as and for the purposes herein specified.

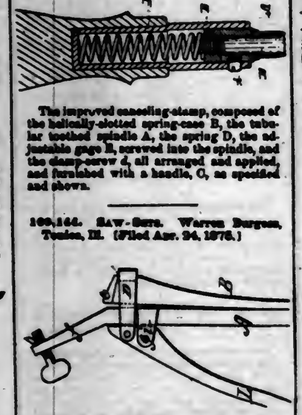
160,141. Marine-Engine Governors. R. W. Briggs and Aaron V. De Pew, New York, N. Y. (Filed May 26, 1874.)

Brief.—When the stern of the vessel is thrown upward by rough sea, the floats are forced downward by the resistance of the water, which motion is communicated to the throttle or cut-off valve, and shuts off the supply of steam to the engine. When the stern is again submerged, the float rises, which communicates the reverse motion to the valves.



1. The combination, substantially as herein described, with the stern-propeller D and its shaft B, of the transverse shaft E, arranged above the propeller-shaft, and carrying the rotating air-vessels or floats F, the whole constructed to operate as and for the purpose specified.

2. The combination, with the shaft E, arranged above the propeller-shaft, and carrying the radial air-vessels or floats F, with the counterbalance-lever G, attached to the shaft E, for regulating the movement of the floats, substantially as herein shown and described.

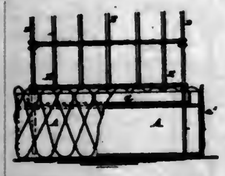


160,142. Portable Vapor-Baths. George Washington Bratton, Gallatin, Mo. (Filed Aug. 14, 1875.)

Brief.—A vapor-bath box, consisting of the frame and flexible covering, shown and described.

The combination of the bottom board A, top board B, and the frame and cloth sides C D, when constituting a vapor-bath box, and being detachably connected together by hooks and eyes, all substantially as specified.

160,143.



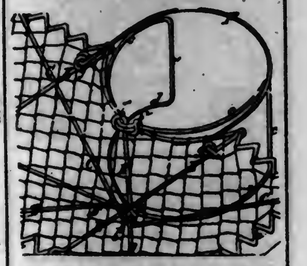
The improved annealing-stamp, composed of the helically-slotted spring-case B, the tubular toothed spindle A, the spring D, the adjustable gage E, screwed into the spindle, and the clamp-screw d, all arranged and applied, and furnished with a handle, C, as specified and shown.

160,144. Saw-Sets. Warren Burgess, Tonica, Ill. (Filed Apr. 24, 1875.)

The saw-set herein described, having the obtuse-angled jaw A, the detachable spring-jaw B, notched at *a*, and the lever L, having the stirrup D for engagement with said notch, as specified.

160,145. Bird-Cages. Dorinda F. Burns, New York, N. Y. (Filed July 17, 1875.)

Brief.—The bar-base is provided with a hinged side, and is adapted to receive the wire sections when separated for transportation.

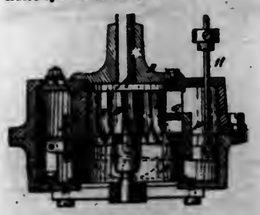


A bird-cage formed by the combination with each other of the hollow or box base A, provided with a hinged side, *a'*, the detachable rods D, the detachable sides E, and the detachable top F, substantially as herein shown and described.

160,146. Weiboed Attachments to Wash-Tubs. A. W. Caldwell, Gainesville, Ga. (Filed Oct. 2, 1875.)

A wash-tub or other article provided with an interior loop and projecting pins at the top rim and outer side, in combination with a wringing-strap having slotted and perforated ends to be applied in manner shown to the clothes to be wrung, and securely fastened to the pins for holding them the article for thorough wringing, substantially as specified.

160,147. Stove-Pipe Shelves. John Christy, Clyde, Ohio, assignor to himself, Milo Hunter, and Byron G. Brigham, same place. (Filed Apr. 28, 1875.)



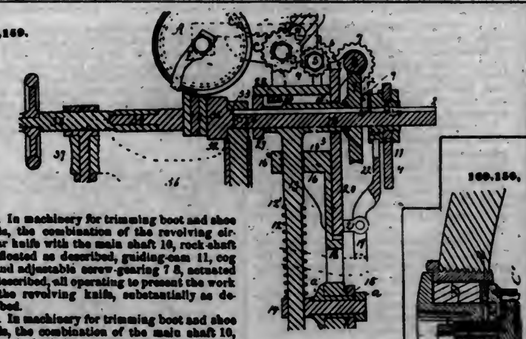
1. The wire stove-pipe shelf or bracket, made with a crimped edge, in combination with the filling-wires woven between the ridges of the crimped edge, substantially as described.

2. The wire shelf-frame, clasp, and diagonal brace, formed of a single piece of wire, in combination with the suspended brass wire rod C, and the strut B, and brass D', substantially as and for the purpose described.

3. The double eye or tie D' D' of the upright strut B, in combination with the wire forming the spring-clasp, substantially as described.

160,148. Tubbing-Wheels. T. H. Clark, Holmes, Mont. (Filed May 20, 1875.)

Brief.—The gate is a cylinder enveloping the wheel, and with an inwardly-projecting flange and segments on its upper end, which segments are fitted to the form of the chutes, and rise and fall in them, forming the bottom of them. The gate is supported in an inclining ring-lever, fulcrumed on one side, and operated by a rod on the other.



In a water-wheel, the combination with a vertically-adjustable gate, F G, the pivoted ring-lever J, and rod M, substantially as shown and described.

160,149. Hub-Tenoning Machines. Lovell G. Cook, Boston, Mass. (Filed Aug. 20, 1875.)

Brief.—The head is automatically presented to the cutting-action of a rotary upwardly knife, gradually and continuously, until reduced to the shape of the pattern-plate.

160,149.

1. In machinery for trimming boot and shoe heels, the combination of the revolving circular knife with the main shaft 10, rock-shaft 13, fluted as described, guiding-cam 11, cog 9, and adjustable screw-gearing 7 8, actuated as described, all operating to present the work to the revolving knife, substantially as described.

2. In machinery for trimming boot and shoe heels, the combination of the main shaft 10, rock-shaft 13, bearing the same, and fluted upon spring 12, rest-bolt 14, bearing-bars 19' 19', slotted sliding bearing-plate 20, cam 11, clutch 23, and pins 9', with the guide 41, and actuating mechanism, as described, all operating substantially as described, for the purpose set forth.

3. The combination of the rock-shaft 13, with its shoulder 13', and rest-bolt 14, with the spring 12 resting on the head of the rock-bolt, surrounding the rock-shaft and abutting against the shoulder of the rock-shaft, which is fluted thereon, substantially as described, for the purpose set forth.

4. The combination of the rock-bolt 14 furnishing a bearing for the rock-shaft 13, and a support for the spring 12, and its sleeve *a'* with the slot 19' in the frame of the machine, for the purpose of adjustment, substantially as described.

5. The combination of the main shaft with the heel-shaped cam 27, guided on the under surface of plate 28, substantially as described.

6. The combination of the main shaft 10, actuated as described, with the jack 31 36 37 38 39 40, holding the work against the heel-shaped rest projecting from the end of the shaft, and fitted to arm 31, substantially as described.

7. In a machine for trimming the heels of boots and shoes, the combination of the screw-gear 7 and 8, and slotted sliding bearing-plate 20, with the operating mechanism and cog-wheel 9, substantially as described, for the purpose set forth.

8. The combination of lever 29, rock-bar 30, and work-shaft 10, substantially as described, for the purpose set forth.

9. In a machine for trimming boot and shoe heels, the arrangement and combination of the lever 17, passing through the hole 18 in the frame of the machine, actuating the shipper 19 22, pivoted to an arm projecting from the sliding bearing-plate 20, with the clutch 23 carrying the cam 11 and pins 9', and having a horizontal movement on the main shaft, substantially as described, for the purpose set forth.

10. The combination of the main shaft, provided with the horizontal keyway 26, with the clutch 23, having a horizontal movement thereon, and carrying the cam 11, and engaging-pin, substantially as described, for the purpose specified.

11. The combination of the slotted hanger *m*, and cog-wheel with the set-screw *n*, substantially as specified.

12. The combination of the bracket *c*, slotted as shown, with the set-screws *c'* and *c''*, to secure a vertical adjustment of the revolving knife, substantially as described.

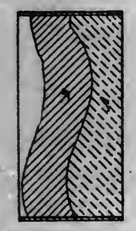
13. The combination of the sliding arm E, slotted as shown, with the set-screws *b' b''*, and bracket C, to secure a horizontal adjustment of the revolving knife in relation to the work, substantially as described.

14. The guard E arranged to conform to the inner surface of the blade, to free the same from the shavings, and bolted to the knife-shaft, substantially as described.

15. The combination of the rock-shaft 13, with the weight 43 suspended over the friction-pulley 45 by cord 4, for the purpose of drawing the main shaft into position for removing the work upon unshipping the cam, substantially as described.

16. In a machine for trimming the heels of boots and shoes, the knife A beveled on its outer edge at A', substantially as described.

160,150.



160,150. Bungs and Vents. H. B. Cornish, River Falls, Wis. (Filed Aug. 14, 1875.)

Brief.—The vent is established through means of a groove in the screw-bolt and a vent-hole in the bottom plate, and openings in a washer and metallic ring-plate the latter being provided with guide-pins, which project through slots in the bottom plate, so that by turning the same in one direction the vent-holes of bottom plate, washer, and ring communicate and admit air. By a short turn of the screw-bolt in the opposite direction, the bottom plate is carried back as far as the guide-pins will allow, thus interrupting the connection of the vent-holes.

The combination of grooved screw-bolt C, placed in the middle of bung, with recessed ring-plate A, having subjacent fins, the washer *f* and the bottom plate C', all having holes separated from or made to communicate with each other, by turning the bottom plate as set forth.

160,151. Making Patterns for Castings. Wm. B. Craig, Indianapolis, Ind. (Filed Aug. 20, 1875.)

160,151.

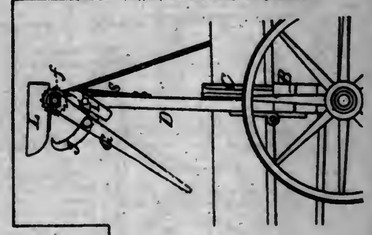
The method of making slab-rate ornamental castings by first modeling the form of the article to be produced in clay, as at A, taking a plaster mold, B, therefrom, applying to said mold a thin sheet of clay, C, forming thereon the back mold F, casting the composition pattern G in said plaster molds, and forming said molds I J from the composition pattern and plaster molds, all substantially as herein described.

160,152. Inkstands. Saml. Darling, Providence, R. I. (Filed June 17, 1876.)

Brief.—A shallow tray, containing water or wet sponge, is arranged in the upper part of the ink-reservoir. The surrounding air, becoming saturated with moisture by evaporation, exerts but little vaporizing influence upon the contained ink, so that the latter remains limpid and free from sediment.

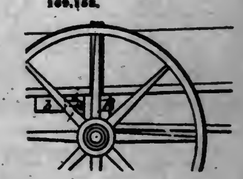
The combination, in an inkstand, of an ink-reservoir, a vessel in the upper part thereof to contain water or a wet sponge, and a removable top, substantially as described, and for the purpose set forth.

160,153. Dumping-Wagons. D. B. Davies, Dundaff, Pa. (Filed Sept. 11, 1875.)



Brief.—The spring which supports the seat presses upon the windlass, operating as a brake to prevent too rapid descent of the box.

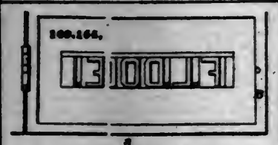
1. In combination with a derrick or bridge crane, a windlass, and a vertically-vibrating hinged wagon-box, the ratchet-wheel *f*, vibrating lever G, having pivoted hook *g*, pawl I, and spring S, substantially as specified.



2. The combination of the bridge-crane D E, the mechanism for raising a wagon body or box, and the driver's seat L, substantially as specified.

3. The combination of a brake-spring, J, with a driver's seat, L, and the winding-drum F of bridge-crane D E, substantially as specified.

4. In combination with the running-gear of a wagon, the removable bridge-crane D E, supporting the hoisting mechanism of a dumping-wagon, substantially as specified.



160,153.

160,154. Molds for Casting Door-Plates. Frank L. Dodge and Charles E. Smith, Grand Rapids, Mich. (Filed Sept. 24, 1875.)

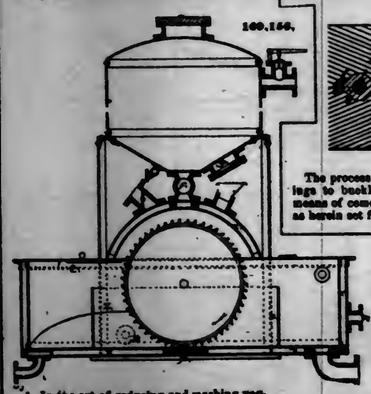
160,162.

The above-described molds for door and other plates, having faces A, with sunken bed a, removable border b, opening h, and holes i, in combination with letters, figures, or characters D, substantially as and for the purpose set forth

---

160,163. Pump-Buckets. E. J. Dunbar, Rosendale, Mich. [Filed Sept. 11, 1875.]

Brief.—A bucket of rubber with bell-shaped cavity, to which is fitted a conical valve, the latter rigidly secured to the rod, and, with the rod, having a short reciprocating stroke through and below the bucket.



The bucket A, made of india-rubber, in cylindrical form, with a bell-shaped cavity, a^2, in its lower end, and with longitudinal holes a^1 through it, the iron valve B, made in the shape of the frustum of a cone, and the iron rod C, provided with a nut or collar, c^1, in combination with each other, substantially as herein shown and described.

160,164. Processes and Apparatus for Making and Cooling. G. Hinsberger, Bidenkopf, Prussia. [Filed June 14, 1875.]

Brief.—The vegetable is treated to the action of steam in a closed vessel, then ground to a fine pulp, in a steam-jacketed vessel, and, when partially cured, the malt necessary to prepare the same for the fermenting-vat is added. The mash then treated is then artificially cooled.

160,164.

1. In the art of reducing and mashing vegetable substances, and preparing the same for fermentation, the process herein described, which consists in first subjecting said substances to steam under pressure, afterward grinding the same, while hot, in a steam-jacketed vessel to a fine pulpy mass, and when said mass is partially cooled adding the requisite malt and sugar, which is followed by artificial cooling and the addition of yeast, substantially as described, and for the purpose set forth.

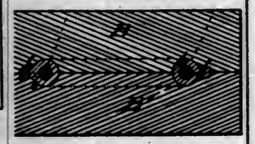
2. In the art of reducing and mashing vegetable substances, and preparing the same for fermentation, the process herein described, which consists in reducing steam-treated vegetable substances to a finely-divided pulpy mass, while subjected to the action of steam-heat from an inclosing jacket, substantially as described and set forth.

3. In the art of reducing and mashing vegetable substances, and preparing the same for fermentation, the process herein described, which consists in incorporating a preparation of malt with the mash while in a finely-divided pulpy mass, and while subjected to the action of steam-heat from an inclosing jacket, substantially as described, and for the purpose set forth.

4. The combination of a closed steam-vat for heating under pressure, with a steam-jacketed vessel for completing the mashing process, substantially as herein described.

5. A mashing-vat composed of two shells, an outer and an inner one, with steam-space between, in combination with a revolving drum and wildfeather, substantially as described.

160,167. Trammers for Millstone-Spindles. Abraham Bahelman, Harleyville, Pa. [Filed May 7, 1875.]



1. In a trammer for millstone-spindles, the bar or arm C, and the adjustable slide D thereon, having the bead e and fork f, substantially as and for the purposes herein set forth.

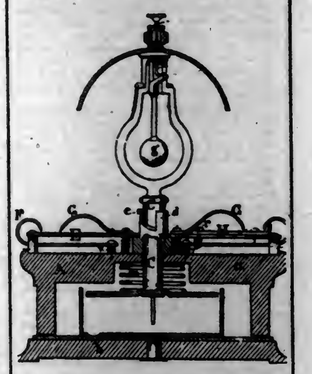
2. The combination of the bar C, with pin b, adjustable slide D, with bead e and fork f, curved arm E, and set-screw G, all constructed substantially as and for the purposes herein set forth.

160,168. Processes of Covering Harness-Mountings with Leather. Joseph Feder, Newark, N. J. [Filed Sept. 4, 1875.]

160,168.

The process of applying the leather coverings to beetles and harness-trimmings by means of cement and pressure, substantially as herein set forth.

160,169. Corsets. Sherwood B. Ferris, Brooklyn, N. Y. [Filed Sept. 2, 1875.]



160,169.

1. The corset having a series of buttons, e e, in a line parallel with its upper edge, in combination with the triangular flaps b b, of which each has a single button-hole, d, near its free corner, substantially as set forth.

2. The adjustable corset, slit at the upper and lower edges, and combined with the triangular flaps b b and f f, and their adjustable fasteners c c d and g g, substantially as specified.

160,170. Game-Counters. David Fay and R. Hermann Pein, Peoria, Ill. [Filed Sept. 2, 1875.]

1. The circular box A, provided with block or sleeve B d, fingers F, and index-plate E, substantially as and for the purposes described.

2. The circular index-plate E, provided with fingers G, &c., sliding fingers H, &c., in combination with the box A and its movable fingers F, substantially as and for the purposes described.

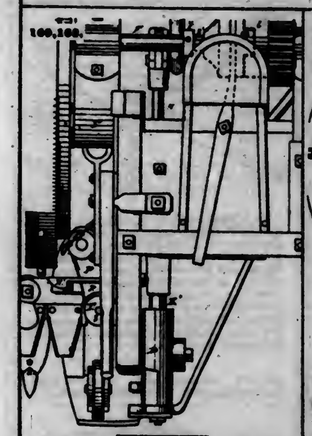
3. The combination, with block or sleeve B d, of the shaft C, provided at its middle with pin a, lengthened above to adapt it for the reception of a call-bell, and extended below the index to adapt it to receive the spring and pressing-plate of a card-press, substantially as and for the purposes described.

4. The construction and arrangement of the index-plate E, fingers G H F, with their fastening-screws, as described.

160,171. Lamp-Burners. John H. Fouch, Sauk Centre, Minn. [Filed July 31, 1875.]

The combination of the inner tube B, having the gas-jet holes b' and the inclosing-tube B, having corresponding slots a', one larger or wider than the other, to operate as and for the purpose specified.

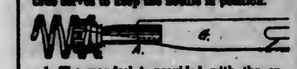
160,172. Mowing-Machines. D. H. Gage, Dover, N. H. [Filed May 10, 1875.]



1. The combination of the pitman F with the shoe w, having the pushing-block x pivoted thereto, and connected with the bell-crank P by the post y, substantially as set forth.

2. The combination of the shoe w, block x, post y, and crank P with the vertical axle z, accompanied by the friction-wheel T, substantially as expressed.

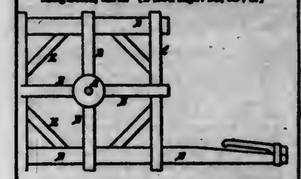
3. The forked rod F, pivoted at its rear ends to the flanges y y in front and forming an axle for the sleeve D', in combination with the beam-rod F', substantially as set forth.



In testimony that I claim the foregoing improvements in mowing-machines, as above described, I have hereunto set my hand and seal this 30th day of April, 1875.

160,166.

160,166. Sewing-Machine for Sewing Rags, &c. Howard P. Garland, San Francisco, Cal. [Filed May 17, 1875.]



Brief.—A helical needle, into which is inserted a mandrel pivoted to a slotted strap, and having an enlarged slotted head. The end of the last spiral at the heel of the needle, being bent inwardly, prevents the enlarged head of the mandrel from passing it, and thus serves to keep the needle in position.

1. The mandrel A, provided with the enlarged head B, slot C, and slotted strap G, as and for the purpose specified, constructed substantially as set forth.

2. The combination, with the mandrel A, provided with an enlarged head and slotted strap, of the spiral needle E, having the point of its last spiral bent in, substantially as and for the purpose specified.

160,165. Knee-Fowers. Wm. T. Grant, Magnolia, Ark. [Filed Apr. 19, 1874.]

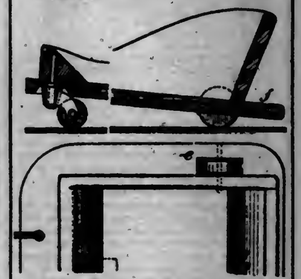
The combination of the radial arms B, arranged at right angles, the sweeps D D, their parallel connecting-bars C, and the diagonal braces E, with the king-post, all arranged as shown and described.

160,166. Water-Wheels. A. W. Haag, Fleetwood, Pa. [Filed Sept. 11, 1875.]

Brief.—The gates are pivoted to the upper and lower rings, which are turned by the shaft and gears. Behind the pivots the gates have a spring, which throws out the points of the gates into the notches in the guides when they close, to shut them tightly. The lower ring has cams, which ride up the cends when the gate closes, and press the beveled side of the ring tight against the cam, making tight joints when closed. On the bottom of the cams is a V-shaped rib, which is designed to press into the floor of the pen-stock, to make tight and prevent leakage of water.

1. The combination of a spring, F, with a gate, A, pivoted at B, and arranged to shut in a notch, G, in the guide, substantially as specified.

2. The combination of cams H with the gate-rings and gates, constructed to close the rings and buckets tightly, substantially in the manner described.



160,167.

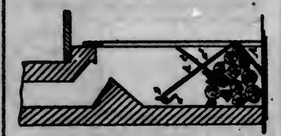
1. The combination, with the fan G, pipe J, and heating-chamber L, of the water-boiler M, connected with the service-pipe, substantially as and for the purpose described.

2. The combined heater and boiler consisting of the pipes E, boiler M, wheel D, and shaft C, in combination with the fan G, the pipe J, heating-chamber L, and burners P, substantially as and for the purposes described.

160,168. Infants' Parlor-Wagons. Benj. J. Harrison, New York, N. Y. [Filed Mar. 20, 1875.]

The infants' wagon made with the fenders e e and f, at the bottom of the body, projecting beyond the wheels, substantially as and for the purposes specified.

160,169. Car-Couplings. Joseph Harris, Paola, Kans. [Filed Feb. 6, 1875.]

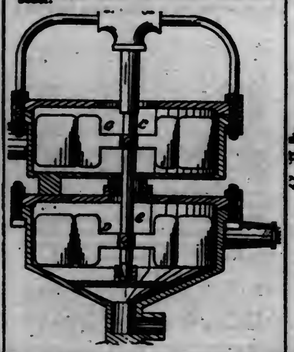


160,166.

3. The V-ring K, combined with the gate-case, substantially as specified.

4. The bearing for the shaft, constructed in two parts, E, and provided with a ring, T, to hold them together.

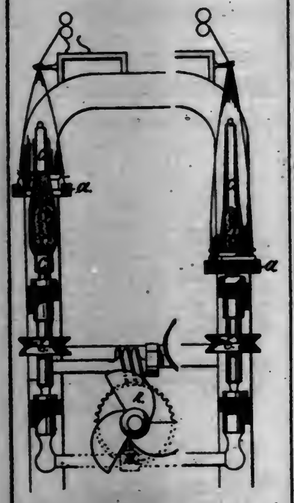
160,168. Fire-Door. Dreton S. Hale, Bellfville, Va. [Filed July 10, 1875.]



1. The fire-dogs A A, having hooks a', and bent inward at their lower ends, and the stay-plate B, secured to the opposite walls of the fire-place, all combined as shown and described, for the purpose specified.

2. The combination of the racks C with the dogs A a' a', substantially as herein shown and described.

160,167. Combined Air-Heaters and Boilers. Thos. M. Herrington, Pittsburg, Pa. [Filed Sept. 6, 1875.]

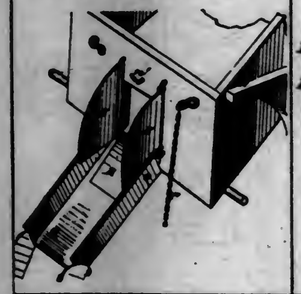


Brief.—It is designed that the flow of water in the service-pipe shall drive the wheel and fan, and that the water shall be kept from freezing in the pipe by passing through the boiler.

The rotating draw-bars A A', having journals *b*, and coupling-arms B B', with angular barbed heads *f*, convex on one side and concave on the other, in combination with lever F, rod G, box C, sliding block D, and spring S, substantially as and for the purposes set forth.

169,170. Spinning-Machine. James P. Hilliard, Fall River, Mass. [Filed July 8, 1875.]

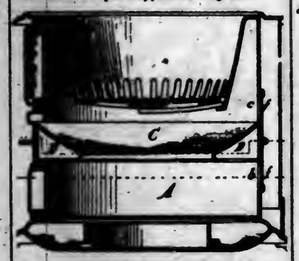
Brief.—To obviate the strain upon the yarn and the liability to breakage which occurs when the building-yarn is laid on at the downward traverse of the ring-rail.



1. The combination with the ring-rail of a spinning-frame, of the weights *h h*, and intermediate mechanism, whereby the rail is lifted and the open spiral binding-yarn caused to be wound in an upward direction on a cop or bobbin, substantially as described.

2. In combination with the reciprocating ring-rail of a spinning-frame, the arm *a*, cam *b*, and weight *h*, adapted to operate together, substantially as and for the purpose specified.

3. In a ring spinning-frame, the combination with the reciprocating ring-rail *a*, of means substantially as described, whereby a slow downward and rapid upward motion is imparted to the same, for the purpose of winding the yarn or thread on the cop or bobbin in close spirals on its downward traverse, and binding the same on its upward traverse by an open spiral binding-thread, as described.

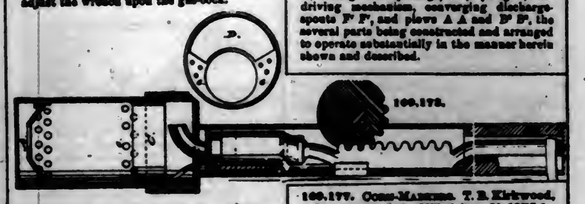


169,171. Dumping-Wagon. A. A. Hoch, Reading, Pa. [Filed May 20, 1875.]

In combination with the dumping wagon-body, having a discharge-opening in its rear end-board, and the sectional chute Q, hinged as specified, the flap E and laterally-swinging guards S, all as shown and described.

169,172. Heating-Stove. Zebulon Hunt, Hudson, N. Y. [Filed July 31, 1875.]

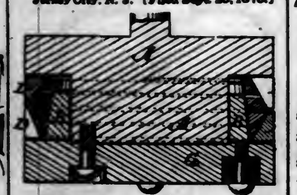
Brief.—Air for draft is taken into the fire located below the grate, and issues in a heated condition at a point opposite its ingress.



1. In a heating-stove, the closed annular air-heating flue, arranged around the wall of the stove beneath the grate, and provided with diametrically-opposite air-induction openings and air-eduction opening, substantially as specified.

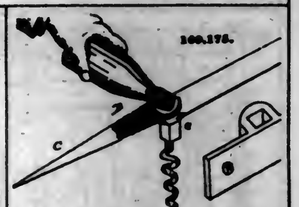
2. The combination and arrangement of the dust-openings *b b'* and *a a'* with chambers A and C, respectively, and in relation to flue D D, substantially in the manner and for the purpose herein described.

169,173. Lard-Lighting Apparatus. H. Idau, New York, N. Y. [Filed Mar. 27, 1875.]



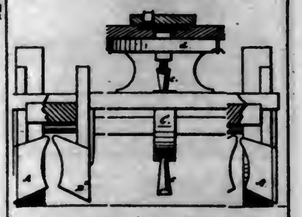
Brief.—The transparent plate in the bottom of the flame-chamber enables the operator to adjust the wrench upon the gas-cock.

1. The deflector A and illuminated base D, combined substantially as described, and for the purpose set forth.



2. The combination of the deflector A, illuminated base D, oblique holes *c c*, and movable cylinder C, substantially as described and shown, and for the purpose set forth.

169,174. Piston-Packings. C. B. James, Jersey City, N. J. [Filed Sept. 25, 1875.]

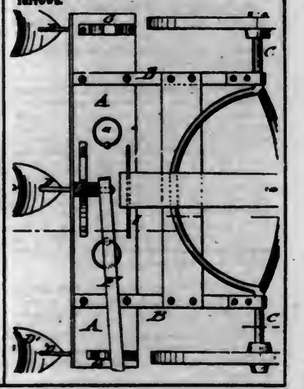


The combination, with the packing-rings, of the double conical expanding-spring, having conical inner surface, and the wedge-shaped ring B, as and for the purpose specified.

169,175. Combined Bottle-Opening, Knives, Ice-Picks, Graters, and Corkscrews. Geo. A. Kiehl and E. H. Kohler, Lancaster, Pa. [Filed Aug. 26, 1875.]

As a new article of manufacture, the described T shaped implement, made centrally concave at D, and provided with a projection, *a*, for removing cork-fragments, and having one arm formed into a knife, A, the other arm into an ice-pick, C, roughened at B to serve as a nutmeg-grater, and a square supporting-collar, *c*, adapted to fit within a contorted bracket, said collar terminating in a corkscrew, E, substantially as shown, and for the purpose specified.

169,176. Corn-Planters. Benjamin King, Jonesburg, Mo. [Filed Mar. 11, 1875.]



The combination, in a corn-planter, of the hopper or seed-box K, receiving feed-slide E, having two openings, *e e*, spring *d*, and driving mechanism, converging discharge-spouts F' F', and plows A A and B' B', the several parts being constructed and arranged to operate substantially in the manner herein shown and described.

169,178.

169,177. Corn-Marking. T. B. Elstwood, Bentonville, Ind. [Filed Aug. 21, 1875.]

Brief.—To a pivoted frame are connected bracketed cutters, turned up at their rear ends to form standards for slotted furrowing-plows. To the rear-standard is pivoted one end of a hinged pole, provided on its outer end with a head having markers for making additional furrows.

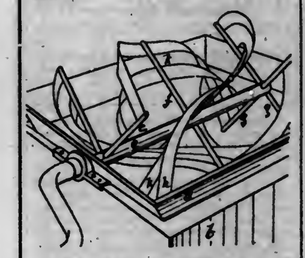
1. The branched cutters D, turned up, as shown, to form standards, in combination with slotted shovels D' and board A, as and for the purpose set forth.

2. The combination, with pivoted frame A B, having cutters D, of the upright E, the pivoted pole F, the guide-brace G, and the boards F', having cutters F, as and for the purpose specified.

169,179. Key-Hole Guards. John Le Blanc and Xavier St. Pierre, Ophir City, Utah. [Filed Aug. 14, 1875.]

The combination of a slide, A, cranked knob-spindle G, connecting-rod, and a stop-pin, L, with a lock, in the manner described, for covering the key-hole.

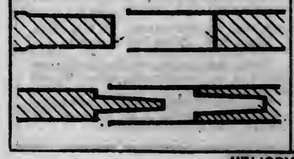
169,180. Molds for Concrete Articles. Richard B. Lanum, Mount Sterling, Ohio. [Filed Sept. 11, 1875.]



Loose or open jointed metal linings, in combination with molds for concrete articles, substantially as specified

---

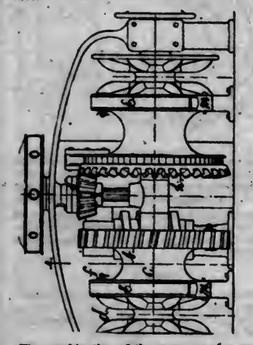
169,180. Lard-Coolers. James G. C. Lee, New York, N. Y. [Filed July 19, 1875.]



Brief.—Ice is placed in the chamber formed by the tank *a* and casing *b*, for cooling the lard.

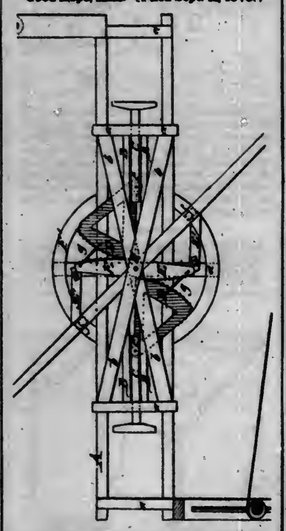
In combination with the shaft *c*, the series of spokes *e*, *f*, and *g*, provided with series of ribbons *h* and *h*, arranged to form spirals running lengthwise, one end thereof being connected to the end spoke next forward of the center line, and the other end connected to the opposite end spoke next behind their center line, and all arranged to operate substantially in manner and for the purpose described.

169,181. Fishing-Rods. Hiram L. Leonard, Bangor, Me. [Filed Aug. 30, 1875.]



Brief.—To render access of water to the end of the wood of the rod-joints impossible in the case of reel and glued rods—an especial desideratum.

A joint for bamboo or other fishing-rods, consisting essentially of an imperforate cap-ferrule, in combination with a correspondingly-shaped and imperforate socket-ferrule, substantially as and for the purposes set forth.



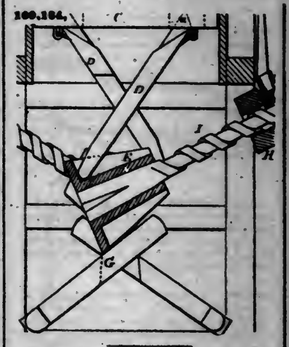
169,182. Windlasses. Joseph P. Manton, Providence, R. I. [Filed Oct. 26, 1874.]

Brief.—The windlass can be worked through bevel-gearing on it, by a pinion on the capstan-shaft, or by hand or steam power, through worm-gearing, the capstan-pinion then being loose.

The combination of the worm *a* and worm-gear *b*, substantially as herein described, as an auxiliary appliance to a windlass consisting of the barrel *c*, the wild-cat *d*, and brake *e*, driven by the bevel-gear *b* and pinion *h*, substantially as described.

169,183. Cotton-Presses. D. S. McBryde, Good Hope, Miss. [Filed Sept. 11, 1875.]

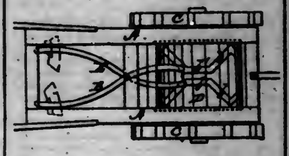
1. A cotton-press composed of longitudinal supporting-sills or frame, with braced guide-pieces and sliding follower-rods, operated by pivoted sectors and eccentric segments of a centrally-fulcrumed main lever, substantially in the manner and for the purpose set forth.



2. The combination of the swinging sectors, by chains or ropes, with the outer ends of the eccentric segments, for returning the followers on the backward motion of the operating-lever, as set forth.

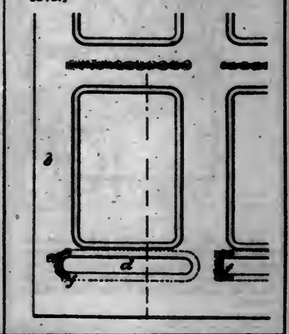
169,184. Cotton-Presses. Thomas G. W. McMeekin and William W. Hunt, Cedartown, Ga. [Filed July 17, 1875.]

Brief.—The recessed wedges, carrying the levers that lift the follower, travel up separate inclines, being operated by nuts provided with spokes.



1. The combination of the follower C, levers D D, recessed wedges E E, and inclined planes G G, substantially as and for the purpose set forth.

2. The combination, with the levers D, wedges E, and inclined planes G, of the screws I, cross-bars H, and nuts J, with spokes *k*, all substantially as and for the purpose set forth.



169,185. Cotton-Openers. Thomas G. W. McMeekin and Wm. W. Hunt, Cedartown, Ga. [Filed July 24, 1875.]

Brief.—A cylinder with two angular cam-grooves, which impart an intermittent motion to two crossed levers. The hose attached are drawn upon the row, except as thrown out at regular intervals.

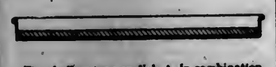
The combination of the cylinder D, having zigzag cam-grooves *h*, with straight parts *i* at the inner angles, and the pivoted levers E working in said cam-grooves, and having the hoe-blades attached to their rear ends, substantially as set forth.

169,186. Photograph-Albums. Charles D. Mosher, Chicago, Ill. [Filed Sept. 16, 1875.]

1. An album-leaf having one or more openings for photographs, and beneath each opening a long narrow opening, *d*, and a cut or slit, *e*, near the one end of each opening *d*, to receive a piece of card, *f*, substantially as and for the purposes set forth.

2. An album-leaf, composed of three or more pieces, the outer pieces *b c* made of thick card-board, provided with one or more openings for photographs, so that in use the pictures will be materially protected from injury.

3. An album-leaf, composed of two or more pieces, the outer pieces *b c*, having one or more openings for photographs, and beneath each opening a long beveled cut or slit, *g*, adapted to be closed up by paste, and practically concealed by means of an ornamental stamp over the same, substantially as and for the purposes set forth.

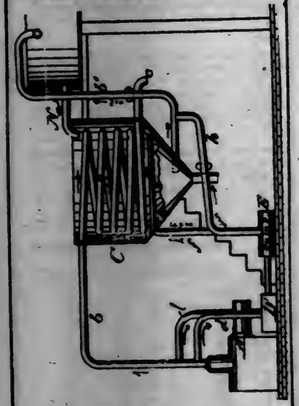


169,187. OILER. Stephen S. Newton, Binghamton, N. Y. [Filed Sept. 30, 1875.]

1. In lubricating-vessels, a compressible neck between the reservoir and the jet pipe or nozzle, substantially as specified.

2. The combination of a reservoir with the tube A, having openings B, and an elastic tube, C, substantially as described.

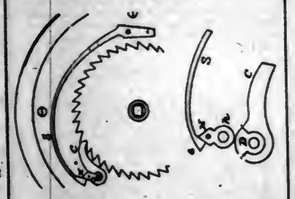
169,188. TRAYS FOR BEER-GLASSES, &c. J. Movinsky, Chicago, Ill., assignor of one-half his right to Mathias Swahla, same place. [Filed Apr. 24, 1875.]



The shallow tray or dish A, in combination with the removable absorbent mat B, arranged in the bottom of the tray, substantially as and for the purposes specified

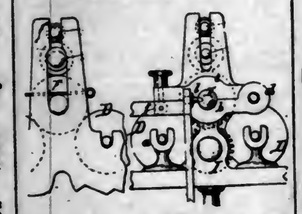
---

169,189. APPARATUS FOR REDUCING CRUDE OIL. Wm. C. Parker, Franklin, Pa. [Filed Sept. 11, 1875.]



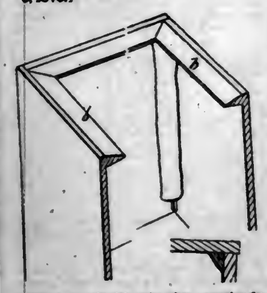
Brief.—The steam heats crude oil by coil in receiver, also works pumps, which severally force air through that oil, and force the same oil up, and spray it into a higher tank, whence it returns to the receiver.

An apparatus for making lubricating-oil without distillation, consisting of the steam-generator A, air-pumps E E', coil B, and jet-pipe *f'* in receiver C, and pipes *h b' g* N and reservoir G, all combined substantially as described.



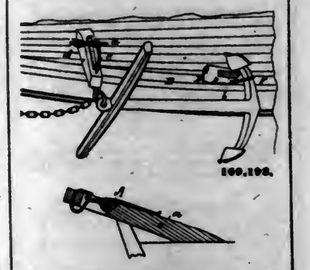
169,190. CLICKS FOR RATCHET-WHEELS. Edwin H. Perry, Lancaster, Pa. [Filed July 7, 1875.]

Brief.—On the pawl there is a recess formed by a circle around the pivot and the space between two radii. On this pivot, and within the recess, there loosely works, to press against one radius or the other, a stop-piece, pressure by a spring on one side or the other of which holds the pawl in or out of gear.



In combination with a click or pawl and ratchet-wheel as independent plate, h, provided with a projecting head, H, and pin for giving it a slight rotary motion on the pivot that holds the pawl C, so as to shift the beard of the spring S from one side of said head H to the other, arranged as shown, for the purpose specified.

169,191. BEARINGS FOR DISTRIBUTING-ROLLERS OF PRINTING-PRESSES. Charles Potter, Jr., and Jas. F. Hubbard, Plainfield, N. J. [Filed Feb. 23, 1875.]

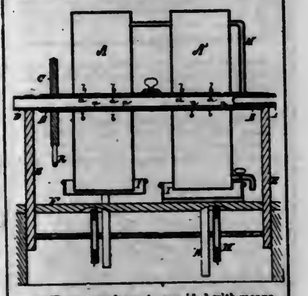


In combination with the inking-rolls D D and distributing-roll F, with one or more rolls mounted above and pressing upon the latter, the hinged housing or jaw *c d*, and its confining means *e*, serving both as a loose guide and support for the upper roller or rollers, and a firm and readily-releasable box for the journal of the distributing-roll F, substantially as herein specified.

169,192. SOLDERING PROCESSES. Milo A. Richardson, Bridgeport, Conn. [Filed Mar. 6, 1876.]

The process of uniting zinc plates, previously treated with an acid, by means of a strip or film of solder placed in the joint of the said plates, and melted by pouring melted zinc upon it, substantially as specified.

169,193. ANCHOR-TRIPPERS. E. Robbins, Cotuit Port, Mass. [Filed Sept. 21, 1875.]



1. The fluke-supporter and tripper D, substantially as described, curved upward at its front, and provided with the ledge *b*, arranged on it as represented.

2. The looped rope C, lever A, and belaying-pin *c*, arranged with and applied to the cat-head, as described, each being for use with the fluke-supporter and tripper D, as set forth.

169,194. DRYING APPARATUS. J. S. Rogers, Gloucester, Mass. [Filed Oct. 5, 1875.]

Brief.—The drums are heated by steam admitted through the perforated pipes. The pans are alternately raised and lowered, for the purpose of immersing the surface of the drum in the substances to be dried, which is thereby deposited thereon in a thin stratum.

1. The rotary drum A, provided with means of heating it, as described, in combination with the liquor pan or reservoir I, arranged with such drum, to operate therewith as explained.

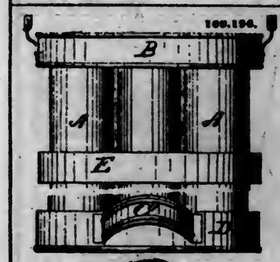
2. The rotary drum A, provided with mechanism for revolving it, and with pipes or means of heating it by steam, as described, in combination with the liquor-pan I, and its mechanism for successively moving it, as set forth, relatively to the drum, while the latter may be in revolution.

3. The pipes D E H G, having the perforations *a b c d*, as described, in combination, and arranged with the drum A, substantially as explained.

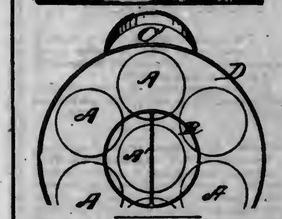
169,195. COLORED COPYING-PENCILS. Gustav Schwanhausser, Nuremburg, Bavaria. [Filed Apr. 5, 1875.]

Brief.—A colored pencil possessing some of the properties of copying-ink.

1. As a measure or vehicle for copying-pencils, the compound of nitrate of oxide of chromium and fine clay, united by a little gum, substantially as specified.

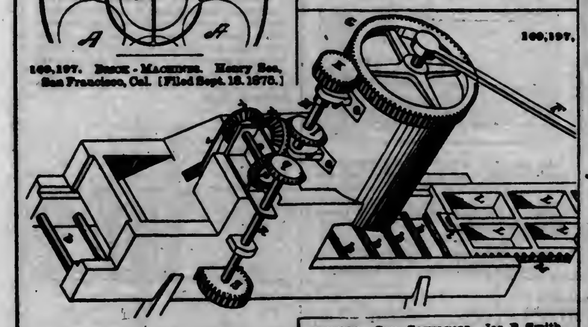


2. Copying-pencils, made of the compound of nitrate of oxide of chromium with a suitable vegetable coloring agent and fine clay, united by a little gum, substantially as described.



169,196. MILK-COOLERS. W. B. Scofield, Miery, N. Y. [Filed Feb. 8, 1875.]

1. The combination, with the tubular vessels A, of the strengthening-rings D E, substantially as specified.



2. The combination, with the vessels A and strengthening-rings D E, of the ring R and brace *r*, substantially as specified.

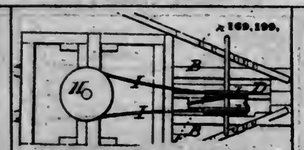
169,196.

169,197. BRICK-MACHINES. Henry See, San Francisco, Cal. [Filed Sept. 18, 1875.]

1. A brick-making machine consisting of the frame A, with its track *b b b*, box C, with its inclined partition or striker D, hinged pressing-plates T T', and peg-mill E, in combination with the trays or molds L, with their hooks *r*, eye-plates *t*, and racks M, when the same power which operates the peg-mill is employed to propel the trays or molds through the machine and operate the presser-plates, all combined and arranged to operate substantially as above described.

2. The trays or brick-molds L, having a hook, *r*, at one end, and an eye-plate, *t*, at their opposite end, so that they can be hooked together, each of said molds having the rack M secured to one side, in combination with a track, *b b b*, and horizontal spur-wheel S, substantially as and for the purpose described.

3. In combination with a brick-making machine having the peg-mill E mounted above it, so as to feed the mud or clay into a chamber of the machine, the hinged presser-plates T T', mounted and operated substantially as and for the purpose described.



169,198. TREATING QUICKSILVER ORE. J. P. Stevenicky, Altona, Prussia. [Filed Mar. 11, 1876.]

The process of extracting free sulphur from quicksilver-ores by subjecting the ore to a preliminary process, substantially as above described, viz., treating the crushed ore with bisulphide of carbon in a closed vessel at a temperature of about 130° Fahrenheit, for the purpose of removing the sulphur in a marketable condition, before heating the ore to vaporize the quicksilver.

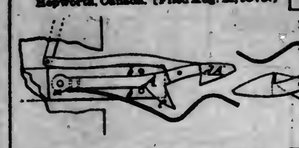
169,199. SEED AND GUANO DISTRIBUTORS. Alonzo H. Simms, Marburg, Ala. [Filed Aug. 21, 1876.]

Brief.—The tension of the opposing-rods regulated by pullers adjustable upon the handles.

169,199.

In a seed-distributer, the handles L L', having the perforated block V and the notched block V', in combination with the shaft K, having cylindrical spindle *e*, adapted to be received into block V, and anti-friction pulleys J J', substantially as specified.

169,200. HARNESS-BUCKLES. J. C. Smither, Nicholasville, Ky. [Filed May 22, 1876.]



A tongued harness-buckle, having upon the forward end of its frame A the tube *a'*, tapered to an edge at its upper end, and provided at the lower edge of outer part with recess *a²*, as and for the purpose specified.

169,197.

169,201. CAR-COUPLINGS. Jas. B. Smith, Hopworth, Canada. [Filed Aug. 21, 1876.]

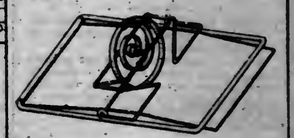
169,201.

An automatic car-coupling, composed of a laterally-swinging draw-bar, with hook end and side spur, a curved guard-spring, extending forward over the spur, and an uncoupling-lever mechanism, substantially in the manner and for the purpose set forth.

169,202. CAR-OPENERS. Robert Smith, Paterson, N. J., assignor to himself and Chas. Littlefield, same place. [Filed Sept. 27, 1875.]

Brief.—The pointed rod being thrust into the car, the rotating knife is guided and controlled by the disk at the end of the handle.

169,202.



The rolling knife *e*, confined to the handle by the ferrule *d*, in combination with gage *i* and pointed rod *f*, as and for the purpose set forth.

169,203. CAR-AXLE BOXES. John D. Start, Brooklyn, N. Y. [Filed Nov. 6, 1874.]

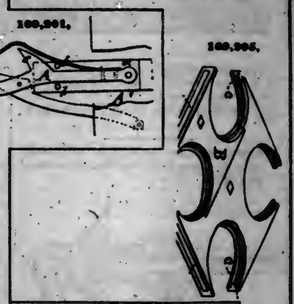
Brief.—Spiral spring (for lubricating wheel) mounted on frame that folds flat, for insertion and removal.

169,203.

1. A lubricating-wheel for axle-boxes, consisting of a flexible rim, in combination with a coiled spring and a hub, on which it is mounted, substantially as and for the purpose set forth.

2. The combination of the tilting standard, the wheel, and the base, on which it doubles down to be put into the box, substantially as and for the purpose set forth.

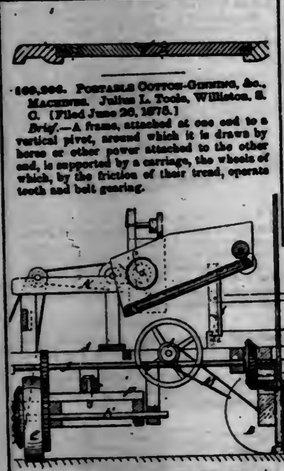
169,204. CUTTER-BITS. Anton Streit, Cincinnati, Ohio, assignor to J. A. Fay & Co., same place. [Filed July 7, 1876.]



Brief.—The bit is provided at one end with a straight cutting-edge, and with a tonguing or grooving edge upon the other.

A cutter-bit, plain at one end, with a straight cutting-edge for earthing, and grooved longitudinally on one side from the center to the other end, to form a matching-edge, either for grooving or tonguing, substantially as specified.

169,205. STOVES. Henry Hite Spurrier, Florence, Iowa. [Filed Oct. 1, 1876.]



169,205.

1. Reversible stove centers or cross-pieces, having both sides constructed alike, substantially as and for the purposes described.

2. The combination of the stove centers or cross-pieces B C, connected by a tongue-and-groove joint, substantially as described.

3. The bellowed bearing-edges of the stove centers or cross-pieces, substantially as described.

160,906. Portable Cotton-Ginning, &c., Machine. Julius L. Toole, Williston, S. C. [Filed June 26, 1875.]

Brief.—A frame, attached at one end to a vertical pivot, around which it is drawn by horse or other power attached to the other end, is supported by a carriage, the wheels of which, by the friction of their tread, operate teeth and belt gearing.

1. The portable power apparatus, comprising the truck A, wheels B, pivot l, tractive-wheels C D, and transmitting-gears, combined and arranged substantially as specified.

2. The portable cotton cleaning and pressing apparatus, comprising the power mechanism, gin, condenser, and the press, combined and arranged substantially as specified.

160,907. Chair-Molds. Heinrich Voits, Cincinnati, Ohio. [Filed June 12, 1875.]

Brief.—The lower sections of the mold are divided longitudinally, and can yield laterally and again assume their normal position, as a spring at one side permits the same.

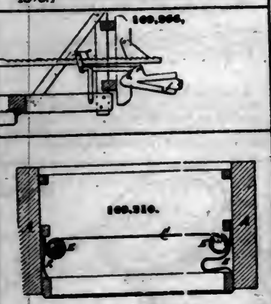
160,907. B E A

The combination, with flanged guide-frames A B, of the sliding grooved fish-molds C D, the former attached to strip b, and provided with spring E, as and for the purpose specified.

160,908. Socket-Couplings. Andrew S. Wolfleigh, San Francisco, Cal. [Filed Jan. 29, 1875.]

The perforated elastic disk A, constructed to form a cone-shaped packing in the chamber B when pressed up by the tube of a burner, substantially as and for the purpose specified.

160,909. Supports for Riding-Saddles. John C. Woodruff, New York, N. Y., assignor of one-fourth his right to D. Smith, same place. [Filed Sept. 28, 1875.]



160,909.

In combination with the arch of the continuous stirrup-iron hoop A, the detent-spring G, recess E, detent-notches or shoulder F, shank C, and swivelly-adjusted stirrup-leather loop D, as and for the purpose described.

160,910. Window-Screens. Henry E. Waldridge, Brooklyn, N. Y. [Filed Sept. 11, 1875.]

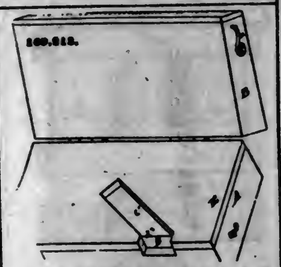
160,910.

An improved adjustable window-screen, formed by the combination of the wire-netting G, the rollers D, and the spring-hook clamps E with each other to adapt it to be applied to a window, substantially as herein shown and described.

160,911. Padlocks. Bodo Wallmann, San Francisco, Cal. [Filed Aug. 31, 1875.]

160,911.

1. The spiral spring S, connecting the dog D by its arm *c*, and pin *b* to the bolt B by the shank-pin *p*, arranged so as to actuate the bolt B longitudinally between the guides I, G, and *k*, fixed to the casing C, and to turn the dog D on the rest A, in the manner and for the purpose herein set forth.



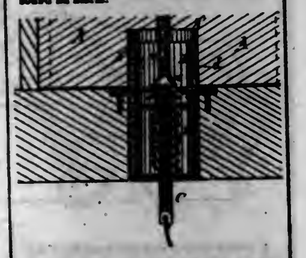
2. The spiral spring S and pivoted dog D, provided with stop *c*, arm *c*, and pin *b*, in combination with the bolt B, fitted within the guides I, G, and *k*, and provided with pin *p* and grooved curved flange *m* F, substantially as and for the purpose specified.

160,912. Compositions for Cement. Richard Warwick, Williamsburg, N. Y. [Filed Apr. 22, 1875.]

The composition of the herein-mentioned ingredients, to wit, lime, alum, borax, tartaric acid or cream-of-tartar, (ground,) or calcined gypsum, and suitable colors, as an article of commerce, substantially as described, for the herein-mentioned purposes set forth.

160,913. Dies for Upsetting the Irons of Plowshares and Blanks Therefor. William Medd Watson, Tonica, Ill. [Filed Oct. 13, 1875.]

Brief.—The die-plate, having a recess, is separable from the section A, so that die-plates having different-sized recesses may be employed for the kind of share intended to be produced.



160,913.

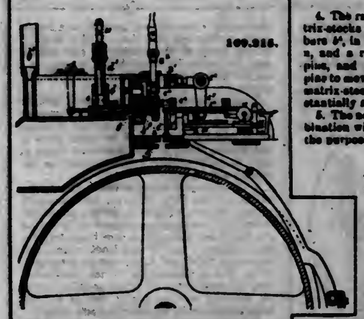
1. The separable plate E, having the die C D, in combination with the section A and hinged section B, substantially as described, and for the purpose set forth.

2. A pierceable blank, E', when constructed substantially as and for the purpose set forth.

160,914. Burglar-Alarms. J. A. Wood, Binghamton, N. Y. [Filed July 12, 1875.]

Brief.—When the sash is down the stud in the sill is depressed by the stud on the sash. When the sash is raised the stud in the sill, with which the alarm mechanism is connected by means of a wire, is thrust upward by means of a spring connected therewith, thus releasing the alarm mechanism, and allowing it to sound an alarm.

In a burglar-alarm, a sliding pin, C, arranged within a socket, in combination with a stud, *a*, attached to the sash, and which enters the socket surrounding the pin or sliding bar to depress said pin, substantially as set forth.



160,915. Type Casting and Setting Machine. Charles S. Westcott, Elizabeth, N. J., assignor to the Westcott's Type-Setting Company, New York, N. Y. [Filed Aug. 11, 1875.]

Brief.—By touching appropriate keys, one for each letter, a matrix-frame is shifted so that the matrix for a letter is thrown into the path of a matrix-carrier. The carrier lifts the matrix and carries it forward to complete the mold, adjusting the side of the mold at the same time, to give the letter a proper body. The bottom of the mold is closed by a shield on the end of the casting-nipple, and shield bearing a rib, which forms the bottom nick of the type. The force-pump throws a jet of hot metal into the mold, and a valve immediately closes the aperture, so that there is no sprue. The matrix is then withdrawn, and the type delivered to dressing-knives, finished, and set up.

1. The frame A, containing four spaces for the matrix-stocks *a*, and a central opening, *b*', through which the matrix-stock from the other frames is carried, in combination with each matrix-stocks and the reciprocating carrier, substantially as set forth.

2. The matrix-stock, provided with pins on its sides, in combination with the frame A, having notched sockets, in which the matrix-stock rests by said pins, and the matrix-carrier that lifts said stock and carries it forward and returns it by the reverse movement, substantially as set forth.

3. The carrier B, provided with inclines *b*' to lift the matrix-stock, in combination with the spring-catches *t*, substantially as set forth

160,916.

4. The range of frames *a*, carrying the matrix-stocks *c*, and sliding endwise between the bars *b*', in combination with the bars *l*, pins *n*, and a range of finger-keys moving each pins, and mechanism for acting upon each pins to move the frames and bring the selected matrix-stock into the path of the carrier, substantially as set forth.

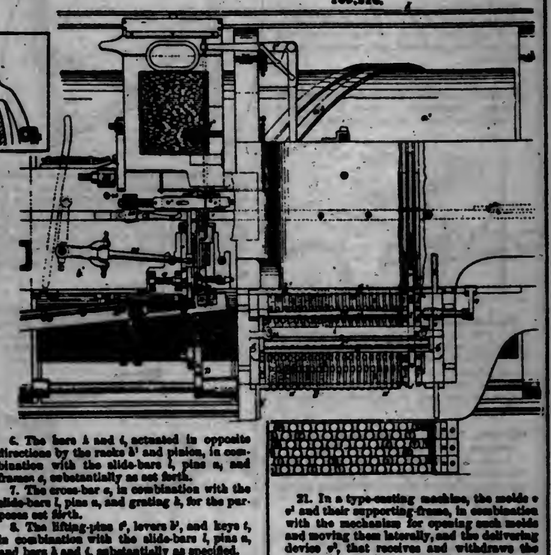
5. The notched stationary grating *k*, in combination with the slide-bars *l* and pins *n*, for the purposes set forth.

6. The casting-nipple *c*, made as a segment of a globe, taking a globular seam, *c*, upon the pot, in combination with the valve *b* that closes the hole in the nipple *c* after the type is cast, substantially as set forth.

8. The combination, in a type-casting machine, of the mold, yielding injecting plunger, nipple *m* the bottom of the type-mold itself, and a valve in the nipple, withdrawn by mechanism, so that when the valve is closed there is no sprue opening into the mold, and the metal, under a pressure, is projected directly into the matrix to form a perfect-faced type, substantially as set forth

9. In a type-casting machine, the combination of the mold with the nozzle or nipple, ribbed and having its jet orifice located as described, so as to cast a type with both ends complete, to avoid the channeling or nicking of the feet of the type heretofore necessary.

7. In a type-casting machine, a rib upon the nose or shield of the bath and grooves upon the back surfaces of the molds, to fit each rib, for the purposes set forth.



160,916. Type Casting and Setting Machine. Charles S. Westcott, Elizabeth, N. J., assignor to the Westcott's Type-Setting Company, New York, N. Y. [Filed Aug. 11, 1875.]

Brief.—The machine has a key and a matrix for each letter. On touching the proper keys, one of the frames, carrying matrices, is shifted into the path of the matrix-carrier. The key is locked as soon as it has moved far enough to start the frame, and all subsequent movement is automatic. No other key can move until the cylinder has made one revolution, which completes a type. If no key is touched, the machine casts and sets up a space for each revolution of the cylinder. As the matrix-frame is shifted, the matrix-carrier comes forward in its groove, takes a matrix, and carries it forward to complete the mold. A shifting plate in the mold is forced back by a projection on the side of the matrix, and the mold thus opened to the proper distance for casting a proper body for the letter presented. The mold, matrix, and injection nozzle are then firmly clamped, and a jet of metal thrown from the foot of the mold through it into the matrix, so that the face of the type is first cast. The matrix is then drawn sideways from the mold until it clears the letter, when it is taken back and hung up in its frame by the carrier. A hook then enters the mold, which opens for the purpose, and draws the type out, also forward, upon a way or track, along which it is propelled by a pusher between pieces, which draws it up, and it is finally deposited on a galley, also forward. A follower presses the letters sideways along the galley, and a ball on the end stop is struck by a tapped when the line is complete.

1. The matrix-stock *c* and matrix *f*, connected together by the screws *g*, which also form jaws for retaining the matrix and stock in the frame *a*, substantially as set forth.

3. The carrier B, having grippers *d*, sliding block *f*, and swinging block *h*, in combination with the pins and slots 6, 7, and 8, substantially as set forth.

4. The frame *a*, carrying the matrix-stocks *c*, and sliding in grooves between the bar *b*', in combination with the transversely-grooved bar *c*, and mechanism for raising and lowering the same, as set forth.

160,916.

6. The bars *h* and *i*, actuated in opposite directions by the racks *h*' and pinion, in combination with the slide-bars *l*, pins *n*, and frames *a*, substantially as set forth.

7. The cross-bar *o*, in combination with the slide-bars *l*, pins *n*, and grating *k*, for the purposes set forth.

8. The lifting-pins *f*', levers *b*', and keys *i*, in combination with the slide-bars *l*, pins *n*, and bars *h* and *i*, substantially as specified.

9. The claw *r*' and frame *r*, in combination with the range of finger-key levers *i*' and the slide-bar *l*, for the purposes and substantially as set forth.

10. The bar *s*' and lifter *s*', in combination with the range of finger-keys *i*', and mechanism actuated by such keys, substantially as set forth.

11. The bath of type-metal, provided with a casting-nipple, in combination with attaching supporting-screws, that are in line, or nearly so, with such nipple, so that the nipple is not displaced by expansion, substantially as set forth.

12. The segment of a globe at the back of the nipple 31, entering a similar recess at the end of the nose upon the bath, in combination with the device *s*', for holding the nipple to place, but allowing such nipple to accommodate itself to the type-molds, as set forth.

13. In combination with the bath of melted metal and the conduit 30, a plunger, *p*', actuated by yielding mechanism, and the valve and rod *t*', that are removable from the rear without disturbing any of the parts of the bath, substantially as set forth.

14. The mold-frame *o*', suspended from the centers 36, in combination with the removable plate *a* and the type-molds, substantially as set forth.

15. The two-part type-mold *o o*', in combination with the regulating-plate *o*', that is adjustable to vary the width of type, substantially as set forth.

16. The combination, with the molds *o o*' and regulating-plate, of the matrix-stock and a connection, 50, between the matrix-stock and the plate *o*', for varying the thickness of type according to the letter to be cast, as set forth.

17. The plunger 49 and lever 52, in combination with the molds *o o*', for pressing such molds together previous to casting, substantially as set forth.

18. The bar 44, hook 51, and means for actuating the same, substantially as specified, in combination with the mold and the matrix and its carrier, substantially as and for the purpose set forth.

19. The combination, with the molds *o o*' and regulating-plate *o*', of the delivery-hook *o*' and mechanism, substantially as specified, for giving the motions to the respective parts, as set forth.

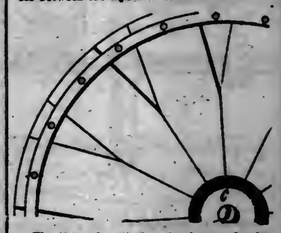
20. The combination, with the molds *o o*', of the regulating-plate *o*', and mechanism for moving said regulating-plate between the successive casting operations, for the purposes set forth.

160,916.

21. In a type-casting machine, the molds *o o*' and their supporting-frame, in combination with the mechanism for opening such molds and moving them laterally, and the delivering device *o*', that receives and withdraws the type, substantially as set forth.

22. The trough 57, spring and hook *o*', in combination with the type-molds and mechanism for moving the same, substantially as specified.

23. The grippers 58 and 59, constructed and operating substantially as set forth, in combination with the pusher 60, and cutters to dress the type, as set forth.



24. The cutters 63 64 65, applied to and combined with the movable block 66 and pusher 60, substantially as set forth.

25. The composing-table 77 and pusher 78, in combination with the trough 79 upon the slide 71, as set forth.

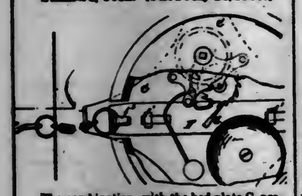
26. The bell 80, attached to the quad that moves with the types upon the composing-table, in combination with the adjustable tappets 81, as and for the purposes set forth.

160,917. Basket-Bottoms. Shepherd H. Wheeler, Peru, Ind. [Filed Sept. 9, 1875.]

Brief.—A basket-bottom having a center rib between the layers of staves.

The above-described basket-bottom, having the rib B at the center, between the layers of staves A A, and secured by means of the caps C C, rivet D, and hoops E E, substantially as and for the purposes herein before set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.

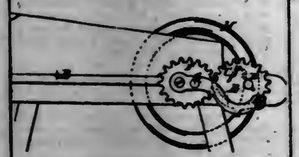


169,918. Composition for Artificial Stone. William H. Whittemore, Chelsea, Mass. [Filed Aug. 6, 1875.]

A composition for building purposes, &c., formed of alum, lime, gypsum, coke, and cement, substantially as described.

169,919. Compound for Removing Boiler-Incrustations. James M. Wishart, Boone, Iowa. [Filed Sept. 7, 1875.]

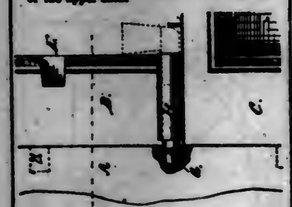
The described process, consisting, essentially, in the employment of chlorine, carbonate of magnesia, spirits of rock-salt, and vinegar, in connection with heat, substantially as described.



169,920. Combined Burglar-Alarm and Door-Fastening. James J. Woolsey, Stamford, Conn. [Filed July 24, 1875.]

The combination, with the bed-plate C, provided with studs *f' f'*, the alarm mechanism D, and chain-fastening E, of the sliding bar F, provided with oblong slots and rigid pawl G, all constructed to operate in the manner described, and to serve the double purpose of a door-fastener and a burglar-alarm, as set forth.

169,921. Feed-Cutter. Robert J. Wylie, Marion, Ill. [Filed Mar. 29, 1875.]



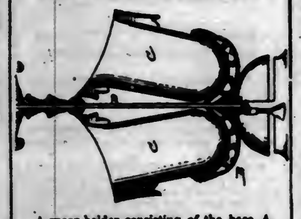
Brief.—By means of the two eccentric gear-wheels an increased power is applied to the rotary knife at the time of its coming in contact with the straw or hay.

The combination, in a feed-cutter, of the two eccentric gear-wheels E F with each other, and with the shaft D, that carries the knife C, the shaft G, that carries the fly-wheel H, and the crank I, substantially as herein shown and described.

169,922. Sash-Fastener. Chas. L. Alexander, Washington, D. C. [Filed Sept. 28 1875.]

Brief.—A bolt secured upon meeting-rail of lower sash locks into a series of holes in the jamb, while the head of the bolt, made at right angles to it, locks into mortises in the frame of the upper sash.

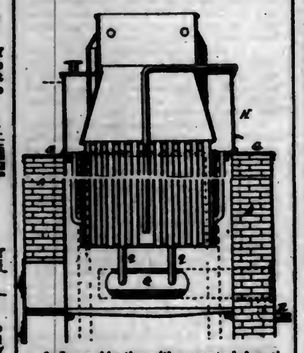
The above-described bolt D, attached to the lower sash C by means of the plate F and bolt-nuts H, and working into the series of holes G in the window-frame A, while the head of the bolt locks into the series of notches E in the upper sash, substantially in the manner and for the purposes set forth.



169,923. Sugar Cooling and Draining Apparatus. Jno. G. Angel, New Orleans, La. [Filed Apr. 17, 1875.]

Brief.—An oblong trough-shaped box is provided with circular ends, to which, exteriorly, are attached gudgeons, which are fastened to standards, thus making the apparatus easy to revolve. The bottom of the box is partly covered by a perforated shield, beneath which is situated a perforated draining-tube.

An improved sugar cooling and draining apparatus, composed of a dumping box or receptacle, with converging sides, laterally inclined bottom, and perforated inclined guard-plate, and of a perforated draining-tube at the lowermost corner of the box, and passing to the outside of the same, to be operated substantially in the manner and for the purpose specified.



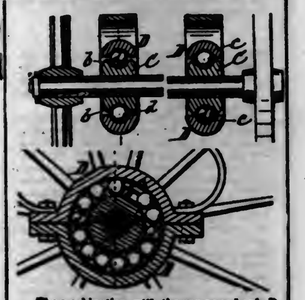
169,924. Spoon-Holders. S. Wm. Babbitt and Henry B. Beach, West Meriden, Conn., assignors to the Wilcox Silver-Plate Company, same place. [Filed Aug. 6, 1875.]

A spoon-holder consisting of the base A, supporting the bracket B, to which are attached the receptacles or cups C, united at their tops with the handle of the utensil, substantially as described.

169,925. Tubular Boilers. Isaac Burton, Williamsport, Pa. [Filed Apr. 19, 1875.]

Brief.—A plate is located upon a brick casing, upon which the boiler is suspended within the combustion-chamber. Iron columns are located within the brick-work, by which the brick casing may be removed without disturbing the setting of the boiler.

1. In combination with a suspended vertical tubular boiler, composed of two cylinders having the same axis, the lower pierced by tubes for the passage of the heated gases, and the upper, of larger diameter, containing the combustion chamber, and serving as a steam-drum, a blow-out pipe leading from near the bottom above or of the boiler-pot, and pierced near the water-line with holes, to serve as a surface-blow, substantially as described and shown.

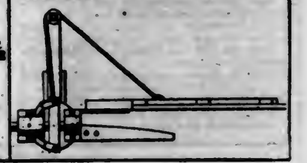


2. In combination with a vertical tubular boiler, two flues, Q, placed below it on each side of the fire-place, and connected with the water-space in said boiler by small pipes q, and further provided with hand-hole plates *f'*, pipe R, and valves *r r*, substantially as described and shown.

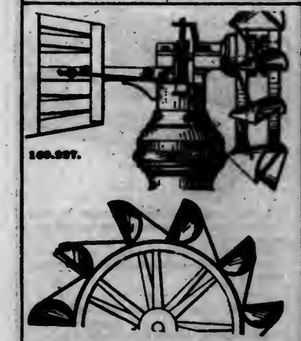
3. In a vertical tubular boiler, the combination of two flues, Q Q, set into the brick casing, one on each side below the pot of the boiler, and connected to said pot by the pipes *q q*, said flues having one end projecting beyond the outer part of said brick casing, and connected by a pipe, R, the pipe R being provided with a connection, *r'*, for connecting with the feed-water pipe, and suitable valves for shutting off the supply to one or both flues, substantially as described and shown.

4. In a vertical tubular boiler, the combination of the following elements, viz: a tubular brick casing, a tubular boiler wholly contained, and suspended within the same, a grate below said boiler, and between the bottom of the same and the bottom of the tubular casing, a drum resting upon the top of said casing, and a free, open space between the sides of the boiler, and the inner wall of the casing, substantially as described and shown.

5. A vertical tubular boiler, suspended by its upper part H on a plate, G, said plate resting upon a series of iron columns, which extend down through, and are entirely isolated in, a cylindrical brick casing A, so that said brick casing may be taken down without disturbing the position of the boiler on said plate G, substantially as described and shown.



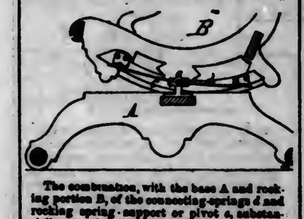
169,926. Vehicle-Axles. George Beck, Charlotte, N. Y. [Filed July 9, 1875.]



The combination, with the compound axle B B', of the collars O O' and bands D D', formed with grooves *b b*, which are concentric to each other and deepest at the bottom to receive the balls *d d*, and of larger diameter in cross-section than the balls, the whole arranged so that the balls receive friction at the top of the axle, thereby preventing crowding and grinding of the balls in the grooves, as herein shown and described.

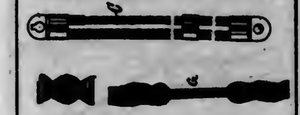
169,927. Wind-Wheels. Abner J. Beckley, Battle Creek, Mich., assignor to Walter Gregory and Braxton H. Gregory, same place. [Filed Sept. 2, 1875.]

Brief.—The wheel is constructed with two hubs, two fellies, and two sets of spokes, in combination with stationary buckets or sails, which are concave-convex in form and shape. The shaft upon which the wheel is secured lies in a horizontal position, and has bearings in the frame.



169,927.

1. A wind-wheel constructed substantially as herein set forth, having two hubs, two fellies, and two sets of spokes, in combination with the stationary air buckets or sails, as is herein fully set forth, and for the purpose specified.



2. A series of sails or buckets made stationary upon a wind-wheel, said sails or buckets being concave-convex in form, and in shape the one-half of a hollow cone, as is herein fully set forth.

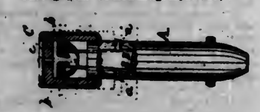
169,928. Rocking-Chairs. Albert Best, Buffalo, N. Y. [Filed Sept. 2, 1875.]

The combination, with the base A and rocking portion B, of the connecting-springs *d* and rocking spring-support or pivot *e*, substantially as and for the purpose hereinbefore set forth.

169,929. Gaiters. Gilbert H. Mahaday and Julius Wright, Bristol, Conn. [Filed Feb. 11, 1875.]

1. The combination, in a garter, of a spring wound in oval shape, and twisted by its recoil in torturous form, and a covering braided over said spring, all substantially as set forth.

2. The combination of the springs C and braided connections or end pieces G with a braid covering, which conforms to the size of said spring and end pieces, substantially as described, and for the purposes set forth.



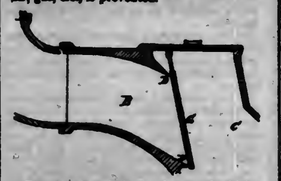
169,930. Drying-Kilns. David Bunnell, St. Joseph, Mich. [Filed Mar. 29, 1875.]

Brief.—The exhaust-pipes near the bottom extend into the drying-room.

The drying-chamber C, having the induction-tubes B B, introduced at a point above midway of its height, and provided at the bottom with the exhaust-pipes E E, in communication with the fan F, as and for the purposes hereinbefore set forth.

169,931. Seal-Locks. Alonzo T. Rose, Chicago, Ill. [Filed Aug. 11, 1875.]

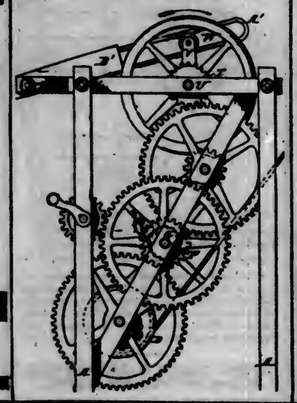
1. The combination of a hollow bolt, having double spring-arms B B, provided with tumblers *b b* and catches *a a*, and cap C, provided with key-hole, substantially as and for the purpose set forth.



2. The combination of a hollow bolt, having double spring-arms, provided with tumblers *b b* and catches *a a*, cap C, and socket D, substantially as and for the purposes set forth.

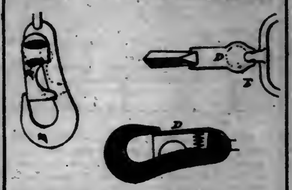
3. The combination of a seal-holder with a hollow bolt, A, having a locking mechanism on the inside, and socket D, for securing the seal-holder, substantially as and for the purpose set forth.

4. The key F, provided with shoulders *f f*, in combination with slot *c* of cap C of the bolt A, substantially as set forth.



169,932. Dry Steam-Trap. John H. Bouchen, New York, N. Y. [Filed Sept. 9, 1875.]

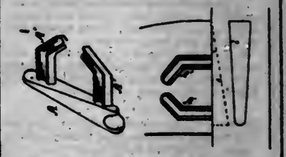
Brief.—The supply-chamber of the trap is formed with a knife-edged seat for a gravitating-valve swung in bearings formed in the discharge-chamber, whereby the escape of foul air, gas, &c., is prevented.



The chambers B C, the former of which is constructed with an inclined knife-edge valve-seat, D, projecting into the latter, in combination with the valve G hung in the chamber C, and adapted to set against said valve-seat, substantially as described.

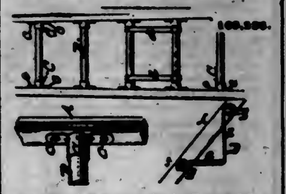
169,933. Motive Power. Enoch Brothell and James Lindsey, Evansburg, assignors to G. B. Slater and J. N. Dunham, of Freedom, and Amos Palmer, Pine Grove, Pa. [Filed Oct. 6, 1875.]

169,934. Snap-Hooks. Charles B. Bristol, New Haven, Conn. [Filed Aug. 9, 1875.]



1. In a snap-hook, the tongue D constructed in ℸ-form in transverse section, its rear end pivoted to the shank, its forward end beneath the point of the hook, and the two sides at the said forward end extending down to overlap, and form a support against, each side of the body of the hook, combined with a spring within the said tongue, substantially as described.

2. In a snap-hook, the tongue D constructed in ℸ-form in transverse section and provided with the internal projections *a*, and the shank of the hook with corresponding depressions, the said projections closed into the said depressions to form the pivot for the hook, and combined with a spring within the tongue, substantially as specified.

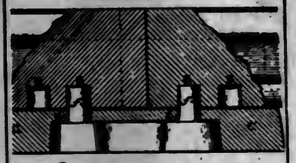


3. In a snap-hook, the tongue D constructed in ℸ-form in transverse section, its rear end pivoted to the shank, and constructed with the spring-chamber E to receive and retain the spring, substantially as set forth.

169,935. Bedstead-Fastener. Stephen D. Butler, Chicago, Ill. [Filed Sept. 20, 1874.]

The herein-described bedstead-fastener, consisting of the locking-head A, provided with the projecting flanges A', the whole being cast solid in one piece, and constructed to operate substantially as and for the purpose set forth.

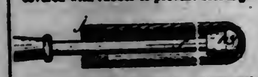
169,936. Ladders. Wheeler Case and Jas. H. Read, Jr., Utica, N. Y. [Filed July 20, 1875.]



Brief.—The rounds are secured in iron sockets provided with flanges, by which they are secured to the side pieces or stiles, thus obviating the boring of holes in said stiles, which tends to weaken them. A movable step, composed of L-irons, is provided with hooks for engaging the rounds.

1. The rounds A A, secured to the sockets C C, having the flanges *c c* fastened to the sides or stiles B B, substantially as shown and described, and for the purpose set forth.

2. The ladder-step, as constructed and adapted for use, consisting of the L-shaped bars *d d*, having the hooks *f f* and foot-rest or board *e*, substantially as and for the purpose set forth.



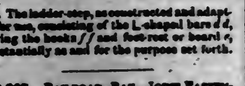
169,837. RAILROAD-RAIL-JOINT FASTENING. Libbeus Oldham, Woonsocket, R. I., assignor of one-third his right to Heath Arnold, same place. [Filed July 21, 1875.]

The combination of the rails provided with holes *b* at each end, chair C with side supports C', constructed and fitting to the sides of the rails, said chair being recessed in its under side, and the coupling-link F, for holding the rails in place, substantially as and for the purpose set forth.

169,839. SYRINGES. Wm. P. Clotworthy, Baltimore, Md. [Filed Oct. 8, 1875.]

Brief.—The glass barrel and piston-rod are covered with rubber to prevent breakage.

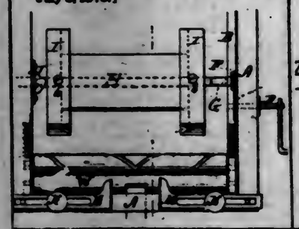
1. The combination, with a glass syringe-barrel, of a rubber jacket therefor, having an end conforming to the shape of the barrel end and openings therein coincident with the barrel-openings, substantially as and for the purpose herein set forth.



2. In combination with the barrel and piston-rod of a syringe, the rubber tube or covering *f* for said piston-rod, substantially as and for the purpose herein set forth.

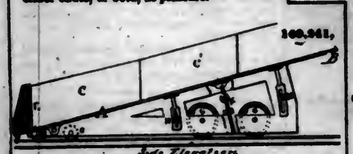
3. In combination with the barrel and piston-rod of a syringe, the solid-rubber piston *g*, having tapering sides and the packing-base line, as and for the purpose specified.

4. In combination with the piston-rod *e*, covered with a rubber tube, *f*, and the syringe-barrel *a*, the rubber cap, in the manner and for the purpose herein set forth.



5. The rubber cap of a syringe-barrel, having the interior hollow neck *i* and the flange *j*, whereby it is adapted as a packing-cap for different-sized barrels, as described.

169,840. RAILROAD-RAIL JOINTS. George E. Doring, Lockleys, near Welwyn, England. [Filed Oct. 8, 1874.]



The improved joint for double headed and flanged rails, as described, consisting of a clip embracing the lower heads or flanges of the rails at their ends, and of fish-plates bearing at top against the lower part of the heads of the rails and at bottom upon the clip.

169,842. CLOTH-WINDING MACHINES. S. C. Dickinson, Washington, D. C. [Filed July 6, 1876.]

169,843. SNOW-PLOWS. John Doman, Bay City, Mich. [Filed Apr. 12, 1876.]

Brief.—Vertically adjusted by screw and slot, and pin-guide. Snow discharged through either chute, or both, at pleasure.

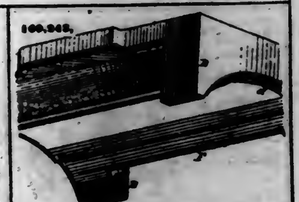
Side Elevation.

1. The inclined plane A, with sides C C, in combination with the slotted guides H H and lifting-screws K K, as and for the purposes set forth.

2. In a snow-plow, the combination of the inclined plane A, diverging rear-discharging chutes B B, guards C C *c' c'*, and shifting-tongue D, substantially as and for the purpose set forth.

3. In a snow-plow, the combination of an inclined plane, A, diverging chutes B B, hinged vertically reversible tongue D, and inner guards *c' c'*, whereby the tongue may be put out of the way for discharging the snow from both chutes, substantially as set forth.

4. In a snow-plow, the combination of an inclined plane, A, diverging chutes B B, and tongue D, hinged for both lateral and vertical movement, to close either chute or open both, substantially as and for the purpose set forth.

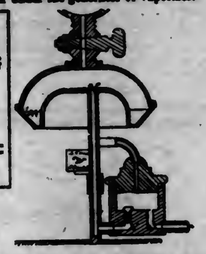


5. The combination of tongue D, double hinge-joint *a b*, and swiveling-leg *c*, as and for the purpose set forth.

169,844. WASHING-MACHINES. Fleiseman A. Downer, Canton, assignor to Lewis Cornell and Enos Shannon, Chicago, Ill. [Filed Oct. 6, 1875.]

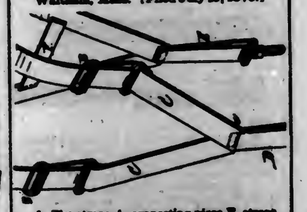
The catch *g*, bent right-angularly, and attached to the hinged frame *a b*, in combination with the plate *f*, having lugs *f'* and recess *e*, whereby both vertical and lateral displacement of the roller-frame is prevented, substantially as described.

169,845. JOURNAL BOXES. Peter Dupuy, St. Louis, Mo. [Filed Aug. 18, 1875.]



1. The journal-box having recess E, with inclined sides F, substantially as and for the purpose set forth.

2. The downwardly-projecting corner B, in combination with inclined sides E, substantially as set forth.

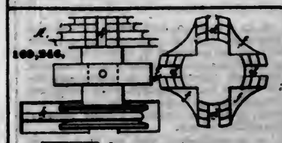


169,846. APPARATUS FOR PRODUCING CARBURETTED LIGHT. Nathan H. Edgerton, Philadelphia, Pa. [Filed Apr. 29, 1875.]

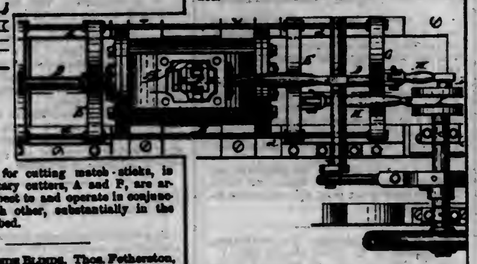
Brief.—Oil passing slowly from the reservoir into the heated generator is vaporized and conducted to the mixing-chamber, where it is mingled with oxygen, and passes to the burner under the generator or vaporizer.

In an apparatus for producing an oxhydrocarbon light from the resultant vapors of hydrocarbon fluids mixed with oxygen and barned in contact with calcium, the combination, with the fluid-reservoir, vaporizing chamber or retort, oxyhydrocarbon-mixing chamber, and illuminating and vaporizing burner, of a tube for the supply of pure oxygen, a stop-cock to regulate the supply of hydrocarbon vapor, and a lime-cap, substantially as described and shown.

169,848. SUSPENDERS. Stephen K. Ellis, Waltham, Mass. [Filed July 19, 1875.]



1. The straps A, connecting-piece F, straps D, E, and C, constructed and arranged substantially as shown, for the purpose set forth.

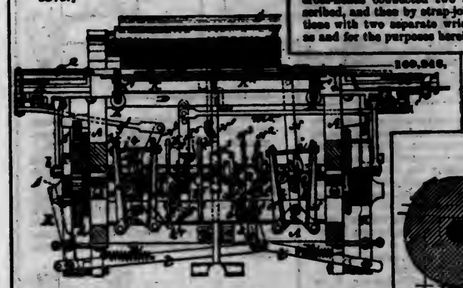


2. In combination with the subject-matter of the above, a pin or other fastening device, for the purpose described.

169,849. MACHINES FOR CUTTING MATCH-STICKS. John S. Fegley, Philadelphia, Pa., assignor to himself and Ephraim K. Smith, same place. [Filed Mar. 20, 1873.]

Brief.—A number of round or nearly round match-sticks can be simultaneously cut from a block of wood by means of two conical grooved cutters rotating in planes at right angles to each other. The rows of match-sticks are severed from the block by passing the block over the cutters, when the rounded edges of the first cutter penetrate the wood in one direction, while those of the second cutter form a series of transverse cuts, crossing the first at right angles.

169,846.



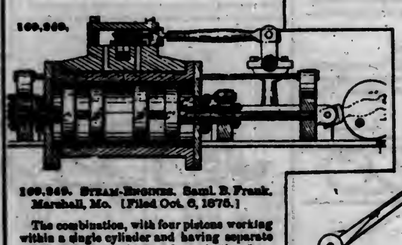
A machine for cutting match-sticks, in which two rotary cutters, A and F, are arranged in respect to and operate in conjunction with each other, substantially in the manner described.

169,847. INSIDE BLINDS. Thos. Fotherston, Fitzroy Township, County of Carleton, Canada, assignor to Arthur A. Spoor, same place. [Filed Sept. 25, 1874.]

The combination of the slats A, staples C, having eyes at their ends to engage with the eyes of the buttons D, extending through the center of the slat and laid parallel therewith, and staples *c*, all as herein set forth and specified.

169,848. SWIVEL-SHUTTLE LOOMS. Joseph Fish, New York, N. Y. [Filed July 13, 1875.]

1. The combination, with the rack I, for driving the supplementary shuttles, of the cam M on the loom-shaft, and an interposed lever, N, connected with the rack, substantially as shown, and adapted to be controlled by the jacquard-machine, or other pattern-controlling device or mechanism, substantially as described.



2. The stirrup Q and bell-crank P, adapted to be controlled by the jacquard-machine or other pattern devices, in combination with the lever N' and cam M', for operating the bar or slide K, essentially as described.

3. The combination, with the movable stop pieces or levers E E on the shuttle-operating cranks S S and crank-pins *s s*, of the cams M' M' and the operating levers P' P', adapted to be controlled by the jacquard-machine or other pattern device, essentially as described.

4. The combination, with the slide or bar K, which carries the supplementary shuttles, of the cam M' on the loom-shaft, an interposed lever, P', adapted to be controlled by the pattern mechanism and a suitable connecting device, all operating to move the slide longitudinally for the purpose of producing the skip or mock motion, substantially as specified.

5. The combination, with the rack I, by which the swivel or supplementary shuttles are driven, of the slide K, the lifter *o'*, the cam M', the interposed lever N', adapted to be controlled by the jacquard-machine or pattern mechanism, and suitable connecting devices, essentially as described, and whereby the rack is disengaged when the skip or mock motion is being made, substantially as specified.

169,849. STEAM-ENGINES. Saml. B. Frank, Marshall, Mo. [Filed Oct. 6, 1875.]

The combination, with four pistons working within a single cylinder and having separate and independent piston-rods projecting from opposite ends of the cylinder, of the four cross-heads connected two and two, as described, and then by strap-joints and connections with two separate wrists, substantially as and for the purposes herein set forth.

169,850.

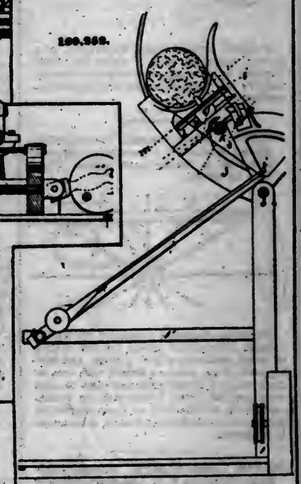
1. The combination, with the rack I, for driving the supplementary shuttles, of the cam M on the loom-shaft, and an interposed lever, N, connected with the rack, substantially as shown, and adapted to be controlled by the jacquard-machine, or other pattern-controlling device or mechanism, substantially as described.

2. The stirrup Q and bell-crank P, adapted to be controlled by the jacquard-machine or other pattern devices, in combination with the lever N' and cam M', for operating the bar or slide K, essentially as described.

3. The combination, with the movable stop pieces or levers E E on the shuttle-operating cranks S S and crank-pins *s s*, of the cams M' M' and the operating levers P' P', adapted to be controlled by the jacquard-machine or other pattern device, essentially as described.

4. The combination, with the slide or bar K, which carries the supplementary shuttles, of the cam M' on the loom-shaft, an interposed lever, P', adapted to be controlled by the pattern mechanism and a suitable connecting device, all operating to move the slide longitudinally for the purpose of producing the skip or mock motion, substantially as specified.

169,851. GRAIN-BINDERS. Joshua Gerrard, Cincinnati, Ohio. [Filed Aug. 7, 1875.]

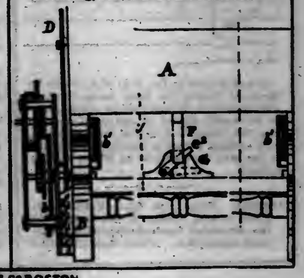


A twister constructed with radial arms, and with a prominence converging at the point or end, rigidly connected, and projecting beyond the plane of said radial arms.

169,852. GRAIN-BINDERS. Joshua Gerrard, Cincinnati, Ohio. [Filed Sept. 11, 1875.]

Brief.—The twister, which has a projecting point beyond the face of the twisting-arms, is located in a revolving cradle.

1. The combination of a sleeve, *h*, and a twister, constructed and operating substantially as herein set forth, to hold the loose ends of the wire bound by snubbing them while the twister is in operation, and to permit their free escape when the twist is completed.



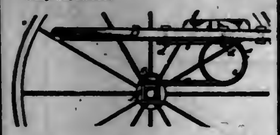
169,852.

2. The combination of the former H, the carrying-arms J Z, the sleeve *h*, the arms *l*, the twister-arms *m*, and the spindle *i*, in conjunction, substantially as herein described, to press the bundle into approximately cylindrical shape, and then release it while the wire is drawn tightly about it, and locked by twisting, as set forth.

3. In combination with a cradle or grain-support, which leaves the bundle free to round itself during the twisting of the wire, a twister having a fixed relation to said cradle, and constructed substantially as set forth, with a prominence projecting beyond the plane of the twisting-arms, and through the cradle or surface on which the grain rests.

169,853. CRADLES. Ebenezer F. Gannon, Pittsburg, Pa. [Filed June 24, 1875.]

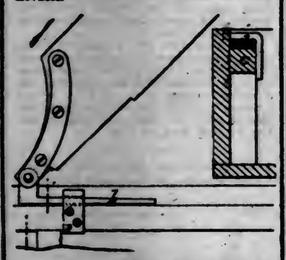
1. The combination of lever D, pivoted on the shaft *c*, and having slot *c'* in the upper part and slot *d* in the lower part of the lever, and pin *c'* on the end of the cradle A, adjusted on the frame B, and plane wheel E, having pin *d'*, attached to the check-cords O, substantially as and for the purposes described.



2. The brace F, attached to the cradle A, and having notches *e'*, in combination with block G and pivoted stops *f'*, substantially as and for the purposes described.

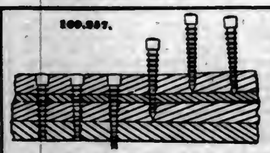
169,864. Vehicle-Springs. Sebastian Gilsinger, Rondout, N. Y., assignor to himself and Abel A. Crosby, same place. [Filed Sept. 17, 1875.]

A coiled vehicle-spring constructed of a piece of metal, the ends of which are joined together by welding or otherwise, substantially in the manner and for the purpose described.



169,865. Vehicle-Springs. Sebastian Gilsinger, Rondout, N. Y., assignor to himself and Abel A. Crosby, same place. [Filed July 12, 1875.]

The herein-described compound spring for vehicles, composed of a piece, bar, rod, or strip of metal, bent into a U or V shape, and having each of its arms *a a* formed with two or more coils, *c c*, in line with, and close to, each other, and the ends *b b* bent back for attachment to the vehicle-body or body-support, in combination with the clips *d* and *e*, substantially as shown.

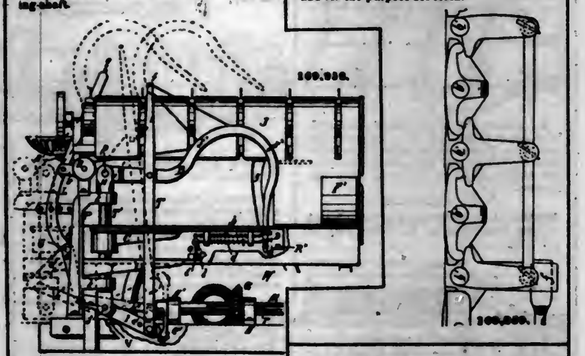


169,866. Carriage-Seats. Sebastian Gilsinger, Rondout, N. Y., assignor to himself and Abel A. Crosby, same place. [Filed Sept. 6, 1875.]

Brief.—Seat provided with hinges, whose lower leaves are held by staples and easily removable.

A seat secured to the body of a vehicle by means of hinges, the lower leaves of which are confined to the seat-rails by staples, so as to be readily slipped to and out of said staples, the hinges and staples being combined with recesses formed in the edges of the plates of the seat, substantially as shown and described.

169,867. Nails for Sole-Fastenings. Louis Goddu, Boston, Mass., assignor to the American Cable-Sewer-Wire Company, same place. [Filed Sept. 20, 1875.]



1. A shoe-nail consisting of a cylindrical head, conical shank, and a series of horizontal parallel grooves or corrugations, extending from the base of the head to the point of the nail.

2. In a boot or shoe nail, the combination of a cylindrical head, having a spherical surface, a conical shank, terminating at a point in line with the center of the head, and horizontal parallel grooves or corrugations, with a clinching-point of indefinite length symmetrical with the conical body.

3. In a boot or shoe nail, the grooves or corrugations, diminishing in depth and width from the head to the point of a cylindrical tapering body.

169,868. Grain-Binders. Jas. F. Gordon, Rochester, N. Y. [Filed May 15, 1875.]

Brief.—The cut grain is delivered by the elevator to the receiver, where it is bound by the vertical reciprocating binding-arm, which also has a lateral axial motion on its supporting-shaft.

1. The vertically-reciprocating binder-arm B, hinged to a vertical axial shaft, T, or its equivalent, in combination with a movable twisting mechanism, substantially as shown and described, whereby the arm is given a horizontal oscillation laterally across the grain, in combination with its vertical reciprocation, for the purposes set forth.

2. In combination with the vertical axial shaft T, or its equivalent, binder-arm B, and twisting mechanism, having a reciprocating motion, the oscillating arm I, substantially as and for the purposes described.

3. In combination with a binder-arm, B, reciprocating binding mechanism, shaft T, or its equivalent, and arm I, the connecting-rod T and crank C, or its equivalent, substantially as and for the purposes described.

4. In combination with the reciprocating binder-arm B and vertical axial shaft T, the swinging arm C, substantially as shown and described.

5. In combination with the stationary shield or sheathing, the sliding or extensible shield E of the movable binding mechanism, substantially as and for the purposes described.

6. In combination with the movable seat and movable binding mechanism, the rock-shaft U, hand-lever L, and arm C, substantially as and for the purposes described.

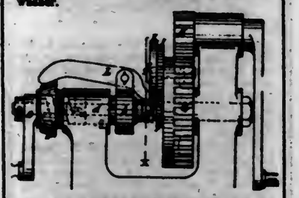
7. The combination, in a grain binding and harvesting machine, of a movable binding mechanism and a movable driver's seat, or equivalent, connected in such manner that their simultaneous adjustment in opposite directions is effected, substantially as and for the purpose described.

8. In combination with the traversing roller *i*, operating the wire-clamping jaw or jaws, the stationary track *i*, provided with the pivoted switch tongue or tongues, substantially as shown and described.

9. In combination with the main frame of a harvesting-machine, a driver's seat, movable forward and backward in relation to the axis of said frame, and a hand-lever connected with said seat, substantially as shown and described, so that the driver, while occupying the seat, can shift the same by means of the lever, as may be required, without affecting the cutting devices.

10. In combination with the fixed box F and fixed driving-gear G, the movable binding mechanism, having its driving-shaft M arranged to slide through the gear G, as shown and described.

11. The connecting-rod or pitman T, extended beyond the point at which it is pivoted to the binding-arm, for the purpose of forming a take-up for the wire.



12. In combination with the moving binding devices, the detent F' at the outer corner of the shield or sheathing, substantially as shown and described, for the purpose of detaining the butts of the grain.

169,869. Furnace-Grates. H. W. Granger, Detroit, Mich. [Filed June 29, 1875.]

In a sectional oscillating furnace-grate, substantially as described, the carrying and intermediate grate-sections, the latter provided with the bearing-jacks, and the former with the carriers and arms, all of which are connected by a single bar, substantially as shown, and for the purpose set forth.

169,870. Machines for Making Spring-Washers. John William Grover, Westminster, England. [Filed Sept. 7, 1875.]

Brief.—A bar of steel, cut with beveled ends, is clamped between two sleeves, which form on a mandrel a spiral groove, and is forced into said spiral groove by a roller, which, in addition to rotating on its own axis, is revolved around the mandrel. The sleeves are separated and the mandrel drawn into one of them, when it is desired to release the washer.

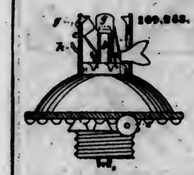
In apparatus for manufacturing the spring-washers A, the combination of the two helical faces *a* and *c*, the sliding mandrel M and its lever L, acted on by the adjustable cone D, with the revolving disk K, whereby a piece of straight steel rod is clamped and bent into the form of the spring-washer, substantially as herein described.

169,871. Manufacture of Castings from Wrought and Cast Iron. Wm. Holmsworth, Pittsburg, Pa., assignor to the Pittsburg Steel-Casting Company, same place. [Filed Sept. 20, 1875.]

The process of making homogeneous refined castings from wrought and cast iron, by first mixing and melting wrought and cast iron in about the proportions specified; second, running the molten mixture off into pigs; third, breaking up and remelting the pigs; and, fourth, running the remelted product off into molds, substantially as set forth.

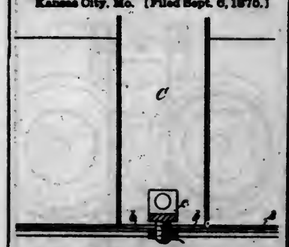
169,872. Ratchet-Drills. Geo. Hayden, Newark, N. J. [Filed Apr. 6, 1875.]

Brief.—An outer slotted sleeve, carrying a center-pin, with its conical end (which fits in a correspondingly-shaped recess in the top of the feeding-sleeve) downward, is arranged so that it will remain stationary, and thereby obviate the necessity of stopping the drill when the feed is being adjusted



In a ratchet-drill, the outer slotted sleeve A, the stationary inverted center-pin B, the pin *c*, the adjusting thumb-screw *b*, the set-screw *c*, and the annular groove *c*, all constructed and arranged to operate substantially as and for the purposes herein set forth and shown

---

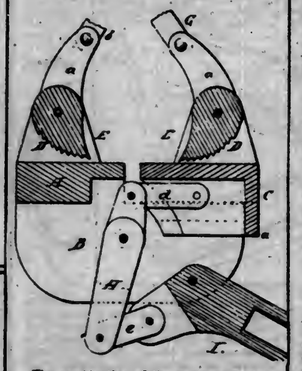


169,873. Automatic Lamp-Extinguishers. John G. Hehr, South Bend, Ind., assignor of one-half his right to J. G. Rilling, same place. [Filed Oct. 21, 1875.]

Brief.—When the lamp is tipped in two directions, the weight of the extinguishers causes them to act in the other direction; they are actuated by the weights.

In a lamp-extinguisher, the pivoted or swinging hoods *g*, in combination with the horizontally-swinging levers *h*, carrying weights *i*, the same operating independently of the hoods, substantially as and for the purpose specified.

169,874. Cake-Pans. Franklin G. High, Kansas City, Mo. [Filed Sept. 6, 1875.]

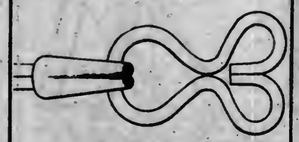


1. An improved cake-pan, in which the body part A, bottom B, and center column C are made detachable, as and for the purpose set forth.

2. The center column C, combined with the bottom B by means of the fastenings *c c' b b'*, as and for the purpose set forth.

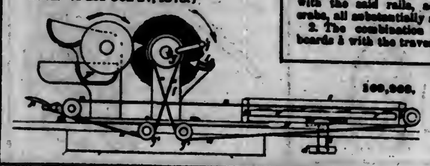
3. The body A, having flange *a*, the bottom B, its cross-bar *b'*, and the center column C, having screw *c*, all combined as herein shown and described, and for the purpose set forth.

169,875. Tire-Upsetting Machines. W. Holdsworth, Chester, Pa. [Filed Sept. 16 1875.]



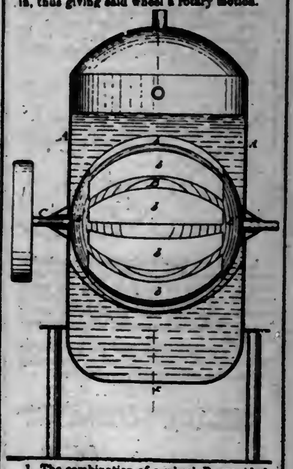
The combination of the stationary bed A, movable bed C, provided with standards E E, the pivoted cams D D, having arms *a a*, lever G, and connecting-bar *b*, and the elbow-lever I, lever H, and connecting-bars *d e*, all constructed substantially as and for the purposes set forth.

169,876. Railroad-Rail Joints. William H. Horsum, New York, N. Y. [Filed Oct. 4, 1875.]



The flat supporting-plate B, provided with a transverse depression, *c*, in combination with rails A A, having raised rims *b*, with recesses *c*, and with U-shaped jaws C C, the lower branches of which are bifurcated and made to straddle the depression in the supporting-plate, while their upper branches lie in the recesses *c c* of the rims *b*, substantially as and for the purpose shown and described.

169,877. Hooks and Eyes for Wearing Apparel. Joseph O. Howells, New York, N. Y. [Filed Nov. 22, 1873.]



A hook or an eye formed of wire, having its portions in close proximity or contact at the neck, and from thence to form loops bulging outward, and returned upon themselves, so as to bring the ends within the circumference of the body, substantially as described.

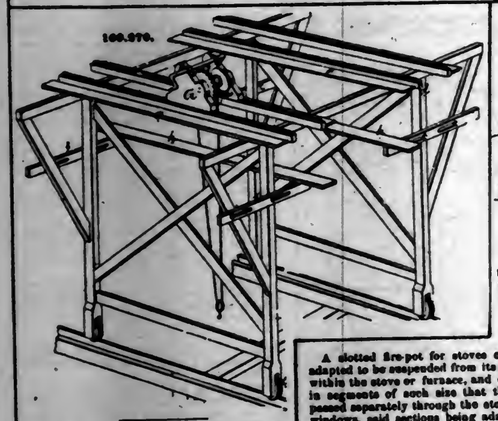
169,878. Mechanisms for Ornamenting Buttons. Robert E. Isbell, New Milford, Conn. [Filed Oct. 27, 1875.]

169,879. Rotary Steam-Engines. James C. Johnson, Boston, Mass. [Filed Oct. 12, 1875.]

Brief.—Steam is generated at the bottom of the boiler, and is deflected by a partition into the buckets of a spherical wheel placed therein, thus giving said wheel a rotary motion.

1. The combination of a wheel, B, provided with buckets *b b*, with the boiler A, arranged substantially as and for the purpose specified.

2. The combination of a spherical wheel, B, having deep concave buckets *b b* and segmental ends *b' b'*, with the boiler A, constructed and arranged substantially as shown and described.



3. The combination of *b* partition, G, with the wheel B and boiler A, when arranged substantially as and for the purpose set forth.

169,880. Traversing Scaffolds. Daniel B. Kelly, Philadelphia, Pa., assignor to Clarke, Reeves & Co., same place. [Filed Oct. 2, 1874.]

1. The within-described traversing scaffold, consisting of frames arranged and braced as described, so that there shall be a clear space between them for the truss-frames of a bridge, in combination with wheels adapted to rails on the false work, and with tracks parallel with the said rails, adapted to traversing cranes, all substantially as set forth.

2. The combination of adjustable foot-boards *h* with the traversing scaffold.

169,270.

169,271. Manufacture of Button-Gaiters. Arthur Kenny, New York, N. Y., assignor of one-half his right to W. H. Miller and J. B. Miller, same place. [Filed Oct. 16, 1875.]

1. As a new article of manufacture, the improved gaiter, having both quarters, vamp, and button-flap in one piece, and the upper part of button-flap and the button-piece of separate pieces, attached to the lower part of the button-flap and quarters, substantially as specified.

2. The pattern for a button-gaiter having both quarters, vamp, and part of button-flap in one piece, substantially as described.

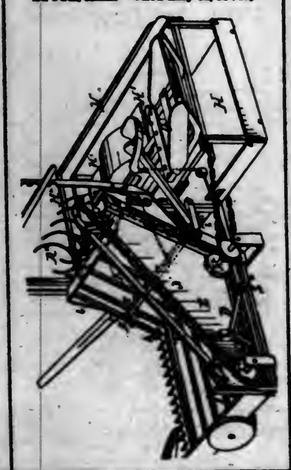
169,272. Carriage-Wheels. Ira Kenter, Wayland, N. Y. [Filed May 24, 1875.]

The combination, with a wooden hub C, and two sets of bracing spokes, B B', of the ring or rings D, shrunk upon the hub, and provided with two sets of screw-holes for the connection of the screw ends of the spokes, the wheels arranged as herein described, and operating in the manner and for the purpose specified.

169,273. Stoves and Furnaces. Philip Klotz, Baltimore, Md., assignor to B. C. Bibb, same place. [Filed Aug. 11, 1875.]

A slotted fire-pot for stoves or furnaces, adapted to be suspended from its upper edge within the stove or furnace, and constructed in segments of such size that they can be passed separately through the stove doors or windows, said sections being adapted to be set and fastened together when inside the stove, substantially as described, for the purposes specified.

169,274. Railroad-Switches. William L. Lamborn, Harrisburg, Pa., assignor to J. S. Williams, Riverton, N. J. [Filed Sept. 9, 1875.]



Brief.—Three rails are arranged upon one plate, which shifts at both ends, and is returned to place by springs. The use of frogs is thus done away with, and the main track is always closed.

1. An unpivoted switch-rail, sliding at both ends, and alternately moved by the action of the wheels and springs, substantially as set forth.

2. The three adjustable rails F, G, and F, in combination with the springs H and plate E, for the purpose of keeping the main track complete and temporarily swinging the rails to complete the side track, substantially as set forth.

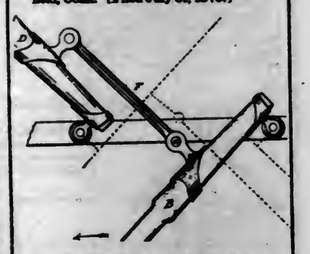
169,275. Harvesters. C. W. Loveless, St. Paul, Minn. [Filed May 31, 1875.]

1. The folding and tilting grain receptacle and clamp A", operating to receive the grain from the elevator, and to compress the gavel and discharge the bound bundle, substantially as described.

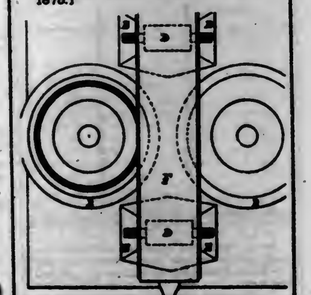
2. The folding and pivoted grain receptacle and clamp connected with and actuated by the elevating rake or mechanism, substantially as described, whereby the movement of said receptacle and clamp, for receiving, clamping, and discharging the grain, are controlled by and timed to the movements of the rake, as set forth.

3. The triangular guard or fender B, arranged in the described relation to the platform and elevator, and operating as a rear guard or fender thereto, while at the same time protecting the endless rake-chain, as described.

169,275.

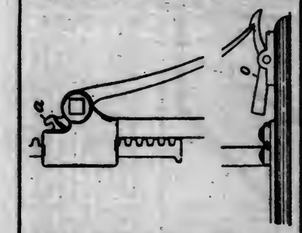


169,276. Feather Dusters. J. L. Little, Muncie, Ind. [Filed Jan. 16, 1875.]



As a new article of manufacture, a brush made of feathers, whose stems have been crushed for the purpose of rendering them elastic.

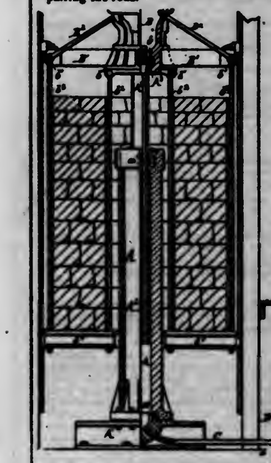
169,277. Oars. William Lyman, Middlefield, Conn. [Filed July 31, 1875.]



The combination of the two parts B D, the part B hung to the gunwale by a ball-joint at its outer end, the part D hung to the gunwale by a ball-joint at its inner end, and the connecting-rod F jointed to the part B inside the gunwale, and to the part D outside the gunwale, all substantially as specified.

169,278. Machines for Ornamenting Cushioned and Similar Articles. C. M. Lyon, Newark, N. J. [Filed June 19, 1875.]

The apparatus for ornamenting cushions and other circular-shaped articles, consisting essentially of the rotating ring-bearing or holders B, rollers D, and tool F, all constructed and arranged to operate substantially as described, for the purpose set forth.



169,279. Carriage-Jacks. Z. McDonald, Washington, D. C. [Filed Oct. 16, 1875.]

In the carriage-jack consisting of the standard A, sliding rack D, and lever L, the weighted catch c, arranged to operate as shown and described.

169,280. Hydraulic Compressors. Edwd. D. Meier, St. Louis, Mo. [Filed Apr. 19, 1875.]

Brief.—A press actuated by an accumulator. The plunger-head of the latter is secured to a crown-piece, from which the weight is suspended by a lock-ring and key, in such a manner that, when the weight is down and at rest, the plunger can be removed for any purpose up through the crown-piece. The washers and collars on the press-rods are rounded on the sides that bear upon the foundation and strain plate, that a little lateral play may be allowed to the parts without bending or impairing the rods.

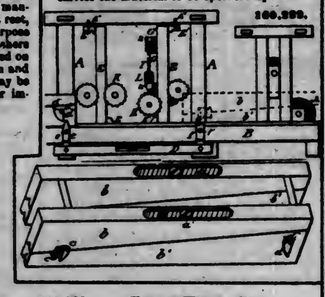
1. The combination of the accumulator, constructed as shown and described, pipe C, having check-valve C', pipe c, its three-valve D, branch pipes d d', and runs E E' of a hydraulic press, the pipe c being further connected by a T-joint, c', to a pipe, c², having enhanced-valve H, and the pipes b b' leading to tank I, all said parts being arranged with relation to each other, and to operate in the manner and for the purpose set forth.

2. The combination of the crown-piece B, plunger A', having enlarged head A², the locking l, all constructed as described and shown, so that the plunger can be removed without raising the weights hanging to it, then forcing the removal of the packing a'.

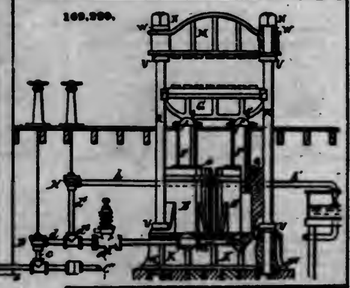
3. The improved features, viz., elastic rods B B', rounded collars U, and washers W, top and bottom plates M K, follower G, having bearings g g', plungers F F', having bearings ff', in combination with runs or cylinders E E', as herein shown and described, to operate as and for the purpose set forth.

169,281. Billiard and other Table Legs. Anton J. Michel, St. Louis, Mo. [Filed June 8, 1875.]

Brief.—The leg is in two portions, connected by a central core, upon the upper end of which is a screw traveling in a fixed nut. The core, being smooth, does not catch dust upon separation of the parts, as the (concealed) screw-threads would if exposed.



The combination, with a table-leg made in two parts, B B', bored out as described, of the nut a, concealed within the part B, and the bolt consisting of the cylindrical part C and screw d, also concealed within the part B, substantially as and for the purposes herein set forth.



169,282. Sawing-Machines. N. M. Miller, Evansville, Ind. [Filed Sept. 9, 1875.]

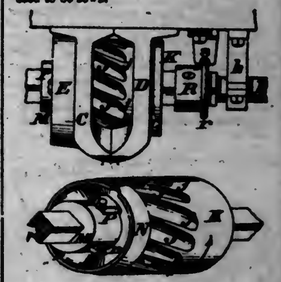
Brief.—The saws are arranged in sets or pairs in two horizontally-sliding frames, which are automatically moved back and brought forward by the reciprocating carriage, which carries the material to be operated upon.

169,282.

169,283.

1. The improved carriage herein described, consisting of two parts, having wedge-shaped slides b b', that slide upon each other, and so covered to each other by set-screws a', affixed to the under part b', and projecting up through slots a in the upper part b, substantially as and for the purpose herein before set forth.

2. The combination of the carriage C, having laterally-projecting hooks or catches e d, with the levers e and f and connecting-beam D, substantially as and for the purpose herein before set forth.



3. The combination of the beam D, branched lever D', pins e, and saw-frames E E', substantially as and for the purpose herein before set forth.

4. The combination of the grooved uprights E with the sliding plates G, having bolts or set-screws h, substantially as and for the purpose herein before set forth.

5. The combination of the sets of saws K K and K' K', having adjustable arbors I, with the sliding frames E E', lever D', beam D, levers e f, and carriage C, all arranged and operating substantially in the manner and for the purpose herein before set forth.

169,283. Feeding Mechanism for Grain-Drills. Edmond Morgan, Dublin, Ind., assignor to himself and Wayne Agricultural Company, same place. [Filed May 25, 1874.]

Brief.—The cylindrical feed wheel is spirally grooved for one-half its length, the other half being smooth. The whole is keyed to a shaft for lateral adjustment, to vary the amount of seed to be sown.

1. The cylindrical feed wheel having one-half spirally grooved, as and for the purpose set forth.

2. The feed-wheel or wallower J, constructed with a smooth periphery, K, and spiral corrugations J, in combination with the shaft H, flange r, clutch s, adjusting-lever S, and clamp U V, as and for the purposes specified.

3. The combination of the hub M, disk N n, pin O, legs P P, and shaft H, as specified, for the purpose set forth.

169,284. Faucets. Wm. C. North, Cleveland, Ohio. [Filed July 13, 1875.]

Brief.—The pump is applied to the faucet by means of a detachable coupling having an adjustable valve located therein.

The valve-chamber E, valve-seat C', constructed with cheeks a a, and india-rubber band b, fastened as described, in combination with tube D and air-pump F, all as and for the purpose described.

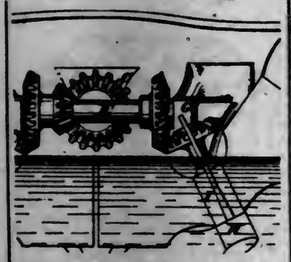
169,284.

169,285.

169,285. Clasps for Wearing Apparel. Enoch Osgood, Boston, Mass. [Filed Oct. 2, 1875.]

1. A clasp consisting of a body made with one or more faces and edges slightly tapered or wedge-shaped, with a slide adapted thereto to give the gripe when adjusted, and which will open when drawn back, substantially as and for the purposes herein set forth.

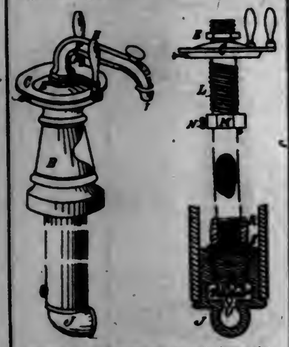
2. A clasp consisting of a body-plate made double, with each end tapering or wedge-shaped on one or more faces and edges, in combination with two slides, adapted to open when pushed back, one slide having an opening through it sufficient to permit the passage of a strap or an elastic when open, substantially as herein set forth.



160,906. Ice-Nails for Horseshoes. E. M. Patterson, Monterey, Va. [Filed May 31, 1875.]

Brief.—The nail is driven in between the shoe and hoof, and then bent so as to bring the calk on the under side of the shoe. The pointed end is then passed through the slot in the head and clinched.

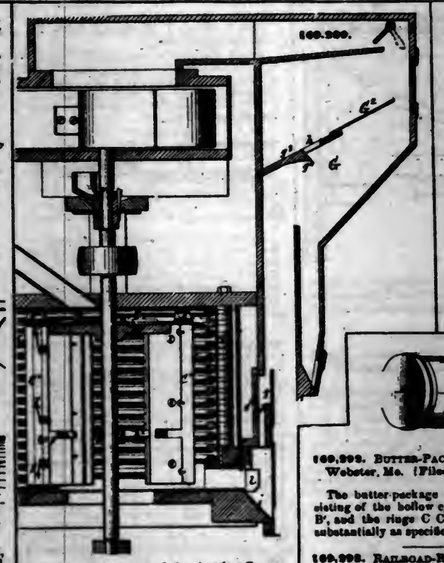
The within-described ice-nail, consisting of the head or calk A, perforated ear B, and strap C, substantially as and for the purposes herein set forth.



160,907. Propeller-Wheels. Newton A. Patterson, Johnson, Tenn. [Filed Apr. 23, 1875.]

The twin-paddle propeller herein described, consisting of two wheels, with blades mounted obliquely on oblique shafts, converging upward, so as to adapt the wheels to operate in conjunction at the stern or stem of the vessel, as herein set forth.

160,908. Hydrants. Joel D. Pease and Robert Campbell, Oxbow, N. Y. [Filed May 17, 1875.]

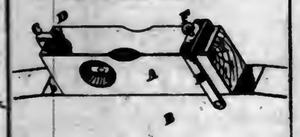


Brief.—The torsion of the spring turns the pipe and screws the plug-valve to its seat. The nozzle plays between two guide-pins at the top of the hydrant.

The improved hydrant described, consisting of the pipe P, provided with the nozzle F, spring I, and collet M, the hollow plug-valve S, provided with the openings Y, the plug J, provided with the conduit U and chamber *s*, and the casing A, body B, and cap C, provided with the stops H H, constructed and arranged to operate substantially as and for the purpose specified.

160,909. Shut-Machines. Dan Pease, Floyd, N. Y. [Filed June 11, 1875.]

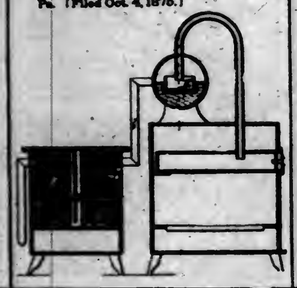
Brief.—Elastic wings or fans are attached to edges of buttons to yield in striking the grain. The suction-chamber is provided with screen of wire-cloth, inclined boards, and opening, to prevent the chaff from being carried up by the blast.



160,909.

1. In a coal-gas apparatus, a dry-scrubber, O, divided into compartments, filled with rye-straw cut in bunches and set on end, substantially as herein set forth.

2. The combination of the chamber G, provided with a slot or opening, *h*, the screen G^2, and the inclined boards g' g', substantially as and for the purpose shown and described.



3. The combination, with the spreader and separator-flue, of the suction-flue F^2, substantially as and for the purpose shown and described.

160,910. Connecting Spirit-Levels and Straight-Edges. Jas. G. Ralph, Aurora, Ill. [Filed Aug. 21, 1875.]

In combination with the spirit-level A and straight-edge B, the stud C, strap E, and set-screws D and F, substantially as and for the purpose specified.

160,911. Portable and Stationary Gas Apparatus. Robt. H. Ramsey, Pottsville, Pa. [Filed Oct. 4, 1875.]

160,912. Butter-Packages. A. Robinson, Webster, Mo. [Filed Aug. 16, 1875.]

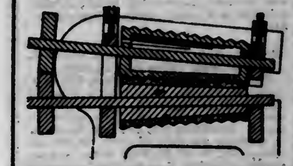
The butter-package herein described, consisting of the hollow cylinder A, the caps B B', and the rings C C', combined and used substantially as specified.

160,913. Railroad-Rail Joints. William H. Robinson, Yates City, Ill. [Filed Oct. 4, 1875.]

The base-plate D, provided with raised projections A and center piece B, in combination with the rails G G, having notches *s s*, the fish-bars C C, and bolt *b*, all substantially as and for the purposes herein set forth.

160,914. Manufacture of Artificial Marble. Wm. Charles Arthur Rootsaer, Brussels, Belgium. [Filed Mar. 4, 1875.]

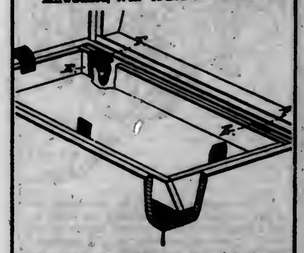
1. The improvement in the art of manufacturing artificial marble hereinbefore set forth, which consists in preparing powder from blocks of Iceland spar or calc-spar, or their equivalents, by burning them in kilns, cooling them, placing them in a bath composed of soluble silicates, sulphates, or acids, drying them in the air, reburning, and reducing them to powder.



2. The improvement in the art of manufacturing artificial marble hereinbefore set forth, which consists in mixing the prepared powder with water to the consistency of cream, adding the colors in a moist state, spreading the compound on a suitable surface, covering the mixture with a cloth, applying cement or other absorbent material to take up the moisture from the compound to dry the composition, and then removing the cloth and absorbent material to make room for the subsequent application of the backing material.

3. The improvement in the art of manufacturing artificial marble, hereinbefore set forth, which consists in mixing the prepared powder with water to the consistency of cream, adding the colors in a moist state, spreading the compound on a suitable surface, covering the mixture with a cloth, applying cement or other absorbent material to take up the moisture from the compound to dry the composition, then removing the cloth and absorbent material, applying a backing of coarser cement, strengthened by a layer of canvas saturated in a solution of a silicate or sulphate to preserve it from rot and prevent it from shrinking.

4. The improvement in the art of manufacturing artificial marble, hereinbefore set forth, which consists in preparing the object in the manner described, filling any holes in its surface with the same mixture of powder and colors, drying it thoroughly, polishing with stone, and rubbing with oil.



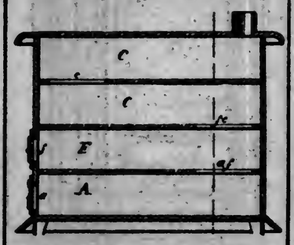
5. The improvement in the art of manufacturing artificial stone, hereinbefore set forth, which consists in cleansing the surface, polished as hereinbefore described, by treating it with hydrochloride-acid, drying the surface and polishing it with a mixture consisting of silicate of soda or potash, olive oil and soft water put on a soft rag, and rubbed in with tin ashes or emery powder.

160,915. Embossing-Machines. Samuel Rogerson, New York, N. Y., assignor to Louis Dryfoos, same place. [Filed Sept. 4, 1875.]

The described combination for the production of imitation quilting of the two conical embossing-rolls, the one an engraved metal roll, arranged to be heated, the other having an exterior of paper, or its equivalent for the purpose, impressed with the reverse of the pattern on the metallic roll, the two being constructed, supported, adjustably held together, and arranged to be revolved positively in unison, as and for the purposes herein shown and set forth.

160,916. Trunks. Anthony V. Romadka, Milwaukee, Wis. [Filed Oct. 21, 1875.]

In combination with a trunk and its inner tray the socket-headed legs F and ear-loops H, when constructed and arranged substantially as herein described, and for the purpose set forth.



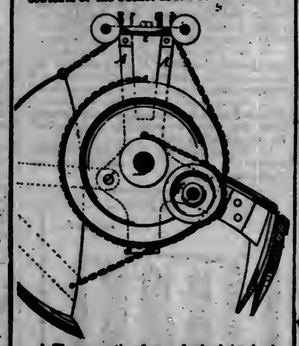
160,917. Wooden Boxes. Christian Boeborg and Anton Kawan, New York, N. Y. [Filed Aug. 28, 1875.]

Brief.—The sides and bottom of the box are formed of two or more layers of veneers glued together, the outer layers being of rose or similar wood, while the inner are of white or any other cheap wood. The top is of concave-convex form, and made from a solid block of rose or other expensive wood.

The combination, in a wooden box, of the sides b and the bottom c, each composed of two or more layers of veneers, having their ends beveled, as at *e*, with the solid top *d*, having an inner concave and an outer convex surface, all constructed and united together substantially as herein shown and described.

160,918. Heating-Stoves. Wm. F. Rose, Davenport, Iowa. [Filed Aug. 21, 1875.]

1. The fuel-chamber F, having a bottom imperforate except at the rear opening *e f*, leading to the ash-pit, and a draft-damper above the same, substantially as and for the purposes set forth.



2. The combination of the fuel-chamber F, having aperture *e f* at its rear, with the ash-pit A beneath, whereby a heated air-draft can be led upon the products of combustion escaping from said fire-chamber upwardly from its open rear, substantially as and for the purposes set forth.

3. The combination, with the sliding doors *f f*, C C, of the fuel-chamber F and register-doors *a a'*, chamber A, and openings *e f*, substantially as and for the purposes set forth.

4. In combination with the close fuel-chamber F, having imperforate bottom, and having an escape and discharge opening at its rear, as described, and the door *f f'* in front; the opening *e f*, and ash-chamber A, having registered doors *a a'*, substantially as and for the purposes set forth.

160,919. Dredging-Buckets. Charles J. Sands, Brooklyn, N. Y., assignee of one-half his right to John B. Wood, same place. [Filed Sept. 22, 1875.]

Brief.—The bucket is in one piece, and closes by chains and pulleys against a toothed anchor rigidly attached to the bucket-frame. The anchor has an apron to prevent spilling the contents of the bucket as it closes.

1. The supporting-frame of a dredging-bucket, constructed to anchor or hold said frame to the ground, substantially in the manner and for the purpose described.

2. The combination of a dredging-bucket with a holding or anchoring device removed to the supporting-frame, substantially in the manner and for the purpose described.

3. In a dredging-bucket, the holding or anchoring device thereof, constructed with a series of projecting teeth, substantially as and for the purpose described.

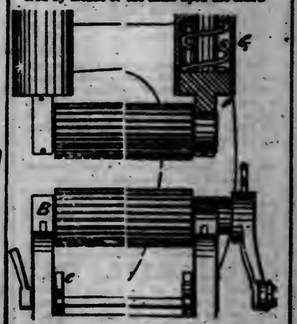
4. In a dredging-bucket, the combination of a central pulley-wheel with two or more pulley-wheels affixed to the arms of the anchoring device, substantially as shown and described.

5. In a dredging-bucket, the combination of an anchoring device with an apron, substantially as and for the purpose described.

6. A dredging-bucket constructed of a single undivided receptacle, with closed and unadjustable bottom, and mounted to a supporting-frame by, and turning on, pivotal bolts, substantially in the manner and for the purpose described.

160,920. Ventilating Buildings. Le Roy Satterlee, Rochester, N. Y. [Filed June 17, 1875.]

Brief.—On the windward side the journaled valves are closed, while the impulse of the air in the apartment opens those to the leeward, thus acting automatically. The trunk extends nearly to the bottom of the room, facilitating the removal of carbonic-acid gas.

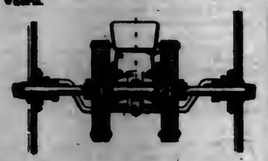


1. In a building or other structure requiring ventilation, two or more outwardly-opening and self-closing valves, *g g*, made close fitting to their seats, to prevent the entrance of cold air to the room, and hung by journals or bearings to be opened automatically by the pressure or impulse of the air within the room, to allow the discharge of said air outward, as herein shown and described, and for the purpose specified.

2. In a building or other structure requiring ventilation, the trunk C, extending to near the bottom of the room, and constructed with the plate *d* and self-acting valve *g*, for the purpose of conveying off and discharging the vitiated air from the bottom of the room, as herein shown and described.

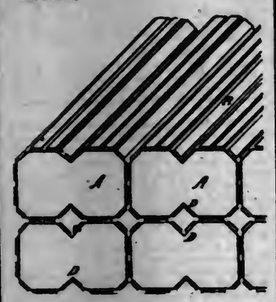
3. In a building or other structure requiring ventilation, one or more self-closing ventilators, *g*, set in the attic or upper story, and one or more tubes, G, extending from the attic or upper story downward into or through the rooms below, and having apertures communicating with said rooms, whereby the vitiated air will be drawn upward through said tube or tubes and be discharged through the ventilators, the whole combined and arranged to operate as described.

160,921. Fluting-Machines. C. Schneider, Newark, N. J. [Filed Mar. 13, 1875.]



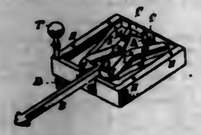
Brief.—The lower roller is raised and lowered by means of the cams upon the shaft.

A fluting-machine consisting of the fluted roller A, pinion or bearings B, cams C, upper fluted roller F, arms F, having the shafts *a*, and notched arms G, provided with the springs *s*, the several parts being constructed, combined, and arranged to operate substantially as and for the purpose set forth.



160,802. Velocipede. F. S. Seagrove, Detroit, Mich. [Filed Apr. 27, 1875.]

Brief.—Movement of feet, in depressing pedals, winds springs which actuate driving-wheels.

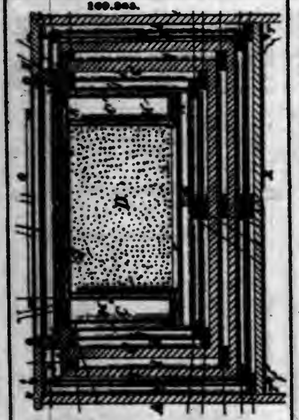


The combination of the pedals, the cord, the frictional clutches, drums, and the friction-wedges, with the spring-cases and their coiled springs, for rotating the axle or wheel shaft, all substantially as and for the purposes set forth.

160,803. Packing Boxes and Crates. H. M. Simons, Charleston, S. C. [Filed July 29, 1875.]

The vegetable-crate composed of cut-away, beveled, or octagonal-shaped bands A C, slats B, and with or without the central V-groove D, as described, whereby, when the boxes are piled one upon another and in rows, there shall be spaces for the circulation of air between the boxes, as and for the purposes specified.

160,804. Car-Couplings. F. L. Small, Houlton, Me. [Filed July 14, 1875.]



The levers J J, once provided with a central inward bend, with hooks at their forward ends, and with outward-extending arms a a at their rear ends, in combination with the chains U U, coupler A, springs S, chain D, and brake-shaft T for connecting and releasing the bend-link B, as set forth.

160,805. Refrigerators. Edgar B. Smith, Albany, N. Y. [Filed Feb. 27, 1875.]

Brief.—A paper refrigerator, made up of a nest of boxes having a thick and a thin wall, separated by paper spacing-strips. The parts are fastened together by an adhesive water-proof compound.—Pasteboard and red wood-covers have wooden frames covered with paper, and have one or more air-spaces, all formed by metal rods and bolts. Ice-boxes and food-chamber are of metal. Ice-boxes have perforated shields for water of condensation, and are set about the sides of the food-chamber, and in a drip-pan set on the floor of the food-chamber.

1. A refrigerator having its walls composed of a nest of paper cases, contained within an exterior cabinet, and provided with dead-air spaces between them, substantially as described, for the purpose specified.

160,805.

2. The paper cases B C, each composed of a thick and a thin wall of paper, having a dead-air space between them, substantially as described.

3. The paper cases B C, constructed in several parts, as described, which are secured together by thin paper and an adhesive water-proof compound, for the purposes specified.

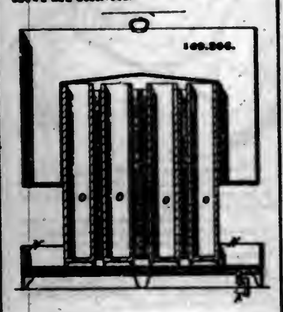
4. The several spacing-strips of the cases, constructed from paper or paper-pulp, and coated with an adhesive water-proof compound, substantially as described, for the purposes specified.

5. The combination of the rectangular frame S with the paper cases B C, substantially as described, for the purpose specified.

6. The method of forming dead-air spaces under the cover of the refrigerator by carrying the paper extensions g of the cases B O over and in contact with the frame S, substantially as described.

7. The rectangular frame S, composed of paper or paper-pulp, and coated with an adhesive water-proof compound, substantially as described.

8. The cover of the refrigerator, composed of a wooden frame, closed at the top by a frame of wood, and at the bottom by a sheet of paper, so as to produce the interior air-spaces *r*, substantially as described, for the purpose specified.



9. The cover of the ice-chest, constructed of paper frames V W, a series of paper partitions, and a bottom of sheet metal, all arranged to form the dead-air spaces *p*, substantially as described, for the purpose specified.

10. The improvement in the construction of refrigerators, consisting of the coating of the paper parts, as specified, with the water-proof adhesive compound, for the purposes set forth.

11. The upright ice-receptacles, constructed with perforated bottoms and perforated shields upon their faces, substantially as described, for the purpose specified.

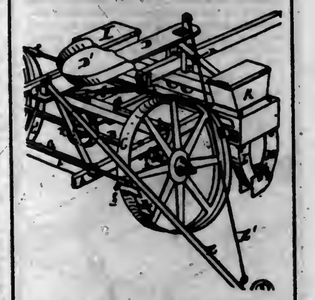
12. The arrangement of the ice-receptacles within the dripping-pan, substantially as shown and described.

160,806.

160,806. Refrigerators. Edgar B. Smith, Albany, N. Y. [Filed Mar. 16, 1875.]

Brief.—Constructed of paper coated with an adhesive and water-proof substance. Ice-box is a cover for the group of food-boxes. Has a detachable metallic protecting-case.

1. In combination with the paper-walled refrigerator, the upright provision-receptacles O O and the ice-chest P, placed over and upon them, substantially as described, for the purpose specified.



2. The ice-chest P, constructed with a raised bottom, to inclose the tops of the upright provision-receptacles O O, and form a cover for the same, substantially as described.

3. The combination of the drip-pan and the superposed group of food-boxes, provided with means for keeping them apart, as and for the purpose specified.

4. The removable sheet-metal inclosing-case M', provided with the cover N', and fitted over the refrigerator for its protection, substantially as described, for the purpose specified.

160,807. Corn-Planters. A. M. Southard, Hilers, Iowa. [Filed Apr. 27, 1875.]

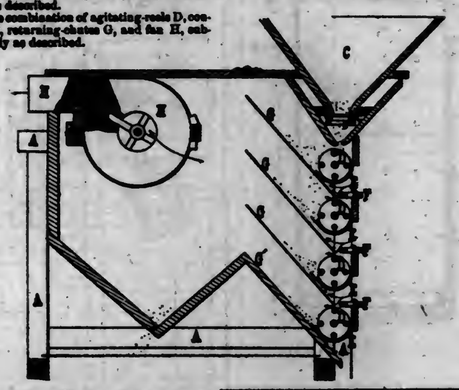
Brief.—The two dropping-plates, with varying-sized holes, are attached to a T-shaped frame, and are adjustable. The runners or furrow-openers are removably attached to the spoots. Extending each way from the center of the frame are arms, on which are secured brakes, that fit the concavity of the bearing-wheels for blocking them, to allow the machine to gain ground by sliding. To the rear of the raised seat-frame is journaled a bar, on the outer end of which revolves a marking-wheel. This bar is strengthened by a rope passing from the bar to the front of the seat-frame.

1. The combination, with the seed-boxes K, of the dropper-plates F, having the holes *a*, and adjustably secured by their shanks F' to the T-shaped reciprocating bar Q Q', substantially as described and shown.

2. The combination, with the seed-boxes, of the seed-spouts I, having the rib *d*, and a hole above and below said rib, adapted to receive a furrow-opener or a plow-shovel, substantially as described and shown.

3. In a seeding-machine, the combination, with the frame A and traction-wheels C, of the brakes H, secured to the ends of separate rock-shafts I I, journaled in the frame in front of said wheels, each rock-shaft extending from the front of one of the wheel-rims to the center of the frame, and provided with a foot-treadle, J, the said foot-treadles being arranged side by side, so that one or both of them can be depressed by one foot, substantially as shown.

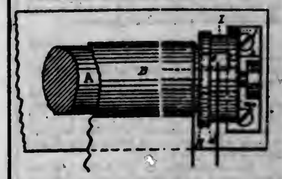
4. The combination, with the elevated seat-frame D, of the bar H, wheel F, swivel *f*, and guy-rope E', arranged as described, so that the said bar and wheel may be changed to the opposite side of the machine, without unlooping the guy-rope, by a half axial rotation, substantially as specified and shown.



160,808. Middlings-Purifiers. Morris Sower, Princeton, Ill., assignor to the Sower Brothers, same place. [Filed June 4, 1875.]

Brief.—Arrangement in connection with suction-current and intermittent feed of a vertical series of agitator-rods, conevers, return-chutes, and independently-adjustable air-openings.

1. In a middlings-purifier, the combination of a suction-fan and a series of returning-chutes with a like series of agitating-rods, substantially as described.



2. The combination of agitating-rods D, conevers E, returning-chutes G, and fan H, substantially as described.

160,809.

3. The suction-fan H, air-chamber I, and slides F, in combination with rods D, conevers E, and chutes G, substantially as described.

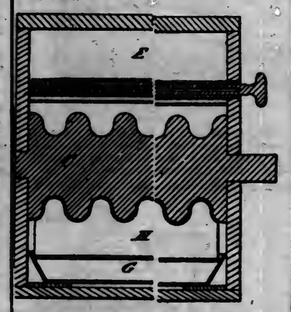
160,809. Curtain-Fixtures. William H. Sparks, Camden, N. J., assignor of one-half his right to Thomas D. Coulston, Philadelphia, Pa. [Filed Sept. 20, 1875.]

1. The combination of the flange *a* of the pivot D with the rabbet *g* of the case I, whereby the case is held longitudinally in place, substantially as set forth.

2. The combination of the disk H with the case I, the disk having a flange or lip, *d*, for guiding the case laterally, substantially as set forth.

3. The case I, having an opening, *e'*, opposite to the cord-opening *e*, for the purpose of threading the pivot D with the cord F, substantially as set forth.

4. The bracket C, having its pivot-bearing constructed opposite to its stop K, to assist in hooking the roller, substantially as set forth.



160,810. Extension-Tables for Sewing-Machines. Roswell H. St. John, Bellefontaine, Ohio. [Filed Sept. 14, 1875.]

The sewing-machine-table cover, constructed with a reversible or swinging side, D, and suitable fastenings to secure said side in either position, so that it may constitute one side of the cover or the top of the table-extension when the cover is inverted and attached to the side of the table, substantially as described.

160,811. Machinery for Desiccating Eggs. William O. Stoddard, New York, N. Y. [Filed July 2, 1875.]

Brief.—The eggs are desiccated on a revolving cylinder by forcible blasts of air, and afterward received in a tank below. The desiccating-cylinder is fed from a tank above, and the supply regulated by means of a suitable valve.

1. In an apparatus for desiccating eggs through the agency of forcible drying-blasts applied to the batter, while the latter is spread upon a rapidly-moving surface, a rotary cylinder to receive and hold said batter during the process of desiccation, and in contact with the air-blasts, substantially as described.

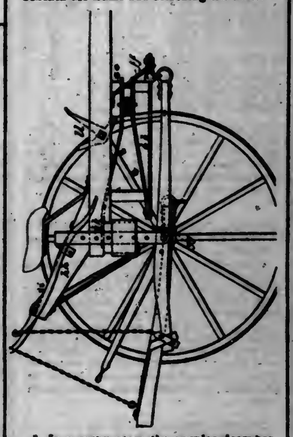
2. The rotary desiccating-cylinder, in combination with the blast-conduits *a*, substantially as specified, for condensing the blast to and against the periphery of said cylinder, substantially as shown and described.

3. The combination, with a revolving cylinder for the reception and desiccation of batter of eggs, of a supply-tank, provided with a faucet or valve to regulate the flow of the batter, substantially as described.

4. The cylinder of an egg-desiccating apparatus, having its shell formed of detachable plates or sections, substantially as specified.

5. The combination of the supply-tank B, faucet or valve b, rotary desiccating-cylinder C, scraper E, and receiver G, substantially as shown and described.

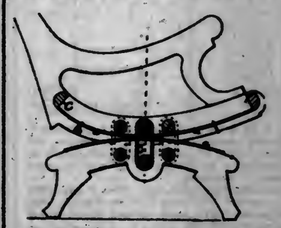
160,812. Tortoise-Shell Handles for Fire-Arms. August Trenkmann, Brooklyn, E. D., N. Y. [Filed July 9, 1875.]



Brief.—The shell is applied, as claimed, to supporting-pieces of metal, which are then fastened to the handle; or the shell may be fixed directly onto the handle.

The mode, substantially as herein described, of combining tortoise-shells with the metal supporting-pieces forming the handles of fire-arms, the same consisting in bending the metal supporting-pieces, and then applying and compressing thereon the tortoise-shell, which, on being partially fused, unites itself to the surface, and partakes of the form of the supporting-pieces, and adheres thereto, as herein shown and described.

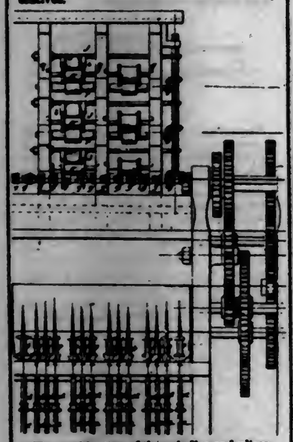
160,813. Plow Attachments. G. M. Todd, Waterloo, Iowa. [Filed Oct. 1, 1874.]



Brief.—Devices for suspending the plows beneath the frame and attaching the draft.

1. In a sulky-plow, the angular draw-bar *b b*, suspended below the frame by the long bolts and sleeves *c c*, and braces *f f* and *e e*, as set forth.

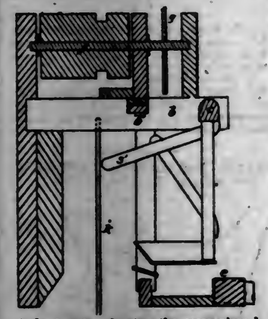
2. The combination of the draw-bar *b b* and braces *e e* with the sulky-frame, and with the plow-beams *c c*, and the adjustable connecting-bars *g g*, substantially as shown and described.



160,814. Rocking-Chairs. Jos. H. Travis, Boston, Mass. [Filed July 14, 1875.]

The combination of the rocker-frame A, provided with one or more rounds, and the bed provided with one or more rounds, of one or more endless rubber bands, constructed to be passed around the round or rounds, substantially as described.

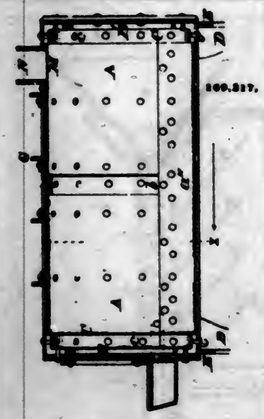
169,816. DOUBLING-MACHINE. Thomas Unsworth, Preston, England. (Filed May 10, 1874.)



Brief.—The take-up bobbins are arranged in tiers, to economize space and enable the yarns to be always kept in sight of the operatives.

The combination of the spindles and pliers, arranged in double rows to twist and double the threads, with the take-up bobbins a, friction-rollers r, and forked levers f, arranged in tiers on each side of the frame, substantially as and for the purposes herein set forth.

169,817. WATER-ELEVATORS. John F. Van Dyck, Lawtonville, Va. (Filed Oct. 6, 1875.)

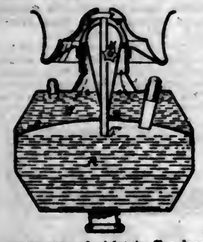


Brief.—The outer frame of this elevator, to which the several operating parts are connected, is pivoted to chute upon the inner sides of the frame, and to a center-piece are bars, to which are rigidly connected frames carrying at their lower ends suitable spoons, which are swung out at the proper time during the ascent of the buckets. There is a cross-piece, which has pivoted to its ends other pieces, which act as bumers for keeping the guide-rods in position at the bottom of the well.

1. In a water-elevator, the cross-piece l, having pivoted to its ends brace-pieces m, for the purpose of securing the guide-rods b in position at the bottom of the well, substantially as set forth.

2. The buckets B, with valve p and lever q, and the guide-rods b, in combination with the swinging frames d, carrying spoons D and arms r, and the blocks b', substantially as and for the purpose specified.

169,818. HEATING-STOVES. John Van. Cincinnati, Ohio. (Filed Sept. 9, 1875.)

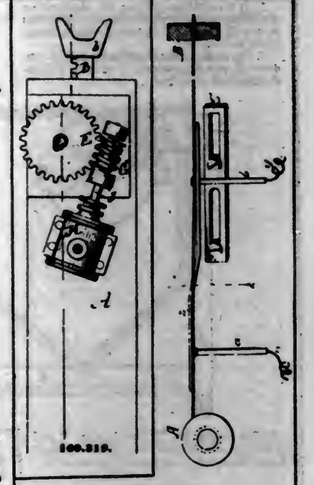


169,819.

As a new article of manufacture, the portable heating-stove herein described, constructed of wrought-iron, and having fire-chamber A, ovate in transverse section, heads B B', extended to form legs D', bracket E, angle-irons C F, and ribs G, all substantially as set forth.

169,820. LAMPS. George W. Vernon, Bensack'n, Va. (Filed Sept. 7, 1875.)

Brief.—The channels conduct water to the flame when the lamp is overturned.



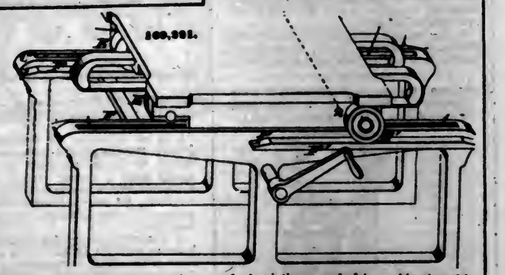
The combination of wick-tube T, enlarged toward its upper end, and the neck E, divided, as shown and described, to form a channel discharging at the top of wick-tube.

169,821. JACKS FOR PRESSES, STOVING, &c. Maurice J. Walsh, New York, N. Y. (Filed Oct. 6, 1875.)

1. The combination, with a rack-jack, of an engine mounted directly thereon and geared with its rack-bar, substantially as herein described.

2. The combination, with the body A and rack-bar B, of the pinion D, pinion-shaft C, worm-wheel E, and worm G, operated by the engine-shaft, substantially as herein described.

169,822.



1. The process of tempering or softening wire or other strips of metal, by subjecting the same to the influences of an electric or galvanic current, as set forth.

2. The mode of heating continuous wires or strips of metal, by traversing the same in contact with bars a b, from one to the other of which an electric current is passed through the said wire or strip, and between which the latter is heated, as set forth.

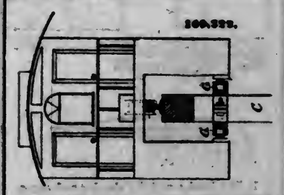
3. The combination, in wire-drawing, of the elastic bars a and b, connected to a battery, with the rod R.

169,823. PRINTING-PRESSES. Chas. Wells, Cincinnati, Ohio. (Filed Aug. 28, 1875.)

Brief.—The bed is on wheels, which run on a track. The track is cut away at both ends, so that the bed rests on a way or table, and not on the wheels at each end of its travel.

169,823.

1. A printing-press bed, in combination with a permanent way or bearing, on which it rests during impression, and with wheels or rollers to convey it to or from the bearing, substantially as set forth.

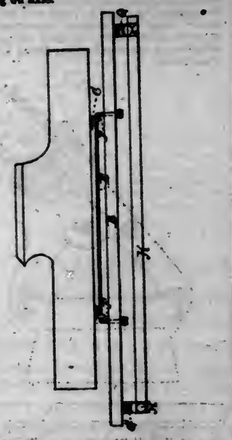


2. A printing-press bed, in combination with a permanent way or bearing, on which it rests during feed, and with wheels or rollers to convey it to or from the bearing, substantially as set forth.

169,824. ELEVATED RAILWAYS. Jno. Westcott, Troxel, Fla. (Filed Sept. 10, 1875.)

169,825. ANNEALING METALS. Joseph H. Warrington, Camden, N. J., assignor of one-half his right to William J. Flanagin, same place. (Filed Apr. 9, 1875.)

Brief.—Wire is annealed, while being drawn, by the heating incident upon its being made the vehicle for a current of electricity.



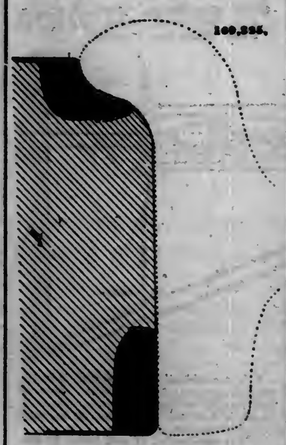
169,826.

In a single-rail railway the combination, with the car having pendent baggage-receptacles, faced upon the inside with iron rails, of the single beam B, surmounted by the main rail, and the supporting-piles C, having the flat-faced friction-rollers G attached to each side of the same, below the main rail and near the level of the bottom of the pendent extension, substantially as and for the purpose described.

169,827. WAGON-SPRINGS. Wm. F. Whitney, Poughkeepsie, N. Y., assignor of one-half his right to Edward Storms, same place. (Filed July 24, 1875.)

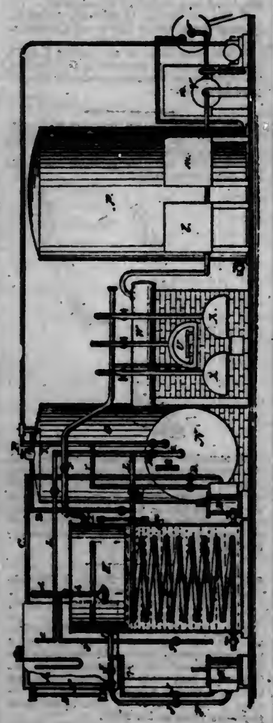
Brief.—Torsional side springs support body on bars, which are supported by leaf-springs resting on axle.

The combination, substantially as described, of the torsional springs F, secured at one end to the body of the carriage, the rectangular frame E, to which they are secured at the other ends, the flexile springs G', secured to said frame, and the axles H, the wheels forming a combined torsional and flexile spring, substantially as herein set forth.



169,828. HARROW-TEETH. Henry M. Williams, Coldwater, Mich., assignor to himself and C. A. Layton, Wapakoneta, Ohio. (Filed June 2, 1875.)

Brief.—The shank of the tooth is composed of tubular iron. The point of the tooth is made of steel, and by means of a screw-thread cut upon its upper end, and a corresponding thread cut in the lower end of the shank, the two are screwed together, the object being to replace the points when worn out.



A harrow tooth composed of a tubular threaded shank, A a, and the solid point B, having the threaded shank B' b, substantially as described and shown.

169,829. GAS-WORKS, CELLS. William Wilmington, Toledo, Ohio. (Filed Sept. 20, 1875.)

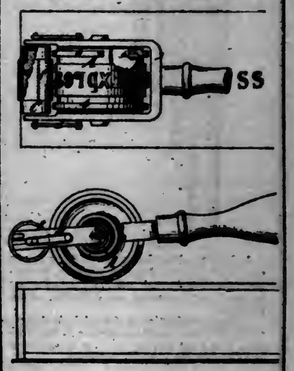
A chill for casting car-wheels constructed with one or more air-chambers near its interior surface, as and for the purpose specified.

169,830. MANUFACTURE OF ILLUMINATING-GAS. Jos. W. Bentley, Brooklyn, N. Y., assignor to E. W. Rutherford and Jos. W. Bentley, trustees. (Filed Oct. 20, 1875.)

1. As an improvement in the process of manufacturing gas from liquid hydrocarbons, the production of a mingled hydrocarbon vapor and superheated steam, by bringing superheated steam into contact with the surface of a liquid hydrocarbon, being kept free from all agitation, and at a temperature below that of the steam, said temperature being proportioned to the density of the liquid employed, and said vapors decomposed into a fixed commercial illuminating-gas by the means used, and as herein described, and for the purpose set forth.

2. The process of manufacturing an illuminating-gas from a mixture of gas produced from bituminous coals and gas manufactured from liquid hydrocarbons, (the production of a mingled hydrocarbon vapor and superheated steam by bringing superheated steam into contact with the surface of a liquid hydrocarbon, being kept free from all agitation and at a temperature below that of the steam,) by simultaneously passing both gases, while in a heated state, from their respective retorts directly into the hydraulic main, thence through the condenser, washer, and purifiers, in the manner and for the purpose herein set forth.

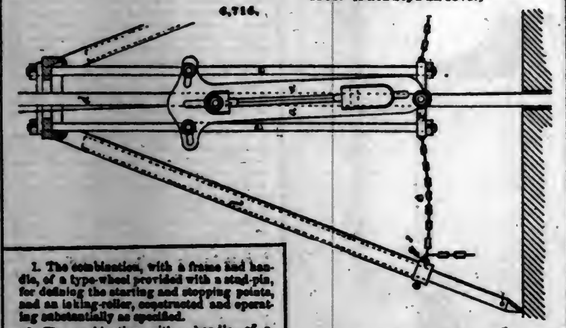
3. In an apparatus for the manufacture of illuminating-gas, the combination of the cone and ring connected with the nozzle of the superheated steam-pipe, located in the top of the still, in relation to the exit vapor-pipe and the internal coil, as herein described, and for the purpose set forth.



4. In an apparatus for the manufacture of gas from liquid hydrocarbons, a coil steam-pipe connected directly with the steam-boiler, the pipe being located within the still at such distance from the outer shell of the still, and of such diameter of coil, as shall produce a uniform heat throughout the hydrocarbon liquid without causing agitation or convective currents, the said coil rising to about the height specified in the still below the entrance of the liquid-supply pipe, as herein described, and for the purpose set forth.

5. In an apparatus for the manufacture of illuminating-gas, a still of the proportions substantially as described, having an internal coil arranged to uniformly heat without disturbing the liquid hydrocarbons, having its upper coil below the supply-pipe, and the nozzle of the pipe that admits the superheated steam arranged at the specified distance above the upper coil of the heating-pipe and below the opening of the egress vapor-pipe, as herein described and set forth.

6. The combination of the still H, superheater M, superheated steam-pipes S I b, steam-pipe Z, nozzle h, with cone-head and ring attached, coil K, liquid-supply pipe I, vapor-escape pipe T, gas-retorts U, coal-gas retorts X, hydraulic main W, condenser l, washer n, exhauster V, and purifier n, constructed and arranged in the manner herein described, and for the purpose set forth.



REISSUES.

6,716. MARKING-WHEELS. Horace Holt, Brooklyn, N. Y. Patent No. 52,169, dated Jan. 23, 1866. (Filed Mar. 26, 1875.)

6,714. ROCK-DRILLS. William R. King, U. S. A. Patent No. 53,305, dated Mar. 20, 1866. [Filed Sept. 21, 1876.]

6,714.

1. The combination, with a frame and handle, of a type-wheel provided with a stud-pin, for denoting the starting and stopping points, and an inking-roller, constructed and operating substantially as specified.

2. The combination, with a handle, of a type-wheel provided with flanges, for keeping the plane of the type parallel with the surface of the article to be marked.

3. A type-wheel provided with yielding flanges, constructed and operating substantially as and for the purpose described.

4. A spring, in combination with a type-wheel and stop-pin, or its equivalent, for retracting the type-wheel to its starting-point, substantially as and for the purpose set forth.

5. The combination of a type-wheel with a combined inking-roller and ink-reservoir, constructed substantially as and for the purpose described.

6. The combination of a handle and type-wheel with a spring, for retracting the type-wheel to its starting-point, substantially as described.

7. In combination with an inking-roller and its usual bearings, secondary bearings so arranged that the roller may revolve independently of the wheel, substantially as set forth.

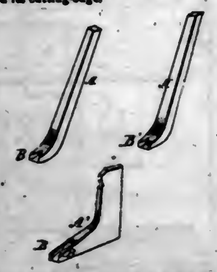
6,715. SAFETY-CATCHES FOR REVOLVERS. Charles W. Hopkins, Norwich, Conn., assignor of one-half interest to Marwin, Hulbert & Co. Patent No. 165,068, dated June 29, 1875. [Filed Sept. 14, 1875.]

1. In a revolver fire-arm, a locking device connected with the hammer, whereby, in combination with the axial pin of the cylinder, the hammer may be locked and unlocked, as described.

2. The combination of the axial pin A, provided with the annular notches *e e'*, the stop-lever *d*, and the locking-pin C, on the hammer H, as and for the purpose described.

1. The combination of telescopic legs, the same hinged at the tops and capable of lateral and vertical adjustment with a tripod-head, to which is secured mechanism for carrying and centering the drill-bar.

2. The combination of mechanism for centering and guiding a reciprocating drill-bar, with a tripod having telescopic legs hinged at the top, whereby such legs may be moved on their hinges outward from the axis of the drill-bar, and an adjustable device applied to the legs below their bearings, for limiting the outward movement of the legs in prescribed degrees, for the purpose of supporting the centering and guiding mechanism in variable positions.



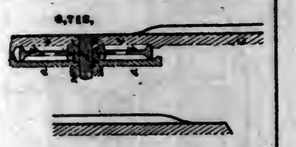
3. The hooks *g' g' g'* attached to the telescopic leg of a tripod, for a rock-drill.

4. The combination of the collar *f* with the guide-plates *a*, slide *b* and *c*, and spring *s*, as and for the purpose described.

5. The combination of the springs K and *l*, Fig. 4, with the guide-plates *a*, slide *b* and *c*, and spring *s*, substantially as and for the purpose described.

6,717. CUTTER-HEADS. Simon P. Randolph, Tehama, Cal. Patent No. 165,063, dated July 20, 1875. [Filed Sept. 24, 1875.]

Brief.—The cutter is provided with side lips on its cutting-edge.

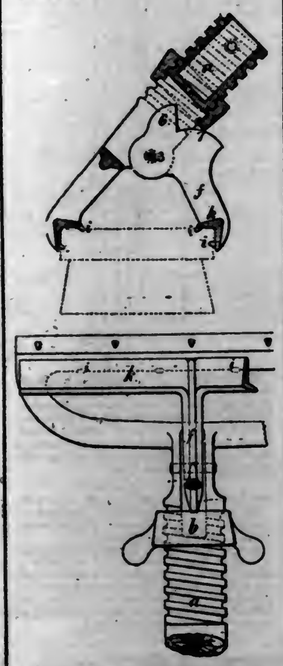


A saw-plate or cutter-head, provided with teeth or cutters A, A^1, or A^2, each of which has a planing lip or flange, B, formed on one or both sides of its cutting-edge, so that the edges of said planing lips or flanges are in the same plane with the cutting-edge of the tooth or cutter, substantially as and for the purpose described.

6,718. DOOR-HINGES. Elijah U. Scoville and Washington L. Scoville, Manlius, N. Y. Patent No. 165,023, dated Oct. 6, 1874. [Filed Oct. 1, 1875.]

Brief.—The shank and one-half of roller-case are cast together, and the case has a perforated conical bearing for the single flat-faced wheel, and also projections upon its rim. The other half of case has corresponding perforated conical wheel-bearing and depression in periphery. The sides of the cased guide the wheel on the track.

6,716.



1. The head *c*, with its shank *s* and cap *c*, having notched and projecting rims made to fit each other, and perforated center bearings, arranged and combined as and for the purpose herein specified.

2. The combination of a plain-faced wheel, *b*, pivoted at its center with the cap *c*, head *c*, and shank *c*, as and for the purposes specified.

6,719. MOP AND BRUSH HOLDERS. Albert F. Seymour, New Britain, Conn. Patent No. 165,469, dated Sept. 20, 1875. [Filed Oct. 4, 1875.]

Brief.—A handle-socket is continuous with one shear-arm, the other arm moving on a pivot, and carrying on its rear extremity two cams, which abut against a screw-ring on the socket, accordingly as said ring is set for such antagonism, to grasp a brush or a mop, the beaks being like troughs transversely, to grasp the brush-block at its sides when widely extended, or the mop between broad surfaces when closed.

1. A mop or brush holder, made with a stationary jaw and screw-socket, a movable jaw and its arm swinging upon a pivot, and a screw-ring that acts against the swinging arm at one place when holding the brush, and at another place when holding the mop, substantially as set forth.

2. The mop-holder, made of two metal trough-shaped jaws, a screw-socket, ring-nut, and swinging arm *f*, against which the ring-nut acts, substantially as set forth.

HELIOTYPE RELIEF PROCESS. JAMES R. OSGOOD & Co. BOSTON.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 18. TUESDAY, NOVEMBER 2, 1875. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

UNITED STATES PATENT OFFICE,
Washington, D. C., October 5, 1875.

The COMMISSIONER OF PATENTS respectfully requests manufacturers of and dealers in engines, machines, apparatus, tools, and appliances of whatever kind, to send to this Office duplicate copies of all catalogues and circulars which they have issued or may issue from time to time. R. H. DUELL, *Commissioner.*

COMMISSIONER'S DECISIONS.

EVANS W. SHIPPEN.—*Appeal.*

[*Appeal from the Principal Examiner in the matter of the application of Evans W. Shippen for letters patent for* IMPROVEMENT IN MANUFACTURING WOODEN SHOES, &c.—*Decided October* 29, 1875.]

A claim for "the improvement in the art of manufacturing wooden shoes by machinery, hereinbefore set forth, which consists in cutting, shaping, and boring the blank by submitting it successively to the operation of mechanism, substantially such as set forth," distinguished from a claim for a function, and construed as a certain well-defined order of mechanical operations, all adapted to each other, and, although requiring a peculiar set of instruments for their operation, yet the order of their performance is not inherent in the machinery.

Where the operation of a machine or a series of machines is supplemented by some new and useful method of operation not contemplated in the construction of the machine, and not the inevitable result of its operation, it may amount to a patentable process. Such was the process claimed in the *Voelter* patent sustained by the court, (5 Fish., 340.)

The doctrine of *Perry vs. Lay*, (C. D., 1869, p. 3,) that it is admissible under proper restrictions for parties to put their claims in different forms to prevent misconstruction, again approved.

Each part of this series of machines without the others, or some equivalents of the others, would be absolutely useless, and since the invention lies mainly in the series as a complete set, and not in an improvement upon separate parts of an old set, they ought to be allowed in one application, and in one only.

SPEAR, *Acting Commissioner:*

The Examiner raises objections to the 1st, 4th, 6th, 7th, and 8th clauses of the claim in this application. The objections relate to matters of form, and will be considered in their order.

In his letter of May 27, the Examiner advised applicant that his first claim was "for a process and functional." What objection could be properly made against a claim solely on the ground that it was for a process, I do not well understand. That a claim is purely functional—that is to say, describes and includes nothing more nor less than the inevitable function of a machine—is always a proper objection to it. Such a claim is not, in any true or proper sense, for an invention, for it is only the machine which can be said to be invented and not strictly the invariable use of it. I infer that the word "process" was used by the Examiner inadvertently, since it can be no valid objection in itself to a claim; and it is manifestly what the applicant is intending to claim in the first clause. The simple question is whether or not that clause includes more than the mere function of a machine. The clause is as follows:

The improvement in the art of manufacturing wooden shoes by machinery, hereinbefore set forth, which consists in cutting, shaping, and boring the blank by submitting it successively to the operation of mechanism substantially such as set forth.

What is set forth is a certain well-defined order of mechanical operations. The successive steps are all adapted to each other, and the operation performed on the block at one step fits it to receive the operation to be performed upon it at the next; and although the operation is wholly mechanical, and requires a peculiar set of instruments, yet the order in which the successive operations are performed is not inherent in the machinery.

The function of a machine is that operation which,

when set in motion, it inevitably performs. Thus it is the function of a grinding-mill to comminute whatever is passed through it, of a lathe to give shape to bodies placed in it, or of an auger to bore. But where the operation of the machine, or of a series of machines, is supplemented by some new method of operation not contemplated in the construction of the machine, and not the inevitable result of its operation, and the new method subserves a new and useful purpose, it may amount to a patentable process, even though the operation depend necessarily upon the machinery. Such was the process claimed in the Voelter patent sustained by the court, (5 Fish., p, 340,) in which the mill or stone upon which the wood was to be reduced to fiber was old, and the novelty consisted in placing the wood in such a way that the fiber was torn transversely—the change in which the invention consisted being solely in the method of using the machine, which method was not contemplated originally in making the machine, did not necessarily result from its operation, required evident invention, and produced a new and improved result.

In the present case, the different parts of the set of machinery, taken separately, have a certain fixed and invariable operation; but these parts of the set of machines which are necessary for the whole complete operation, are used, as I have said, in a certain order. If that order be inverted, or changed in any respect—if, for instance, the boring precede the turning, or if it be attempted to bore by the inclined auger before using the vertical auger—the result will be materially different, and worse. Therefore, so far as appears, this applicant has invented something more than an instrument by which the woolen blank is cut—namely, a certain beneficial method of using these, or any equivalent machines, which may be substituted for any one of these. I see, therefore, no reasonable objection to the grant of this claim, so far as relates to the form of it.

The next objection of the Examiner is that the 4th and 8th claims "are so drawn as to render the subject-matter intended to be covered thereby uncertain."

The 4th claim is as follows:

> The combination of a revolving-cutter, H³, and the sliding vibrating holder carrying the blank, these members being constructed and operating substantially as set forth, whereby the shoes are cut away toward the toe on the inside of the instep.

It is explained that the sliding motion of the holder is for the purpose of making the cutter operate upon the shoe from side to side, and that the vibrating motion makes it possible to cut away the wood more upon one side of the shoe. The precise parts are specified: the cutter, the holder, the construction giving the sliding and vibrating motion, and the explanation, all in the claim, of the nature and object of these motions. It is difficult to see how the applicant could have been more explicit without specifying all the parts by letter, and this he has done in the eighth claim, to which the Examiner makes like objections. I cannot see how the applicant could in any way define this invention more precisely than he has done in the claim last named; and, if there be no other objection than this, these claims ought to be allowed.

The rejection of the 6th and 7th claims is based on equally untenable ground. The doctrine laid down in the *ex parte* case of *Perry* vs. *Lay*, (C. D., 1869, p. 3,) and often repeated since, is familiar, and should govern the Office. It is sanctioned by the courts, and is plainly founded in reason—

> It is admissible, under proper restrictions, for parties to put their claims in different forms, to prevent misconstruction of them by the public or by the courts.

In the present instance, however, the claims are plainly not equivalent. The 7th includes the pivot, which the 6th does not, and the frame on which the holder slides is also included, and is not in the 6th. The difference is gross and palpable.

The Examiner, in his answer to the reasons of appeal, raises a new objection, which he ought to have raised, if at all, at the outset, and certainly should have advised applicant of it before appeal, and not surprised him with new and unheard-of objections when he appeared before the Commissioner at the hearing granted upon other points. The objection, however, ought not to have been raised at all. It would be a hard and unnecessary proceeding to require the applicant to make separate applications for each part of this series of machines. Plainly, each part alone without the others or some equivalent of the others, would be absolutely useless; and since, so far as appears, the invention lies in the series mainly, as a series or complete set, and not in an improvement upon separate parts of an old set, they ought to be allowed in one application, and not be allowed in more.

The questions here discussed may seem elementary and familiar, but the fact that they have been raised justifies the discussion.

The decision of the Examiner is reversed, and the case will be examined upon its merits.

ADLER *vs.* VAN WAGENER.—*Interference.*

[*Appeal from the Examiner of Interferences in the matter of the interference of Adler* vs. *Van Wagener for letters patent for* IMPROVEMENT IN TIPS FOR BOOT-SOLES.—*Decided October* 15, 1875.]

> An interference may be dissolved for reasons stated in rule 59, but should not be allowed to terminate by the abandonment of his application by one of the parties to the controversy, when the other party desires a decision upon the merits.

SPEAR, *Acting Commissioner:*

This appeal is taken by counsel for Van Wagener from the decision of the Examiner dissolving the interference. That decision was based on an abandonment of his application by Adler, filed in the course of the proceedings before the Examiner of Interferences. The Examiner, in dissolving the interference, relied for authority upon the decision of the Commissioner in the case of *Eames* vs. *Seeley & McDougall*, (C. D., 1871, p. 206.)

Rule 59 provides for the dissolution of an interference "if no interference in fact exists, or that there has been such irregularity in declaring the same as will preclude the proper determination of the question of right between the parties."

Further provision is made in the rule for such dissolution, in case it be found that neither party is entitled to a patent. The dissolution in this case rested on no such basis. It is not alleged that there is no interference, or that there has been any irregularity in the declaration; nor does it appear from the record that the patentability of the subject-matter in controversy is anywhere denied. I see no reason whatever, so far as the papers in the case are concerned, why the interference should not go on, and judgment be rendered. And it appears to me unwise to place in the hands of one of the parties the right to terminate the proceedings at any point, with the power of renewing them at his pleasure; for this abandonment of the application does not deprive Adler of the right to file a new application at any time; and even if the same testimony were used in that case which was taken in this, still the practice would give one party the right to cause indefinite delay at his pleasure, and without any possible advantage, except to himself, so far as I can discover. It concerns the Office and the public that these questions, once raised, should be settled once for all, and as speedily as possible, while the matters are fresh in the minds of the parties and their witnesses.

The question in this case is not precisely the same as that in the case of *Eames* vs. *Seeley & McDougall*, cited above; but I am constrained, though not without hesitation, to vary from the dictum of my learned predecessor in that case. I see no hardship in requiring a party to an interference either to prosecute the same to judgment or to let the case go by default. If he wishes to have the proceedings stopped he may concede priority of invention to the other party, and the judgment will be based upon that; otherwise the interference must proceed.

The decision of the Examiner is reversed.

LEWIS N. GREEN.—*Appeal.*

[*Appeal from the Examiner of Trade-Marks in the matter of the application of Lewis N. Green for the* REGISTRATION OF A TRADE-MARK.—*Decided September* 27, 1875.]

> The words "German Sirup" held to be a lawful trade-mark.
> As a rule a geographical name cannot be a lawful trade-mark, but may become so when not descriptive, and when arbitrarily chosen and applied for lack of a better term.

SPEAR, *Acting Commissioner:*

This appeal is taken from the decision of the Examiner of Trade-Marks, refusing to register the words "German Sirup." The Examiner says that—

> Although these words (German, American, &c.,) are not, strictly speaking, geographical names, yet, from long usage, they have been accepted as properly designating the people living in well-defined divisions of the earth.

Unquestionably a geographical name, as a rule, cannot be a lawful trade-mark, for the reason that, ordinarily, it is descriptive of the article to which it is applied. Wherever it is descriptive, it cannot be made a lawful trade-mark; but a geographical name, like any other word, may be chosen and arbitrarily applied, and in such instance may be a lawful trade-mark. The Examiner must judge in each particular case whether or not the word be descriptive. In this case I think it cannot be called purely descriptive. If the article were purely a German product, then it would be naturally, and in the ordinary use of the word, designated as German; but, obviously, it is not. It is simply a medicated compound, evidently designated "German" for lack of a better term, and, I think, should be registered as a trade-mark.

The decision of the Examiner is, therefore, reversed.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date November 2, 1875.]

8,764.—Glassware.—HENRY FRANK, Pittsburg, Pa. Application filed October 18, 1875. Term of patent 3½ years.

8,765.—Coffin-Plates.—CEPHAS B. ROGERS, West Meriden, Conn., assignor to C. ROGERS & BROTHERS, same place. Application filed September 21, 1875. Term of patent 7 years.

8,766.—Parlor-Stoves.—GURDON G. WOLFE, NICHOLAS S. VEDDER, and FRANCIS RITCHIE, Troy, N. Y., assignors to HICKS & WOLFE, same place. Application filed October 20, 1875. Term of patent 7 years.

8,767.—Ranges.—GURDON G. WOLFE and FRANCIS RITCHIE, Troy, N. Y., assignors to HICKS & WOLFE, same place. Application filed October 20, 1875. Term of patent 7 years.

8,768.—Cooking-Stoves.—RICHARD A. CULTER and DAVID C. PROCTER, Peoria, Ill. Application filed October 1, 1875. Term of patent 7 years.

8,769.—Cooking-Stoves.—GURDON G. WOLFE, NICHOLAS S. VEDDER, and FRANCIS RITCHIE, Troy, N. Y., assignors to HICKS & WOLFE, same place. Application filed October 20, 1875. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date November 2, 1875.]

3,102.—Friction-Matches.—BARBER MATCH COMPANY, Akron, Ohio. Application filed October 5, 1875.
"words 'DRAWING-ROOM MATCHES.'"

3,103.—Shirts.—BLOOMER, KING & Co., New York, N. Y. Application filed October 2, 1875.
"words 'The King of Shirts,' with the monogram of our firm, composed of the letters 'B. K.,' the character '&' just before the monogram, and the abbreviation 'Co.' just after it."

3,104.—Gummy or Resinous Extract of Old Varnish.—BUTLER & NORWOOD, Boston, Mass. Application filed October 18, 1875.
"'VERNISINE.'"

3,105.—Linen Threads.—DUNBAR, MCMASTER & Co., Gilford, Ireland. Application filed September 16, 1875.
"a horse's head and the words 'Vorus ad Finem.'"

3,106.—Smoked and Pickled Meats.—FRANK A. FERRIS, New York, N. Y. Application filed October 8, 1875.
"a plumb-seal of any suitable metal, that is attached to the strings by which the meats are suspended, the words 'F. A. Ferris & Co., Trade-Mark, N. Y.,' being stamped on the seals in embossed letters."

3,107.—Books.—FRALICK & MEEKE, St. Paul, Minn. Application filed October 2, 1875.
"word 'Centennial.'"

3,108.—Cigars and Tobacco.—HENRY GAULLIEUR, New York, N. Y. Application filed October 11, 1875.
"words 'RIO HONDO.'"

3,109.—Pop-Beer.—CHARLES C. HALEY & Co., New York, N. Y. Application filed October 2, 1875.
"words 'CALIFORNIA POP-BEER.'"

3,110.—Gloves.—PATRICK HEALY, New York, N. Y. Application filed October 8, 1875.
"words Diamond Cut.'"

3,111.—Lamps.—CHARLES F. A. HENRICHS, Brooklyn, N. Y. Application filed October 16, 1875.
"words SAINT GERMAIN.'"

3,112.—Canned Lobsters.—KIMBALL & JEWETT, Shediac, Canada. Application filed October 8, 1875.
"the figure of crossed flags, and the figure of a lobster."

3,113.—Cigars.—KREMER BROTHERS & Co., Detroit, Mich. Application filed September 17, 1875.
"word 'Fortune,' together with a mining scene."

3,114.—Whiskies.—BENJAMIN LIEBER, New York, N. Y. Application filed October 18, 1875.
"a pictorial representation of a log cabin, in connection with the words 'Old Log Cabin.'"

3,115.—Pianos.—F. C. LIGHTE & Co., New York, N. Y. Application filed October 2, 1875.
"word 'EUTERPIA.'"

3,116.—Medicine.—ORRIN B. MANSELL, Lynn, Mass. Application filed October 18, 1875.
"word 'PAINOLINE.'"

3,117.—Gin.—AUGUSTUS E. MASTERS, Jr., Brooklyn, N. Y. Application filed October 19, 1875.
"the royal arms of Holland, and above are the words 'Royal Signet.'"

3,118.—Cigars and Tobacco.—WILLIAM C. NICHOLSON, New York, N. Y.—Case A. Application filed October 12, 1875.
"words 'LADIES' FINGERS.'"

3,119.—Cigars and Tobacco.—WILLIAM C. NICHOLSON, New York, N. Y.—Case B. Application filed October 12, 1875.
"an ornamental border having a circular center and rectangular ends. The circular center is embellished with a series of dots or balls, arranged around the same at equal distances apart, and with scrolls arranged at both sides of the border. The rectangular ends of the said border are likewise embellished with scrolls at their ends."

3,120.—Scotch Oatmeal.—ROBERT SHOEMAKER & Co., Philadelphia, Pa. Application filed October 2, 1875.
"the name 'Robert Shoemaker & Co., Philadelphia, U. S. A.,' and the pictorial representation of a stag's head."

3,121.—Medical Preparation or Compound.—SNYDER & GUE, Decatur, Ill. Application filed October 12, 1875.
"word 'MALARION.'"

3,122.—Carpets.—A. T. STEWART & Co., New York, N. Y. Application filed October 13, 1875.
"the pictorial representation of an eagle with uplifted wings, printed over a sun-burst, with a bundle of arrows in one of his talons, and a branch in the other, and the motto 'Forward' on a ribbon underneath, with the words 'E pluribus unum' on a narrow ribbon in his beak."

3,123.—Trace-Buckles.—H. S. WOODRUFF & Co., Janesville, Wis. Application filed September 13, 1875.
"the name 'Champion,' and the representation of the buckle itself as it appears in the cut."

3,124.—Medical Compound.—DR. HEATH & Co., Washington, D. C. Application filed September 25, 1875.
"the arbitrary word-symbol 'OXYGENIZED AIR.'"

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date November 2, 1875.]

363.—Title: "Ribbons and Dress Goods as they appear when Photographed."—DAVID T. BURRELL, Brockton, Mass. Application filed October 23, 1875.

364.—Title: "Carell's Aromatic Wine-Bitters."—S. F. CARELL, New York, N. Y. Application filed October 21, 1875.

365.—Title: "Glycerine-Camphor Cream."—RUTGER L. DRAKE, Troy, N. Y. Application filed October 25, 1875.

366.—Title: "The Triumphant Gas, or Domestic Compound for Illuminating Purposes."—S. B. FARRAR & Co., Chicago, Ill. Application filed October 15, 1875.

367.—Title: "John H. Gause & Co.—Neptune Brand Spices."—JOHN H. GAUSE, Cleveland, Ohio. Application filed January 12, 1875.

368.—Title: "Anti-Frothing Oil."—E. H. KELLOGG, New York, N. Y. Application filed October 25, 1875.

369.—Title: "The Celebrated Florentine Flake Candy."—CHAS. F. KING, P. B. HOWLAND, and SAMUEL PARKER, Chicago, Ill. Application filed October 29, 1875.

370.—Title: "Sachet Powders—T. Metcalf & Co., Boston."—THEODORE METCALF & Co., Boston, Mass. Application filed October 29, 1875.

371.—Title: "William V. Noe, Manufacturer of The Phosphatic Lead-Paint."—WM. V. NOE, New York, N. Y. Application filed October 22, 1875.

372.—Title: "List of Goods Shipped."—EDMUND D. REYNOLDS & OLIVER B. REYNOLDS, Brockton, Mass. Application filed October 23, 1875.

373.—Title: "Centenary Tooth-Powder."—DR. E. C. WADSWORTH, Brooklyn, N. Y. Application filed October 28, 1875.

374.—Title: "H. Lockard's Horse Ointment."—S. E. WOODHULL & SON, Newark, N. J. Application filed October 20, 1875.

BOUND VOLUMES OF PATENTS.

The bound volumes of patents, containing the specifications and drawings of patents in full from May 30, 1871, to within a few months of date, may be consulted at the following places:

Astor Library, New York city.
American Society Civil Engineers, New York city.
Bronson Library, Waterbury, Ct.

Y. M. M. L. A., Cincinnati, Ohio.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

INDEX OF INVENTIONS PATENTED NOVEMBER 2, 1875.

	Class No.	No. of Patent.
Air, apparatus for devaporizing, L. K. Fuller	46	169,535
Armpit shield, E. C. Bragg	34	169,515

Broom machines, mandrel for, H. Anderson	23	169,330
Buckle, trace, M. T. Burke	23	169,519
Burial case, metallic, H. M. Gray	30	169,436
Burner, liquid fuel, G. H. Perkins	90	169,372
Burners, lens attachment to gas, M. C. Meigs	64	169,366
Button feeding device, Z. Gelinas	23	169,433
Cake making, batter feeder for, D. H. Lafferty	98	169,556
Can, oil, N. Peterson	107	169,576
Cane and umbrella combined, J. Boyd	165	169,406
Cane and whip, combined, O. H. Saxton	165	169,485
Car brake, S. G. Howe, (reissue)	122	6,724
Car brake, J. N. Sawkins	122	169,593
Car couch, T. H. Neal	121	169,560
Car coupling, A. Cyr	122	169,434
Car coupling, H. F. McKervey	122	169,563
Car wheel, W. H. Paige	122	169,370
Cars, gong for street, W. Gulifoyle	121	169,336
Carriage curtain fixture, Knight and Ripple	31	169,555
Carriage top, R. F. Painter	31	169,371
Carriage top, Power and Anderson	31	169,579
Carriages, umbrella top for, L. P. Tibbals	31	169,599
Catarrh, empirical prescription for cure of, J. W. Harvey	98	169,540
Chain links, machine for bending, J. Baird	80	169,333
Chair seats, material for, D. H. Donovan	64	169,598
Chemists' test apparatus, C. Fahlberg	35	169,348
Cherry stoner, S. A. Darrach	88	169,525
Children, inclosure or play house for, H. J. Parker	62	169,471
Cigar pipe, R. L. Weed	160	169,501
Clothes drier, G. A. Brooks	91	169,517
Clothes line reel, C. L'Hommedieu	91	169,453
Clutch, B. F. Young	67	169,394
Cock, stop, R. G. Smeaton	167	169,489
Coffee roaster, F. Thomas	154	169,498
Comb, band, A. Poppenhusen	161	169,578
Cooking steamer, M. Pifer	154	169,373
Copy book, letter press, S. W. Scesbe	146	169,491
Cotton gin, W. S. Reeder	41	169,584
Cotton scraper, chopper, and cultivator, R. L. McClung	43	169,462
Curtain fixture, F. Backofen	62	169,400
Curtain fixture, E. B. Lake	62	169,450
Cylinders, automatic air valve attachment for steam, J. N. Lauder	150	169,452
Dental engine, S. D. Engle	46	169,345
Dental engine, W. W. Evans	46	169,346
Dental engine, W. W. Evans	46	169,347
Dental engine, E. P. Ryder	46	169,375
Dental engines, hand piece for, G. H. Cushing	46	169,342
Desk, school, T. Redmayne	62	169,478
Digger, potato, D. J. Roush	114	169,483
Door check, Breidenback and Euchenhofer	24	169,407
Door spring, J. M. Blood	24	169,405
Door spring attachment, W. M. Gray	24	169,351
Draftsman's ink saucer, F. Stith	97	169,597
Drawing board attachment, J. C. Hints	54	169,543
Drilling machines, tripod for rock, J. B. Waring	124	169,389
Dropper, potato, Zane and Kennedy	133	169,395
Drying apparatus, T. Webber	48	169,500
Dye in black silk thread or fabrics, testing the purity of, W. H. Seaman	11	169,377
Earth boring apparatus, Ruth and Crain	51	169,590
Egg preserving compound, E. A. Sayder	58	169,595
Electricity, apparatus for lighting lamps by, Voisin and Dronier	50	169,387
End gate, E. G. Martin	31	169,461
Engine, rock drilling, G. H. Reynolds	150	169,587
Engine, rotary, I. Van Kersen	150	169,603
Excelsior, machine for making, L. H. Whitney	173	169,607
Exercising apparatus, J. B. Newbrough	143	169,467
Eyeleting machine, J. J. Allred	23	169,398
Faucet, measuring, F. C. Heiser, (reissue)	167	6,722
Fence, barbed wire, A. V. Wormley	59	169,393
Fence post support, H. McKenzie	32	169,562
Fence, wire, J. M. McClellan	59	169,365
Fertiliser distributer, W. H. Cook	133	169,523
Fire arm, breech loading, C. E. Billings	18	169,335
Fire arm, breech loading, H. C. Bull	18	169,413
Fire blower, J. Reid	154	169,585
Fire ping, C. F. Rapp	167	169,476
Fire shield, Moore and Bradley	30	169,466
Fires, automatic sprinkler for extinguishing, H. Conant	167	169,422
Floor for refrigerating houses, Rochevot and Schmidt	58	169,481
Fluting iron, Fisher and Brown	91	169,534
Fluting machine, H. Albrecht	38	169,327
Fork, barley, S. Saell	77	169,594
Fork, hay, M. M. Cherry	77	169,417
Fruit jar, C. R. Carter	58	169,340
Fruits, preserving, F. H. L. C. Saco	58	169,591
Furnace, J. K. Caldwell	149	169,338
Furnace, hot air, S. E. Foster, (reissue)	154	6,727
Furnace, hydrocarbon, P. M. Qvist	149	169,583
Furnace, reverberatory, J. Price	85	169,581
Furnace, steam boiler, J. Enright	149	169,531
Furnace, steam boiler, J. A. Locke	149	169,455
Furnaces, device for pushing tube skelps into and through, G. Matheson	60	169,460
Gas, apparatus for lighting and extinguishing, Green and Barrow	64	169,352
Gas fitters' hooks, blank for, J. W. Lyon	64	169,364
Gas or air, &c., process and apparatus for enriching, E. H. Covell	27	169,423
Gas to burners, apparatus for regulating the flow of, Jacobsen and Murphy	64	169,549
Gasalier, drop light, J. Fox	64	169,430

	Class No.	No. of Patent.
Gate, J. A. Knepper	52	169,449
Gate latch, S. Churry	93	169,418
Glass, decorating, J. Budd	54	169,412
Glass spheres, blowing, F. Rhind	68	169,479
Glove, gantlet, Latcher and Dunham	38	169,351
Gong attachment for releasing horses in engine houses, C. Sibert	50	169,379
Grain binder, S. S. Jackman	74	169,360
Grain decorticator, S. Dodson	57	169,426
Grain drills, feeding mechanism for, A. J. Martin	133	169,561
Grain, machine for scouring and decorticating, W. P. Robinson	57	169,589
Grate, J. A. Buckwalter	154	169,411
Gun stocks, recoil check for, W. D. Miller	55	169,465
Hame fastener, A. J. Park	72	169,572
Hand cuff, G. P. Honston	93	169,443
Hay, baling short cut, C. Brown	7	169,518
Hay ricking apparatus, J. R. Hill	150	169,542
Horse and water power apparatus, W. S. Watkins	150	169,391
Horse power, J. Smith	150	169,380
Horses in engine houses, gong attachment for releasing, C. Sibert	50	169,379
Horseshoe, S. Stone	60	169,495
Horseshoe nails, machine for rolling, G. L. Hall	60	169,357
Hose pipe nozzles, stand or holder for, O. Edwards	167	169,344
Hydrant, W. D. Greenlee	167	169,538
Inclosure or play house for children, H. J. Parker	62	169,481
Induction apparatus, electrical, R. K. Boyle	50	169,514
Iron and steel from the ore, apparatus for production of, W. A. Lyttle	85	169,560
Ironing board, W. M. Tobey	91	169,609
Jack, carrying, A. K. Norris	79	169,369
Knitting machine, C. J. Appleton	89	169,331
Knobs to spindles, attaching, C. Coleman	93	169,421
Lamp, F. A. Taber	90	169,497
Lamp extinguisher, Warren and Packard	90	169,604
Lantern, H. Beebe	90	169 511
Lantern, C. H. Lyman	90	169,457
Letter box and door bell, combined, J. Lovenguth	24	169,558
Liquids, apparatus for expressing, L Breval, (reissue)	155	6 721
Lock, door, C. L. Bates	93	169,401
Loom pattern chain, J. F. Wicks	95	169,608
Loom shedding mechanism, O. W. Knilson	95	169,552
Loom shuttle, D. Wright	95	169 504
Loom shuttle, D. Wright	95	169,505
Loom weft stop mechanism, O. M. Stillman	95	169,506
Mail bag catcher, E. F. Hotchkiss	121	169,545
Mains, machine for tapping, J. Hancock	167	169 438
Match, safety, E. Haanel	71	169,539
Mattress and cushion, W. H. Horton	62	169,442
Meats, preservation of, F. H. L. C. Sace	58	169,592
Mechanical movement, O. Child	67	169 341
Millstone dressing machine, G. Heydrich	153	169,440
Molders' match plates, machine for operating, J. T. Peet	33	169,473
Mowing machine, A. G. Gray	74	169,435
Nets, machine for the manufacture of, J. H. Coevoet	89	169,522
Oven, bakers', J. Bieder	6	169,404
Overshoe, J. I. Mellon, (reissue)	16	6,725
Packing, piston, G. H. Reynolds	151	169,586
Paint breamer, J. P. Hayes	107	169,439
Paper bag, C. Amascen	109	169,399
Paper bag for brooms, E. D. Messinger	109	169,464
Paper box, F. Salomon	109	169,484
Paper collars, machine for cutting, C. A. Brown	109	169,408
Paper perforating machine, J. S. Ives	109	169,548
Pattern chart for drafting garments, M. A. and L. A. Melcher	38	169,564
Pegging machine, leather screw, C. M. Higgins	16	169,541
Piano, upright, G. Trayser	112	169,386
Pinchers, crimpers', Wright and Bassett	16	169,503
Pipe, F. G. Merriam	160	169,565
Pipe, F. G. Merriam	160	169 566
Pipe, cigar, R. L. Weed	160	169 501
Pipe drilling machine, F. Grinnell	100	169,354
Pipe, sprinkling, F. Grinnell	167	169,355
Pipe stem, J. W. Fleischmann	160	169,349
Pipe tongs, S. H. Dickerson	100	169,425
Pipes for sprinkling water, drilling holes in, F. Grinnell	100	169,353
Planing machines, priming attachment to, B. C. Chambers	100	169,520
Planter, check row, Klar and Dixon	133	169,361
Planter, corn, J. Bryer	133	169,409
Planter, corn, Gardner and Hayes	133	169,432
Plow, rotary gang, J. K. Underwood	114	169,499
Pocket book, D. E. Osbourn	146	169,470
Postal cards, device for facilitating the filing of, P. M. Hitchcock	146	169,441
Press, G. H. Reynolds	7	169,588
Printing press, oscillating, J. L. De Huff	117	169,526
Printing press, oscillating, W. C. Evans	117	169,533
Printing press, oscillating, Watson and De Huff	117	169,605
Pruning implement, Henkel and Ward	63	169,359
Railway, elevated, J. Westcott	120	169,606
Railway signal, F. Raymond	120	169,477
Railway signal, electric, E. E. Bean	30	169,509
Rain water cut off, H. Wilkins	126	169 609
Rake, horse, W. Aldrich	77	169,329
Rake, horse hay, W. Aldrich	77	169,328
Ratchet movement, J. Parr	67	169,574
Refrigerating houses, floor for, Rochevot and Schmidt	58	169,481
Roofing composition, L. F. Teed	87	169,573
Roller for endless aprons, guide, J. Parr	126	169,385
Row lock, F. D. Graves	13	169,537
Sad iron, O. Swift	91	169,496
Safe and vault door, M. Briggs	128	169,337
Safe, burglar proof, E. R. Morse	128	169,567
Salesman's seat, S. D. Sollers	62	169,381
Salt and pepper box, combined, G. H. Lomax	88	169,363
Sash fastener, I. H. Stoddard	24	169,494
Sash holder, Frost and Merrill	24	169,431
Saw buck, H. Disston	131	169,343
Saw gumming machine, H. Baughman	131	169,508
Sawing machine, scroll, W. H. Kimball	130	169,553
Sawing machine, scroll, L. C. Pratt	130	169,475
Scale beam, E. A. Chamerey	132	169,415
Sealing device, hermetic, T. Roberts	58	169,480
Seeders and cultivators, lifting device for, W. A. Van Brunt	133	169,602
Seeding machine, W. P. Penn, (reissue)	133	6,726
Sewing machines, clamp for attaching hemmers, braiders, &c., to, J. Dunn	134	169,530
Sifter, flour, Lintner, Weller, and Kellogg	88	169,454
Sink, L. Jones, Jr	8	169,551
Soap boiling apparatus, M. J. Palmer	26	169,472
Spinning frame, J. E. Atwood	142	169,507
Spoke tenoning machine, H. R. Carmany	31	169,414
Stove, G. W. Herrick, (reissue)	154	6,723
Stove, C. Warren	154	169,390
Stove grate, W. B. Hosford	154	169,544
Stove, heating, W. B. Treadwell	154	169,601
Stove, magazine, J. A. Buckwalter	154	169,410
Stove pipe drum, E. S. Blake, (reissue)	154	6,720
Swimming shoe, O. G. Ahlstrom	138	169,396
Syringes, atomizers, &c., shield attachment for bulb, E. T. Starr	98	169,384
Table leaf support, J. Wanner	62	169,388
Tailor's apparatus for drafting patterns, J. Bellamy	38	169,402
Tailor's pattern, J. H. Nichols	38	169,468
Telegraph, electric, R. K. Boyle	50	169,513
Telegraph, magneto printing, G. L. Anders	50	169,506
Temperatures, instrument for regulating, A. Camp-bell	154	169,339
Tenoning machine, H. Brand	173	169,336
Testing machine, W. J. Scott	92	169,376
Thill coupling, T. J. Quick	31	169,582
Tobacco cutter, W. H. Pease, (reissue)	160	6,728
Tobacco in bags, machine for packing, J. B. Farrar	160	169,533
Tool handle, G. W. Miller	29	169,367
Toy, automatic, Ives and Pilkington	143	169,547
Toy ball, bell metal, J. C. Clark	143	169,419
Toy gun and horn, L. Duvall	143	169,427
Toy target, J. Poszanski	143	169,580
Transplanter, Johnson and Bowman	63	169,445
Truck, hand, P. Lugenbell	31	169,559
Tube skelps into and through furnaces, device for pushing, G. Matheson	60	169 460
Valve, E. H. Beckwith	118	169,510
Valve attachment for steam cylinders, automatic air, J. N. Lauder	150	169 459
Vehicle spring, Corey and Neff	31	169,524
Venetian shade, C. Wildemann	62	169,502
Ventilation of commodes or close stools, R. D. O. Smith	8	169,490
Vise, A. H. Brainard	100	169,516
Vise, A. O. H. P. Sehorn	100	169,486
Wagon box, T. Jenning	31	169,444
Wagon brake, H. Markrud	31	169,459
Warper, Moulton, Damon, and Rice	95	169,468
Washing machine, T. Allen	91	169,307
Washing machine, A. Hale	91	169,437
Watch, J. K. Bigelow	36	169,512
Watch regulator, E. McNutt	36	169,458
Watchman's register, D. Shive	42	169,378
Water filter and purifier, A. Le Tellier	167	169,362
Water meter, W. B. Mounteney	167	169,368
Water supplying apparatus, J. N. Poage	167	169,577
Water traps, manufacture of, G. W. Wicks	8	169,392
Weather board gage, R. J. Dodd	29	169,527
Weather strip, J. Cleave	30	169,420
Well packing, drive, V. F. Thomascich	51	169,598
Whips, snapper loop for, H. H. Jones	72	169,550
Wrench, A. B. Lipsey	100	169,557
Yarn, thread, &c., machine for finishing, Rhodes, Shillito, and Speed	17	169,374
Yeast compound, J. Pfeiffer	6	169,474
Yoke, neck, C. Shuman	144	169,487

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED NOVEMBER 2, 1875.

	Patent No.
Ahlstrom, O. G., Swimming shoe	169 396
Albrecht, H., Fluting machine	169,327
Aldrich, W., Horse hay rake	169,328
Aldrich, W., Horse rake	169,329
Allen, T., Washing machine	169,397
Allred, J. J., Eyeleting machine	169,398
Amascen, Z., Paper bag	169,399
Anders, G. L., Magneto-printing telegraph	169,506
Anderson and Power	169,579
Anderson, H., Mandrel for broom machines	169,330
Appleton, C. J., Knitting machine	169,331
Atlantic Refining Company, assignee	169,372
Atwood, J. E., Spinning frame	169,507
Austin, W. J., Feed water heater for steam boilers	169,339
Backofen, F., Curtain fixtare	169,400
Baird, J., Machine for bending chain links	169,333
Barrow and Green	169,352
Bartlett, C., Machine for framing boats	169,334
Bassett and Wright	169,503
Bates, C. L., Door lock	169,401
Baughman, H., Saw gumming machine	169,508
Bean, E. E., Electric railway signal	169,509
Beckwith, E. H., Valve	169,510
Beebe, H., Lantern	169,511
Bellamy, J., Tailors' apparatus for drafting patterns	169,402
Bellinger, J. R., L. M. Bolles, and W. J. Fryer, Jr., Bridle bit for horses	169,403
Bieder, J., Bakers' oven	169,404
Bigelow, J. K., Watch	169,512
Billings, C. E., Breech loading fire arm	169,335
Blake, E. S., Stove pipe drum, (reissue)	6,720
Blood, J. M., Door spring	169,405
Bolles, Fryer, and Billinger	169,403
Bosson, W., assignee	169,442
Bowman and Johnson	169,445
Boyd, J., Cane and umbrella combined	169,406
Boyle, R. K., Electric telegraph	169,513
Boyle, R. K., Electrical induction apparatus	169,514
Bradley and Moore	169,466
Bradley and Hubbard Manufacturing Company, assignee	169,457
Bragg, E. C., Armpit shield	169,515
Brainard, A. H., Vise	169,516
Brand, H., Tenoning machine	169,336
Breidenbach, C. W., and E. E. Eudenbofer, Door check	169,407
Breval, L., Apparatus for expressing liquids, (reissue)	6,721
Briggs, M., Safe and vault door	169,337
Brooks, G. A., Clothes drier	169,517
Brown and Fisher	169,534
Brown, C., Baling short cut hay	169,518
Brown, C. A., Machine for cutting paper collars	169 408
Bryer, J., Corn planter	169,409
Buckwalter, J. A., Magazine stove	169,410
Buckwalter, J. A., Grate	169,411
Budd, J., Decorating glass	169,412
Buffington, T., assignee	169,527
Bull, H. C., Breech loading fire arm	169,413
Burke, M. T., Trace buckle	169,519
Caldwell, J. K., Furnace	169,338
Campbell, A., Instrument for regulating temperature	169,339
Carmany, H. R., Spoke tenoning machine	169,414
Carter, C. R., Fruit jar	169,340
Cassad, W. S., assignee	169,527
Chambers, B. C., Priming attachment to planing machines	169,520
Chameroy, E. A., Scale beam	169,415
Chapin, E. P., assignee	169,608
Chapman, W. M., Belt fastener	169,416
Chase, C. H., Bale tie	169,521
Cheney, J. W., assignee, (reisene)	6,724
Cherry, M. M., Hay fork	169,417
Cherry, S., Gate latch	169,418
Child, O., Mechanical movement	169,341
Clark, J. C., Bell metal toy ball	169,419
Cleave, J., Weather strip	169,420
Coevoet, J. H., Machine for the manufacture of nets	169,522
Coleman, C., Attaching knobs to spindles	169,421
Conant, H., Automatic sprinkler for extinguishing fires	169,422
Cook, W. H., Fertiliser distributer	169,523
Cool, K. P., assignee	169,479
Corey, B. J., and E. Neff, Vehicle spring	169,524
Covel, E. H., Process and apparatus for enriching gas and air, &c	169,423
Crain and Ruth	169,590
Cushing, G. H., Hand piece for dental engines	169,349
Cyr, A., Car coupling	169,424
Damon, Rice, and Moulton	169,568
Darrach, S. A., Cherry stoner	169,525
De Huff and Watson	169,605
De Huff, J. L., Oscillating printing press	169,526
Delamater, C. H., assignee	169,586, 169,587, 169,588
Detroit Stove Works, assignee, (reissue)	6,723
Dickerson, S. H., Pipe tongs	169,425
Disston, H., Saw buck	169,343
Dixon and Klar	169,361
Dodd, R. J., Weather board gage	169,527
Dodson, S., Grain decorticator	169,426
Donovan, D. H., Material for chair seats	169,528
Drayton and Osborn	169,571
Dronier and Voisin	169,397
Duhem, C., Galvanic battery	169,529
Dungan, A. S., assignee	169,480
Dunham and Latcher	169,451
Dunn, J., Clamp for attaching hemmers, binders, &c., to sewing machines	169,530
Duvall, L., Toy gun and horn	169,427
Edwards, O., Stand or holder for hose pipe nozzles	169,344
Engle, S. D., Dental engine	169,345
Enright, J., Steam boiler furnace	169,531
Estey, J., & Co., assignees	169,535
Eudenbofer and Breidenbach	169,407
Evans, W. C., Oscillating printing press	169,532
Evans, W. W., Dental engine	169,346
Evans, W. W., Dental engine	169,347
Fahlberg, C., Chemists' test apparatus	169,348
Fairfield and McKay	169,463
Farrar, J. B., Machine for packing tobacco in bags	169,533
Fisher, C. N., Brick machine	169 428
Fisher, W. F., and A. C. Brown, Fluting iron	169,534
Fitzgerald, W., Boot and shoe nailing machine	169,429
Fleischmann, J. W., Pipe stem	169,349
Florence Sewing Machine Company, assignee	169,344
Foote, E., Head for barrels and kegs	169,350
Foster, S. E., Hot air furnace, (reissue)	6,727
Fox, J., Drop light gasalier	169,430
Frampton, J., assignee	169,498
Frost, J. E., and J. Merrill, Sash holder	169,431
Fryer, Bellinger, and Bolles	169,403
Fuller, L. K., Apparatus for devaporizing air	169,535
Gardner, S. N., assignee	169,471
Gardner, W., and G. L. Hayes, Corn planter	169,432

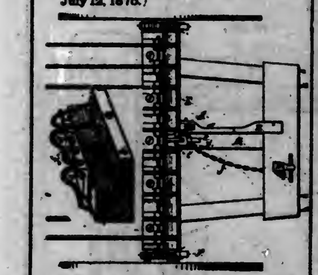
TITLES, DRAWINGS, AND CLAIMS

OF



PATENTS GRANTED NOV. 2, 1875.

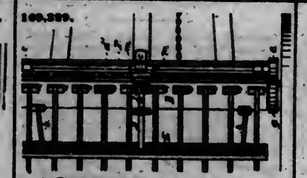
169,337. FLUTING-MACHINE. H. Albrecht, Philadelphia, Pa. (Filed Aug. 6, 1875.)

In a fluting-machine, the combination of the upper fluting-roller and its frame H, and the arm a of the latter, with the adjustable spring, J, lever I, and a device for retaining and releasing the said lever, all substantially as set forth.

169,338. HORSE HAY-RAKES. W. Aldrich, Dayton, Ohio, assignor of one-half his right to H. C. Hershelrode, same place. (Filed July 12, 1875.)

1. The improved tooth-holder D, composed of a plate and bearings, *d d*, in combination with the end of a rake tooth, bent in the shape shown, and pivoted by means of the rod *f*, substantially as described.

2. The beam *a*, provided upon its forward face with circular openings, in which the spiral springs are placed, as described, in combination with the slotted beam *b*, the tooth-holder D, and the ends of the rake-teeth, when the respective parts are arranged as and for the purpose specified.



3. The torsion-rod B, provided with the dogs F, for engaging with the ratchets G, and having the slotted arm H, connected to the treadle *m* by the chain *j*, in combination with the gravitating latch K, when arranged to operate in the manner and for the purpose specified.

4. The holding-down lever B, arranged as described, and provided with the gravitating arm S, substantially as and for the purpose specified.

169,339. HORSE-RAKES. W. Aldrich, Dayton, Ohio, assignor of one-half his right to H. C. Hershelrode, same place. (Filed July 12, 1875.)

Brief.—A horse-rake having adjustable beam hinged to lower edge of main axle, and connected with foot-treadle. Attached to top face of beam are two shafts, placed end to end in the middle bearing, and revolving independently of each other, and having at outside pinions, which mesh with gear on hubs of main wheels. By pressure upon treadle, the pinions on shaft attached to adjustable beam engage with gears on main wheels, and the shafts wind upon themselves a chain attached to lever connected with lifting-bar of rake, causing rake to rise and discharge hay.

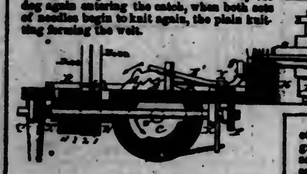
169,340.

1. The shafts *d d*, arranged as described, and provided with the pinions *e e*, in combination with the adjustable beam *b*, as and for the purpose specified.

2. The lifting-lever H, attached as the separate shafts, *d d*, by means of a chain, *n*, arranged as described.

3. The combination of the lifting-bar E, lever H, spool *l*, chain *n*, shafts *d d*, beam F, arm A, chain *j*, and treadle *i*, when the respective parts are arranged in the manner and for the purpose specified.

169,341. MANDRELS FOR BROOM-MACHINES. Henry Anderson, Vallejo, Cal. (Filed Sept. 11, 1874.)

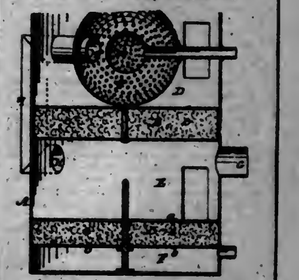


Brief.—The screw-threaded part receives the threaded socket of the broom-head, and the corn that is bound thereon is cut off against the ring of soft material. The parts are held together by a screw on the threaded portion.

The mandrel G L M, consisting of the threaded socket-holder G, provided with the screw-shank *l*, ring for the trimming of broom-corn ends, as described, L, spindle M, and pin *p*, for the adjustment of the device to the holder H of the broom-machine A A, substantially as and for the purposes herein set forth and specified.

169,342. KNITTING-MACHINES. Charles J. Appleton, Philadelphia, Pa. (Filed June 10, 1875.)

Brief.—Yarn of different colors is placed upon two sections of the needles in the cylinder and dial, which yarn changes sections at determined revolutions of the cam-ring, which is given an oscillating, and at times a stunting, motion, so that each section of needles knits first one color and then the other, constructing fabric similar to "hand-loom work." Welts are produced on each fabric automatically, at pleasure, by means of the welt-cam, moved by the ratchet, which depresses the inner end (by lifting the other end) of the spring welt-lever, which strikes a dog and catch, detaching the dial-ring from the cam-ring, so that the dial-needles cease to work, and plain knitting is done (by the needles operated by the cam-ring) until the dial-needles are again thrown into action by the dog again entering the catch, when both sets of needles begin to knit again, the plain knitting forming the welt.



1. The combination, with the needle-cylinder K and dial O, of the cam-ring J and dial-ring H, constructed substantially as described, so that ribbed or plain work may be produced automatically, at pleasure, as set forth.

2. The combination of a cam-ring, J, slide R, pulleys 1 2 3 4, and pattern-cam O, adapted to operate together, substantially as described.

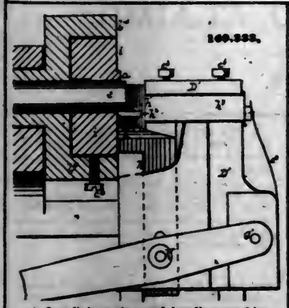
3. Four sliding pulleys, alternately tight and loose, applied to a chart, D, and combined with shifting mechanism, as described, whereby circular and semicircular movements may be imparted to the cam-ring J, at pleasure, substantially as specified.

169,343. FEED-WATER HEATERS FOR STEAM-BOILERS. William J. Austin, Hortonsville, Wis. (Filed Dec. 7, 1874.)

The combination of the cylinder A, filtering-diaphragms B C, with steam space or chamber B between them, steam-inlet G, and steam-conveying pipe H, leading from said chamber to the water and steam distributing heads *e f*, one within the other, so that the partially-boiled feed-water from the heads, after passing through the first diaphragm B, shall drip through a volume of more highly heated steam in the chamber E, all as and for the purpose described and represented.

169,344. MACHINES FOR BENDING CHAIN-LINKS. Jas. Baird, Allegheny, Pa. (Filed Sept. 30, 1875.)

Brief.—A pair of feed-rolls for feeding the rod through a cut-off block, and against a shoulder formed by the cut-away portion of a spiral sleeve attached to the rotating head-block, through which the bending-mandrel passes. End of rod, before striking the shoulder, passes underneath a cam shaped griping-dog, swinging in a slot in the head-block, which gripes it tightly against the bending-mandrel. Next blank is severed from the rod, and, the bending-mandrel retreating, is discharged from the machine.

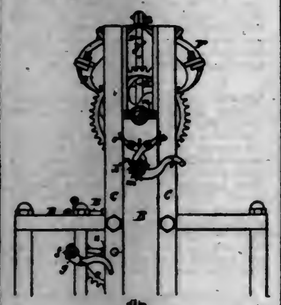


1. In a link cutting and bending machine, the combination of a bending-mandrel, *e f*, adjustable bridge P P', griping-dog *p*, head-block *i*, with spiral sleeve *a*, shear *b b*, and feeding-rolls *r r'*, operated substantially in the manner and for the purpose set forth.

2. In combination with the bending-mandrel of a link cutting and bending machine, the griping-dog *p*, guide-bar *s*, feeding-rolls *r r'*, and spiral sleeve *a*, operated and arranged substantially as set forth.

3. In combination with the bending-mandrel of a link cutting and bending machine, the automatically-adjustable bridge P P', lever B, yoke *y*, and cam or segment *x x'*, arranged and operated substantially as set forth, whereby the bridge P P', by an upward and downward motion, follows the elliptical form of the bending-mandrel.

160,825.



4. In a link cutting and bending machine, the horizontally-adjustable angular plate N N' and vertically-adjustable plate D', carrying thereon the cutting and feeding devices, and in combination therewith, whereby the cutting and feeding devices are adjustable to mandrels of different sizes, substantially as set forth.

5. In combination with the shears *h h'*, the adjustable tappet *o*, with a lever connection to the shears, for effecting the cut at the end of a variable feed, and the adjustable tappet *p'*, and inclined-faced projection *q*, with pawl-and-ratchet connection to the feed-rollers, for imparting to the rod a feed variable in length at pleasure, substantially as set forth.

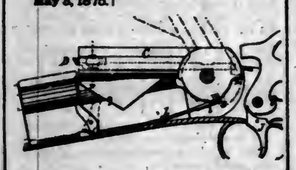
6. In a link cutting and bending machine, the combination of a bending-mandrel, *o o'*, with the spiral sleeve *o*, stop *o'*, and gripping-dog *p*, substantially as set forth.

7. In a link cutting and bending machine, the combination of a bending-mandrel, *o o'*, head-block *i*, and hollow shaft *b b'*, having an enlarged hollow cylindrical head, *b'*, operated and arranged substantially as set forth.

160,826. Machines for Framing Boats. Chas. Bartlett, Newburyport, Mass. [Filed Oct. 5, 1875.]

1. The combination of the series of ribs, cam, or outwater and stern-supporters F G G' H H', substantially as described, with a rotary shaft, A, such supporters being applied to the said shaft, essentially as set forth.

2. In combination with said shaft A and its series of outwater, rib, and other supporters, the mechanisms for raising, lowering, and revolving said shaft, and holding it in position, each consisting of the slides B B, racks *b b*, pinions *c c*, shaft *d*, gears *e e*, pinions *f f*, shaft *g*, bolts E E, gear *i*, pinion *k*, shaft *h'*, ratchet-wheels *m m*, and the pawls *o p*, all arranged and to operate essentially as explained.

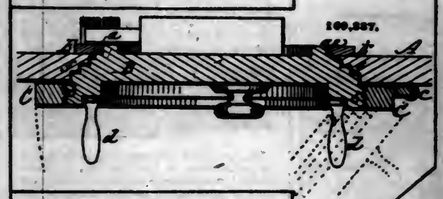


160,827. Safe and Vault Doors. Martin Briggs, Rochester, N. Y. [Filed Sept. 6, 1875.]

1. The combination, with the swinging frame C, of the door B, constructed with the threads *a b*, the outer thread being of the greatest diameter, and engaging with the frame, thereby having the face of the door free for the passage of the spindle or key, and forming a firm support for the door, to prevent sagging, as shown and described.

2. In a burglar-proof safe, the combination, with the plating A and screw-door B, of the independent ring attached on the inside of the safe, and provided with a thread for the reception of the screw *a*, as shown and described, and for the purpose specified.

3. The combination, with the screw-door B and swinging frame C, of the arm *i* and stops *h h'*, projecting unequally from the frame, the lower stop constructed of right-angled form, in the manner and for the purpose specified.



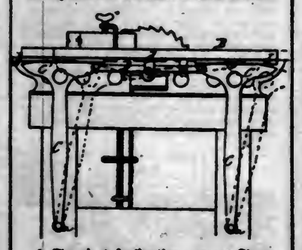
160,828. Bridges - Loading Fire - Arms. Chas. B. Billings, Hartford, Conn. [Filed May 3, 1875.]

1. The combination of the locking-bolt D with the firing-pin F, by means of the connecting-pin *d* and shoulder *b*, so that the firing-pin is retracted whenever the breech is opened or closed, but is free to move forward sufficiently to fire the charge when the breech is locked, substantially as herein described.

2. The combination of the lever K and the spring-bar L with the projections *n* and *n* on the rear of the breech-block to form an extracting mechanism operated by the movement of the breech-block, substantially as herein described.

160,827.

160,829.



3. The cutter-arms F, hinged to the rings L L', in combination with the adjusting-rods *g*, arranged and operating substantially as described.

4. The cutter-heads, constructed substantially as described—that is to say, having the saws M M and the intermediate sleeve and adjustable cutters, arranged and operating substantially as described.

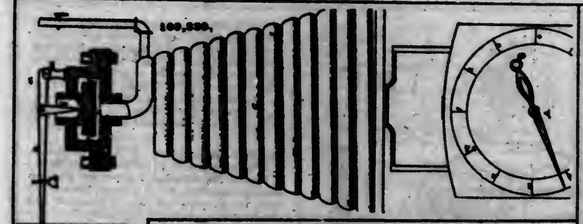
160,830. Threshing-Machines. H. Brand, St. Paul, Minn. [Filed Mar. 24, 1875.]

Brief.—The labor of operating the carriage of a tenoning-machine is diminished, and the friction consequent upon the movement of the carriage upon the ordinary guideways is greatly relieved, by means of pivoted vibrating segments or parallel links, which support one end of the carriage, and have their swinging ends formed in arcs of circles, the pivots upon which the arms swing being the centers, so that the carriage resting on the segments will move in right lines. The cutter is formed of two sections, each consisting of a circular saw and an overlapping hinged cutter adjustable upon the exterior of a ring located upon a sleeve on the saw-arbor. The sections are adjustable to cut different-sized tenons.

1. The pivoted vibrating segment C', constructed and applied to the reciprocating carriage B, substantially as described, whereby said carriage is supported by and adapted to be moved in right lines upon said segments, for the purpose and substantially as set forth.

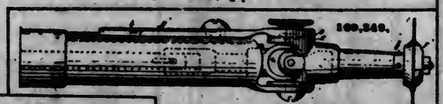
2. The cutter-head sleeve K, provided with the right and left hand screws, as described, in combination with the rings L L', to which the cutters are attached, substantially as described.

160,831. Furnaces. Joseph K. Caldwell, Philadelphia, Pa., assignor to himself and John L. Kates, same place. [Filed Sept. 4, 1874.]



Brief.—Compressed air is forced through the upper pipe, into which is fed coal-dust from the hopper. Petroleum is injected through the lower pipe by a steam-jet. Both pipes are heated by the furnace and the petroleum converted into gas.

The pipes B and D communicating with the nozzle *d*, the hopper H communicating into the pipe B, the oil-pipe *b* communicating with the pipe D, and nozzle *a* arranged opposite the open end of the pipe D, all combined with each other and with a furnace substantially as and for the purposes set forth.

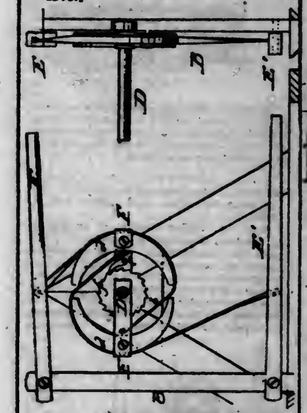


160,832. Instruments for Regulating Temperature. Augustus Campbell, Westbridge Township, Middlesex County, N. J. [Filed Mar. 26, 1875.]

The combination of the balance A with the coil or vessel C, regulator B E E, and damper F, as and for the purposes specified.

160,833.

160,840.



160,834. Fruit-Jars. Charles R. Carter, Zanesville, Ohio. [Filed Mar. 15, 1875.]

The combination, with a fruit-jar having a flat top and provided with two or more annular wedge-shaped recesses thereon, of a cover provided with a corresponding flat bottom, and having two or more annular wedge-shaped projections opposite the said recesses on the jar, and a gasket interposed between the two, with suitable mechanism for forcing the jar and cover together, substantially as and for the purposes set forth.

160,841. Mechanical Movements. Orlando Child, Claremont, N. H. [Filed Apr. 8, 1875.]

The combination and arrangement of the vertical standards B, levers E E, treadles E' E', diametrical frames F F, having pawls, the connecting-rods *a a*, and the shaft D, having ratchet-wheels *f f*, substantially as and for the purpose specified.

160,842. Hand-Pieces for Dental Engines. George H. Cushing, Chicago, Ill., assignor to Saml. S. White, Philadelphia, Pa. [Filed Sept. 28, 1875.]

Brief.—The hand-piece is made up of two tubular sections pivoted together, and adjustable at any angle by a serrated clamping-arm. Through both the sections is passed the rotating shaft, from a dental engine. The shaft is coupled by a universal-joint.

1. The hand-piece constructed, substantially as described, with a tubular main section, a movable clamping-arm mounted thereon, and a movable tubular section pivoted on the main section and clamping-arm, for the purposes specified.

2. The combination, substantially as hereinbefore set forth, of the tubular main section, its clamping-arm, the movable tubular section carrying the tool-holder, the driving-shaft, and the universal joint connecting the driving-shaft and tool-holder in the line of the joint of the hand-piece, for the purposes specified.

160,843. Saw-Bucks. Henry Dawson, Philadelphia, Pa. [Filed Oct. 22, 1874.]

Brief.—The legs of a saw-buck, where they cross each other, are provided with recesses, one having a convex and the other a concave recess, and the connecting-bar is threaded at each end where it passes through the outer leg, for packing in a small compass for transportation.

The combination, in a saw-buck, of recessed legs A A', and a connecting-bar, D, having at each end a shoulder, *x*, and a cylindrical projection plain at *a*, where it passes through the inner leg, and threaded at *b*, where it passes through the outer leg, all as and for the purpose specified.

160,844. Stands or Holders for Hose-Pipe Nozzles. Oliver Edwards, Florence, Mass., assignor to Florence Sewing-Machine Company, same place. [Filed June 30, 1875.]

Brief.—The support is forced into the ground to give security to the nozzle, which is placed in hooks and clamped thereto by turning the button or cam hard onto the nozzle; then the nozzle is given its direction, and the thumb-nut is turned down and holds the nozzle in its position.

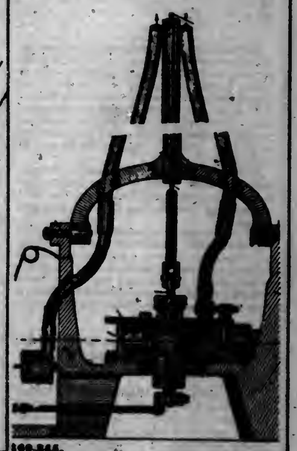
160,845.

1. The stand or support A of a hose-pipe nozzle, bent or offset at *x*, as and for the purpose substantially as described.

2. The combination of the bent support A and forming part A', with the holder B, having hooks *b*, and the screw *b'* and thumb-nut *b''*, substantially as described.

3. The combination of the holder B and cam or button B' with the nozzle C, substantially as described.

4. The support or stand A, bent at *x*, and nozzle-holder B, constructed as above described, as a new article of manufacture.



160,846. Dental Engines. Stephen D. Hogle, Hazleton, assignor to Saml. S. White, Philadelphia, Pa. [Filed July 6, 1875.]

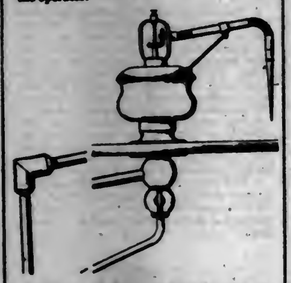
Brief.—The driven shaft is mounted in bearings in a rocking frame pivoted to the engine-frame, and connecting said shaft and that of the motor by a flexible joint. Connected with the motor and operating-tool is an exhaust apparatus, for removing dust or moisture from the point at which the tool is operating; also, a pump for applying a jet of air or liquid at or near the point upon which the tool is operating. There is also an arrangement to regulate the temperature of the fluid ejected, by combining with the motor a coil of pipe and a lamp. The shaft is mounted in bearings of rubber in a tube supported upon the rocking frame of the engine, to prevent the trembling of the driven shaft.

1. The combination of the frame, the water-wheel mounted therein, the rocking ball pivoted on the frame, the tubular shaft-supporting frame mounted on the ball, the driven shaft mounted in bearings in said tubular frame, and a flexible shaft connecting the water-wheel and driven shafts, these members being constructed and operating in combination substantially as hereinbefore set forth.

2. The combination, substantially as hereinbefore set forth, of the water-motor, the driven shaft by which the tool is operated, and the exhaust apparatus for removing moisture, filings, &c., from the point of operation.

3. The combination, substantially as hereinbefore set forth, of the water-motor, the shaft for operating the tool, and the pump for discharging air or fluid at the point of operation.

4. The dental engine hereinbefore set forth, consisting of the combination of the water-motor, the operating-shaft, the ejector-pump, and the exhaust apparatus.



5. The combination, substantially as hereinbefore set forth, with the pump, of the apparatus for varying the temperature of the fluid ejected by it.

6. The combination, substantially as hereinbefore set forth, of the tube, the bearings of elastic material arranged at short intervals therein, and the driven shaft.

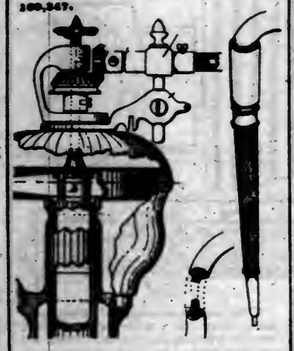
7. In a dental engine, the combination of the frame, the casing, the percussion-wheel, the tapering injection-pipe, and the discharge-pipe, both arranged tangentially to the wheel, as and for the purposes set forth.

160,846. Dental Engines. W. W. Evans, Georgetown, D. C., assignor to Saml. S. White, Philadelphia, Pa. (Filed June 26, 1874.)

Brief.—A small water-wheel rests upon the swinging operating-table, and has its supply of water and its waste carried off through a hollow support. To the shaft of the water-wheel is connected by gearing the ordinary flexible shaft of a dental engine. The valve to control supply of water is directly beneath the operating-table, and swings with the bracket, so as to be always within reach of the operator.

1. The combination, substantially as herein-before set forth, in a dental engine, of flexible shafting, and a water-motor mounted upon a hollow bracket or support, through which the supply and waste water for the motor flows.

2. A dental engine constructed substantially as herein-before set forth, and mounted upon a swinging bracket or support, whereby its position relatively to the operator may be varied.



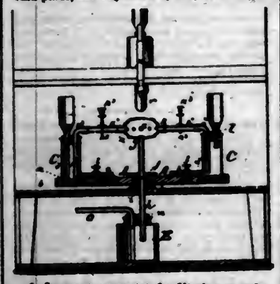
3. The combination, substantially as herein-before set forth, of the tube, the bearings of elastic material arranged at short intervals therein, and the driven shaft.

4. The combination, substantially as herein-before set forth, in a dental engine, of the frame, the casing, the percussion-wheel, the tapering injection-pipe, and the discharge-pipe, both arranged tangentially to the wheel, as and for the purposes set forth.

160,847. Dental Engines. W. W. Evans, Georgetown, D. C., assignor to Saml. S. White, Philadelphia, Pa. (Filed July 16, 1875.)

Brief.—This is an improvement on United States Patent No. 151,463, June 2, 1874. The motor is a water-wheel adapted to be mounted on the operator's table, and capable of being readily controlled by the operator, and connected therewith to a tool having great freedom of movement.

1. The combination, substantially as herein-before set forth, of the casing, the supply-pipe, the wheel revolving on the supply-pipe, the chuten, and the battery for the purposes specified.



2. The combination, substantially as herein-before set forth, of the casing, the supply-pipe, the wheel, its spindle, the post on the casing, the flexible sheath, and the flexible shaft.

3. The combination, substantially as herein-before set forth, in a dental engine, of the casing; the water-wheel revolving therein, and a dental tool driven by a flexible shaft mounted on a frame swinging around the water-wheel shaft, and driven by a gearing from said shaft, whereby great freedom of movement is imparted to the tool.

4. The dental engine, herein-before set forth, consisting of the combination of the casing, the supply-pipe, a wheel mounted thereon, the annular waste-pipe, and a dental tool driven by a flexible shaft connected directly with the water-wheel shaft, whereby the parts are adapted to be mounted directly upon the operator's table or other suitable support.

160,848. Chemists' Test Apparatus. C. Fahlberg, New York, N. Y. (Filed Apr. 7, 1875.)

Brief.—A chemist's test apparatus, consisting of a series of bottles placed on a rotating table, the said bottles connected by pipes to a central pipe, which discharges in a receiver. The filtering process is hastened by an air-pump, which is connected to these bottles by said pipes, and regulated by stop-cocks.

1. In a test apparatus for filtering or refining sugar or other substances, the combination of the table A, carrying a series of test-bottles, C C, with the stationary receiver B, which connects with all said test-bottles, as set forth.

2. A test apparatus containing a series of test-bottles, C C, each of which carries a separate filtering-funnel, all of said bottles being connected with and operated by a single air-pump, as specified.

3. In combination with the stationary tube h, the rotary tube g on the turn-table A, and the radial tubes b b, extending from the rotary tube g, substantially as and for the purpose herein shown and described.

4. The turn-table A, carrying the upwardly-projecting central tube g and the downwardly-extending cup f, combined with the stationary hollow cone i, and with the tube h projecting therefrom, substantially as specified.

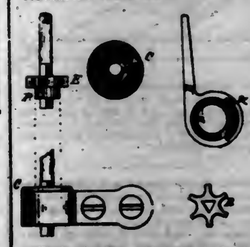
5. The turn-table A, made with a series of cavities, a a, and locking-plates c c, for securing a series of test-bottles, C C, substantially as herein shown and described.

160,849. Pipe-Stems. J. W. Fleischmann, Williamsburg, N. Y. (Filed Apr. 21, 1875.)

Brief.—The stem has a removable mouth-piece attached, which receives the nicotine from the tobacco, and can be taken off and cleaned when necessary.

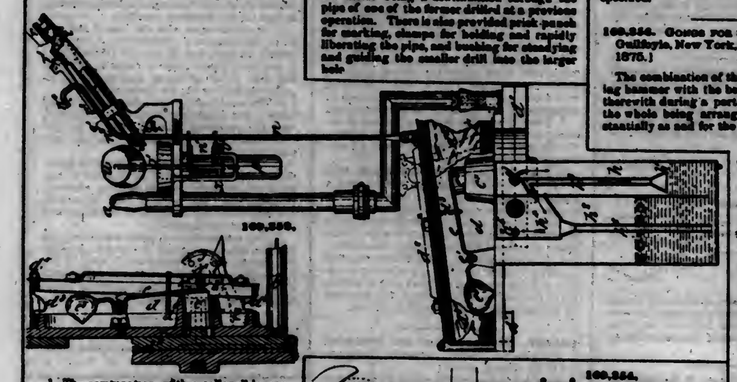
The stem A and shell C attached by screw-thread, in combination with the detachable glass receptacle B having perforation c, all as and for the purpose herein set forth.

160,850. Heads for Barrels and Kegs. Edward Foote, North Somerville, Mass. (Filed Sept. 21, 1875.)



Brief.—For removing the contents of barrels without disturbing the hoops, and preventing the evaporation of fluids or access of insects, the head is formed in two parts—one a main head provided with a central opening, graduated to the size of the vessel and having beveled edges, the other a removable head, which has its edge also beveled, and acts as a stopper for closing the opening in the main head. A strap is passed over the removable portion, and fastened to the main head, as additional security in transportation.

The barrel-head herein described, constructed in two parts, A and B, with beveled edges, relatively arranged as shown, the removable portion B being secured by the strap C, all as and for the purpose set forth.



160,851. Door-Spring Attachments. W. M. Gray, Brooklyn, N. Y. (Filed Aug. 6, 1875.)

Brief.—A bracket attachment for keeping up a torsion door-spring is made in three parts—the intermediate diaphragm being pierced with a triangular hole for the end of the spring to run in, the bracket suitably recessed, and the cap-piece provided with two or more corresponding detents; the main object being to avoid machine-work and cheapen the details of construction.

The bracket B, provided with the diaphragm D and recesses E, the cap C, provided with the detents d d, and the plug P, provided with the projection B, in combination with S door spring, and operating in the manner set forth.

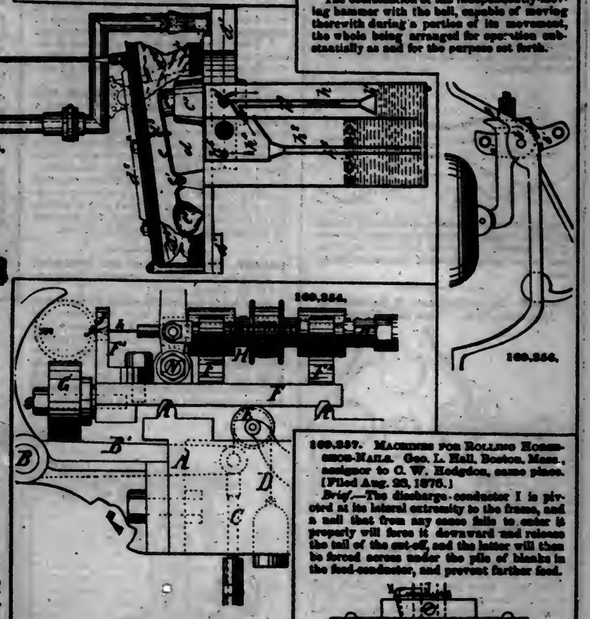
160,852. Apparatus for Lighting and Extinguishing Gas. Henry Green, Preston, and John Barrow, Clayton, Great Britain. (Filed Sept. 17, 1875.)

1. The combination, with a collapsible vessel, an inlet for gas, an outlet to a burner, and a valve for closing or regulating the communication between said inlet and outlet, of a governing weight or body for proportioning the expansion of the collapsible vessel until a predetermined pressure of gas exceeding the ordinary maximum working pressure, and sufficient to displace said governing weight or body, shall have been put on, and a cam arrangement for retaining the collapsible vessel in a partially-expanded state, to permit the continued flow of gas to the burner, notwithstanding such variations as may occur in the gas pressure within its predetermined ordinary working limits.

2. The combination, with a gas-burner, of a mixing-chamber for containing a liquid chemical agent, a receptacle or reservoir for containing pills or balls composed of suitable chemical ingredients, a valve, cam, spring, and other mechanism, operating as hereinbefore described, for regulating the delivery of said pills or balls, one at a time, into the mixing-chamber, as required, to produce the necessary flame for igniting gas issuing from the burner.

3. The combination, with the collapsible vessel *d*, valve *e*, and orifices communicating, respectively, with the gas-supply and with the burner, of the hydraulic trap, for governing the admission of gas into the collapsible vessel *d*, and the cam device *f m*, for retaining the collapsible vessel *d* in a partially-expanded state, said device being arranged to allow the vessel *d* to collapse or close as required, all substantially as hereinbefore described and illustrated.

4. The combination of the collapsible vessel *d*, operated and regulated as described, the rod *n*, the lever *o o'*, and cap *r*, the covering and governing cap *m*, the rod *p*, and the lever *q q'* and arm *s*, for regulating the delivery of pills or balls into the mixing-chamber, as above set forth, for the purpose specified.



160,853. Methods of Drilling Holes in Pipes for Sprinkling Water. Frederick Grinnell, Providence, R. I. (Filed June 10, 1875.)

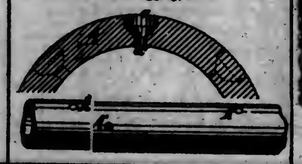
The within-described method of drilling sprinkling-pipe, by first producing a large hole partially through from the outside, then inserting a projection, *j*, therein, and, third, continuing the hole through to the interior of a smaller diameter, as herein specified.

160,854. Pipe-Drilling Machines. Fredk. Grinnell, Providence, R. I. (Filed June 10, 1875.)

Brief.—The machine drills a large hole through something more than half the thickness of the pipe at one point, at the same time that a smaller hole is drilled at another point, the latter being a continuation through the pipe of one of the former drilled at a previous operation. There is also provided print-punch for marking, clamps for holding and rapidly liberating the pipe, and bushing for steadying and guiding the smaller drill into the larger hole.

1. In combination with means F for holding and releasing the pipe *a*, the small drill I, and the larger drill J, connected as shown, and operated at a single motion, substantially in the manner herein specified.

2. The bushing J *j*, adapted to enter the partially drilled hole and determine the position of the pipe, and having a concentric aperture adapted to receive the drill I, as herein specified.



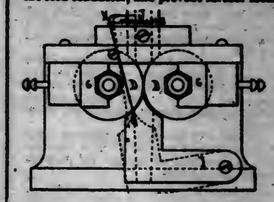
3. The print-punch P, mounted as shown, in combination with the drills I and J, and their impelling and operating means, substantially as and for the purpose herein specified.

4. The fly-wheel L, in combination with the drill I, and adapted to serve both as a means of steadying the drill in operation, and of confining and releasing it, as herein specified.

5. The combination of the supporting-rollers C, clutching-arms D, lateral support F, and drills I J, and their driving means, the several portions serving relatively to each other as and for the purposes herein specified.

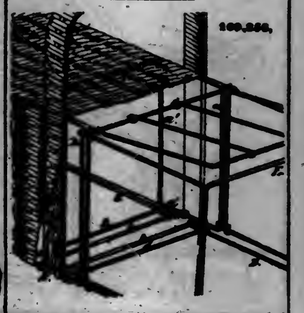
160,855. Sprinkling-Pipes. Frederick Grinnell, Providence, R. I. (Filed June 10, 1875.)

Brief.—The sprinkling-pipes used for fire-extinguishing purposes have the perforations shown, to prevent clogging, &c.



160,856. Discharge-Conductor. Wm. Guilfoyle, New York, N. Y. (Filed June 1, 1875.)

The combination of the independently-moving hammer with the bell, capable of moving therewith during a portion of its movement, the whole being arranged for operation substantially as and for the purpose set forth.



160,857. Machines for Rolling Horseshoe-Nails. Geo. L. Hall, Boston, Mass., assignor to C. W. Hodgdon, same place. (Filed Aug. 23, 1875.)

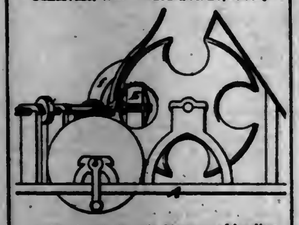
Brief.—The discharge-conductor I is pivoted at its lateral extremity to the frame, and a nail that from any cause fails to enter it properly will force it downward and release the tail of the cut-off, and the latter will then be forced across under the pile of blanks in the feed-conductor, and prevent further feed.

The combination of the discharge-conductor I, frame A, dies D D, cut-off H, spring J, and the feed-conductor F, substantially as herein described and set forth.

160,858.

160,869. FOLDING SAWHORSE. G. Hammersley, Pittsburg, Pa. [Filed June 8, 1875.]

The stationary central foundation A, in combination with the top, bottom, and sides hinged thereto, and the end E hinged to the bottom B, so that the several parts are capable of being folded within the central foundation, substantially as described.



160,870. PURPOSE IMPLEMENTS. George H. Rexford and Wm. C. Ward, Middletown, Ohio. [Filed Nov. 27, 1875.]

Brief.—The pole which operates the shears by an upward thrust has a cross-head grooved at each side for guiding the two shanks of the shear-blades.

In a pruning implement, in which the blades are closed upon the limb by an upward thrust of the handle, the guide, follower, or cross-head in which the shanks of the shear-blades work.

160,900. GRAIN-SPREADER. S. S. Jackman, Janesville, Wis. [Filed Dec. 26, 1873.]

1. The herein-described process of binding grain by clamping the gavel and rotating it against the butts, which separates a portion of the heads from the gavel at intervals, and twisting the straw around the bundle to a point past the beginning, and severing the end in a cleft.

2. In a grain-binder, the combination of the rotating clamping-lugs with the rotating twister C, having its lateral spiral slot for the purpose of forming a band around and attached to grain-bundles, substantially as described.

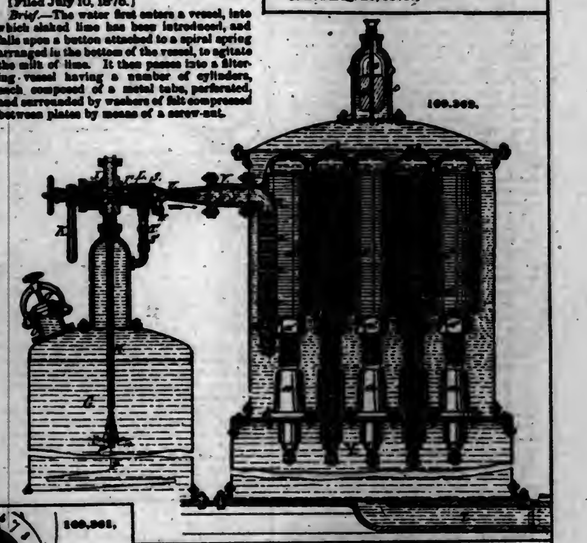
3. Twister C, standard X, clamp or lugs R, grooved wheel or eccentric *f*, in combination, substantially as and for the purposes hereinbefore set forth.

160,901. CHECK-ROW PLANTERS. Joseph Kier and Monty S. Dixon, Shelbyville, Ill. [Filed Aug. 12, 1875.]

1. In a corn-planter, the wheel F, operated by a check row cord or rope and mounted on an axis, plate, or wheel, I, index-arm K, and a valve-operating crank or device, M, in combination with bars S, provided with scales, substantially as and for the purpose described.

2. The combination, in a corn-planter, of an adjustable valve actuating device, wheel F, check-row cord, and rods or bars S, provided with scales, as described, with the T-square U, substantially as and for the purpose described.

3. The combination, in a corn-planter, of the check-row cord reel r^1, provided with pulleys r^2 with supporting and driving-wheel A^1, substantially as described.



4. In a corn-planter, the combination, with the pulley F, axis F', plate or wheel I, and a stationary index-dial, L, of a valve-operating arm or cam surface provided with index-hands or pointers, and capable of being connected to and disconnected from the plate or wheel I, substantially as and for the purpose described.

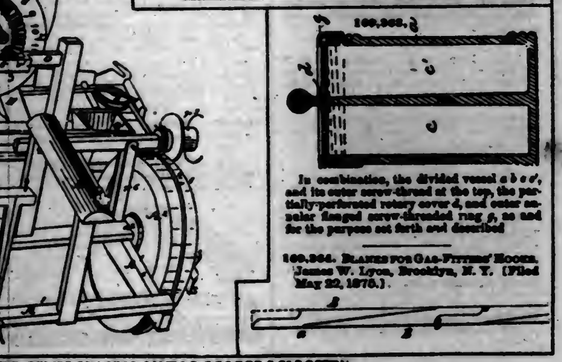
5. In a corn-planter, the combination, with a pulley, F, plate or wheel I, stationary index-dial L, index-arm K, and crank arm or surface M, of the sliding bar O, lever *p*, and slide-bar Q, substantially as shown and described.

160,902. WATER FILTERS AND PURIFIERS. Adolphe Le Tellier, Brussels, Belgium. [Filed July 10, 1875.]

Brief.—The water first enters a vessel, into which slaked lime has been introduced, and falls upon a button attached to a spiral spring arranged in the bottom of the vessel, to agitate the milk of lime. It then passes into a filtering-vessel having a number of cylinders, each composed of a metal tube, perforated, and surrounded by washers of felt compressed between plates by means of a screw-nut.

160,903.

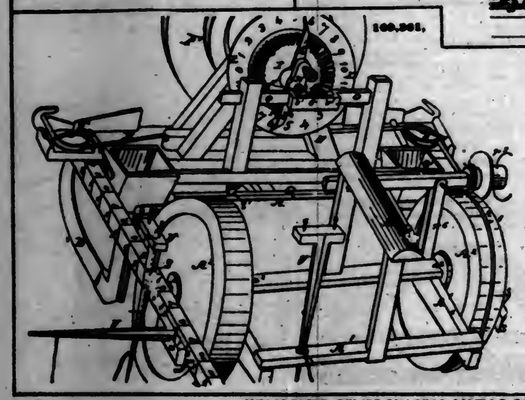
1. The combination, to apparatus for filtering water, of a vessel, G, fed by a pipe, N, provided with means for regulating the supply, the said pipe being arranged in conjunction with a rod, P, provided with a button or projection, P', and forming an agitating-spring, as and for the purposes specified.



2. In combination with the tube N and vessel G, the chamber J', hollow plug J, threaded spindle m, obturator M, pipe or nozzle L, pipe or nozzle b, pipe S', tap or valve T, and conical pipe U, all arranged and operating together as and for the purposes specified.

3. The combination of the filter I, perforated tubes *a*, and filtering-washers *d'*, as described, with the purifying-vessel G, tube N, and the connections S *b* T U V, as and for the purposes specified.

4. The compound filter composed of perforated tubes *a*, surrounded by washers or layers of felt, or other suitable filtering material, *d'*, compressed and held in place by screws, the whole inclosed in a proper casing, as and for the purposes specified.

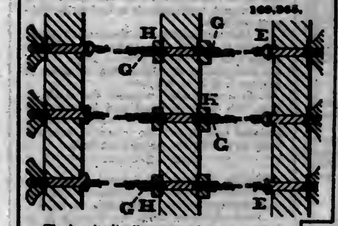


5. The combination of parts comprising the vessel I, tubes *a*, washers *d'*, plates *a'*, handles *a²*, screwed nuts *a³*, basement Y, tube Z, tap *h*, tube X, bars *z*, tube *c*, valve *d*, rod *q*, guide *f*, and foot *g*, forming the improved multi-tubular filter shown in the drawings.

160,904. COMBINED SALT AND PEPPER BOXES. Geo. H. Lesser, Somerville, Mass. [Filed Aug. 20, 1875.]

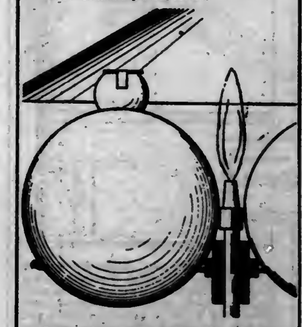
In combination, the divided vessel *a b c d*, and its outer screw-thread at the top, the partially-perforated rotary cover *d*, and outer annular flanged screw-threaded ring *g*, as and for the purpose set forth and described

160,905. BLANKS FOR GAS-FITTERS' HOOKS. James W. Lyon, Brooklyn, N. Y. [Filed May 22, 1875.]



160,906.

The within-described improved hook-blank B, produced by the cuts *a* to *a'* and *b* to *b'*, substantially as herein specified.



160,907. WIRE FENCING. Jas. M. McClellan, Philadelphia, Pa. [Filed July 24, 1875.]

160,908.

The longitudinally-arranged screw-bolts E, with perforated heads, the longitudinally-arranged screw-bolts G, with perforated ends, the nuts F E, and wires D, combined and operating substantially as and for the purpose set forth.

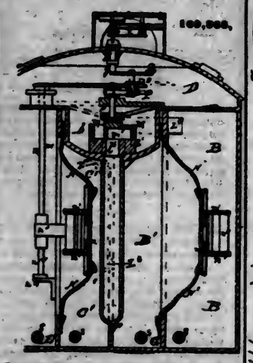
160,909. LEVEL ATTACHMENTS TO GAS-BURNERS, &c. M. C. Meigs, Washington, D.C. [Filed Apr. 22, 1875.]

1. The combination of two hollow glass lens-shaped bottles, adapted to be filled with transparent liquid, a support therefor attached to and located upon a gas-pipe, with its jet between the compound glass and liquid lenses, these members arranged, constructed, and operating substantially as and for the purpose set forth.

2. The combination of two hollow glass lens-shaped bottles, adapted to be filled with transparent liquid, a support therefor on different sides of an illuminating-flame, a reflector, and an illuminating-flame, these members arranged, constructed, and operating substantially as and for the purpose set forth.

160,910. TOOL-HANDLES. Geo. W. Miller, Meriden, Conn. [Filed June 26, 1875.]

Brief.—Two holes are formed in the end of the handle, at such an angle that they will intersect each other between their outer and inner ends. The tang of the wire implement is bent back by forcing it in the holes.

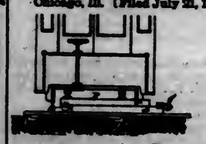


The method of securing implements in handles, substantially as herein described—that is to say, by making two holes, *c*, in the end of the handle, in such relative position and inclination to each other that the said holes shall intersect at some point between their inner and outer ends, and forcing the implement therein, as set forth.

160,911. WATER-METERS. Wm. B. Mountenay, Chicago, Ill. [Filed Sept. 1, 1875.]

Brief.—The water under pressure is alternately conducted to and allowed to flow from opposite sides of a pair of diaphragms, in such manner that both diaphragms shall be caused to move alternately back ward and forward, and by means of connecting-arms, links, &c., revolve a valve and the index-gearing. The valve at each revolution causes the chambers to be alternately filled and emptied.

160,912.

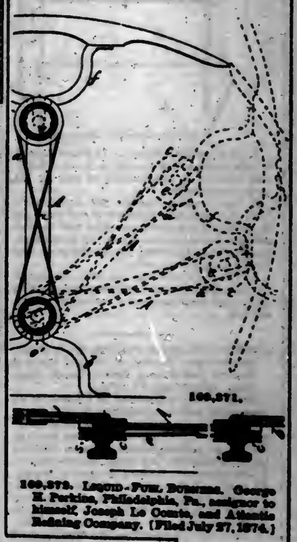


1. In a meter for measuring liquids, the combination, with the chambers B B' O O' and diaphragms N N', of the chamber D, provided with a well, L, and valve-seat L', having apertures P P P P, controlled by a revolving valve, M, formed with passages *n n'*, substantially as shown and described.

2. The combination, with the chambers B B', O O', and D, and well L² of the seat L', apertures P P P P, valve M, passages L, L', L², and R, all constructed substantially as described.

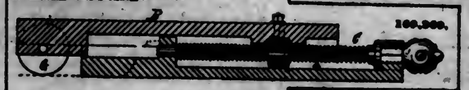
3. In a water-meter provided with chambers B B' O O', the inlets and outlets to which are controlled by a revolving valve, M, the combination, with the diaphragms N N', of the plates *n*, arms *n²*, shafts or rods *n³*, links *o o'*, crank-arm P, slotted arm Q, shaft *q*, and index-gears *t*, substantially as shown and described.

160,913. CARRYING-JACKS. A. K. Norris, Chicago, Ill. [Filed July 21, 1875.]



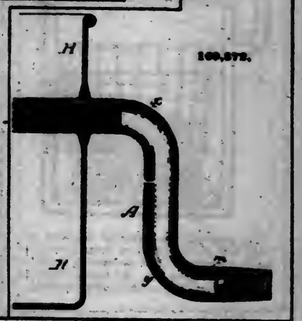
160,914. COMBINED CARRIAGE-TOP. R. F. Painter, Greenfield, Mass. [Filed Sept. 8, 1875.]

Brief.—The cord and pulleys regulate the position of the top.



The combination of the bar A, the bearing *m* attached to the carriage, and the bearing *m'* attached to the canopy, the pulleys *r* and *r'*, the cord or chain *a*, and clamping devices to clamp said pulleys, substantially as herein described.

160,915. LIQUID-FUEL BURNERS. George H. Perkins, Philadelphia, Pa., assignor to himself, Joseph Le Conte, and Atlantic Refining Company. [Filed July 27, 1874.]

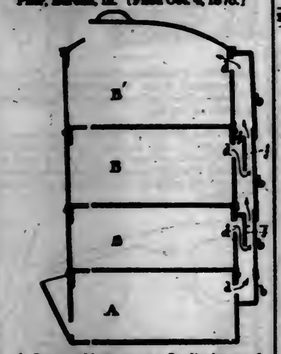


160,916.

In combination with the grooved bed A and movable platform B, adapted to move in the groove *a* of the bed, and provided with the auxiliary wheel G, the screw C, and nut F, all arranged substantially as and for the purpose specified.

160,917. GAS-WHEELS. William H. Paige, Springfield, Mass. [Filed Apr. 10, 1875.]

160,918.



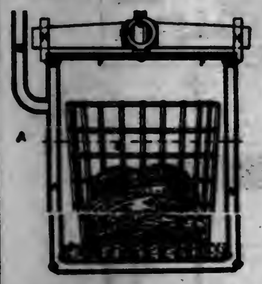
1. An improved railway-car wheel, having the side plates A and C made of wrought metal, each fitted into an annular channel in the tire, which is also made of wrought metal, and secured thereto by turning the metal of the tire over upon the edge of the plate, substantially as set forth.

2. In a railway-car wheel, the wrought-metal side plates, having the pieces *c* formed up from the center of the plate, and turned back against it, to furnish a solid bearing for the bolt *f* and washer *e*, substantially as described.

1. The within-described burner, consisting of a jointless tube, *A*, plugged and welded at the end, having an outlet-aperture, *a*, near said plugged end, and bent at two points, *c c*, so that the flame at the aperture will rest on the bent portion of said endless tube, all as set forth.

2. The combination of the burner supply-pipe, its regulating-cock *g*, and the vessel *H*, through which the said pipe extends, and to which it is cushioned at opposite sides of the cock, as set forth.

160,272. COOKING-STEAMER. Michael Filer, Bowden, Ill. [Filed Oct. 4, 1875.]



1. In a cooking-steamer, the diaphragm *f*, in combination with the pipe *h*, the opening *d*, and steamer B, substantially as and for the purposes described.

2. In a cooking-steamer, the combination with the respective steamers B and passage *d*, of the outside pipe *h*, provided with the diaphragm *f* over the passage *d*, constructed, arranged, and operating substantially as and for the purposes described.

3. The combination of the boiler A, steamers B, and upper steamer B', sectional outside pipe, and diaphragms *f f*, arranged as described.

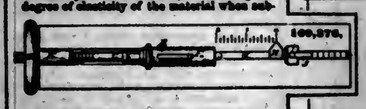
160,273. MACHINERY FOR FINISHING YARN, THREAD, &c. Samuel G. Rhodes, Michael Sidlow, and John I. Speed, Leeds, England. [Filed Aug. 27, 1875.]

Brief.—Yarn in hanks or on bobbins, in an open-work basket or receiver, is placed in a metal cylinder of greater diameter, composed of an inner and outer wall, and provided with an air-tight cover. An inlet-pipe admits steam into the space between the two walls, whereby the air in the cistern surrounding the yarn is heated. By means of a pipe, connected at one end with the outer wall and at the other with the inner wall, steam may be admitted into the interior in order to moisten the air, or a small quantity of water may be placed in the lower part of the cistern.

The described apparatus for finishing, setting, and giving lustre to yarn, thread, or braid, consisting of the jacketed cylinder A and its steam-inlet pipe, the open receiver or basket E, and close cover F, all as set forth.

160,274. DENTAL ENGINE. R. P. Ryder, Brooklyn, N. Y., assignor to S. S. White, Philadelphia, Pa. [Filed May 20, 1874.]

Brief.—Air-engines are combined with the hand-piece of a dental engine.



The dental air-engine herein before described, consisting of the combination of the air-chamber, the oscillating cylinders, the pistons, the crank-shaft, the gearing, the tool-holding spindle, and the frame constituting both a hand-piece and a support for the engine, these members being constructed and operating in combination, substantially as set forth.

160,275. TESTING-MACHINE. W. J. Scott, Albany, N. Y., assignor to F. A. Scott, same place. [Filed Aug. 27, 1875.]

Brief.—A machine for testing leather, &c., consisting of a movable scale bar indicating the amount of power applied to break the material. Attached to the shell of the movable scale is a piece which slides in a groove, and has a pointer and rack formed upon it. The pointer on this piece moves over a graduated scale, and is for indicating the elasticity of the material tested. A pawl engages with the rack, and prevents its movement when the breaking of the material occurs, and allows the reading of the scales to be taken off.

1. A testing-machine constructed substantially as herein shown and described, and consisting of a scale for determining the amount of power applied, and an indicator, fixed to a movable part of said scale, for showing the degree of elasticity of the material when subjected to the power indicated, in the manner and for the purposes herein specified.

2. The combination of the spring-scale B with the sliding rack G and spring-pawl J, as and for the purposes specified.

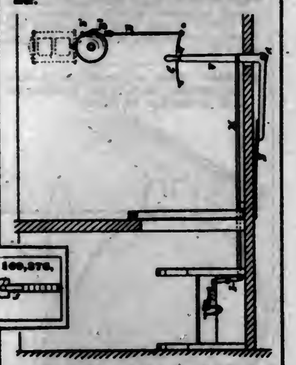
160,277. PROCESSES FOR TESTING THE PURITY OF DYE IN BLACK SILK THREAD OR FABRICS. Wm. H. Seaman, New York, N. Y. [Filed Aug. 4, 1875.]

Brief.—The silk to be tested is immersed in a liquid consisting of a saturated solution of muriatic acid, to which a portion of hydrochloric acid and camphor may be added. The dye is discharged from the fabric or thread in a degree proportionate to its purity, leaving the material paler in color. The depth of color in liquid and the color of material after immersion are indicative of the purity of the dye.

The process of treating black silk thread and fabrics by immersion in a chemical liquid of which muriatic acid is the base, as herein described, for the purpose of ascertaining the purity of the dye, as set forth.

160,278. WATCHMEN'S REGISTERS. David Shive, Philadelphia, Pa., assignor to the Shive Governor Company. [Filed Oct. 10, 1875.]

160,279.

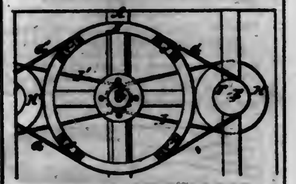


1. In a watchman's time-register, wherein marking mechanism is operated by the direct action of the clock, the cylinder *G* and cylinder H, in combination with the sleeve D of the pinion A, substantially as and for the purpose set forth.

2. The combination, with the pinions V, of the cylinder C, formed with the bent-spaces F, the single space G, and the grouped spaces G' G'', and the cylinder H, formed with the series of grooves L M N, as set forth.

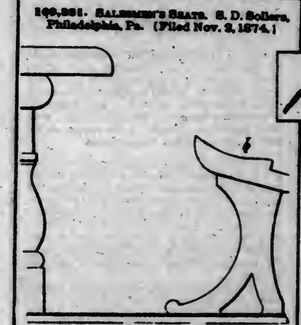
3. In a watchman's register, the combination, with the cylinders C and H, and their marking-studs *f*, of the continuous circumferential band J, and the groove K, substantially as and for the purpose set forth.

160,280. GONG ATTACHMENTS FOR BELL-AND-HAMMER HOISTING-HOUSES. C. Sibert, Indianapolis, Ind. [Filed Mar. 31, 1874.]



Brief.—Relieves the horses through an arrangement of levers tripped by the gong-hammer.

1. The combination of the rod B, the arms B' B'', and the spring-catch C with the gong-hammer of a fire-alarm apparatus, in the manner substantially as described, whereby said spring-catch is held in a state of tension, and the arm B' retained on its center until released therefrom by the blow from the gong-hammer, for the purposes set forth.



2. The combination of the bent lever F, the spring S, the connecting-rod H, lever I, and bell J with the spring-catch C, whereby the bells J is either held stationary or reciprocated, in the manner substantially as described, for the purposes set forth.

160,281. HOISTING-POWERS. Jno. Smith, Burlington, assignor of one-half his right to P. B. Merrihew, Fond du Lac, Wis. [Filed Mar. 29, 1875.]

The revolving master-pulley B, constructed for receiving two belts, in combination with the pulleys F F', H H', and D, belts G G' and I I', and the shafts E, E', and C, for transmitting power from two belts, which are run upon the master-wheel, to a shaft, C, and therefrom to the shaft to be driven, substantially in the manner shown and described.

160,282. SALESMEN'S SEATS. S. D. Sellers, Philadelphia, Pa. [Filed Nov. 2, 1874.]

As an article of manufacture, a salesman's seat, consisting of a base, *A*, supporting a stool, *a*, and a foot-rest, *b*, placed opposite to and inclined downward from the stool, all as set forth.

160,283. ADJUSTABLE BRACKETS. Eli T. Starr, Philadelphia, Pa., assignor to S. S. White, same place. [Filed Mar. 6, 1875.]

1. The hereinbefore-described adjustable bracket, consisting of the combination of the horizontally-swinging crane, the parallel radius-bars pivoted thereto, the horizontal frame, to which the radius-bars are also pivoted, the ratcheted locking-bar pivoted to the horizontal frame, the loop secured on the upper radius-bar, and through which the locking-bar slides, and the holding-spring, these members being constructed and operating in combination substantially as hereinbefore set forth.

2. The combination of the crane, the radius-bars, the horizontal frame, the locking-bar, and the swinging table, pivoted by one corner to said frame, these members being constructed and operating substantially as hereinbefore set forth.

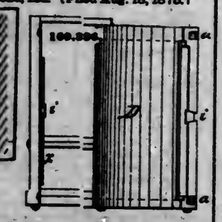
160,284. BALL-AND-SOCKET JOINTS. Eli T. Starr, Philadelphia, Pa., assignor to S. S. White, same place. [Filed June 24, 1875.]

The ball-and-socket pivot-joint hereinbefore described, consisting of the combination of a socket, a perforated slotted ball rocking therein, a supporting-rod turning and moving in said ball, and a clamp-screw, these members being constructed and operating in combination, substantially as set forth, whereby the rod may be adjusted and clamped in the ball.

160,285. SHIELD ATTACHMENTS FOR BULB-SYRINGES. ATTACHMENT, &c. Eli T. Starr, Philadelphia, Pa., assignor to S. S. White, same place. [Filed June 10, 1875.]

Brief.—The detachable shield adapted to the shape of the palm of the hand, to clasp the neck of the bulb, so that the compressive force is applied on the side of the bulb opposite that against which the shield rests.

1. As an attachment for bulb-syringes, the shield constructed, substantially as hereinbefore set forth, with a concave-convex body, adapted to conform to the body of the syringe, and with a collar adapted to clasp its neck and the discharge-tube, for the purpose specified.



2. The combination, substantially as hereinbefore set forth, of the elastic bulb, its rigid nozzle, and the shield constructed, as described, with a collar to clasp the neck and nozzle.

160,286. ROOFING COMPOSITIONS. Lorenzo P. Teed, Erie, Pa. [Filed Apr. 3, 1875.]

Brief.—A roofing composition consisting of two parts slaked lime, one part sifted sand, five pounds lamp-black, one hundred pounds cement, five pounds plumbago, and sufficient coal-tar (with the volatile elements removed) to mix to a mortar.

The manufacture or preparation of a compound roofing-cement in the proportions and mode of compounding described, for the purpose set forth.

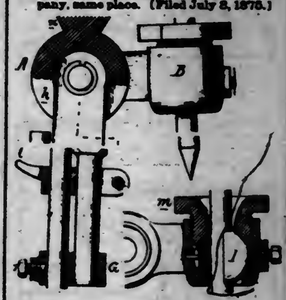
160,287. UPRIGHT PIANOS. Geo. Trayser, Richmond, Ind. [Filed Aug. 18, 1875.]

1. The back D of an upright piano-forte, consisting essentially of the string-frame, wrest-plank, and sound-board, hinged to the framing or case A, substantially as and for the purposes described.

2. In combination with the subject-matter of the preceding clause of claim, the fastening devices *a a'*, *b b'*, and *c*, substantially as set forth.

160,288. APPARATUS FOR LIGHTING LAMPS BY ELECTRICITY. J. A. Volain and P. Drouhin, Paris, France. [Filed May 1, 1874.]

Brief.—The sheath or case carries the conducting-wires leading from the battery to the platinum coil and lamp to be lighted.

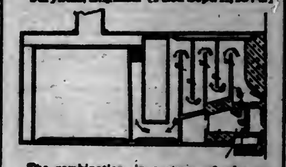


The combination, in an apparatus for producing a flame or light by means of electricity, of the sheath or case *f*, provided with an insulating or resistance substance, wires *d d'*, tubes *b b'*, and the platinum wire or strip *a*, all as shown and set forth.

160,289. TABLE-LEAF SUPPORTS. Joseph Wagner, Syracuse, N. Y., assignor of one-third his right to Brant Hurst, same place. [Filed July 21, 1875.]

The metallic box *b*, provided with straight groove *c* in its top, and enlargements *c c* on its sides, attached to the under side of the table by screws through said enlargements, and fitted into a recess in the side rail *a*, and the straight metallic bar *a*, provided with aperture at the inner end, and ring *r* at the outer end, and fitted to slide in groove *c*, constructed and combined with a drop-leaf table, substantially in the manner described, for the purpose specified.

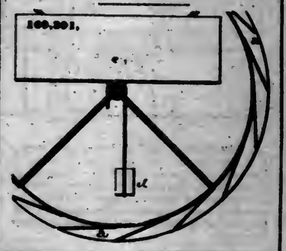
160,290. TRIPOD FOR ROCK-DRILLING MACHINES. John B. Waring, New York, N. Y., assignor to Waring Rock-Drill Company, same place. [Filed July 8, 1875.]



1. The within-described tripod-head, composed of a central portion, *A*, with its slot *h*, and the leg-carrying arms B and B', combined with the bolt D and upper end of the leg E, all substantially as set forth.

2. The slotted clamp, consisting of two parts, *a a'*, connected together, and having a slot, *h*, and beveled projection *n*, all substantially as set forth.

3. The central portion A, having conical recesses, the arms B and B', having conical projections, combined with the cone-shaped projection *f* of the leg E, and with a bolt, D, all substantially as set forth.

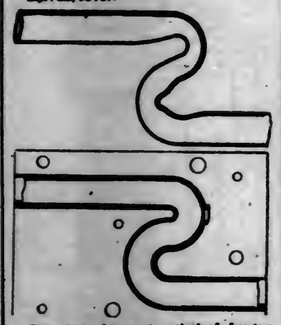


4. The combination of each arm B and B', the socket *i* and leg H, with the severed sphere I, follower *m*, and set-screw *n*.

160,291. STOVES. Charles Warren, Shoeburyness, England. [Filed Sept. 11, 1874.]

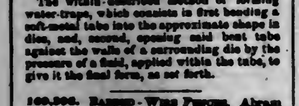
The combination, in a stove, of a box or hopper, cast or framed with front and back gratings near its bottom, through which a continuous feed and a horizontal draft are obtained, and air-supply pipe in rear of said box or hopper, and deflecting-plates arranged behind the box or hopper, on opposite sides of the flue, one overlapping another, so as to drive the products of combustion from side to side in a zigzag course, thus greatly retarding them, substantially as described, for the purpose specified.

160,292.



169,891. Horse and Water Power Apparatus. William S. Watkins, St. Louis, Mo. [Filed Oct. 19, 1875.]

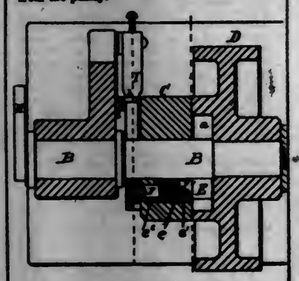
1. A water-wheel, having its interior surface so formed that it is adapted to receive horses or other animals, for the purpose of operating it, whereby a convertible horse or water power is formed, as described.



2. The wheel *a*, shaft *c*, weight *d*, and frame *e*, the parts being combined for operation, as shown.

169,892. Manufacture of Water-Traps. Geo. W. Wicks, New York, N. Y. [Filed Apr. 22, 1875.]

The within-described method of forming water-traps, which consists in first bending a soft-metal tube into the approximate shape in dies, and, secured, opening said bent tube against the walls of a surrounding die by the pressure of a fluid, applied within the tube, to give it the final form, as set forth.



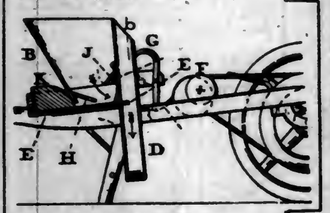
169,893. Barbed-Wire Fences. Abram V. Wormley, Corydon, Ill. [Filed Sept. 17, 1874.]

The metallic barb *a*, having its points *b c d* interwoven with two or more separate strands of wire twisted together to form a single-barbed strand, *e*, with the barbs fastened between and standing out from the folds of the strand, substantially as herein described.

169,894. Clothespin. Benjamin F. Young, Boston, Mass. [Filed Oct. 12, 1875.]

Brief.—When the movable abutment is thrown in the path of the revolution of the dog, the shaft to which the latter is attached is partially rotated, and the pawl released from the pulley.

1. The shaft F, pawl E, dog G, and spring *e*, in combination with the shaft B, collar C thereon, and the driving-pulley D, or other wheel, having the annular recess *a* and curved enlargement *a'* thereof, formed in the end of one of its hubs, all constructed, arranged, and adapted as operate as and for the purpose described.



2. The combination of the shaft B, provided with the collar C, a driving-pulley or other wheel, D, provided with an annular recess, *a*, having upon one side thereof the curved enlargement *a'*, the pawl E, shaft F, dog G, spring *e*, and the lever I, provided with a shoulder or abutment to engage with the dog G, and adapted to be withdrawn from the path of said dog, as and for the purposes described.

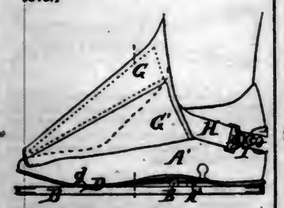
3. The lever I, provided with the movable abutment I', and the spring J, in combination with the pawl E, shaft F, spring *e*, and dog G, arranged and adapted to operate as and for the purposes set forth, as a means of causing an engagement or disengagement between the driving-wheel and its shaft, substantially as described.

4. The hardened steel pin *b*, set in the end of the hub of the driving-wheel D, and forming a portion of the curved enlargement *a'* of the annular recess *a*, as and for the purposes described.

169,895. Potato-Droppers. Geo. H. Zane, Shoemakertown, and Saml. A. Kennedy, Philadelphia, Pa. [Filed Sept. 14, 1875.]

Brief.—A slide carries the potatoes forward beneath a division-board to a pivoted tooth, by which a single potato is taken up and carried backward until the hook passes through a vertical slot, when the potato is forced off, and is discharged into a spout, and thence to the ground.

1. The rising and falling door J, in combination with the conveying-slide E, substantially as and for the purpose set forth.



2. The projecting arm H, in combination with the conveying-slide E and door J, substantially as and for the purpose set forth.

3. The vertical plate K, in combination with the conveying-slide E, substantially as and for the purpose set forth.

4. The vertical plate K and projecting arm H, in combination with the conveying-slide E and door J, substantially as and for the purpose set forth.

5. The partitioned hopper B, rising and falling door J, and projecting arm H, in combination with the conveying-slide E, plate K, and tooth O, substantially as and for the purpose set forth.

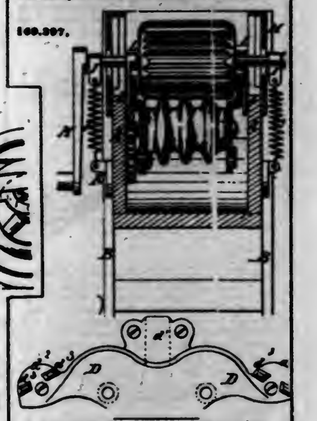
169,896. Swimming-Shoes. Oscar G. Ahlstrom, New York, N. Y. [Filed Sept. 20, 1875.]

1. A swimming-shoe having the sole A, hinged leaves B, catches D, and cut-water G G', all constructed substantially as and for the purpose described.

2. The catches D and keepers E, in combination with the falling leaves B and cross-bars A', as and for the purposes specified.

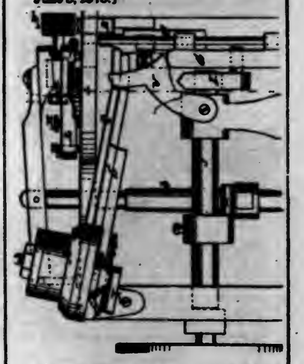
3. The cut-water G and wings G', in combination with the upper A', sole A, and falling leaves B, as and for the purposes herein specified.

169,897. Washing-Machine. Timothy Allen, Fort Madison, Iowa. [Filed Oct. 2, 1875.]



Brief.—Two ring-grooved rollers are moved by the friction of a corrugated roller above them, the latter being adjusted in sliding spring-journals. The lower rollers move in the same direction by means of a set of gearing placed under flanged plates, in which they have their bearings. Guards to the rollers are attached by lugs to the flange-plates.

1. The combination of the ring-grooved rollers C, the flanged plates D, provided with the lugs *b' d'*, and the gear-wheels E E F, with the longitudinally-grooved roller G and the box A, substantially as herein shown and described.

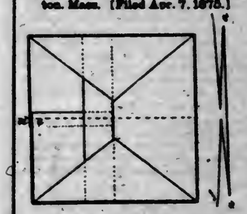


2. The combination of the sliding guards L with the journals of the upper roller G, and with the recessed legs *b'* of the flanged plates D, substantially as herein shown and described.

3. The combination of the tongues *d'*, formed upon the end legs *b'* of the flanged plates D, and the guard and guide bars N, having grooves formed in their ends, with the said plates D, and with the lower rollers C, substantially as herein shown and described.

169,897.

169,898. Stitching-Machine. John J. Allred, Charlotte, N. C., assignor to himself and A. G. Jordan, same place. [Filed June 5, 1875.]

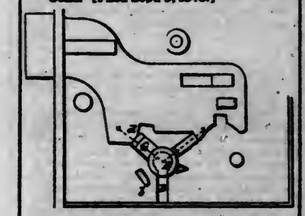


1. The combination of the feed-slide B, lever E, spring F, and the slide G of the inserting-tool, substantially as specified.

2. The combination, with sheets Q, spring T, lever U, and the slide G, of the inserting-tool, substantially as specified.

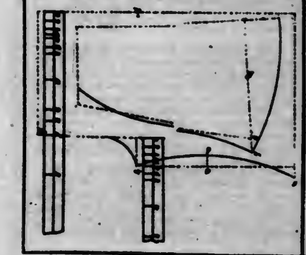
3. The combination of roller H, ratchet O, and pawl P with the reciprocating sliding feed S, substantially as specified.

169,899. Paper Bags. C. Amazeen, Boston, Mass. [Filed Apr. 7, 1875.]



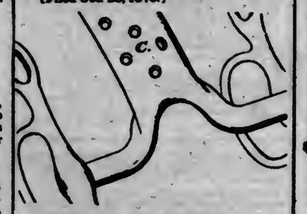
As a new article of manufacture, a paper bag having its pasted portion to form the bottom turned within the bag, and made of a strip of paper folded at *a b*, then folded on itself, as at *c*, to form the bottom, then folded at *f* to complete the bag and the bottom, as shown and described.

169,900. Curtain-Fixtures. Fredrick Backofen, Williamsburg, Brooklyn, E. D., N. Y., assignor to himself and I. H. Williams, same place. [Filed Mar. 1, 1875.]



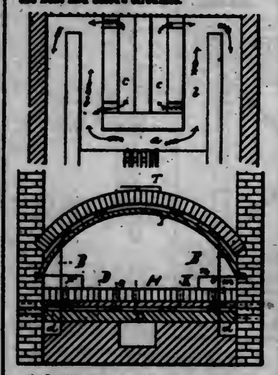
A case, B, having spindle C and collar G, combined with coil-spring A, attached at one end to case, and at the other to spindle, as shown and described, to avoid all necessity for the use of gearing.

169,901. Door-Locks. Charles L. Bates, Bridgefield Township, Bergen County, N. J., assignor to Thos. Kennedy, Branford, Conn. [Filed Sept. 9, 1875.]



The combination, in a door-lock, of the following elements: the case, constructed with a key-hole on each side, in substantially the same horizontal line, but in different axial planes; a case, G, the axis of which is the axis of one of the key-holes, and constructed for the insertion of the key, so that the bit of the key will enter at an angle to the said case; a bolt, constructed to be thrown by the key in one key-hole, and by the cam through the other, and with a shoulder, against which the cam bears when the bolt is thrown, the key retaining it in that position, substantially as set forth.

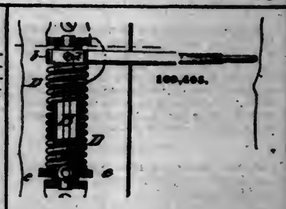
169,902. Tailors' Apparatus for Drafting Patterns. John Bellamy, New York, N. Y. [Filed July 10, 1875.]



169,903. Bridle-Bits for Horses. James R. Bellinger, Lazarus M. Boller, and Wm. J. Fryer, Jr., New York, N. Y.; said Bellinger assignor to C. L. Fryer, same place. [Filed Oct. 26, 1875.]

A bridle-bit having its mouth-bar made straight at its point of intersection with the cheek-bar, and arched and concaved in the center, to accommodate itself to the tongue of the horse, in combination with a perforated roof-plate, C, made concave to correspond to the shape of the tongue, and convex to bear against the roof of the horse's mouth, substantially as and for the purposes set forth.

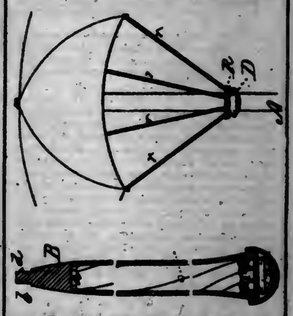
169,904. Ranges' Ovens. Jacob Bieler, Ashtabula, Ohio. [Filed Aug. 26, 1875.]



Brief.—The top and bottom of the oven are each made of double walls, through which the heat and smoke circulate.

1. In a baker's oven, the combination of the lower horizontal flues *a b c d* with the vertical flues D and upper horizontal flues E, formed in the manner for the purposes specified.

2. The combination of the several separate plates D E, hearth H, and smoke-arch I, removed at their corresponding corners, for the purposes shown and set forth.

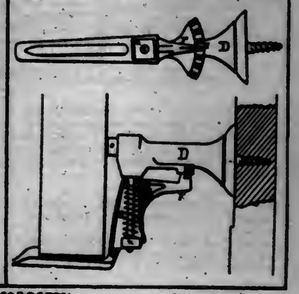


169,905. Door-Springs. James M. Hood, Denver, Colo. [Filed Sept. 17, 1875.]

As the improvement herein before described, the journaled roller or barrel B, having the series of fixed radially-projecting pins *c*, and the curved adjustable arm A, and clamp-curve *d*, and the spiral spring D, all combined and arranged as set forth and shown, for the purpose specified.

169,906. Canes and Umbrellas Combined. John Boyd, East Boston, Mass., assignor of one-half his right to Charles Smith and William McKinnon, same place. [Filed July 8, 1875.]

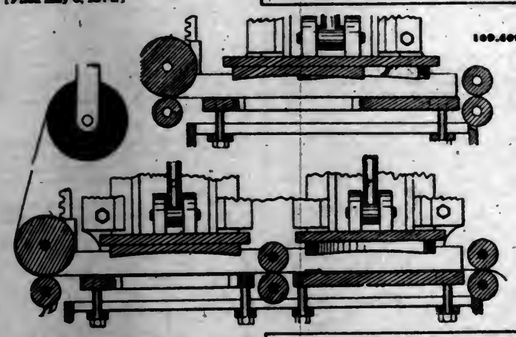
Brief.—The frame is detached from the stick by unlocking the annulus from the end ring, and may be inclosed in the hollow stick.



1. The combination of a spring-bail, D, with a runner, M, and a perforated sheath or case, A, substantially as specified.

2. The sheath A, having the rabbet *b*, and lug 4, at its upper end, in combination with the annulus *a*, having the groove *s* and notch *n*, the rib *r*, runner R, and cover, substantially as described.

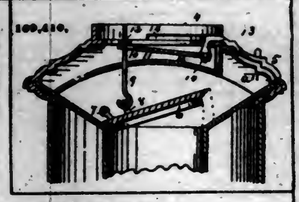
169,907. Door-Checks. Conrad W. Breidenbach and Edward H. Breidenbach, Dayton, Ohio. [Filed Aug. 14, 1875.]



Brief.—A metal door, with rubber ring or cushion, has upon its under side a segmental ratchet, and carries, by suitable rod attachment, a rotating catch for holding the door at any desired angle. This catch, which has a suitable pawl, is yieldingly attached to the step by means of the spring-controlled rod, and the pawl and ratchet enable it to be placed in various positions, or to be swung entirely aside, leaving the device a door-stop or buffer only.

1. In a door stop and catch, the combination, with a stud, D, having segmental rack g, of a rotating catch or hook, K, having rigid pawl F, substantially as specified.

2. The combination, with stud D, having segmental rack g, and downwardly-projecting rod I, of the rotating catch or hook K, having pawl F, and a spring, S, applied upon rod I and nut a, substantially as specified.

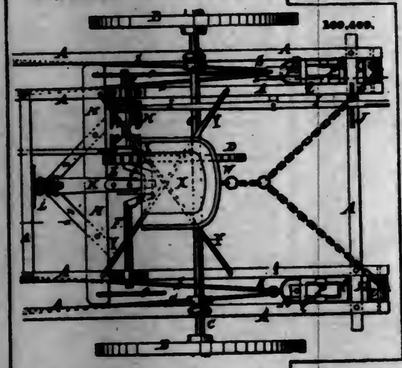


169,409. Machines for Cutting Paper Collars. Charles A. Brown, Troy, N. Y. [Filed May 6, 1874.]

169,409

A series of simultaneously-operating male dies of the shape of the blanks to be cut, having a reciprocating movement transmitted to them through the medium of a common revolving shaft, a series of female dies corresponding to said male dies, to receive the same, the several male and female dies of said series occupying a reversed position with reference to the blanks to be cut, and an intermittent feed united to the distances apart of the said cutting devices, and designed to feed the stock to and remove the same from the dies, all combined, arranged, and operating substantially as hereinbefore described, and for the purposes specified.

169,410. Coal-Planters. John Bryer, Wagram, Ohio. [Filed Aug. 6, 1875.]



169,410

The combination of the coupling devices, whereby the opening and closing motions of the cover 5 of the fuel feed-opening in a magazine-stove, are caused to open and close the cover 6 of the magazine without exposing the opened mouth of the magazine to the open air above the stove, as described, the said coupling devices consisting of the vertical rod 9, the rod 11, the inclined plate 15, and the eccentric-convex plate e'', constructed and arranged to operate together substantially as set forth.

169,411. Grater. Joseph A. Bankwalter, Boyer's Ford, Pa. [Filed Oct. 4, 1875.]

Brief.—The inner ring rests and rotates upon the stationary ring. The draw-bar supports the drop-plate.

169,409

The combination of the centrally-pivoted vertical lever I, horizontal reciprocating bar M, and linkage with the pinion K, crank-axle F, shank and gearing D E H, connecting-rods C, and reed-dropping slides P, as and for the purpose set forth.

169,412. Magazine-Stoves. Joseph A. Bankwalter, Boyer's Ford, Pa. [Filed Oct. 4, 1875.]

Brief.—The sliding of the feed-door operates the magazine-cover by means of the rods and inclined plane.

169,411

1. The swinging drop-plate C and the draw-bar A of the handle B, in combination with an oscillatory grate provided with the open central space d, substantially as set forth, for the purpose described.

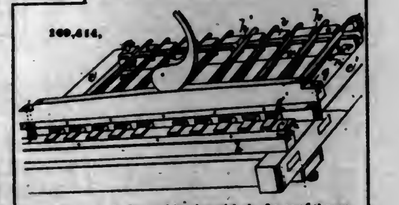
2. The combination, substantially as described, of the inner ring c'' of the grate A with the stationary ring B, the said parts being constructed and arranged to operate as and for the purposes set forth.

169,413. Producing or Decorating Glass. James Budd, New York, N. Y. [Filed May 10, 1875.]

1. The within-described method of decorating glass, consisting essentially of first treating it with a layer of coloring matter in a solution of gelatine in dilute acetic acid, then coating it with a transparent varnish, then applying a second layer of coloring matter ground in a solution of gelatine in dilute acetic acid, and finally protecting it with a layer of tracing or analogous insoluble coating, as and for the purposes specified.

2. The glass plate herein described, adapted to be mounted on tables, walls, and the like, having one or more coats of coloring matter in a solution of gelatine and acetic acid, and a protecting coat of water-proof varnish, as specified.

169,414. Breech-Loading Fire-Arms. Henry C. Ball, New York, N. Y. [Filed Jan. 18, 1875.]



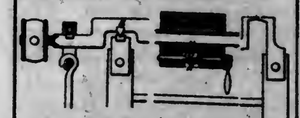
Brief.—The trigger serves the double purpose of locking the breech-block and disengaging the cock from the tumbler.

The combination of the breech-block, notched as at b', hammer D, cock F, and trigger G g, all connected and operating substantially as and for the purpose specified.

169,414. Grain-Threshing Machines. H. B. Clemmer, Shippensburg, Pa. [Filed Sept. 28, 1874.]

Brief.—Any desired number of spokes, of varying thickness, are securely clamped, while tenons of uniform size, partially true, and either straight or tapering, are being formed upon them, by means of an adjustable bed, a notched guide-bar for holding the large ends of the spokes, a vertically-adjustable notched bar, in which rest the smaller ends, and a laterally-adjustable notched slide-bar for tightening all the spokes at once, the whole secured in position by a clamping cross-bar, provided with a series of elastic pads, and operated by a central tightening cam-lever. The spokes are released by suitable springs placed between the frame and cross-bar.

169,414



1. In combination with the frame of the machine, the clamping cross-bar p, provided with the series of elastic pads, the central tightening-lever s, and the releasing-springs, substantially as and for the purpose set forth.

2. In combination with the frame, the vertically-adjustable notched bar t, extending across the frame, and operating to adjust all the spokes by one adjustment, as and for the purpose set forth.

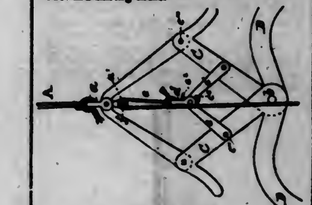
3. In combination with the frame A, the vertically-adjustable notched bar t, extending across the frame, and operating to adjust all the spokes by one adjustment, and the laterally-adjustable notched slide-bar u, operating to tighten all the spokes by one adjustment.

169,415. Scale-Beams. E. A. Chemeroy, Paris, France. [Filed Sept. 28, 1875.]

Brief.—The counterpoise has a cam rotated by a crank, which presses against the lower side of the beam, upon which are projecting graduation figures. The card or paper is inserted between the cam-plate and the figures upon the beam, and an impression of the ascertained weight is obtained.

A counterpoise for weighing-scales combined with a compressing device, between which and the graduations of the beam a card or material may be inserted to receive by compression the indication of weight, substantially as described.

169,416. Belt-Fastenings. William M. Chapman, Bevenna, Ohio. [Filed Aug. 28, 1875.]



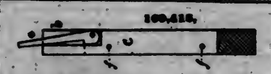
1. In a belt-fastener, the combination, with the curved link-rods B, having slots a, of the latch-rods C, having shouldered enlargement c, substantially as specified.

2. The latch-rod C, having an enlargement, c, at each end, adapted for use substantially as specified.

3. The combination, with the belt-ends A A', having slots a, of the curved slotted link-rods B and latch-rods C, substantially as specified.

169,417. Hay-Forks. Moses M. Cherry, New Plymouth, Ohio, assignee of one-half his right to Samuel Cherry. [Filed Aug. 10, 1875.]

Brief.—The tines are held firmly together, until it is desired to discharge the fork, by means of a hook fitting over a pin near the knuckle-joint on the rod, connecting the two outward-flaring arms.



The tines D, pivoted at A, and having the outward-flaring arms a, the knuckle-joints a' provided with the shackle d and hook and pin d' d', and rods B, having the shackle a and pulley f, all combined with the ropes A and c, substantially as and for the purposes specified.

169,418. Gate-Latches. Samuel Cherry, New Plymouth, Ohio, assignor of one-half his right to Moses M. Cherry, same place. [Filed July 12, 1875.]

Brief.—A lever pivoted in a mortise in the gate-post serves as a latch, and also as a lever, to raise the gate over obstructions. The lever carries a cam-face upon its inner end.

169,418.

The hinged gate B, pin d, rabbeted latch-post C, stops f, and latch-lever e, provided with the eccentric or cam end and shoulder c, all combined and operating substantially as and for the purposes herein specified.

169,419. Ball-Metal Toy Balls. J. C. Clark, Middle Haddam, Conn. [Filed Sept. 4, 1875.]

1. A toy ball made of a hollow shell of ball-metal, and provided with a cleft or other opening and a small ball in its interior to produce the sounds, substantially as herein shown and described.

2. The combination of the ball B with the hollow perforated ball-metal ball A, substantially as herein shown and described.

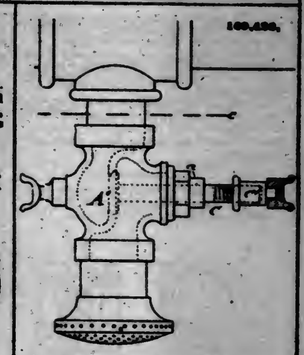
3. The combination of a cord, C, with the ball-metal ball A herein described, whether a ball be used or not, substantially as herein shown and described.

169,420. Weather-Strips. James Clegg, Cleveland, Ohio. [Filed Sept. 8, 1875.]

1. In combination with a door, the weather-strip B, operated by the spring G, and a horizontal latch, D, working against a catch, O, the latter placed on a sill, substantially as shown, so that its outer extremity is in the rear of that of the door, substantially as and for the purpose described.

2. The combination of the weather-strip B and catch-piece D, the latter extending from the lower inner edge of the door and engaging with the catch O, whereby, when the door is closed, the inner extremities of both catch and latch may snugly overlap one another, substantially as and for the purpose described.

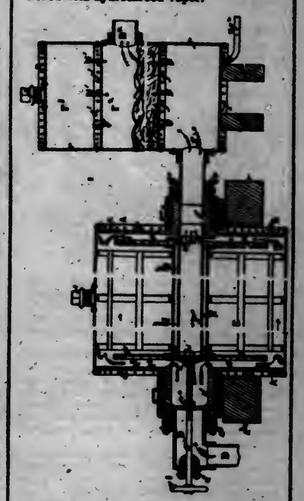
169,421. Attaching Knobs to Spindles. Cornelius Coleman, West Meriden, Conn., assignor to Parker & Whipple Company, same place. [Filed Sept. 28, 1875.]



The combination of the spindle A, the spring D attached to the spindle, its free end at the end of the spindle, and constructed with several notches, a knob, the neck of which is constructed to pass onto the spindle over the free end of the said spring, and with a shoulder, c, to engage either of the said notches on the spring, and with the perforation f through the neck onto the spring, substantially as described.

169,422. Automatic Speed-Regulating for Reciprocating Pumps. Hezekiah Conant, Pawtucket, R. I. [Filed Aug. 21, 1875.]

Brief.—The valve-stem is adjustable, and retained by a chain of cotton wound tightly over a grooved T-bearing of the valve-stem, and a stationary T-bearing in opposite direction to the former. In case of fire the chain is burned, and the valve forced open by the pressure of the water. The operation may be tested at any time by simply cutting the chain.



169,420.

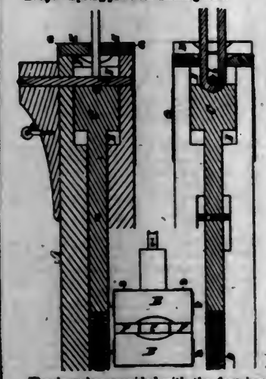
The combination of discharge-pipe A', having stationary arm O, with the T-bearing D', and the end-threaded sliding valve-rod having T-bearing D, as well as nut O, with the flexible connection E, as and for the purpose specified.

169,423. Processes and Apparatus for Burning Gas or Air with a Definite and Regulated Percentage of Hydrocarbon Vapor. B. Hall Cowl, New York, N. Y. [Filed June 7, 1875.]

Brief.—The air or gas to be carbureted enters through the hollow journal of the carbureting-cylinder, and is deflected by a disk to pass under the perforated diaphragm through the shower of gasoline. A pipe on the line of the hollow journal extends centrally through the cylinder, and is provided with a valve at the induction end, whereby a regulated per cent. of the gas or air may be passed directly through the carburetor without being enriched with hydrocarbon vapor.

1. The process of carbureting air or gas, which consists of passing the air or gas through a shower of liquid hydrocarbon, and sustaining the shower and the operation by returning the carburetor, substantially as set forth.

2. The reversible carburetor A, constructed with the diaphragm A^1, passing through its diameter, and hung in the hollow trunnions A^2, so that it may be reversed when the hydrocarbon fluid has passed from the upper to the lower section, bringing the fluid in position to again pass through the diaphragm, substantially as described.



3. The regulating gas-pipe G, arranged concentrically with the carburetor A, substantially as and for the purposes set forth.

4. The combination and arrangement of the carburetor A and the dripping and mixing chambers F F, substantially as and for the purposes set forth.

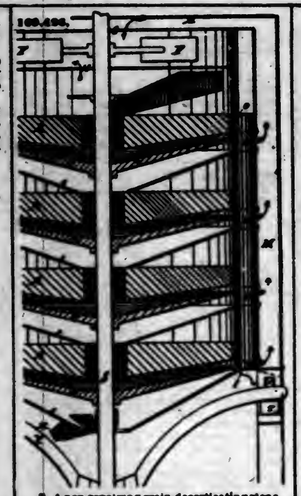
5. The auxiliary carbonization and mixing apparatus, consisting of the chambers F F, in combination with the rotary carbonizer A, substantially in the manner herein shown and described.

169,494. Gas-Coupling. Amos Orr, Lowell, Mass. [Filed Oct. 12, 1875.]

Brief.—Spring-jaws for holding link.

The draw-bar provided with the four jaws E E F F and the springs G, and with the coupling-slide C and its spring or springs D, all arranged in manner and to operate as specified.

169,495. Pipe-Tongs. Samuel H. Dickerson, Cincinnati, Ohio, assignor to himself, Benj. F. Stanley, and Wm. A. McCallum, same place. [Filed Sept. 18, 1875.]



1. As applied to a pair of adjustable pipe-tongs, the herein-before-recited eccentrically-adjusting bearing-pin C, having a base, *a*, adapted to interlock with a recess in the holding-jaw, substantially as and for the purpose specified.

2. As applied to a pair of adjustable pipe-tongs, the combination of bearing-pin C *a*, having any preferred form of teeth *t*, and adapted to engage with similar teeth in the recess *a* of the holding-jaw, retaining-pin E, and pawl F, constructed, connecting, and operating substantially as and for the purpose specified.

3. The combination of bearing-pin C *a*, retaining-pin E, pawl F *f*, and ring G, constructed, connected, and operating substantially as and for the purpose specified.

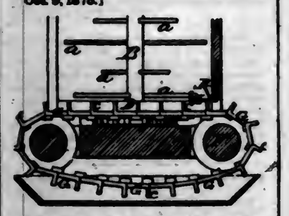
169,496. Grain-Decorticators. Silas Dodson, Rochester, N. Y. [Filed Apr. 10, 1875.]

1. In a machine for decorticating grain, the combination of a non-revolving stone A and cast-metal annularly-ribbed revolving disk B, relatively arranged substantially as set forth, whereby the grain shall be subjected to a percussive action on the stone, as distinguished from a rubbing action between the stone and disk.

2. A non-revolving grain-decorticating stone, A, dressed on its lower operative face to the form of an inverted frustum of a cone, in combination with the revolving disk B, made with a pitch in its upper face in excess of that of the operative face of the stone, substantially as set forth.

3. In combination with the jackets I and K, air-passages L and M, and the inclosed stones, disks, and hoppers, and the fan F, the openings into the air-passages L and M, with their adjustable covers or dampers P, as shown and described.

169,497. Combined Toy Gun and Horn. L. Duvall, Georgetown, D. C. [Filed Sept. 18, 1875.]

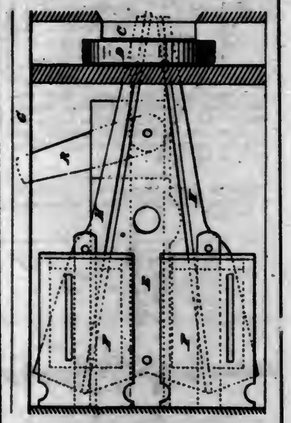


Brief.—When not in use for shooting it serves as a toy horn, the rubber spring forming the reed or vibrator.

1. The combined toy gun and horn, consisting of the cylinder or tube B, having fastening E, the head A, and the hollow piston C, substantially as described.

2. The combined shooter and horn A B, and the hollow cylinder C, substantially as described.

169,498. Brick-Machine. Chas. N. Fisher, Willis Tee., assignor of one-half his right to Joseph Frampton, same place. [Filed Oct. 9, 1875.]



1. An endless chain of molds at the bottom of the pug-mill box A, driven by means of a wheel on shaft B engaging with the studs on link G, substantially as described.

2. The pressure-plate L and cut-off P, combined with the endless chain of brick-molds and their guideways D D, substantially as described.

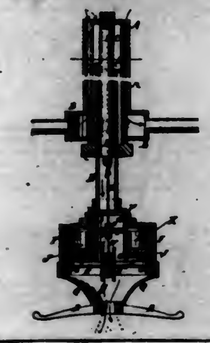
3. Links G, constructed with pivotal hooks *d*, notched lugs *e*, and plates C, as and for the purposes described.

169,499. Boot and Shoe Nailing Machine. Walter Fitzgerald, Boston, Mass., assignor of two-thirds his right to W. H. Putnam and H. S. Jenkins, same place. [Filed Feb. 1, 1875.]

Brief.—Slotted rotating cylinders are provided for receiving the nails in belt.

1. The combination of the cam I, lever J, feed-bar K, spring Y, and swivel L, in the manner and for the purposes described.

2. The combination of the pawl O, spring Q, and arm P, in the manner and for the purposes described.



3. The throat V, provided with the opening in its upper rear side for the reception of the nails from the guideways, as described.

4. The combination of the slotted nail-drums F F, for receiving and delivering nails of different lengths, the vibrating double guideways H H, throat V, and driver U, in the manner and for the purposes set forth.

5. The throat V, in combination with the lever K, provided with the slotted end N, as described, for the purpose of bringing the lower end of the throat into contact with the sole of the boot or shoe, so as to give accuracy to the nailing without interfering with the feed, as stated.

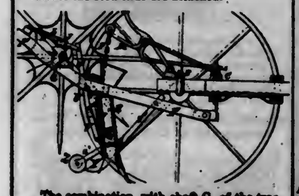
169,500. Door-Latch Gearing. J. Fox, New York, N. Y. [Filed Sept. 20, 1875.]

Brief.—The spring-drum is rotated by means of the pinion on the axis that carries the spool, which is revolved by the cord when the sliding tube is lowered.

1. In central drop-chandeliers, the combination of case-tube G, spring-drum K L, spool M, and cord N, as and for the purpose specified.

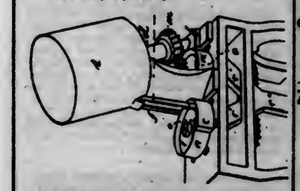
2. The combination of the four concentric tubes A C E D, the drum-chamber F, the inner tube G, the chest, spool, and gear-wheels H M I J, the drum and spring K L, the cord N, and the cap Q, with each other, substantially as herein shown and described.

169,501. Rake-Holders. John B. Frost and Josiah Merrill, Berwick, Me. [Filed Aug. 14, 1875.]



Brief.—A suitable case carries a pair of angular levers, having rubber-faced roller-heads and broadened ends, serving as handles. Interposed between the headed ends, back of the fulcrum-pins, is a triangular piece of rubber, acting as a spring to force the handles apart, and hold the roller-heads in position.

The angular levers C C, having rubber-faced roller-shaped front ends and broadened rear ends, serving as handles, said levers being fulcrumed in a case, D, and provided at the rear with an intermediate elastic wedge, E, as and for the purpose specified.

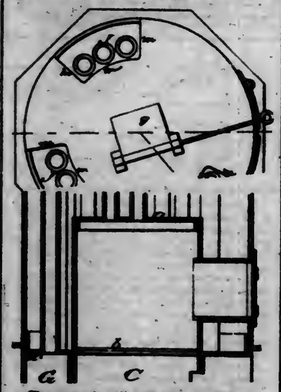


169,502. Corn-Planters. Wilson Gardner and George L. Hays, Pikeston, Ohio. [Filed Aug. 21, 1875.]

Brief.—In journals on the supplemental pivoted frame revolves the axle of rimless wheels, carrying with it a notched wheel, that strikes in its revolution a hinged cross-bar, (held in place by a spring,) to which arms that vibrate the seed-slide are attached.

The combination, with shaft G, of the traction-wheel H, carrying intermediate cam-wheel, the cross-bar J, having pivoted rear arms K, the spring L, resting upon said cross-bar, and the seed-slide rods V, all arranged substantially as and for the purpose specified.

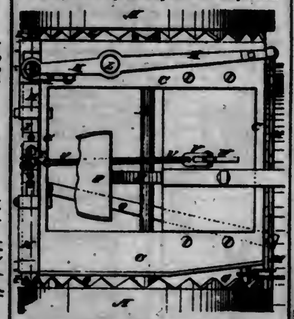
169,503. Button-Fastener Device. Noel Gallaun, Springfield, Mass., assignor to M. Goldthwaite and Frank H. Goldthwaite. [Filed July 16, 1875.]



1. In a button-fastening device, the combination of a receptacle or hopper, A, to receive the buttons, a throat, *f*, open at the lower end, and one or more spring-catches, *s*, upon opposite sides of the throat, in connection with vertical guides *a*, against which the button slides, said catches operating to draw said buttons in rapid succession from the lower end of the throat to a chute, *c'*, with the front sides of all in the same relative position, substantially as described.

2. The combination of the receptacle or hopper A, the throat *f*, the spring-catches *s*, vertical guides *a*, the flanges *o* to trip the catches, and the chute *c'* divided at the upper end to receive the buttons from both sides of the throat, substantially as set forth.

169,504. Steam-Boilers. T. W. Godwin, Norfolk, Va. [Filed Oct. 21, 1875.]



Brief.—The sparks and heavy products of combustion are trapped in a water-chamber surrounding the base of the furnace, the smoke passing through a flanged cap, forming a chamber resting on top of the uppermost tube-sheet.

The recessed cap E, having projecting flanges *n n* and damper *p*, in combination with the tubes D F J, spark-trap G, and chamber C, substantially as described, and for the purpose set forth.

169,505. Mowing-Machine. A. G. Gray, St. John, Canada. [Filed Aug. 6, 1875.]

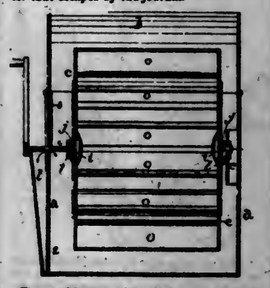
Brief.—A mowing-machine with cams rigidly attached to its driving-wheels and operating a reciprocating bar, which may be thrown in gear with the driving wheels by means of a joint near its center, and which may be connected with the cutting apparatus by means of a bent lever, which forms a portion of the eye upon the vibrating lever connecting the reciprocating bar and the pitman.

1. The combination of the notched wheels G, the reciprocating bar I, and the lever K with the drive-wheels A, the frame C, and the chain bar pitman M, substantially as herein shown and described.

2. The combination of the bars P, the short shaft Q, the cam R, the connecting-bar S, the crank-arm T, the connecting-bar U, and the lever W with the inner ends of the two parts of the reciprocating bar I, substantially as herein shown and described.

3. The combination of the bent lever X with the open rear end of the lever K and the pin J of the reciprocating bar I, substantially as herein shown and described.

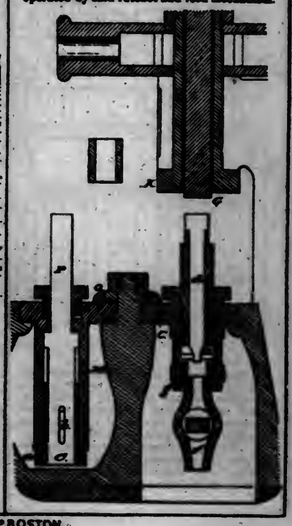
169,506. Metallic Burial-Cases. Henry M. Gray, San Francisco, Cal. [Filed June 26, 1875.]



Brief.—The metal ear for the hearse rests underneath a lip in the upper flange of the body of the casket, and thus in a great measure relieves the attaching-screws of the weight of the coffin.

The combination, with coffin-case handle F, of an attaching-plate, E, fitted under a lip, *e'*, of lower case flange C, as shown and described, to relieve the screws of lifting-strain.

169,507. Washing-Machine. Alonzo Hale, Eureka, Ill. [Filed Oct. 4, 1875.]



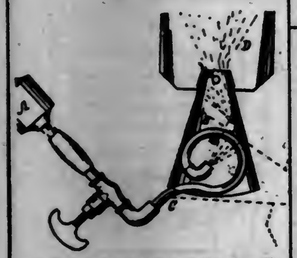
Brief.—A trap at the side receives the water that escapes by the journal.

The combination of the boiler a and trap *i*, there being a hole, 2, in the side of the boiler to allow the water to pass back into the boiler, as described.

169,508. Machine for Tapping Mains. John Hancock, Danville, Pa. [Filed June 17, 1875.]

Brief.—A ratchet and feed mechanism of peculiar construction, under which is consecutively brought a drill, a tap, and a valve or gate inserting device, to be coupled with and operated by said ratchet and feed mechanism.

1. The hollow rounded K and square feed-bar G, in combination with the nut L, swivel R, and ratchet R.

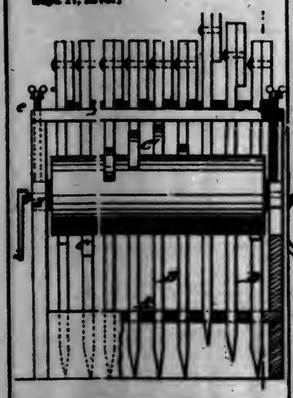


2. The lock H, Fig. 2, and thumb-screw I, in combination with the ratchet wheel and pawls, with which the ratchet is locked to form a backward motion, as and for the purpose above described.

3. The friction-plate c, operated by the bolt d in the curved ratchet-wheels Q, for fastening or loosening rockers f or seat f, in combination with the square feed-bar G, nut L, swivel R, and ratchet R.

4. The device consisting of the bar P, shaft q, opening r for gate, pin and slot b, in combination with the square feed-bar G and feed-wheel F for inserting gates into seams.

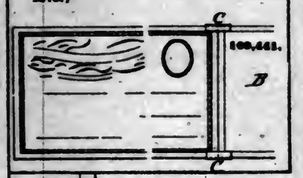
169,439. Paint-Burners. John P. Hagen, Philadelphia, Pa. [Filed Sept. 9, 1875.]



Brief.—By means of the tube and its adjustable attachment to the burner, the flame can be directed at various angles. The reflector is also adjustable around the tube.

1. The vibratile tube B, in combination with the flame-jet pipe C of a paint-burner, the said tube and pipe being constructed and arranged to operate together, substantially in the manner and for the purpose set forth.

2. The protecting or deflecting plate D, in combination with the tube B, substantially in the manner and for the purpose hereinbefore set forth and described.



169,440. Melanoid-Dressing Machine. Gustav Engelrich, New Ulm, Minn. [Filed Sept. 17, 1875.]

1. The roller G, having spirally-arranged cams, the adjusting-screws e, and vertically-adjustable vertical shafts B, constructed as shown and described, whereby the roll may be adjusted to set the cams at a height corresponding to the sheets, as set forth.

2. The shafts B, adjustable in length by loop shoulder-plates and clamp-screws, in combination with continuous blades to produce even dressing of seams, substantially as specified.

169,441. Device for Facilitating the Filing of Postal-Cards. F. M. Hinchcock, Cleveland, Ohio. [Filed Apr. 8, 1875.]

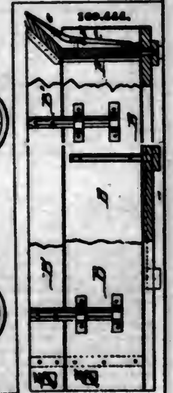
1. The combination, with the extra length B, of suitable clips or fastenings C, whereby the said piece B may be readily attached to a postal-card, and the postal-card thereby be made of suitable size for filing, substantially as and for the purpose described.

2. As an article of manufacture, piece B, provided with suitable clips C, whereby it can be readily attached to a postal-card, substantially as and for the purpose described.

169,442. Mattresses and Cushions. W. H. Horton, Chelsea, Mass., assignor to himself, W. Bowers, and M. Nichols, same place. [Filed Mar. 15, 1875.]

Brief.—The balls and cases are perforated, to provide for the ventilation of the mattress.

The combination of a series of perforated hollow elastic balls or bulbs, C, with the cases A and its stuffing B, all being substantially as and for the purpose or objects as set forth.

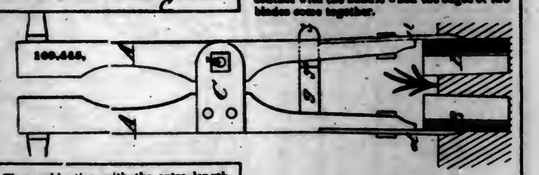


169,443. Handcuffs. George P. Hewston, Washington, D. C., assignor to himself and Wilson Brothers, New York, N. Y. [Filed Oct. 1, 1875.]

A handcuff formed of two pieces of wrought metal, bent as described, forming parts A A and bars B, said parts being hinged at one end and locked at the other, substantially as and for the purpose described.

169,444.

169,444.



169,444. Wagon-Boxes. T. Jennings, Madison, Iowa. [Filed June 5, 1875.]

The combination of the front end board and dash-board, perforated, bent, and ribbed straps or plates e connecting said boards, the grooved straps D, having bolts b, rods E E, the top box F and body B of the wagon, all as shown and described.

169,445. Transplanters. W. R. Johnson and J. C. Bowman, Pickens Station, Miss. [Filed Apr. 24, 1875.]

Brief.—This invention consists of two semi-circular blades secured upon curved pivoted handles, and below the pivot is an arm secured to one of the handles, and passing through a mortise in the opposite one, the arm being provided with shoulders that form contact with the handle when the edges of the blades come together.

In a transplanter, the semicircular shovels B B, rigidly secured to the short arms of two pivoted levers, A A, having handles a a, in combination with a stop, g, as shown and described.

169,446. Stave Baskets. Horace C. Jones, Dowagiac, Mich. [Filed Sept. 18, 1875.]

A stave-basket having the upwardly-bulged strengthening bottom, which bottom is formed of pieces halved together, held in place by a rivet and washer, and surrounded by a hoop, substantially as described.

169,447. Stave Baskets. Horace C. Jones, Dowagiac, Mich. [Filed Aug. 17, 1875.]

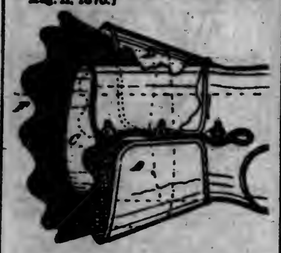
The stave-basket composed of the two series of lining-staves A and the two series of outer staves F, both series tapered from the bottom hoops C C to the central rivet R, and the four ends arranged as described, and strengthened and bound together at the center of the bottom by a riveted washer, H, and at about the circumference of the bottom of the basket by hoops C C and nails and a circular board, I, extending between the bottom of the basket and the outer bottom hoop C, substantially as herein described and shown.

169,448. Stave Baskets. Horace C. Jones, Dowagiac, Mich. [Filed Aug. 17, 1875.]

1. A stove-basket having the rabbeted or shouldered board H extended between the outer bottom hoop and the outer staves, substantially as described.

2. The basket with outer staves placed edge to edge, and the inner series of lining-staves tapered at their lower ends and lapped upon one another at the bottom of the basket, and both the inner and outer series bound together and strengthened at the bottom of the basket by a central rivet and washer, and nails, and inner and outer hoops C C, and sheathered board H, extended between the outer bottom hoop and the bottom of the basket, substantially as described.

3. A basket having a bottom board, which is convex on its top, into which the lower ends of the outer staves are inserted, while a lower portion of said bottom board extends outwardly beyond the point where the staves enter, substantially as and for the purpose described.

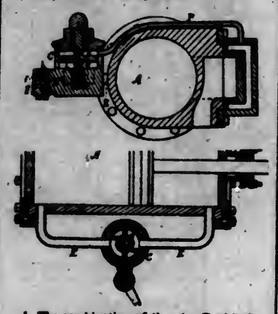


169,450. Gates. John A. Knepper, Delta, Ohio. [Filed Aug. 14, 1875.]

1. A gate constructed of rails or sections, connected by links sliding in staples of one rail, and being attached to the next rail, so that the rails may be folded sidewise of each other to the height of one rail, substantially as specified.

2. A gate, made of separately-sliding and link-connected rails, and of a horizontal top piece, in combination with the base-box set into the ground for storing the folded gate, and locking the same generally for the passage of vehicles, &c., substantially as specified.

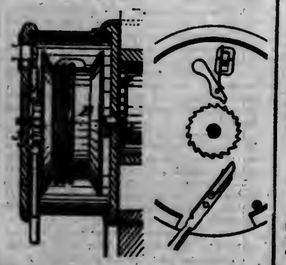
169,451. Gauntlet-Gloves. J. W. Letcher and M. B. Dunham, Johnstown, N. Y.; said Letcher assignor to said Dunham. [Filed Aug. 11, 1875.]



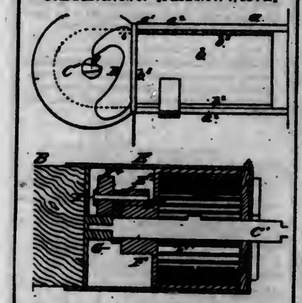
1. In a glove or gantlet, the wrist-extension C and fastenings c c, when arranged with relation to the cuff D, substantially as and for the purposes described.

2. In combination with the cuff D and extension C, as shown and described, the detachable cuff F, as set forth.

169,452. Automatic Air-Valve Attachments for Steam-Cylinders. James N. Lauder, Concord, assignor to himself and N. P. Stevens, Hopkinton, N. H. [Filed Oct. 12, 1875.]



Brief.—Valve is kept closed by pressure of steam from steam-chest. When steam is shut off, the valve is forced from its seat by a spring, and establishes communication between the ends of the cylinder.

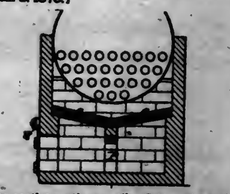


1. The combination of the pipe P with the steam-engine cylinder A, valve-chest B, automatic valve-chest C, its valve D, and the pipes E E, all being arranged and operated substantially as and to operate as specified.

2. The combination of the pipe P, steam-engine cylinder A, valve-chests B and C, valve D, spring d, and pipes E E, all arranged and applied essentially in manner and to operate as explained.

169,453. Cloth-Lint Rolls. Charles L'Hommedieu, Middletown, N. Y. [Filed June 26, 1875.]

169,454. Curtain-Fixtures. Rufe B. Lake, Tom's River, N. J. [Filed Nov. 7, 1874.]



1. The combination, with the stationary shaft C', having a convoluted hub terminating in surface with the shoulder a, and the roller B operating automatically through the agency of a spring, of the brass-pawl D, having its tail-piece and locking arm jointed at substantially an acute angle, the former being weighted so as to control, by gravity, the normal position of the pawl and lock it against the shoulder a by centrifugal force, operationally as shown and described.

2. The adjustable bracket C, composed of the section c, having the flanges c' slot c², and bridge P', and the sliding section b having the notched flange b', in combination with the locking device c, substantially as described and shown.

3. The combination, with the stationary shaft C' and the running barrel B', of the rigid post or frame P' carrying the gearing F' G, engaging, respectively, with the pinion G secured to the roller, and the toothed wheel F attached to the barrel, substantially as shown and described.

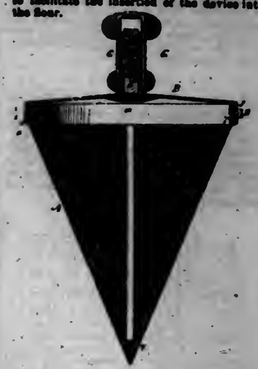
4. The roller B having a cylindrical chamber, B, at one end containing a coiled spring, and a ratchet-drum, a pinion attached to the outside-roller, and intermediate multiplying gearing or mechanism, substantially as described.

169,455. Furnaces for Steam-Boilers. James A. Locke, New York, N. Y. [Filed Jan. 8, 1875.]

The earthy continuous tiles C C, perforated at its end in rear of the bridge-wall, forming a continuous downward incline toward the center throughout the entire length of the chamber, supported at the center by the perforated partition P, in combination with the register G and its operating means H, as and for the purposes specified.

169,456. Bottle-Stoppers. A. Lusby, New York, N. Y. [Filed Sept. 28, 1875.]

Brief.—This stopper consists of a curved wire spring-lever, that carries the stopper, and is secured on the bottle by a bail pivoted to the neck-band of the same, binding on a recessed top rest of the stopper-plate.



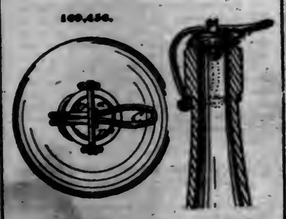
---

1. The combination of the slide mechanism and check-pawl, with the fast ratchet of the spring-actuated drum, for checking action of spring at any length of line drawn out, substantially as specified.

2. The combination of the drum, having fast ratchet-wheel, end of the operating cloth and spring mechanism, with a fulcrumed lever, having a pivoted spring-pawl, for readjusting tension of main spring, substantially as shown and described.

169,454. Flour-Sifters. W. T. Lindsay, Marvin B. Weller, and D. S. Kellogg, Fort Plain, N. Y. [Filed Sept. 11, 1875.]

Brief.—The sieve is provided with a removable cover, secured by means of a spring-catch. The handle is provided with a device for jarring the material through the mesh. The apex is provided with a solid metallic tip, to facilitate the insertion of the device into the flour.



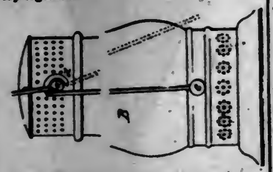
1. The combination of a detachable top, B, having flange f, with projecting hook d, and a spring-catch, D, with the conical sieve A, having rim e, with perforations f f, substantially as specified.

2. The combination, with the sieve A and detachable lid B, of the staple-shaped rod G fixed to the latter, and an endwise-movable handle, E, substantially as specified.

3. In combination with a conical sifter, its top B, a wire staple-shaped rod, G, and an endwise-movable handle, E, the rubber deadener H T, substantially as specified.

4. The combination, with the conical sieve A, of the solid aperial tip T, substantially as specified.

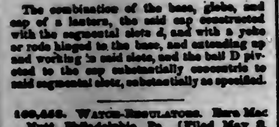
169,456.



1. A bottle-stopper made of a curved spring-lever, swinging over the mouth of the bottle, and having a suitable stopper attached thereto, in connection with a swinging looking-bail, substantially as and for the purpose set forth.

2. The stopper having a lug lug or rest, with side recess for the looking-bail, substantially as specified.

169,457. Lanterns. Charles H. Lyman, West Meriden, Conn., assignor to the Bradley & Hubbard Manufacturing Company, same place. [Filed Aug. 9, 1875.]

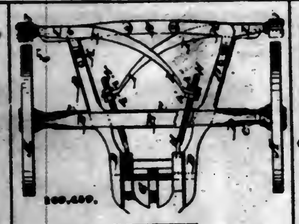


Brief.—In raising the handle to a vertical position, the guard-wires are caused to move in the slots in the globe to such a position as will insure the binding of base, globe, and cap together.

The combination of the base, globe, and cap of a lantern, the said cap constructed with the segmental slots *d*, and with a yoke or rods hinged to the base, and extending up and working in said slots, and the bail D pivoted to the cap substantially eccentric to said segmental slots, substantially as specified.

169,458. Watch-Regulators. Rare Mac Watt, Philadelphia, Pa. [Filed May 6, 1875.]

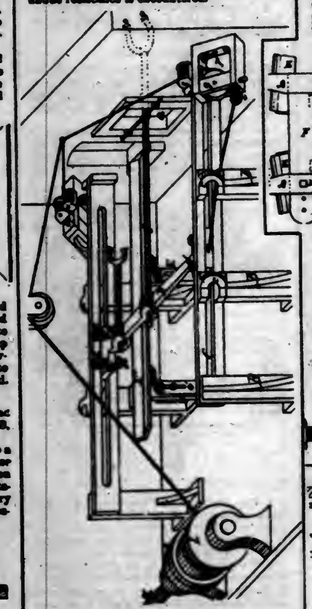
Brief.—A cut-screw in the nut attached to a balance-wheel watch-regulator, for the purpose of holding the nut in the same position when taken apart for repairs, &c., and an adjustable curb-pin, in combination with a stationary curb-pin, for the purpose of clamping or loosing the hair-spring, as may be required.



1. The combination of the cut-screw pin L, with the screw-nut on the shaft C, of the watch-regulator described, for the purpose of rigidly fixing the said nut upon the screw C, as occasion may require, as before set forth.

2. The movable curb-pin J, constructed to operate as described, in combination with the groove *g* in the curb or lateral extension F of the regulator-pointer B, and the stationary curb-pin I, for the purposes set forth.

169,459. Wagon-Brakes. H. Martzed, Beloit, Wis. [Filed July 24, 1875.]



The combination, with brake-shoes, of levers I, bowed and crossed as shown and described, the cross-bar E, the adjustable screw-bolts H, and the sliding tongue F, as and for the purposes specified.

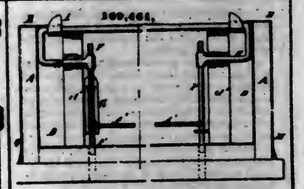
169,460.

169,460. Devices for Pushing Tubes Endwise into and Through Furnaces. Geo. Matheson, McKeesport, Pa. [Filed July 6, 1875.]

Brief.—A cross-head mounted in guide-ways, and carrying a pusher for forcing a tube-skelp through the furnaces to the rolls on the other side, is propelled by means of cords, which are wound on a drum revolved by a friction-clutch, so as to allow a slipping when undue resistance is encountered.

1. The combination, with a pipe-welding furnace, of the pusher, the friction-drum, and intermediate mechanism for guiding the pusher and transmitting the power from the drum to the pusher, substantially as and for the purpose specified.

2. The combination, with a pipe-welding furnace, of the pusher, a cross-head provided with anti-friction and guide rolls, and suitable ways or frame for supporting the cross-head, substantially as and for the purpose specified.



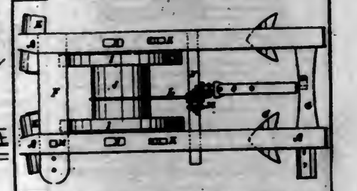
3. The combination, with a pipe-welding furnace, of the guide-trough, the cross-head, and suitable power mechanism for operating the head, substantially as and for the purpose specified.

4. The combination of the pusher, the rope for transmitting power to the pusher, and a set of swivelling-sheaves and guide-rollers, substantially as and for the purpose specified.

5. In combination with the pulley-sheave and pulley, the bell-mouth or funnel-shaped sleeve, substantially as and for the purpose set forth.

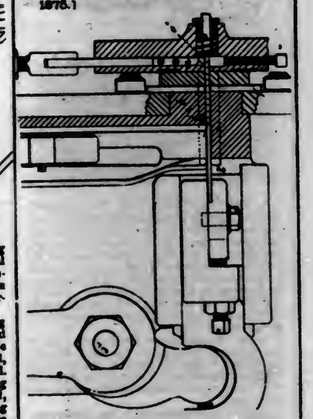
169,461. Bird-Gates. Edward G. Martin, Kankakee, Ill. [Filed Oct. 16, 1875.]

169,461.



1. The combination of the rod E, the bolts F, the straps H, and the hooks I with the gate D *d* and the side-boards A of a vehicle body, substantially as herein shown and described.

2. The combination of the spring G with the bolts F of the device E F H I, substantially as herein shown and described.



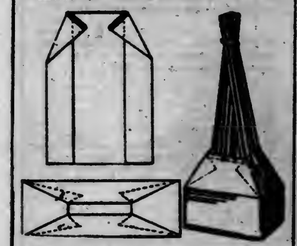
169,462. Cotton Scrapers, Choppers, and Cultivators. Richard L. McClung, La Fayette, Tex. [Filed Apr. 3, 1875.]

Brief.—Enlarged axle of bearing-wheels serves as a drum, from which driving-belt extends to chopper-shaft, after passing over pulleys. Scrapers in front of wheels, and cultivator-teeth in rear of chopper.

The combination of the wheels I, shaft J, head L, guide-pulleys M, cross-bar N, the shaft and arms O P, and hoe or cutter Q, with the frame, and the plow-standards B D, substantially as herein shown and described.

169,463. Machines for Uniting the Uppers and Soles of Boots and Shoes. Gordon McKay, Cambridge, and Hadley P. Fairfield, Boston, Mass. [Filed May 15, 1875.]

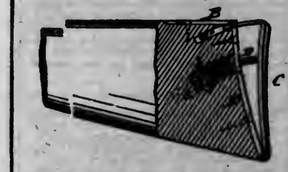
1. The combination, with a sailing-machine of mechanism for cutting nails from a strip, mechanism for corrugating the nails cut from the strip, and mechanism for supporting and cutting each nail just prior to its being driven to a length corresponding to the thickness of the sole, substantially as described.



2. The combination of the strip-guiding tube and nail-cutter with the movable rest for the severed nails, substantially as described.

3. The combination of the movable slide and nail-tube, variable in position, according to the thickness of the sole of the boot or shoe, and its head-cutter, with the rest for supporting the nail while being cut, and with the nail-driver, substantially as described.

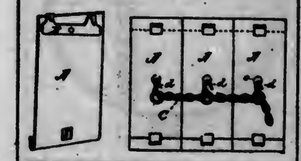
4. The combination, with the strip-guiding tube, of a cutter adapted to cut a nail from the strip and move it into a nail-guiding passage, substantially in line with the path of the cutter's movement, as and for the purpose set forth.



5. The combination of the cutter *i*, adapted to sever the nails from the nail-strip and move them forward in the nail-guiding passage, with the spring-supporting plate *o'*, substantially as described.

169,464. Paper Bags for Brooms. Edwin D. Messenger, Chicago, Ill. [Filed May 17, 1875.]

A broom-bag, for covering a package of brooms, made with both ends open, but one of the openings being contracted by means of gores, substantially as shown and described.



169,465. Breech-Orifices for Gun-Stocks. William D. Miller, Pittsburg, Pa. [Filed Oct. 2, 1875.]

1. A recoil-check for fire-arms, made of a fixed butt-plate, and a hinged, guided, and spring-acted cheek-plate applied to it and of the gun-stock, substantially in the manner and for the purpose set forth.

2. In a recoil-check for gun-stocks, the combination of the solid block B with the curving plate C, curved rod D, spring *f*, and set-screw *s*, substantially as and for the purpose specified.

169,466. Fire-Shields. Thomas P. Moore and David H. Bradley, Chicago, Ill.; said Moore assignor to said Bradley. [Filed Apr. 24, 1875.]

2. The combination, with the strip-guiding tube and nail-cutter, of the movable rest for the severed nails, substantially as described.

3. The combination of the movable slide and nail-tube, variable in position, according to the thickness of the sole of the boot or shoe, and its head-cutter, with the rest for supporting the nail while being cut, and with the nail-driver, substantially as described.

4. The combination, with the strip-guiding tube, of a cutter adapted to cut a nail from the strip and move it into a nail-guiding passage, substantially in line with the path of the cutter's movement, as and for the purpose set forth.

5. The combination of the cutter *i*, adapted to sever the nails from the nail-strip and move them forward in the nail-guiding passage, with the spring-supporting plate *o'*, substantially as described.

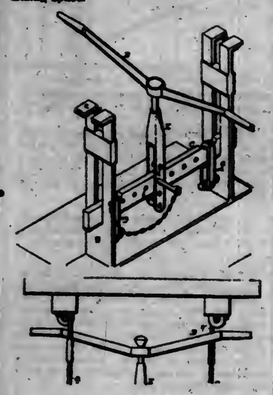
169,464. Paper Bags for Brooms. Edwin D. Messenger, Chicago, Ill. [Filed May 17, 1875.]

A broom-bag, for covering a package of brooms, made with both ends open, but one of the openings being contracted by means of gores, substantially as shown and described.

169,465. Breech-Orifices for Gun-Stocks. William D. Miller, Pittsburg, Pa. [Filed Oct. 2, 1875.]

1. A recoil-check for fire-arms, made of a fixed butt-plate, and a hinged, guided, and spring-acted cheek-plate applied to it and of the gun-stock, substantially in the manner and for the purpose set forth.

2. In a recoil-check for gun-stocks, the combination of the solid block B with the curving plate C, curved rod D, spring *f*, and set-screw *s*, substantially as and for the purpose specified.



169,466. Fire-Shields. Thomas P. Moore and David H. Bradley, Chicago, Ill.; said Moore assignor to said Bradley. [Filed Apr. 24, 1875.]

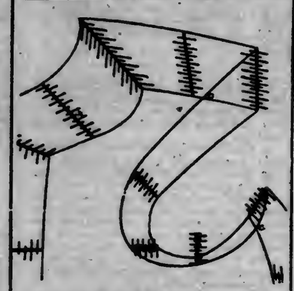
1. The oscillating bar B, provided with its hooks *a a*, in combination with the plate A, as specified.

2. In combination with the plates forming the separate sections, the chain or bar Q, secured to the plates by the hooks *d*, as specified.

169,467. Exercising Apparatus. John B. Newbrough, New York, N. Y. [Filed Sept. 17, 1875.]

Brief.—The table-top being removed, an exercising-machine is disclosed, thus economizing space.

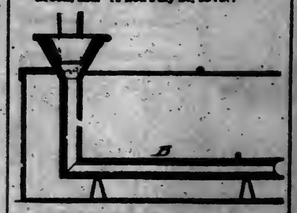
1. The combination, in a calisthenic apparatus, of a sliding bar, C, a cross-bar or handle, D, connected thereto, and springs *n n*, applied to the bar near its opposite ends, substantially as set forth.



2. The combination of the bar C, handle D, and rod B, adjustable on the bar, as specified.

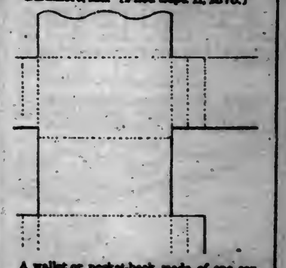
3. The combination, in a calisthenic apparatus, of the bar C and springs *n n*, applied to the bar near its opposite ends, and removable, as specified.

4. The guiding-standards *a a*, having slots *a'*, for the reception of the handle D, as described.



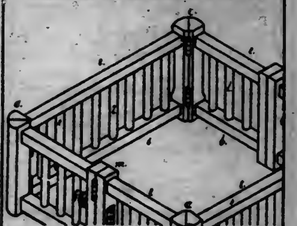
5. In a calisthenic apparatus, the detachable plate B and the frame constructed to support the said plate, and form therewith a table, substantially as set forth.

169,468. Tailors' Patterns. J. H. Nichols, Boston, Mass. [Filed Mar. 27, 1875.]



The set of drum and frock coat charts herein described, having independent outlines of the largest and smallest sizes in use, said outlines extending entirely around each pattern, crossing each other at *c* and *c'* in the front and sleeve patterns, spaced further apart, proportionally, in the upper and front portions of the body and lower portions of the sleeves, and connected by transverse slots or series of perforations with scales for marking the intermediate sizes, as shown and described.

169,469. Feed-Rollers. Stark Olmstead, Brook, Ind. [Filed July 21, 1875.]

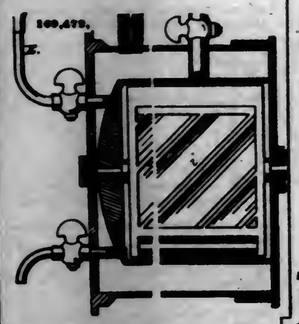


The combination, with box or tank A, of the boot tube B, arranged within the same, and the central beater supported upon the top thereof, as shown and described.

169,470. Pocket-Books. D. K. Osborne, Baltimore, Md. [Filed Sept. 11, 1875.]

A wallet or pocket-book made of one continuous blank, of paper or other cheap material, that has a central part with end flap and side extensions, and symmetrical side pieces folded in gussets and pockets, and connected at the edges to form the wallet, substantially in the manner and for the purpose set forth.

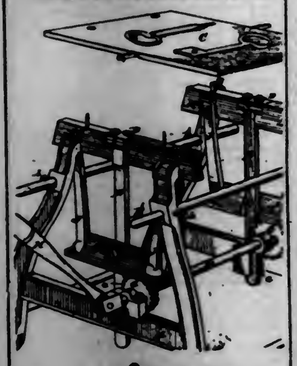
169,471. Inclosures on Flat-Houses for Chickens. Hiram J. Parker, Rochester, assignor of one-half his right to S. N. Gardner, Troy, N. Y. [Filed Mar. 22, 1875.]



1. A rectangular play-house, having four corner-posts, *a*, divided diagonally and joined by the hinges *h*, two middle posts, *m*, divided at right angles and joined by the hinges *i*, forming, with the sides *l* of the balustrade, an endless frame-work, which may be closed into a fourfold compact block, for the purposes substantially as herein set forth.

2. In combination with the folding play-house *a a' l h*, connected by the hinges *h* and *i*, the cover-bolts *f*, for the purposes substantially as herein set forth.

169,472. Soap-Boiling Apparatus. M. J. Palmer, Detroit, Mich., assignor to himself and Archibald C. Glass, same place. [Filed Oct. 6, 1875.]



Brief.—The steam generated in the tank passes into the mixing-vessel, whereby it comes in contact with the chemicals contained in said tank, which, by means of the agitator, are thoroughly intermingled. The chemicals are introduced into the mixing-chamber through the inlet.

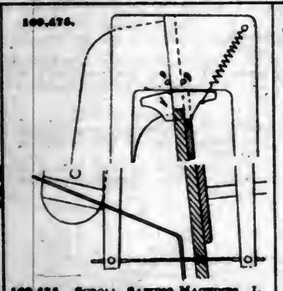
160,472.

The combination of a horizontal boiler, A, mixing-chamber B, tube b, inlet E, and agitator E, provided with concave floats h and slots i, set diagonally across, substantially as described.

160,473. Machines for Operating Mold-ing Match-Plates. John T. Post, Cincinnati, Ohio. [Filed Mar. 6, 1876.]

1. The combination of frame A B, swinging match-plate C, inclines K, standards E F' D, and supporting-fingers J J, connected and operating substantially as and for the purpose specified.

2. The combination of the adjustable sides A, standards D E D E, swinging match-plate C, bars E D' D'' D'', and set-screws b, substantially as and for the purpose specified.



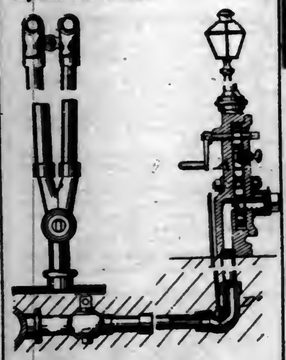
3. The combination of the standards E e, shaft F, pinions G, and jointed lever H, and the bar B, substantially as and for the purpose specified.

4. In combination with the four-holed match-plate C, the hinged and latched flask F F' g g', having diagonally-arranged pins O, and holes O' on opposite corners to the pins, substantially as and for the purpose specified.

160,474. Yeast Compounds. Jacob Pfaff-fer, Brooklyn, N. Y., assignor to himself and Paul Kook, same place. [Filed Sept. 11, 1875.]

A yeast compound consisting of cooked and mashed potatoes, hops, malt, wheaten flour, and corn-starch, in about the proportions specified.

160,475.



160,475. Scroll-Sawing Machines. L. C. Pratt, New York, N. Y. [Filed Aug. 21, 1875.]

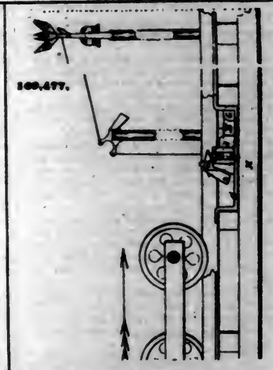
Brief.—The bifurcated saw-carrier works on a reciprocating pivot, which is located either above or below the table, and operated by a cam held against the main frame by a spring, for the purpose of making the saw cut smooth.

The combination, with table A and cam F, of the bifurcated saw-carrier B B, working on pivot D, as and for the purpose specified.

160,476. Fire-Plugs. Christian F. Rapp, Cincinnati, Ohio. [Filed Aug. 26, 1875.]

Brief.—A fire-plug connected by two branch-tubes with two supply-pipes branching out from the main pipe, and controlled by a stop-cock of special construction, so that in the winter the pumping out of the supply-pipes by the engines is secured. A waste-cock at the elbow of the supply-pipes serves to drain any water from the same.

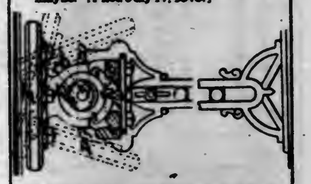
1. The combination of the adjustable disk, having suitable recesses, with a spring-stop device of the front plate, to secure rigid position of disk in open or closed position, as specified.



2. The elbows of the water-supplying branch pipes, provided with a joint waste-cock, set from above to drain off leakage, as set forth.

3. The combination of a fire-plug with a water-supply pipe and a second branch vent-pipe, being opened and closed by a common stop-cock or valve, to shut off the water from the main and allow the pumping out of the water from the supply pipe by the fire or other engine, to prevent freezing up of fire-plug in the winter season, substantially as and for the purpose set forth.

4. The combination of the double exit-openings of the casing, disk, and front plate with branch supply-pipes and a regulating stop-cock or valve between the same and the main pipe, that allows the opening of one or both branch pipes, or the communication of the branch pipes by closing the main pipe, substantially as set forth.



160,477. Railroad-Signals. F. Raymond, Cleveland, Ohio. [Filed Aug. 30, 1875.]

160,477.

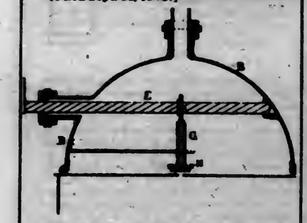
The trip F and ball-crank lever E, having a counter-balance, G, in combination with the lever H, in the manner substantially as described, and for the purpose set forth.

160,478. School-Desks. Thos. Redmayne, Sheffield, England, assignor to Wm. Redmayne. [Filed July 17, 1875.]

1. The combination of a desk-board, attached to an adjusting-wheel with central aperture and notches at the circumference, with a recessed support or frame-work of the desk-standard, and with a central tooth or stud of the same, so that the wheel is held firmly at any point of its circumference, and adjusted by being vertically raised from the teeth, substantially as and for the purpose shown and described.

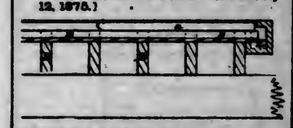
2. The combination of the wheel of the desk-board, swinging in the support of the main standard, and fitting on the teeth or stud, with a locking-device for holding the notched wheel rigidly in contact with the detent or tooth, substantially as and for the purpose shown and described.

160,479. Methods of Blowing Glass Spheres. Frank Rhind, Brooklyn, N. Y., assignor of two-thirds his right to Jesse H. Smith, Cranford, N. J., and Keyes P. Cool, Glen Falls, N. Y. [Filed Sept. 2, 1875.]



Brief.—A rod is passed through a hole formed in the mold. The melted glass is inserted through the neck of the mold, so as to rest upon the top of the rod until ½ falls on all sides, when the vessel is blown.

1. The method herein described of blowing open tubes through glass vessels, substantially as specified.



2. A new article of manufacture—a glass vessel having a tube open at each end and connected to the bowl at both top and bottom, the bowl and tube being blown together, substantially as specified.

160,480. Hermetic-Sealing Devices. T. Roberts, Baltimore, Md., assignor of one-half his right to A. S. Dungan, same place. [Filed Sept. 14, 1876.]

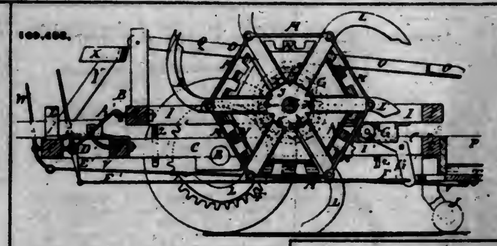
The combination of the dome B, crank E, eccentric F, and strap G, with its cap H, substantially as and for the purpose described.

160,481. Floors for Refrigerating-Houses. George Beebevot, Buffalo, and F. Schmidt, New York, N. Y. [Filed July 12, 1875.]

The combination of the planks C, having their sides a chamfered, the longitudinal troughs D, and the cross-troughs E, arranged and constructed substantially in the manner and for the purpose hereinbefore set forth.

160,482. Modes of Uniting the Ends of Belting. Cyprenus Chapin Roe, Hamilton, Canada. [Filed Apr. 5, 1875.]

The method of uniting the ends of machine-belts by means of a metallic buckle, slotted longitudinally and adapted to set over said ends, the width of each slot being exactly the same or slightly less than that of the two ends, so that the ends, when the belt is stretched longitudinally, will impinge against and be held by the edges of the slot without the use of a wedge or key, substantially as described.

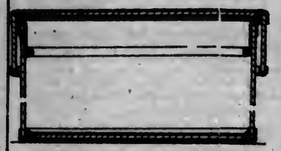


160,483. Potato-Diggers. D. J. Roush, Syracuse, Ohio. [Filed July 17, 1875.]

Brief.—A scoop-wheel, armed with six sets of curved fingers, is mounted upon a pair of wheels, which causes a forced rotation of the digging-wheel. The central portion of this wheel is provided with a slatted drum, highest in the center, so that the potatoes that fall upon the drum are cast off upon either side upon a shaking-screen, by which the potatoes are conveyed to a receptacle at the rear end of the frame.

1. The combination of the screen O and the ratchet-wheels S with the digging-wheel L M N, the shaft H, and the frame I, substantially as herein shown and described.

2. The combination of the levers U W, and the connecting-rod V, with the slide T of the receiving-box P, attached to the frame C, substantially as herein shown and described.

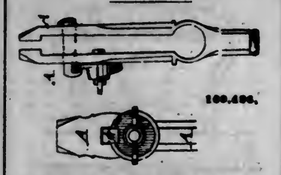


160,484.

3. The combination of the set-screws Z, the hooks A', and the adjustable eye-bolts B', with the carriage-frame C, the digger-frame I, and the gear-wheels F G, by which the digger-wheel L M N is driven, substantially as herein shown and described.

4. The combination of the lever C, the crank-shaft D' E', the connecting-rods F', the forked levers G', the rollers H', and the keepers I', with the carriage-frame C, and the digger-frame I, substantially as herein shown and described.

160,485. Paper Boxes. Felix Salomon, New York, N. Y. [Filed Sept. 11, 1875.]



As a new article of manufacture, a paper box, having its top and bottom edges bound with sheet metal, and its bottom also similarly bound and fastened in by solder uniting the bindings, and also having its top strengthened by a wire inclosed in a tube formed in an inner extension of the top binding, substantially as specified.

160,486. Combined Cane and Whip. O. H. Saxton, Washington Court-House, Ohio. [Filed Mar. 20, 1875.]

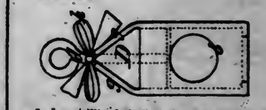
The improved combined cane and whip composed of the solid flexible whip portion F and the tubular sections E A, said parts being telescopically arranged and correspondingly threaded at G to adapt them to be rigidly connected by a screw-joint when extended or drawn out, all as shown and described.

160,486.

160,486. Vises. Alex. O. H. P. Sahorn, Murfreesborough, Tenn. [Filed Sept. 25, 1875.]

A vise made of spring-jaws A, adjusted by cross-bar connecting with hooked bearing on an inclined circumferential flange or cam of a thumb-nut applied to one of the jaws, constructed and operating substantially as specified.

160,487. Neck-Yokes. Charles Sherman, Red Oak, Iowa. [Filed May 1, 1876.]



1. The combination of two curved plates, B C, fitting upon each other, having open *b' c'* on the opposite ends of their upper edges, and *b'* tongue-hole in their lower middle parts, substantially as and for the purposes set forth.

2. The flanged hook E *c'*, in combination with the plates B C, having rubbeted tongue-hole D, substantially as set forth.

3. The neck-yoke A, having head *a'* on its center, in combination with the open *b' c'* of the plates B C, substantially as set forth.

160,488. Billiard-Chalk Holders. Joseph Simonton, Clarinda, Iowa. [Filed Sept. 20, 1875.]

1. In a billiard-chalk holder, the combination of plunger D, adjusting-screw *d*, with open casing A, having flaps *g g*, substantially as described.

2. In combination with a billiard-chalk holder, the sand-paper receptacle *b* and leather backing C, substantially as described.

160,489. Stop-Cocks. Robt. G. Sumston, Chicago, Ill. [Filed Sept. 20, 1874.]

Brief.—The weight of the wrench and rod rests upon the shoulder formed on top of the case.

Cock A, with shoulder A', plug B, wrench B', with prongs C resting on shoulder A', in combination with rod D, substantially as and for the purpose specified.

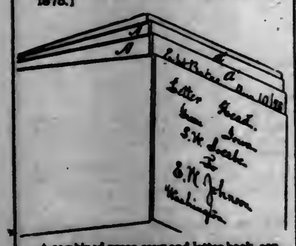
160,490. Ventilation of Connections on Closet-Stools. Robt. D. O. Smith, Washington, D. C. [Filed Oct. 6, 1875.]

Brief.—The essential features are a case or receptacle to receive the excreted matter, a ventilating-outlet located at or near the top of said receptacle, and a hopper, preferably funnel-shaped, extending down into the case below the upper side of the ventilating-outlet, so that there will be at the side of or around the lower end of the hopper a chamber or space, and a ventilating-outlet leading from the same.

169,690.

1. A case or receptacle, A, hopper C, and ventilating-outlet D, combined to constitute a ventilated odorless commode, as set forth.

2. A movable commode combined with a flexible pipe, to connect the same with a proper ventilating-flue, substantially as set forth.



3. In combination, the case A', hopper C, outlet D, and inclosed removable vessel B, substantially as set forth.

4. A case, A', provided with a handle for easy transportation, a removable seat, a, and hopper C, attached thereto, a ventilating-outlet, D, neck H, and an inclosed removable vessel, B, substantially as set forth.

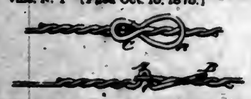
5. A case, A', provided with a handle, d, and ventilating-outlet D, and neck H, provided with a valve or damper, combined with a hopper, C, attached to a removable seat, and an inclosed removable vessel, B.

6. Combined with a case, A', hopper C, and ventilating-pipe, the permanent draft-openings h, to secure a continuous flow of air downwardly through the seat and hopper, and into the ventilating-flue, as set forth.

169,691. Letter-Press Copy-Books. S. W. Scobie, Greene, Iowa. [Filed Aug. 26, 1875.]

A combined press copy and letter book, consisting of alternate leaves of writing and copying paper bound in book form, each sheet of writing-paper being double the width of the copying-leaf, whereby the leaf written upon protects the blank copying-leaf beneath it from moisture, and a white surface is at all times below the press-copy leaf, allowing the writing thereon to be more easily read, substantially as described.

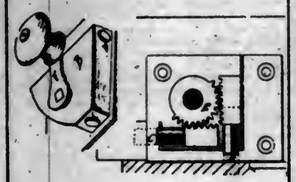
169,692. Boiler-Covering. Francis B. Stevens, Hoboken, N. J. [Filed Aug. 9, 1875.]



Brief.—Hollow metallic sections provided with inward-projecting flanges, forming an intermediate air-space, are secured around the boiler.

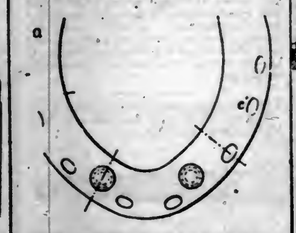
1. The hollow sections of metal formed by the inner sheet of metal A, the outer sheet of metal B, and the side sheets of metal D D.

2. The hollow sections of metal formed by the inner sheet of metal A, the outer sheet of metal B, and the side sheets of metal C C, in combination with the inner projecting flanges E E, as and for the purpose specified.



169,693. Bale-Ties. R. Stewart, Barnesville, N. Y. [Filed Oct. 16, 1875.]

The hook A, having a brace, B, which constitutes an eye, which receives and secures the eye C, substantially as specified.



169,694. Fastenings for the Meeting-Rails of Sashes. Isaac H. Stoddard, Ansonia, Conn. [Filed Apr. 20, 1875.]

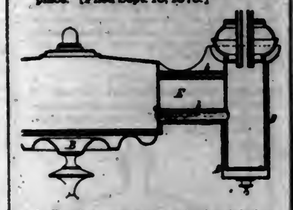
Brief.—The sector, operated by a crank-handle, engages with rack-teeth to throw the two bolts—one direct, and the other in transverse position.

The herein-described sash-fastener, consisting of the longitudinal and transverse bolts O D, to engage both sashes, and the window-jamb, combined with the pinion E, working in a toothed rack on each of the bolts, as described, to simultaneously operate both bolts.

169,695. Horseshoes. Saml. Stone, North Manchester, Conn., assignor to the Steel-Centered Calk and Set-Screw Company, same place. [Filed Nov. 8, 1873.]

As a new article of manufacture, the horseshoe c, provided with calks b', having a steel center from end to end, and fitted in place by means of a screw-end, substantially as described.

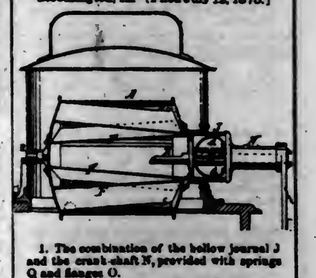
169,696. Sad-Irons. Oliver Swift, Madison, Wis. [Filed Sept. 17, 1875.]



Brief.—The body or smoothing-surface is made of glass, and has a detachable spring-handle.

1. The combination of the notched pins a', the tube B, provided with a wooden handpiece, b', the catches D, the springs E, and the wooden ring F, with each other, and with the body A of a sad-iron, substantially as herein shown and described.

2. An improved sad-iron, in which the body A is made of glass, substantially as herein shown and described

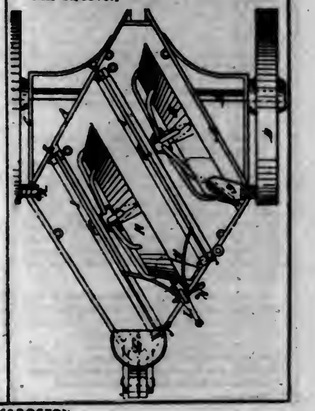


169,697. Lamps. Freeman A. Tabor, Boston, Mass., assignor to Philip S. Page, same place. [Filed Sept. 10, 1875.]

1. The improvement on the herein-before-specified patented improvement in lamps, consisting in the combination, with the oil-fount provided with a wick-receiver connected with the fount by supply-tubes, as described, of the receiving shell or case, provided with an extension which incloses the wick-receiver, and a connecting-thread, which inclosos the supply-tubes, said fount and wick-receiver being removable bodily from the receiver shell or case, and the whole arranged substantially as shown and set forth.

2. The outer receiving shell or case of the lamp, as composed of the cap B and extension D, united by the thread E, substantially as and for purposes stated.

169,698. Coffee-Roasters. F. Thomas, Bloomington, Ill. [Filed July 12, 1875.]

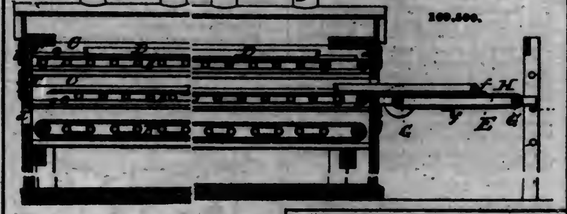


1. The combination of the hollow journal J and the crank-shaft N, provided with springs Q and flanges O.

2. The combination of the hollow crank-shaft N, and tester R, and hollow journal J.

3. The combination of the roasting-cylinder A and the flanges F, attached diagonally to the cylinder and to each other, thus forming a regular zigzag around the inner surface of the former, substantially as and for the purpose specified.

169,699. Rotary Gang-Plows. John K. Underwood, Sauk Centre, Minn. [Filed July 31, 1875.]



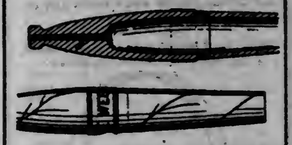
1. The frame A C, having two sets of axles, D E, hook-bolts U, standard M, and keepers K, adapted to receive rotary plows or cultivators, in the manner described.

2. The combination, with rotary plows H, of beams I, pivoted upon the frame at J, and swinging in keepers K, the forked lever L, the bars O, standard M, and pin P, as and for the purpose specified.

169,700. Dieting Apparatus. T. Webber, Chicago, Ill. [Filed Sept. 28, 1875.]

Brief.—The rods distribute the weight of the pans over the pipes. The endless feeding-belt and the transferring-roller carry the pans into the rods.

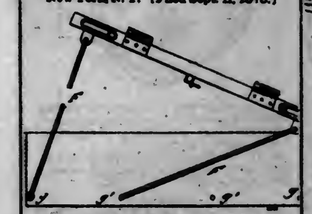
169,701. Locks-Shuttles. Daniel Wright, Lowell, assignor to Sawyer Spindle Company, Boston, Mass. [Filed May 18, 1875.]



1. The combination, with the spindle and its head, of the detaining-catch constructed with the head of the spindle and bent, substantially as described, with relation to the spindle to enter an internal groove in the base of the bobbin, substantially as set forth.

2. The combination of the truncated bobbin, provided with an internal groove, A, with the spindle, its head, and the hooked detaining-catch, connected with the head, and stop f, all constructed and combined to operate substantially as described.

3. A bobbin having an enlarged opening in the base, and an internal groove to receive the bobbin-catch, combined with the spindle, the shuttle and a bobbin-catch, adapted to project from the outside into and engage a groove in the interior of the bobbin, substantially as described.



169,702. Cigar-Press. Robert L. Wood, New York, N. Y. [Filed Nov. 7, 1874.]

Brief.—The tube is divided in the center, and the tobacco-cavity decreases gradually therefrom toward each end, whereby the tobacco inserted at the center cannot fall out.

A two-part tobacco-pipe having a middle joint and a cavity decreasing therefrom gradually toward each end, as and for the purpose specified.

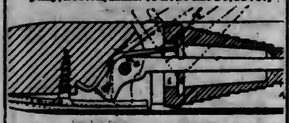
169,703. Venetian Shades. C. Widemann, New York, N. Y. [Filed Sept. 11, 1875.]

The rods F, pivoted to bottom of lower slat, and fastening detachably in staples f, as and for the purpose described.

169,704. Ornaments' Punches. George O. Wright and Geo. Bassett, Spencer, Mass. [Filed Aug. 14, 1875.]

169,705.

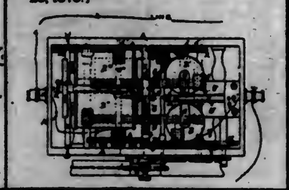
The compound tool or boring-pincher, herein described, consisting of the stationary jaw A, handle B, rod or lever C, pivoted jaw and claw D E, hammer F, and spring G, as and for the purpose set forth.



169,706.

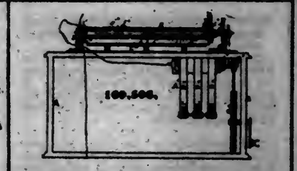
1. In a kiln for drying animal matter the combination of the pans D with the steam-coils B B' B'' and the supporting and equalizing rods D', substantially as specified.

2. The combination of the transferring-rollers a with the supporting-rods D' and coils B, substantially as specified.



3. The combination of the frame E, having rollers G, and endless belt H with the casing A, having openings d d', and tiers B B' B'', substantially as specified.

169,707. Loom-Shuttles. Daniel Wright, Lowell, assignor to Sawyer Spindle Company, Boston, Mass. [Filed June 26, 1875.]

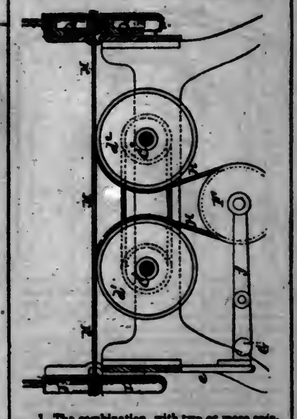


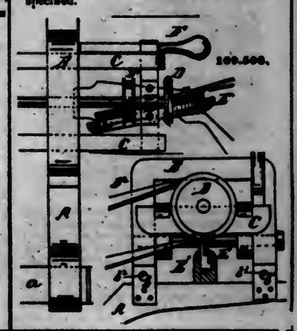
The combination, with a shuttle, of a detached catch, substantially as described, adapted to enter and engage a groove in the base of a bobbin, as set forth.

169,708. Magneto Printing-Telegraphs. George L. Anders, Boston, assignor to E. B. Welch, Cambridge, Mass. [Filed Mar. 26, 1873.]

1. The combination, with two or more spindles on opposite sides of the frame, and two horizontal shafts arranged lengthwise of the frame, of the two pulleys S' S' on said shafts, the endless band H, running on said pulleys S' S' and V k, and the idler-tightening-pulley F, substantially as shown and described.

2. The combination with the idler-pulley F, and its lever f, of the counter-balance weight G, as shown and described, for the purpose specified.





1. The combination, with type-wheel of a printing-telegraph instrument, operated or controlled by currents from a magneto-generator, without the use of a relay or galvanic battery.

2. The combination of a type-wheel and printing mechanism placed in the same circuit, and both operated or controlled by currents from a magneto-generator without the use of a relay or galvanic battery.

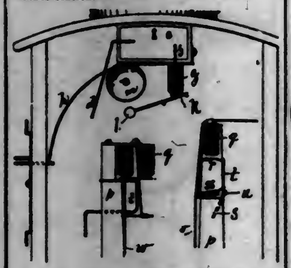
169,709. Spinning-Frames. J. B. Atwood, Willimantic, Conn. [Filed Mar. 27, 1875.]

Brief.—A single band passes across the frame, around the whirls of four or more spindles, (two or more on each side of the frame,) and thence over two drums, and is kept tight by an idler-pulley, which is counterbalanced to regulate the tension, and prevent wear of the bearing of the lever which carries it.

169,710.

1. The combination, with two or more spindles on opposite sides of the frame, and two horizontal shafts arranged lengthwise of the frame, of the two pulleys S' S' on said shafts, the endless band H, running on said pulleys S' S' and V k, and the idler-tightening-pulley F, substantially as shown and described.

2. The combination with the idler-pulley F, and its lever f, of the counter-balance weight G, as shown and described, for the purpose specified.



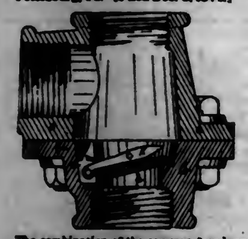
169,506. SAW-GUMMING MACHINE. Henry Bonshomme, Dunn's Gold Mine, S. C. [Filed Apr. 2, 1875.]

Brief.—The main frame is adjustably attached to a platform, and the frame carrying the grinding-wheel is pivoted thereto. A gage-stop attached to the pivoted frame determines the vertical movement of the wheel for the depth of tooth.

The combination of the frame A B, constructed as described, with the pivoted frame C carrying the grinding-wheel D, and adjustable stop F, substantially as and for the purpose set forth.

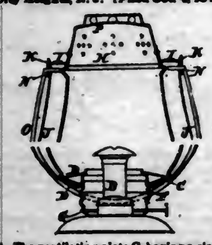
169,509. ELECTRIC RAILWAY-SIGNALS. E. B. Bean, Boston, Mass. [Filed Jan. 26, 1874.]

Brief.—Battery and signal-instrument on train; one pole of battery to earth through metal of train—other pole to projection *i* on side thereof; posts at each station along track. Each post has magnet, whose circuit extends to a preceding or succeeding post, or both, and through a beat lever, *o t*, mechanically connected to ground. This lever is normally in such position that projection *i* bears against it, closing circuit of signal on train if everything is clear. Projection *i* bears it to such position that the lower end *o* is locked away from where the projection *i* of a succeeding train can touch it, as shown in Fig. 5, until the train has sent back an impulse from another station.



1. In combination, with a battery, its projecting pole *i*, and the operating-levers *o t*, as described, an additional projection, *s*, on the engine or other moving part of a train, for the purpose set forth and described.

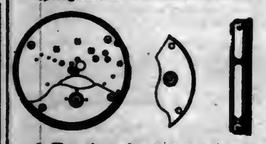
2. The stationary posts *p p'*, with their electro-magnets *q q'*, armatures *r r'*, rocking levers *s t o i*, springs *s s*, or their equivalents, and wires *a a*, in combination with a movable battery, as and for the purpose set forth.



3. The combination, with a switch or other movable part of a railway, of connections 3 7, receptacle 4 6, with their flexible diaphragms, support 10, and connecting-pipe 5, or their equivalents, as and for the purpose set forth and described.

169,510. VALVES. Edwd. H. Bookwith, St. Petersburg, Pa. [Filed Dec. 8, 1874.]

The combination of the one-way flaps *h*, provided with slots *s* and angular receptacle *a*, for the reception of the wedge-shaped piece *d*, the upper plate *c*, resting upon the piece *d*, and holding it in position; the valve *e*, covering the opening *f*, and pivoted to the pointed rod *b*, the pointed rod *b*, hinged to the wedge-shaped piece, and fitting within an upturned slot set therein.

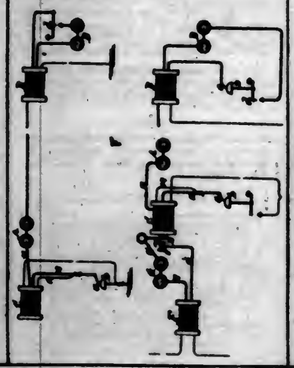


169,511. LANTERNS. Henry Beebe, Jersey City Heights, N. J. [Filed Oct. 4, 1875.]

1. The ventilating-plate G, having a circumferential flange, which forms a support for the globe, and constructed with a depending screw-collar, F, in combination with the concave-convex ferruginous plates D D and the base A, having a screw-collar, G, all substantially as shown and described, for the object specified.

2. The combination of the radial arms I of the cap H of the lantern, having plate K, with the lantern-guards J, both the arms and the guards having apertures N, and with the ball O, substantially as described.

169,512. WATCHES. John K. Bigelow, Springfield, Ill. [Filed Apr. 2, 1874.]



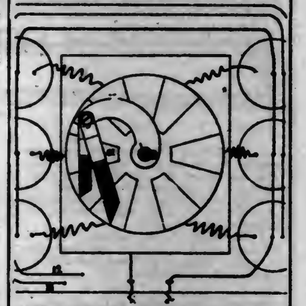
1. The above-described barrel-bridge *c*, with its lower edge coming down flush with the under side of the top plate, and having a beveled outer edge corresponding with the beveled outer edge of said top plate, thus forming a complete annular and bevel bearing for the inside bevel of the dust-ring *e*, substantially as set forth.

2. The combination of a dust-ring, having a bevel inside surface extending from top to bottom, as above described, with a corresponding shoulder on the pillar-plate, substantially as set forth.

3. The dust-ring *e*, provided with an inside bevel for the purpose of forming a close joint or joints, and for easy removal of said ring, substantially as set forth.

4. The convex or catches *s* in combination with the milled recesses on the inside of the dust-ring, for holding said ring in place, substantially as set forth.

169,513. ELECTRIC TELEGRAPHS. Robert E. Boyle, New York, N. Y. [Filed Mar. 30, 1875.]



1. In a telegraphic apparatus, the combination of two induction-coils, one in each terminal of the line, with a battery in the line of the telegraph, the current of said battery being closed continually over the line-wire, and being made to act on the pen or stylus of a chemical-writing instrument, while its force is alternately increased and then controlled by the currents induced in the induction-coils, whereby signals are recorded by breaks in the line drawn in the paper moving under the pen or stylus, as shown and described.

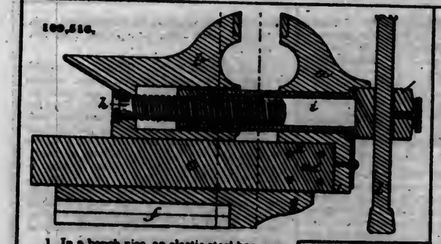
2. The combination, in a telegraphic apparatus, of induction-coils B C, line-battery A, circuit-breaking armature H, local battery G, and induction-coil F, substantially as and for the purpose set forth.

169,514. ELECTRICAL INDUCTION APPARATUS. Robert E. Boyle, Brooklyn, N. Y. [Filed Mar. 16, 1875.]

Brief.—In a series of induction-coils, secondary helices connected to one conductor. Primary helices alternately brought into action, so as to give a steady induced current.

The combination of a series of induction-coils with one or more brushes or keys, and with a surface composed of alternating segments of a non-conducting and conducting material, either the keys or the surface being made removable, substantially in the manner and for the purpose herein shown and described.

169,515. ASHPIT-SHIELDS. Ella C. Bruce, Lynn, Mass. [Filed Apr. 20, 1875.]

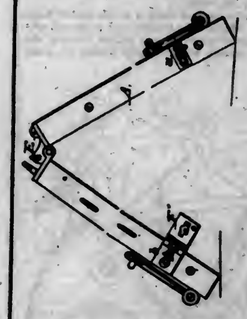


1. An ashpit-shield composed of yielding fabric or material, stiffened or expanded by a marginal frame, substantially as described, for the purpose specified.

2. The combination of the shield A, marginal frame B, and shoulder-strap C, substantially as described.

169,516. VISES. Amos H. Packard, Hyde Park, Mass. [Filed Apr. 1, 1875.]

Brief.—The bearings of the screw by which the moving jaw is operated have slight play, so that the broad thin steel bar, which, fixed to the moving jaw, slides in a slot in the stationary jaw, allows certain self-adjustment of the face of the sliding jaw to the contour of the article held in the vise.



169,518.

1. In a bench-vise, an elastic steel bar, *c*, secured to the front jaw, and movable through a slot in the rear jaw, substantially as herein set forth.

2. In combination, the stationary jaw *b*, and screw-shaft *h*, movable jaw *a*, and its screw-sleeve *i*, and the elastic steel bar *c*, with its corresponding slot, as and for the purpose set forth.

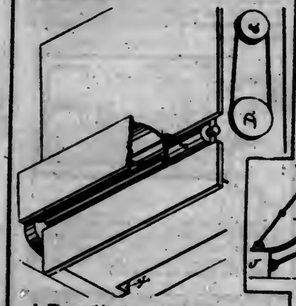
169,517. CLOTHES-DRYERS. G. A. Brooks, Norwich, Conn. [Filed Oct. 26, 1875.]

1. The arrangement, with the frame A B, of the slotted step-hinges E F upon the top, and the side step-hinges F F, all with their respective turn-buttons or keys, as and for the purpose set forth.

2. As a means of connecting the parts of a clothes-drier, the step-hinge with its slot *c*, step *b*, and turn-button or key *d*, all as and for the purposes set forth.

169,518. RAISING BROOM-CUT HAY. Charles Brown, New York, N.Y. [Filed Sept. 28, 1875.]

The combination of the longitudinal and segmental plate O O' with the cross-edge sticks B B B' B', the longitudinal edge sticks A A A' A', applied to opposite sides of the hole, and the binding-bands, cords, ropes, or wires D, substantially as shown and described, and for the purpose herein set forth.



169,519. TRACE-BUCKLES. M. T. Burton, Portsmouth, Ohio. [Filed July 7, 1875.]

A trace or harness buckle consisting of the frame A, having side pieces H, lower cross-bars *a a*, top bar *c*, side flanges E, and projections L, in combination with the sliding wedge B, having rolling sides, cross-bars *f* and *g*, recesses N, and flanges O, and a tongue or stud, *e*, on its front cross bar, substantially as herein specified.

169,520. PRIMING ATTACHMENTS TO PLANING-MACHINES. Benjamin C. Chambers, Shady Plain, Pa. [Filed June 8, 1875.]

Brief.—The planer feeds the lumber directly into the primer.

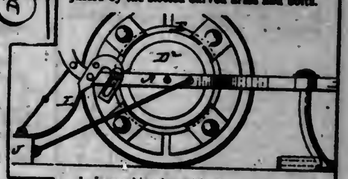
1. The combination, with a planing, or planing and matching, machine, of a priming apparatus at the delivery end of the former, whereby the planed lumber will be fed directly from and by the planer to the primer, substantially as described.

2. In a lumber-priming machine, the combination, with the supply-trough, of the grooved priming-roller, substantially as described.

3. The adjustable scraper *d* having the converging scraping-ridges, substantially as and for the purposes described

---

169,521. BALE-TIES. Charles H. Olsen, New Orleans, La., assignee of one-half his right to Jasper Thayer, same place. [Filed Apr. 26, 1875.]



The coil K', with projecting guides or lugs *e* and *f*, elongation B, rounded corners *a a*, rivet *b*, and wedge *S*, all constructed and arranged substantially as described, and for the purpose specified.

169,522. MACHINERY FOR THE MANUFACTURE OF NUTS. J. H. Couvrot, Calais, France. [Filed Feb. 4, 1875.]

The combination, in a nutting-machine, of plunging-bolts B, points D and C, sliding bar K, and chamber H, whereby parallel warp-threads are formed into loops, and a shuttle-thread is carried round the cross-thread of each loop, the whole being adapted to operate together to form a nut, as set forth.

169,523. FERTILIZER-DISTRIBUTERS. Wm. H. Cook, Meridian, Miss. [Filed Aug. 26, 1875.]

Brief.—Between the annular rim and one-half of the drum are interposed adjustable segmental blocks for varying the size of the seed-openings. The covering device is adjusted by the slotted curved arms and bolts.

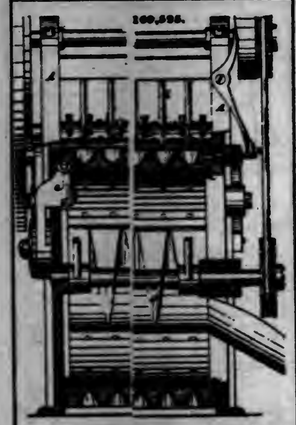
1. In combination with the annular rim D and half-drums D' D', the segmented blocks E, provided with enlarged bolt-holes for radially adjusting the same to increase or diminish the seed-openings, as set forth.

2. The combination of the coverer J, pivoted spring-arms I I, having their upper front ends curved and slotted, as described, and the bolts *d d* for adjusting the covorer, substantially as herein set forth

---

169,524. VEHICLE-SPRINGS. S. J. Corey and Elijah Neff, Rochester, Ind. [Filed Sept. 14, 1875.]

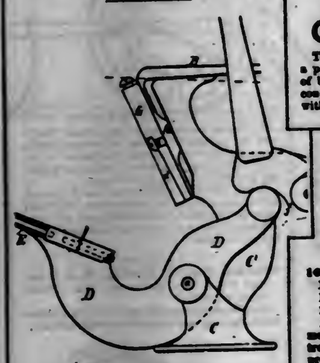
Brief.—As the spring opens the pin catches the lower leaf, and stops the motion upward.



The bar D, with its arms *a* and *c*, the connecting-rod *d*, and arm *e*, in combination with the upper and lower leaves of a spring for vehicles, as and for the purpose set forth.

169,525. CHERRY-STONERS. S. A. Darrach, Orange, N. J. [Filed Aug. 26, 1875.]

Brief.—The cherries are fed down an inclined trough to a cylinder having cells to receive them, with a perforation in the bottom to allow the pit to pass through. The emptied cherries are thrown off the cylinder by a revolving brush. A stoning device is attached to the frame, consisting of a spear-point reciprocating through a perforated plate, entering the cherry as it lies in the cell, and being "stripped" by the perforated plate. The pits drop into a trough, and are carried away by means of a worm-shaft.



169,595.

1. The pit-receiving trough I and endless screw J, in combination with the cylinder B and plunger G, substantially as set forth.

2. The combination of the rotary cylinder B, having the coils b, with the perforated bar r; barbed clearers f, cam-grooves h, and slides p, for operating the clearers to clear the coils, substantially as described.

3. In combination with the cylinder B, provided with coils b, and containing the pit-receiving trough I and endless screw J, the plunger G, clearing-brushes D, and barbed clearers f, all constructed and arranged to operate substantially as described.

169,596. Oscillating Printing-Presses. John L. De Haff Webers, assignor to Jos. Webers, Everett, Mass. [Filed June 20, 1875.]

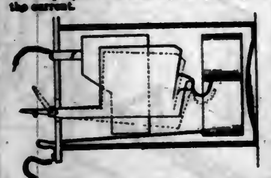
Brief.—A toy or amateur press operated by a cam-lever.

1. The lever D, pivoted at or near the middle of its length to the frame C, and carrying upon one end the platen E, cast upon or otherwise secured thereto, and provided at its other end with a bent, trunk, or rounded surface, in combination with the pivoted bend-lever F, having formed upon its under side, near its fulcrum, the reverse-curve cam-surface e f, arranged to operate as and for the purposes described.

2. The chase G, provided with a rabbet, d, formed in the outer corner of each end, the bottom surface of which is at a slight angle to the outer and inner faces of the chase, in combination with the adjustable screw-bolts c c, set in the face of the type-bed, and adapted to engage with said rabbet to hold the chase in position, substantially as described.

169,597. Weather-Board Gages. Robert J. Dodd, Crawfordsville, Ind., assignor to himself, Taylor Burlington, W. S. Cassel, Noah Wilkinson, and D. W. Milholland. [Filed Aug. 14, 1875.]

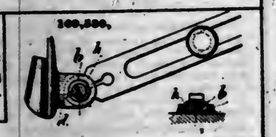
The within-described weather-board gage, consisting of the staff A, cut out as described, the spring-plate B, attached thereto, extending to the top of the staff, and having a spur, a, formed thereon, the adjustable gage C b d, and the spring-holder D, all constructed as and for the purposes set forth.



169,598. Materials for Chair-Seats. D. H. Donovan, Bayonne, N. J. [Filed Sept. 27, 1875.]

Brief.—Layers of veneer and leather-board cemented together.

As a new article of manufacture, a material for chair-seats and other purposes, consisting of a veneer or veneers cemented to one or more sheets of leather-board, as set forth.

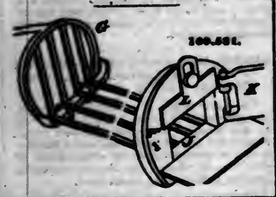


169,599. Galvanic Batteries. C. Dubois, Denver, Colo. [Filed July 9, 1875.]

Brief.—The supplementary electrode is hung on pivots, and by a lever-arm can at pleasure be moved into contact with the positive plate, for the purpose of increasing the quantity of the current.

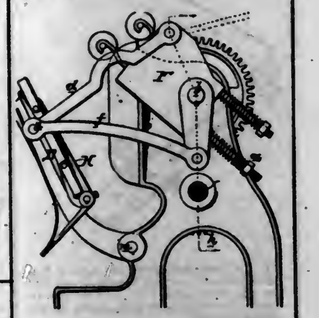
The application to any galvanic battery of a positive supplementary electrode, capable of being easily and quickly connected or disconnected with the positive plate of a battery within the liquid, as described.

169,600.



169,600. Clasps for Attaching Hinges, &c., to Sewing-Machines. Jno. Dunn, Philadelphia, Pa. [Filed Aug. 16, 1875.]

Brief.—The slotted bar, designed for attachment to the cloth-plate, is divided at its vertex, and upon each part is a semi-annular projection, forming an expansible nut, over which the eye of a hammer or other attachment may be slipped. A tapering screw, as it is turned into the nut, spreads it apart, thereby firmly securing the attachment at any desired angle with the slotted bar.



The expansible cylindrical nut b and tapering screw c upon the slotted arm c, in combination with the plate g, having an eye, h, and carrying a hammer or other sewing-machine attachment, as and for the purposes set forth.

169,601.

169,601. Oscillating Printing-Presses. Wm. C. Evans, Philadelphia, Pa. [Filed July 14, 1875.]

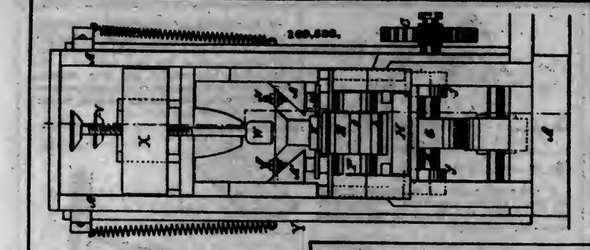
Brief.—An arm from a crank on the main shaft vibrates the platen, and a second arm from same pivot on the platen vibrates the roller-frame, which swings loosely on main shaft.

The combination of the shaft A, having cranks c, connected to a pin, a, on the hinged platen D, with the inking-frame F, hung loosely to the shaft d, and connected to the said pin a of the hinged platen, all as set forth.

169,602. Machines for Packing Tobacco in Bags. James R. Farrar, Cary, N. C. [Filed Aug. 23, 1875.]

Brief.—An endless band carries the bag-holders, which, as they pass under an automatic feeder, are supplied with the tobacco, when two different plungers enter each bag and compress the tobacco. The holders are removable at will, to take off a filled bag or put on a new one.

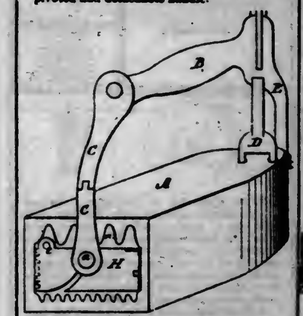
1. In a tobacco-packing machine, an endless belt, E, having cords b thereon, in combination with the bag-holders K and the guides M N, substantially as and for the purposes described.



2. The combination, with the endless belt, having catches c, of the pawl I, slide H, cam G, and spring J, substantially as described, for the purpose of operating the belt.

3. The combination, with the endless belt, carrying cords, and the bag-holders K, of the two plungers V W, attached to the same cross-head, and located the same distance apart as the bag-holders in the cords, whereby a single movement is made to effect the packing of one bag and the shaking down or settling of the tobacco in the bag following, substantially as described.

4. The combination, with the endless belt and the bag-holders, of the plungers V W, the cross-head X, slide-bars Y, springs Z, and the cam G, as and for the purposes set forth.

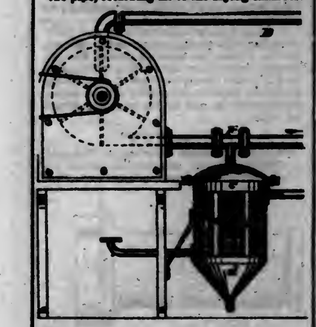


5. The combination, with the bag-holder, of a support, d, as and for the purposes described.

169,603.

169,604. Plotting-Irons. Wm. F. Fisher, Brunswick, and Amos C. Brown, Kenosha, Tex. [Filed Feb. 27, 1875.]

Brief.—A bolting and flatting iron has within it a bolting-iron, in which is placed a heating-iron. The said iron and the flatting-iron may be used together or separately by the pivoted and detachable handle.



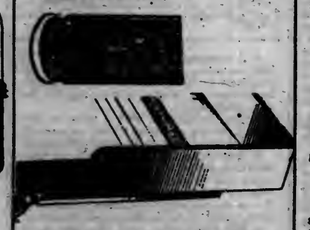
1. The combination of handle B, locking device D, and an iron for smoothing or flatting, said handle being pivoted in the manner shown and described.

2. The hollow irons A and G, having corresponding inner and outer surfaces, respectively, combined as shown and described.

3. The combination of hinged lock-plate b and slide d with the handle B C H and iron A, as shown and described.

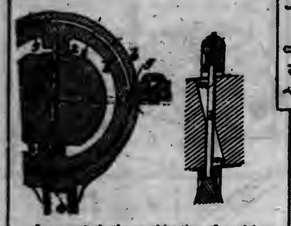
169,605. Apparatus for Dryingfanning Air. Levi K. Fuller, Brattleborough, Vt., assignor to J. Estey & Co., same place. [Filed Sept. 28, 1875.]

Brief.—The condenser communicates with the pipe, returning air to the drying-chamber.



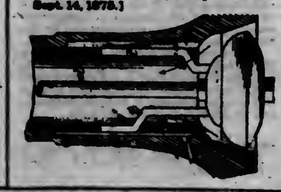
1. In a drying apparatus, a condenser communicating with the pipe from the blower to the chamber by means of a connection-branch, as shown, so that the air-current will not pass directly through the condenser, but be in connection therewith, as described.

2. The combination of a blower or fan, the outlet and inlet pipes D E, and a condenser, G, the latter being connected with the inlet-pipe E by means of a branch, F, in the manner and for the purposes set forth.



3. In combination with the inlet-pipe E and outlet-pipe D, a condenser, G, provided with a branch, F, and a conical lower head or chamber, d, to deflect the downward blast in the center, and collect the water of condensation, substantially as specified.

169,606. Fire-Proof Coverings for Books. Edwd. W. Glover, Malden, Mass. [Filed Oct. 22, 1875.]



In combination with the binding of a book, a fire-proof protecting-cover, consisting of an open box adapted to fit closely over the leaves and between the covers of the binding, the whole forming a tight inclosing-box around the leaves, substantially as described.

169,607. Rowlocks. F. D. Graves, South Boston, Mass. [Filed July 22, 1875.]

In a rowlock, the combination of ear f, having slot s s, narrowing toward the center of said ear, trunnion-rod k, and ring b', arranged to slip in the pivoted outer ring b, as described.

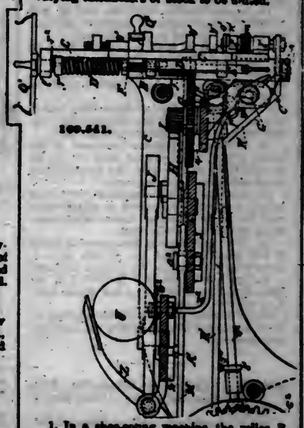
169,608. Hydrants. W. D. Greenville, New York, N. Y., assignor to J. D. Keegan, Jr., and Reuben J. Greenville, same place. [Filed Sept. 14, 1875.]

Brief.—A plate or bar attached to the valve-rod or valve serves to operate a spring-bar provided with a conical valve, for closing the waste-aperture. A sliding bar and spring, bearing against the inside of the hydrant on the side opposite the spring-bar, keep the latter in proper position.

In combination with the valve-rod or valve of a hydrant a plate or bar attached to the same, and operating a spring-bar, provided with a conical valve for closing the waste-aperture, and a sliding bar and spring bearing against the inside of the hydrant-cylinder on the side opposite the spring-bar and the valve, substantially as described.

169,609. Safety-Matches. E. Hessel, Osbourn, Canada. [Filed Aug. 14, 1875.]

1. The friction-match composition made of potassium chlorate, sulphide of antimony, sesquioxide of iron, binoxide of manganese, chromate of potassium, powdered glass, and mucilage, in the proportions and manner substantially as specified.



2. The friction-match made of potassium chlorate, sulphide of antimony, sesquioxide of iron, binoxide of manganese, chromate of potassium, powdered glass, and mucilage, in combination with the friction-tablet made of amorphous phosphorus, sulphide of antimony, powdered glass, and mucilage, in the proportions and in the manner substantially as specified and described.

169,610. Medicinal Prescriptions for the Cure of Catarrh. J. W. Harvey, Memphis, Mo. [Filed Oct. 2, 1874.]

The medical compound for the cure of catarrh herein described, consisting of nitrate of potassa, chlorate of potash, golden seal, common salt, and gum-camphor, in about the proportions herein specified.

169,611. Leather-Screw-Pegging Machines. Chas. M. Higgins, Brooklyn, N. Y., assignor to Karen O'Brien, same place. [Filed July 12, 1875.]

Brief.—The drill for perforating the stock, and the hollow spindle for conducting the screw-thread material to the perforation, are carried by a lateral reciprocating sliding frame, which alternately brings the drill and spindle to the same point, between each feed-movement of the last or shoe. A roller, adjustable with fixed relation to the drill, is provided with a flange, which bears against the inner marginal surface of the outsole, for regulating the depth of hole to correspond with the varying thickness of stock to be united.

169,611.

1. In a sliding-seating machine, the roller B, provided with a flange or projection, bearing against the margin of the inner surface of the outsole of a shoe, and adjusted in fixed relative position with the drill or other devices which penetrate the sole, as a means of insuring the accurate and uniform penetration of the sole to the required depth at all points, substantially as herein set forth.

2. In combination with a fixed pressure plate or foot, A, a vertically-moving slide, C, having fixed thereto both the support, or partial support, for the work, and also the drill or other devices for penetrating the work, the former being fastened below and the latter above the pressure-plate, substantially as herein shown and described.

3. The combination of the screw-stem *k*, nut *m*', and retaining-socket P, whereby a vertically-adjustable attachment of the flanged roller B to the slide C is provided, substantially as and for the purpose set forth.

4. In combination with the roller H, the shaft *o*', and dial *o*', as and for the purpose set forth.

5. In a leather-boring machine, a drill, R, the upper body portion of which is a cast-tube, while the lower extremity includes more than a cast-tube, and is provided with an edge-cutting end, substantially as and for the purpose described.

6. The combination of the cam K, sector H, and lever J with the screw-spindles E F.

7. The combination of the screw-spindles E F and sliding frame D, arranged to reciprocate across the face of a driving-wheel, to effect the simultaneous engagement and disengagement of the respective spindles with one movement, substantially as herein set forth.

8. In combination with the shifting screw-spindles E F, the retaining brakes or springs *o o*, substantially as herein set forth.

9. In combination with the screw-spindles E F and sector H, with mechanism for driving it, the fixed stops S S and elastic slot T, substantially as and for the purpose set forth.

10. In combination with the shifting-lever M, the curved slot B' and guide-pin A', and the movable fulcrum *d* P, whereby the lever is prevented from moving out of true position when once adjusted, substantially as shown and described.

11. In combination with the thread-spindle F, the elastic griping-cushion Q, substantially as and for the purpose set forth.

12. In combination with the thread-spindle F and its clutch-collar *g*', the plate X, attached to the fixed frame, and pressed down and kept in definite position by the spring Y, to effect the closing of the clutch at a certain point in the upstroke of the spindle, substantially as herein shown and described.

13. In combination with the thread-spindle F, and its clutch-collar *g*', the arm F' and spring W, arranged to effect the opening of the clutch when the needle reaches the end of its stroke, substantially as shown and described.

14. In combination with the thread-spindle F, an adjustable griping guide-eye, V, adapted to grasp the peg end, substantially as and for the purpose set forth.

15. In combination with the reel Q' and spindle F, the flexible connection D', substantially as and for the purpose set forth.

16. The hook F', arranged to reciprocate in the base of the presser-plate A, with the cutting and separated from contact with the work by means of the thin plate F', substantially as herein set forth.

17. The combination of the rubber ball U and its jet-pipe *s*' with the compressor I, substantially as and for the purpose set forth.

18. The feed mechanism, composed of the rotary cam E' and stand lever O', the lower end being shorter than the crank-throw, substantially as herein set forth.

19. In the jack of a shoe-machine, the tilting handle *g*, having a screw end, in combination with the center-pin *r* and socket *n*, substantially as shown and described.

20. The combination of the retaining-screw *s* and handles *p p* with the pivoted plate *t*, substantially as and for the purpose set forth.

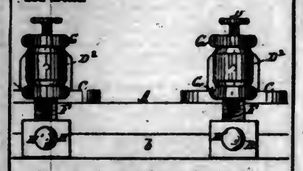
21. In combination with the rod *d* of the jack, the ball and socket *r p* and elastic band *h*, as shown and described.

22. In combination with the shoe-socket *n*, the rubber-faced binding-screws *s s*, as shown and described.

169,542. HAT-BLOCKING APPARATUS. John R. Hill, Bloomfield, Iowa. [Filed June 7, 1875.]

Brief.—A swinging platform hinged at both ends, and adjustable by sliding edges in different heights of hat-stands. The heated platform is swung up by dashtick and rope.

1. The platform D, carried by the bars *c* and hinged posts *b*, substantially as and for the purposes shown and described.



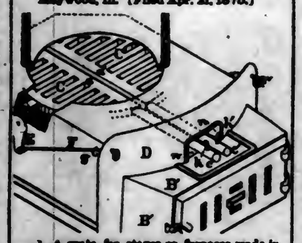
169,543.

2. The combination of the derrick H, having rope A and the adjustable swinging platform D, substantially as and for the purposes shown and described.

169,543. DRAWING-BOARD ATTACHMENTS. Julius O. Hintz, Canton, Ohio. [Filed Aug. 19, 1875.]

Brief.—The invention involves special mechanism for truing the angles of drawing-boards and tables.

1. A squaring attachment for drawing-tables, consisting of the border-rails B, in combination with horizontal and vertical adjusting mechanism, substantially as and for the purpose described.



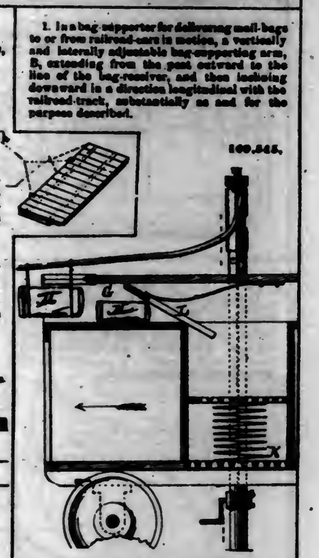
2. The combination, with a table, of bed-plate C, having shoulders C' and support C', substantially as and for the purpose described.

3. The border-rails B and jaws B, provided with shaft F and milled nuts G, whereby the cloth can be adjusted up or down, in combination with a shaft or support, D, and screw E, and the shaft can be adjusted horizontally, substantially as and for the purpose described.

4. The combination, with the table A, of bed-plate C, shaft D, screw E, shaft F, nuts G, and jaws B, substantially as and for the purpose described.

5. The combination, with the table A, of bed-plate C, shaft D, screw E, shaft F, nuts G, and border-rails B and rib *b*, of jaw H and set-screw H', substantially as and for the purpose described.

169,544. STOVE-GRATES. W. B. Hosford, Maywood, Ill. [Filed Apr. 21, 1875.]



1. A grate for stoves or furnaces made in sections, and provided with journals *b b'* and *c c'* and lugs *d d'*, in combination with the sections *a a'*, cranks B B', and shifting-rods F F', all arranged to operate together in the manner shown, and for the purposes set forth.

2. The combination, in a dumping-grate, of the sectional grates G G', sections *a a'*, cranks B B', and shifting-rods F F' with the pins *h h'* and dumping-lever G, the latter constructed as shown, and all arranged to operate substantially in the manner shown, and for the purposes specified.

3. In combination with the sectional grate G G', having journals *c c'*, provided with pins *h h'*, the dumping-lever G, provided with a hole, *i*, and elongated slot *j*, to engage with the said pins, substantially in the manner shown, and for the purposes herein set forth.

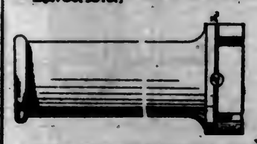
169,545. MAIL-BAG CATCHERS. Edgar P. Hotchkiss, Unadilla Forks, N. Y. [Filed Oct. 18, 1875.]

169,545.

1. In a bag-supporter for delivering mail-bags to or from railroad-cars in motion, a vertically and laterally adjustable bag-supporting arm, B, extending from the post outward to the line of the bag-receiver, and then inclining downward in a direction longitudinal with the railroad-track, substantially as and for the purpose described.

2. An apparatus for delivering bags and other packages to, or receiving them from, railway-cars in motion, having a support from which the bag is suspended by cords, and a cutting-edge operated by the power of the moving car for severing said suspending-cords at the proper moment, and allowing them to drop upon or into the receptacle prepared for them, substantially as described.

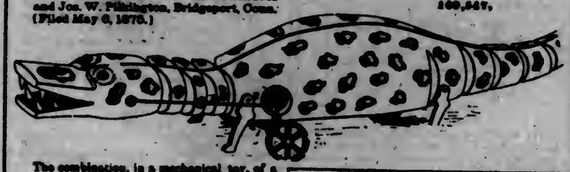
3. The combination of the inclined bag-supporting arm B and the floor-roof, having the notch or notches *g*, with edges adapted to sever the cords that support the bag or package, substantially as described.



4. In an apparatus for receiving and delivering bags and packages from and to railway-cars in motion, the floor G, combined with a spring-brake, I, substantially as and for the purpose described.

5. In an apparatus for receiving and delivering bags and packages from and to railway-cars in motion, the floor G and receiving-chamber H, having a grated bottom, combined and arranged substantially as described.

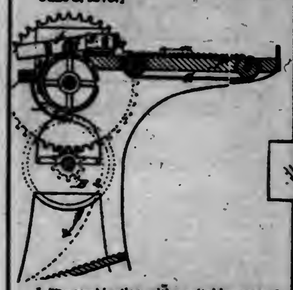
6. In an apparatus for receiving and delivering bags and packages from and to railway-cars in motion, the combination of the chamber H, having a grated bottom and a spring false bottom, with the floor G, substantially as described.



7. In an apparatus for receiving and delivering bags and packages from and to railway-cars in motion, the receiving floor or floors G, having their roof provided with a cutting edge or edges, and having the floor of the passage projecting beyond said cutting edge or edges, substantially as and for the purposes herein set forth.

169,546. SPOOLS. Horace J. Hubbard, Chicopee, Mass., assignor of one-half his right to E. F. McLean, same place. [Filed Apr. 20, 1875.]

The bobbin having its head re-enforced by means of the wire I, which is fitted in the groove *b*, and has its ends twisted together and sunk into the hole *d*, and held therein by means of solder or other similar material, as described.

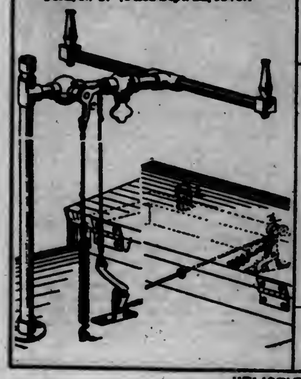


169,547. AUTOMATIC TOYS. Edward R. Ives and Jos. W. Pilkington, Bridgeport, Conn. [Filed May 6, 1875.]

169,547.

The combination, in a mechanical toy, of a body mounted on wheels, and containing a clock mechanism, a sectional flexible tail, and a sectional flexible head or neck, connecting with the clock mechanism by a pitman, all substantially as set forth.

169,548. PAPER-PERFORATING MACHINES. Joseph S. Ives, New York, N. Y. [Filed June 3, 1875.]

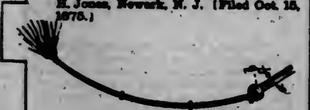


1. The combination, with a suitably-grooved rotatory surface, on which the sheet is supported, of a cutter-wheel driven therefrom, and formed or provided with knife-edge cutters, the whole so constructed and operating that the sheet passed between said two wheels will have a row of clean cuts made in it, as and for the purpose described.

2. The combination, with a grooved driving-wheel, of a cutting-wheel and a means for pressing and holding the cutter-wheel toward the driving-wheel, the whole arranged and operating together as and for the purpose described.

3. In combination with the means for perforating the paper, a receptacle for the finished sheets, arranged immediately under the perforating mechanism.

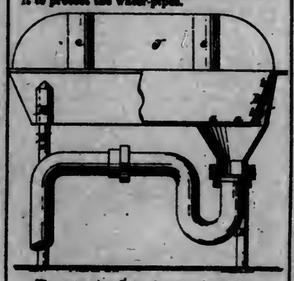
4. In combination with the perforating mechanism and a suitable receptacle for the finished sheets, arranged beneath said mechanism, a deflector or guide-board, the whole arranged and operating as and for the purposes set forth.



169,549. APPARATUS FOR REGULATING THE FLOW OF GAS TO BURNERS. Charles F. Jacobsen and George M. Murphy, New York, N. Y. [Filed Sept. 23, 1875.]

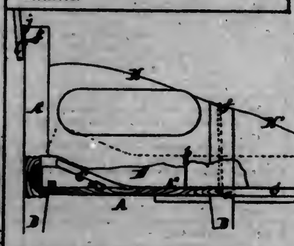
1. The depressible platform, located at that point on or in the floor where the occupant of the desk stands or sits when at his desk, in combination with the gas-flow-regulating cock of one or more gas-burners, and mechanism intermediate between the cock and the platform, actuated by the movement of said platform to operate the cock, in the manner set forth.

2. The combination, with a gas fixture or burner, of a main cock, adapted to be operated, in the usual way, by hand, to turn on and off the gas, and an auxiliary cock or gas-flow regulator, combined with a depressible platform, and operated to regulate the flow of gas to the burner, (when the main cock is turned on,) at times and in the manner set forth.

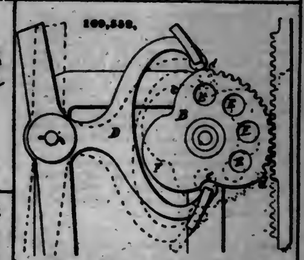


169,550. SNAPPER-LOOPS FOR WHIPS. H. H. Jones, Newark, N. J. [Filed Oct. 15, 1875.]

As a new article of manufacture, the improved flexible and elastic snapper-loop for whips, herein described, consisting of the tube or casket A, shank *a*, and eye A, substantially as and for the purpose herein set forth.



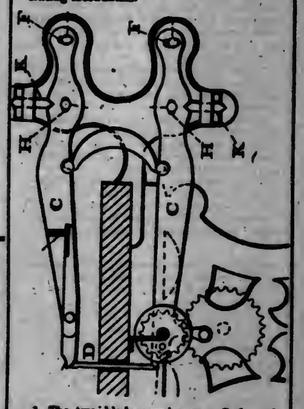
169,551. SINKS. Louis Jones, Jr., New York, N. Y. [Filed May 4, 1875.]



Brief.—The sink-extension has ribs cast in it to protect the water-pipes.

The extension A', having the ribs *b*, in combination with a sink-basin, substantially as described.

169,552. SEEDING MECHANISMS FOR LOOMS. Orrin W. Kenison, Lawrence, Mass. [Filed July 24, 1875.]



169,553.

1. The combination of the cam E, having two inclines and rests upon the outside thereof, with the two forked arms D, to move and lock the heddle-levers A, substantially as described.

2. The counterpoise F to the cam E, and the jack, in combination with the cam and jacks, substantially as described.

169,553. SCROLL-SAWING MACHINES. W. H. Kimball, Burlington, N. J. [Filed Aug. 2, 1875.]

Brief.—An advancing motion in right lines, or at a right angle to the transverse direction of the table, is imparted to the saw by two blade-carrying arms having sliding axes, by means of pins passing through vertical and horizontal slots in the rear ends of the arms, and steels pointed at each end and fitted between the arms and the adjacent portions of the supporting-frame, in connection with suitable operating mechanism.

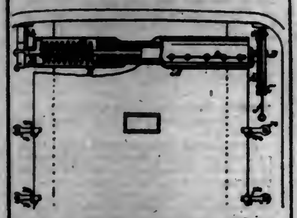
1. The two blade-carrying arms C, formed with vertical slots F and horizontal slots H, and operating substantially as and for the purpose set forth.

2. The steels K, in combination with the slotted blade-carrying arms C C, substantially as and for the purpose set forth.

169,554. TABLE-BEDSTEADS. Emerick Kiss, New York, N. Y. [Filed Aug. 18, 1875.]

1. A table-bedstead, in which is combined, substantially as hereinbefore set forth, the stationary head-frame A, a series of independent sections, C C, hinged together and to

169,554.



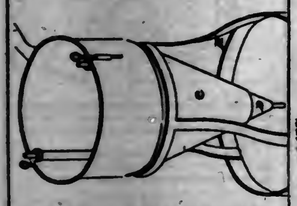
the head-frame, the hinged foot-board D, the sectional hinged rails B B', and the table-leaf I, hinged near the upper end of the head part A' of the head-frame A, substantially as and for the object specified.

2. The combination of the stationary head-frame A, series of hinged sections C C, hinged foot-board D, braces F, having slots e, and the studs d on one of the sections C, all substantially as shown and described, for the object specified.

3. The stationary frame A, in combination with the sectional side rails H H', hinged together and to the head-frame, and the series of hinged sections C C, and hinged foot-board D, all substantially as shown and described, for the object set forth.

4. The combination, with the table-leaf I, and head-frame A, of the hook and staple h i, or their equivalent devices, for retaining the leaf in an elevated position, substantially as described.

169,665. Garment-Curtain Fixtures. D. B. Knight and John M. Hipple, Waynesborough, Pa. [Filed Sept. 4, 1875.]

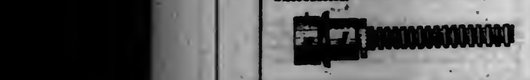


1. The combination, with the central continuous shaft B, rigidly held in supports, of the springs F F, the detachable cylindrical end caps E E, provided with longitudinal offsets, and the revolving sleeves D, provided with corresponding offsets, and rigidly revolving with said end caps, as and for the purpose described.

2. The curtain-roll having deeps d, in combination with the curtain provided with eyelets and a rod, c, as and for the purpose described.

3. The combination, with the curtain-roll provided with holes or cavities, of the rod f, attached to a spring-plate, A, the vertically-sliding cam i, and the rod j, substantially as and for the purpose described.

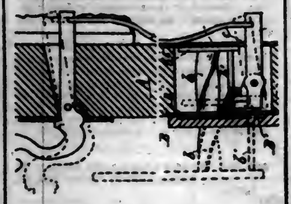
4. The upwardly-pointing right-angular hooks n, attached to the curtain side so as to project beyond the roll, in combination with the hooks o, pivoted to the sides of the carriage, substantially as described.



169,666. Batter-Feeders for Oakum-Mixers. Daniel H. Lafferty, San Francisco, Cal. [Filed Apr. 2, 1875.]

A batter-feeder consisting of the vessel A, having the conical end C and stopper D, in combination with the tripod E, having the right solid bottom G', substantially as and for the purpose set forth.

169,667. Wrenches. Andrew B. Lipsey, Jersey City, N. J., assignor of one-half his right to H. A. Sherrill, New York, N. Y. [Filed Aug. 11, 1875.]



Brief.—A removable sleeve is attached to the movable jaw, through which the screw-rod passes. A pin through the rod inside the sleeve prevents the screw-rod from becoming disconnected.

The nut or stop-collar J, in combination with the sliding jaw and screw of a wrench, substantially in the manner and for the purpose described.

169,668. Combined Letter-Boxes and Door-Bells. John Lovenguth, St. Louis, Mo., assignor to himself and F. R. Hoffman, same place. [Filed Sept. 13, 1875.]

1. The spiral stem b of the door-plate, in combination with the correspondingly-mortised plate B', whereby, when the door-plate is raised to open the letter-port, it is carried away from the door, to permit it to pass projecting fastings or paneling, as set forth.

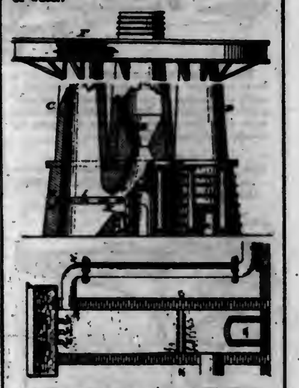
2. The spiral stem b of the door-plate, stem b', and plate b', in combination with the mortised and slotted plate B' and crank-lever b', whereby when the letter-port is opened the stem b is caused to describe the arc of a circle, during which movement it operates upon one arm of the crank-lever, and depresses it for the purpose of sounding the bell, as set forth.

3. The combination of a door-plate with a bell, by means of the spiral stem b, fixed stem b', casting B', having a journaled stem, b', and arm b', said parts being constructed to operate in the manner and for the purpose set forth.

169,669. Hand-Trucks. Peter Lagenbell, Greensburg, Ind. [Filed Apr. 12, 1875.]

Brief.—By inverting the truck it may be used to convey boxes. By attaching the extra wheel it may be used to roll over gangway-planks or other narrow ways.

1. The combination of the shafts A A, adjustable beams B B', and adjustable clutches F F, substantially as and for the purposes set forth.



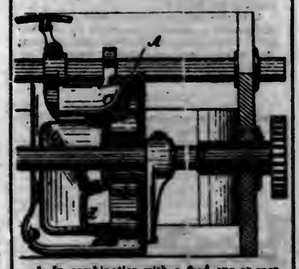
2. The combination of the arms or shafts A A, adjustable beams B B', clutches F, and slotted cross-beam D, substantially as set forth.

3. The combination of the shafts A A, secured together by adjustable cross-beams, the clutches F F, and wheels G G, as and for the purposes specified.

4. The combination of the arms or shafts A A, secured together by means of adjustable cross-beams, clutches F F, and detachable center wheel H, substantially as specified.

169,670. Apparatus for Production of Iron and Steel from the Ore. Wm. A. Lyttle, The Grove Hammersmith, England. [Filed May 7, 1875.]

Brief.—Lateral fuel-chambers are combined with a central cupola, into which the ore mixed with carbonaceous matter is charged. Products of combustion are condensed by a spray of water.



1. The combination of the cupola in which the smelting is effected, chambers c and D made to taper outward toward the base, cover F, ring f, into which the tuyeres of the blast are led, and passage K L, all relatively arranged as and for the purposes described.

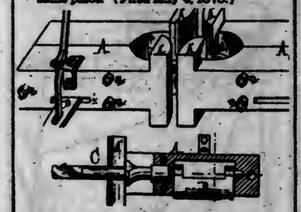
2. The combination of the sistern A, from which water issues by nozzles S T V, pipe F, through which the products from the furnace pass, pipe E H E, grating B C, and door D, as and for the purposes described.

169,671. Feeding Mechanism for Grain-Drills. Andrew J. Martin, Springfield, Ohio, assignor to P. P. Mast & Co., same place. [Filed Aug. 10, 1875.]

Brief.—Passing through the case at the side, and into the vertically-revolving seed-wheel, is a laterally-moving cut-off, for controlling the flow of seed, and adapted to discharge one portion of the seed out through the side of the case, while the other portion is permitted to continue its course around within the wheel.

1. In combination with a feed cup or case and a vertical feed wheel or ring, a gate movable laterally in a plane parallel with the axis of the wheel, substantially as shown and described, for the purpose of regulating the rate of feed.

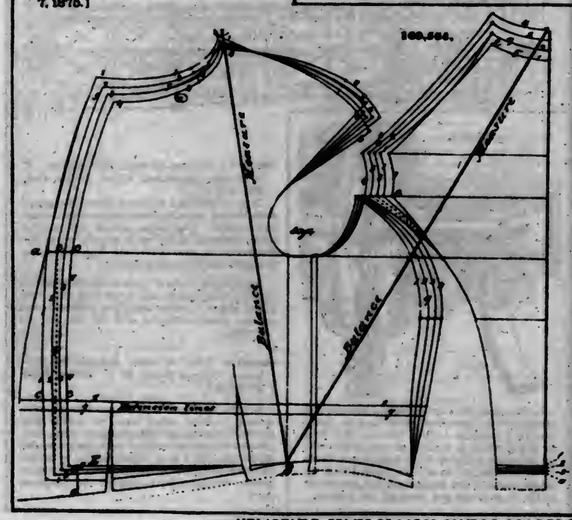
2. In combination with the cup A and the ring B, or its equivalent, the horizontally-sliding gate having the sharp edge and the inclined outer face, substantially as shown and described.



3. In a feeding device for grain-drills, consisting of a cup or case and a vertical wheel or ring, a laterally-moving gate, substantially as shown and described, adapted to direct one portion of the grain out through the side of the cup, while the other portion is permitted to continue its course around within the same.

169,662. Fence-Post Supports. Hugh McKenzie, Oronoco, Minn. [Filed Apr. 23, 1875.]

The within-described fence-post base, consisting of the blade A, rib B, with recess c, and arm C, with rib b, all cast in one piece, substantially as and for the purposes herein set forth.



169,663. Car-Couplings. Hugh F. McKervey, Chebogrue, Mich., assignor to himself, Angus McKay, and C. S. Ramsay, same place. [Filed May 4, 1875.]

1. The combination, with the draw-head A, having hooks A' and bearing e, of the end-pivoted transioned counter-weight B, with socket-d, and the harpoon coupling-bar C, provided with shank S, lateral arms h h, and flat head f, all as shown and described, to operate as specified.

2. In combination with the coupling-bar C, constructed as described, and the end-pivoted swinging counter-weight B, arranged within the chamber of the draw-head, the horizontal slotted side D and vertical lever E, for raising and retaining counter-weight and holding it in an elevated position, as shown and described, for the purpose specified.

169,664. Pattern-Charts for Drafting Garments. Michael A. Meleher and I. A. Meleher, Constantine, Mich. [Filed Aug. 7, 1875.]

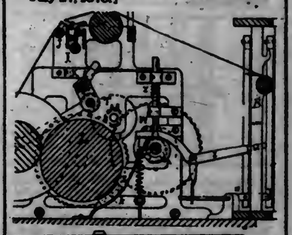
1. The pattern-chart for drafting garments, herein described, provided with the scales 1 to 9 or more, inclusive, arranged as shown and described, and for the purposes herein set forth.

2. The waist-strap, with its double number and line of holes, arranged as shown and described, adapted for use with the combined patterns, as herein described.

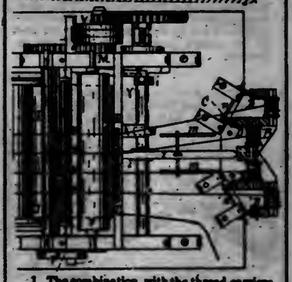
169,665. Farm. Flavel G. Merriam, Akron, Ohio. [Filed Aug. 7, 1875.]

A pipe wholly or partially composed of clay, saturated with the enamel herein described, and baked after the application of the enamel, substantially as and for the purposes set forth.

169,666. Farm. Flavel G. Merriam, Akron, Ohio. [Filed Sept. 7, 1875.]



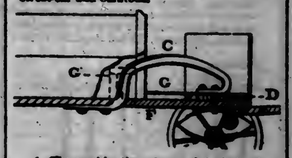
A pipe composed wholly or part of clay of wood, saturated with the enamel herein described, and baked after the application of the enamel, substantially as and for the purposes described.



169,667. Burglar-Proof Safes. Enoch R. Morse, Boston, Mass. [Filed Sept. 15, 1875.]

A burglar-proof safe having a door, B, provided with one or more flanges, a, arranged to fit over corresponding flanges b, projecting from the front of the body A of the safe, whereby the line of the joint between them is rendered zig-zag or bent from the front surface of the door, in combination with the casing C, extending in front of or covering the joint c, substantially as and for the purposes described.

169,668. Warpers. Oliver H. Moulton, Lowell, Mass., Laura S. Damon, (administratrix of Alex. M. Damon, deceased,) Albany, Vt., and I. L. G. Rice, Cambridge, Mass.; said Rice assignor to Chas. H. Rice and R. H. Parker, Boston, Mass. [Filed July 27, 1875.]



1. The combination, with the thread-carriers and stopping mechanism of a warping-machine, of the spool-cradle and warp-beam-driving cylinder, and friction mechanisms adapted to operate upon the spools and the driving-cylinder, whereby when a thread breaks the warp-beam and the spools are simultaneously stopped, as and for the purposes set forth.

2. In combination with the warp-beam-driving cylinder of a warping-machine and the belt-shipping mechanism controlled by the thread-carrier, the cam-shaft and intermediate mechanism, substantially as shown, for controlling and operating it, which shaft is adapted, through intermediate friction-brake devices, to stop the beam and the spools simultaneously, as and for the purposes set forth.

3. In a warping-machine, the combination of a belt-shipping mechanism, controlled by the thread-carriers, with the friction-brakes adapted to operate upon the spools, and intermediate operating mechanism, substantially as described, whereby the spools are stopped when a thread breaks, as and for the purposes set forth.

169,669. Car-Coaches. Thomas H. Neal, Philadelphia, Pa. [Filed Mar. 20, 1876.]

Brief.—Intended to combine advantages of street-car and omnibus.

1. The combination of a coach-body having a front door with a driver's platform, D, and curved springs C, substantially as and for the purposes set forth.

2. The combination of a coach-body having a front door with the platform D, curved suspension-springs C, the platform F, having axe a and axe b on the body, substantially as and for the purposes set forth.

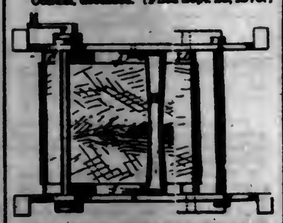
3. The combination of the suspended platform D, curved springs C, rotary platform F, having axe a, the body of the coach having axe b and overhanging sill G', and the stationary platform G, substantially as and for the purpose set forth.

169,570. Blind-Slat Adjusters. George Michels, Brooklyn, N. Y. (Filed Oct. 14, 1875.)

Brief.—A small piece of rubber is fitted upon one end of the slat, and by its friction against the blind-frame keeps the slat at any required angle.

The automatic blind slat fastener, consisting of a pad or block of rubber or other elastic material, slotted on one side, and adapted to fit over the end of a movable or shifting slat, and bind against the inner side of the blind-frame, in such manner as to automatically adjust itself, and at the same time hold the slats in any desired position, substantially as described.

169,571. Bird-Cage Hooks. George B. Osborn, East Orange, N. J., and Benjamin A. Dempsey, New York, N. Y. (Filed Oct. 28, 1875.)



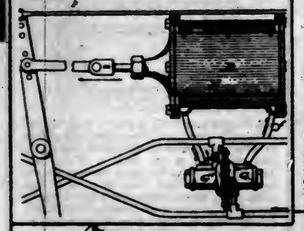
The notched or drilled lug c on the fine-plate A, in combination with the stud or Y-shaped shoulder b on the arm B, operating substantially as and for the purpose shown and specified.

169,572. Hame-Fasteners. A. J. Park, Virginia, Mo. (Filed Sept. 13, 1875.)

In a hame-fastener, consisting of a rod and thimble, united and adjusted by a latch or catch, the combination, with the lever-arm of the latch, of locking-slide D, substantially as described.

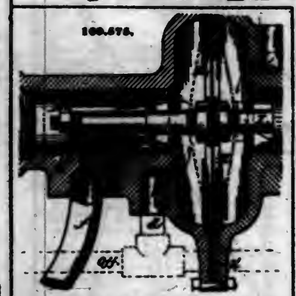
169,573. Guide-Rollers for Reeling-engines. Joseph Farr, New York, N. Y., assignee to Lydia A. McCollum, sole executrix and trustee of the estate of John McCollum, deceased. (Filed Sept. 28, 1875.)

The guide-roller B, having a concave longitudinal profile, and journaled at each end to the slotted arms c c, secured to the frame A by means of the bolts f, which allow said arms to be adjusted independently of each other, for the purpose of adjusting the roller to the belt, substantially as described.



169,574. Ratchet-Movements. Joseph Farr, New York, N. Y., assignee to Lydia Ann McCollum, sole executrix and trustee of the estate of John McCollum, deceased. (Filed Sept. 28, 1875.)

The combination, with a pawl, ratchet, and ratchet-shaft, of an arm, D, having an inclined slot, d, engaging with a projection on the pawl, and provided with a spring, F, for holding it in contact with the ratchet, as herein described, whereby the pawl is held clear of the ratchet during the backward movement, and thrown into gear during the forward movement, substantially as shown and set forth.

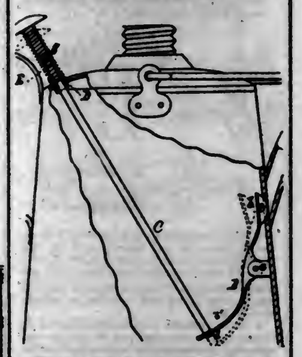


169,575. Double-Acting Air-Brakes. H. Lansing Perrine, Freehold, N. J. (Filed Oct. 21, 1875.)

Brief.—Pressure is maintained in two independent lines of pipes. A diaphragm, centrally secured in a valve-case, has hollow piston-valves secured to its opposite sides. Each valve governs an induction and eduction port, leading to the opposite ends of the brake-cylinder. When the pressure is reduced in one pipe, the pressure in the other pipes forces the diaphragm and valves in a position to allow air to enter the brake cylinder and set the brakes. A reverse operation forces off the brakes.

169,576.

1. The method of operating car-brakes, substantially as described, consisting in maintaining a pressure in two independent lines of pipes, which is equable or variable at will, for actuating a duplex-valve mechanism, whereby air is admitted to and exhausted from opposite ends of the brake-cylinder simultaneously, so as to set and force off the brakes.



2. In a brake mechanism operated by means of the pressure of air through two lines of pipe equalized and varied at will, the two cocks F F, constructed as described, and arranged one in each line of pipe, substantially as specified.

3. In a pneumatic-brake mechanism, substantially as described, the combination of a duplex-valve mechanism with two lines of pipes, and compound cocks therein, whereby an equalized or variable pressure is maintained in said valve, governable at will to set and release the brakes.

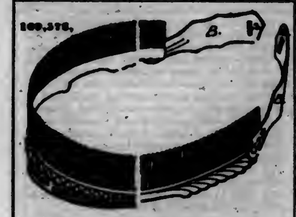
4. The combination of the duplex valve G, constructed substantially as described, with the brake-cylinder B, two lines of pipe, and compound cocks therein.

5. The combination of a movable or flexible diaphragm with two hollow piston-valves and two lines of pipe, substantially as described.

169,576. Oil-Cans. Nicolai Petersen, Chicago, Ill. (Filed Aug. 20, 1874.)

The improved oil-can, having the sleeve D, the actuating-rod C, provided with the notch B and reduced end A, the valve-lever E, provided with the slot b, into which the reduced portion of the rod C is passed, and the spring S, applied upon the upper end of the rod C outside of the can, all constructed and combined as described.

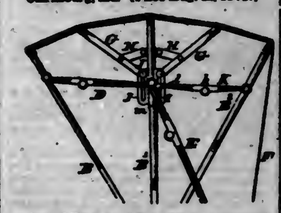
169,577. Water-Supply Apparatus. J. N. Fraps, Cincinnati, Ohio. (Filed Oct. 26, 1875.)



Brief.—One tank is placed above the other, each having suitable frame-support and pipe-connections. The lower tank is supposed to have sufficient elevation to supply water for domestic use, &c., while the upper can be available for fire-extinguishing.

Two water tanks or reservoirs, arranged at different elevations, and combined with each other and with water-supply and distributing mains, substantially as and for the purpose specified.

169,578. Band-Cutters. Adolph Puppenhusen, College Point, N. Y. (Filed June 21, 1875.)

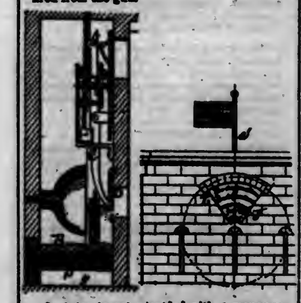


1. The combination and arrangement, with a band-comb, or other comb of similar construction, of the movable pieces or wings B B, pivoted to the ends of the comb, and provided with the slots 3 3, or other device by means of which their outer ends may be connected together, substantially as and for the purposes forth.

169,579.

2. The combination and arrangement, with a band-comb, or other comb of similar construction, of the movable pieces or wings B B, provided with the slots 3 3, substantially as and for the purpose set forth.

169,579. Carriage-Tops. Wm. H. Power, Washington, D. C., and C. T. Anderson, Clarksburg, Md. (Filed Aug. 21, 1875.)



1. A falling top for carriages constructed with one or more supplemental bows, G, connected to one of the main bows by hinged struts or links H, causing the feet of the said supplemental bows to slide up and down on the main bow by the action of the stretchers F, as explained.

2. The combination, with the main bows B B', braces D d, and stretchers F, of the supplemental bows G, (one or more,) connecting links or struts H, and the slotted plates I, for confining the heels of the supplemental bows, as explained.

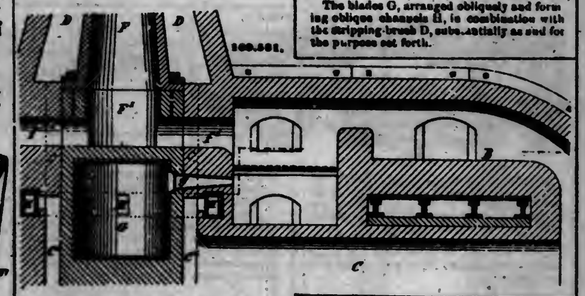
3. The supplemental jointed props or struts K, formed with shoulders i resting against the upper pivots a of the props E, but disconnected therefrom, so as to be free to leave said pivots when the top is lowered, and connected to said props at m, so as to be thrown up and deflected by the deflection of the said props E, as explained.

169,580. Toy Targets. Joseph Pennenstil, New York, N. Y. (Filed Sept. 15, 1875.)

Brief.—Toy target and money-bank combined. Pennies may be used as missiles and fired from the gun.

1. A toy target provided with a money-receptacle, into which coins can be deposited through the bull's-eye, substantially as described.

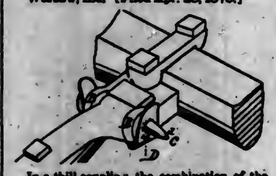
2. The combination of the open bull's-eye b, the swinging door D, the locking and releasing lever and catch O c, and the outlining flag-staff c' or c², arranged to operate, as herein shown and described.



3. The combination, with an open bull's-eye and a movable door, of a rotating disk or tablet, substantially as herein described.

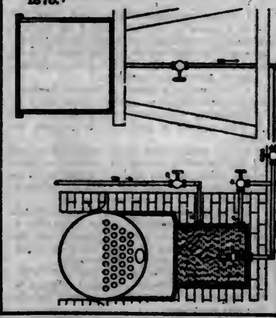
4. The combination, with the bull's-eye and movable door, of inclines or guards forming a money safe or receptacle, substantially as and for the purpose herein described.

169,581. Reverberatory Furnaces. John Price, Sunderland, England. (Filed Aug. 2, 1875.)



Brief.—The fuel and blast are both heated by the waste gases of the furnace.

169,581.

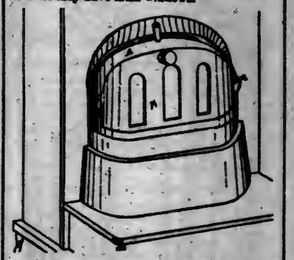


The combination of the combustion-chamber A, the heating-chamber or hearth B, the return-flue C, the retort-heating chamber D, with its contained fuel-retort F, and the hot-air chamber G, for supplying heated air to the combustion-chamber, with which the fuel-retort is also in communication, substantially as shown and described, and for the purposes herein set forth.

169,582. Tells-Couplings. T. J. Quick, Warsaw, Ind. (Filed Apr. 23, 1875.)

In a thill-coupling, the combination of the shackle A, the bolt C, having a pointed end, *f*, and annular flange *d*', and the curvilinear spring D, having two oval-shaped apertures for the reception of the bolt, all constructed as and for the purposes described.

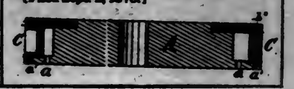
169,583. Hydrocarbon-Furnaces. Peter M. Quist, St. Paul, Minn., assignor of two-thirds his right to Hermann Trott and Cooper Klein, same place. (Filed Sept. 13, 1875.)



169,584.

169,585. Fire-Blowers. John Reid, New York, N. Y. (Filed Oct. 16, 1875.)

Brief.—The inner blower is mainly of gauze or other finely-perforated surface. The outer blower may have mica windows.



1. In combination with a gauze or perforated blower, A, the tight supplementary blower B, substantially as described, and for the purposes set forth.

2. The gauze or perforated blower A, provided with suitable catches or fastenings, in combination with the lugs or ears on the supplementary blower, substantially as and for the purpose described.

3. A supplementary blower provided with mica windows, substantially as shown, in combination with a gauze or perforated blower, for the purposes set forth.

169,586. Piston-Packings. Geo. H. Reynolds, New York, N. Y., assignor to himself, C. H. Dalmeister, and C. H. Robinson. (Filed Sept. 2, 1875.)

To apparatus for burning oil upon a body of water, substantially as described, the combination, with the water-reservoir and oil-feeding pipe, of a check or poppet-valve, located in the discharging end of the latter, operating to permit ingress of oil from the pipe into the reservoir, and to prevent ingress of water from the reservoir into the pipe, substantially as shown and set forth.

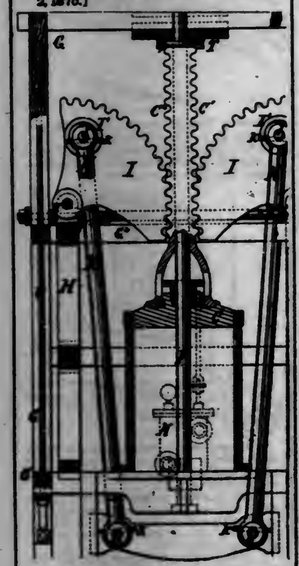
169,588. Cotton-Gins. William S. Reader, St. Louis, Mo., assignor to Kingsland, Ferguson & Co., same place. (Filed Aug. 10, 1875.)

Brief.—The whipping-board is grooved obliquely.

The blades G, arranged obliquely and forming oblique channels H, in combination with the stripping-brush D, substantially as and for the purpose set forth.

If combination with the single-acting piston A and expansible packing C, the series of apertures a, on one face of the piston only, admitting steam to the space within the packing, and the double series of apertures a' b', against the respective edges of the packing, substantially as and for the purpose specified.

169,587. Rock-Drilling Engines. Geo. H. Reynolds, New York, N. Y., assignor to himself, C. H. Delamater, and G. H. Robinson. [Filed Sept. 2, 1875.]



Brief.—The pistons of the engine serve as valves to admit and exhaust the steam. The parts extending around the cylinder permit the steam to exhaust freely.

1. In combination with a solid double piston, E, serving both as piston and valve, the ports or mouths F' F' of the respective steam-passages extended quite around the cylinder, as and for the purposes specified.

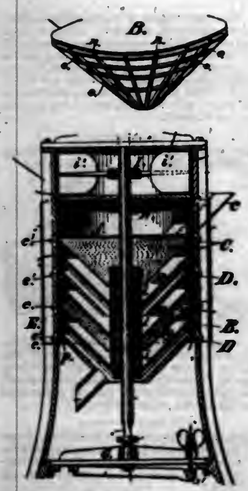
2. The crooked steam-passages, having the bend E' arranged as shown relatively to the annular exhaust-port F', as and for the purposes specified.

169,588. Presses. Geo. H. Reynolds, New York, N. Y., assignor to himself, C. H. Delamater, and G. H. Robinson. [Filed Sept. 2, 1875.]

1. The cross-rods E, arranged to not only connect the struts H at points adjacent to the centers of the sectors I, but also to hold the press in position within the gallows-frame, in combination with said frame, as herein specified.

2. The central tie-rod P, extending down from the top of the gallows-frame to the top plates, and serving both as a tie for those parts, and as a guide for the racked bar and its connections, as herein specified.

3. The combination T, in combination with the central tie-rod P, and with the actuating-pinion O and its connections, as and for the purposes herein specified.



4. In combination with the piston C and its connections, a valve, F, arranged to automatically control the motion when the press has reached the limit of its movement, as and for the purposes herein specified.

5. In combination with the sectors I, receiving motion from the piston C, as shown, the shafts J L, fixed to the rods K, and turning with the changing inclination thereof, as herein specified.

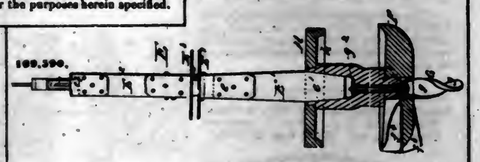
6. In combination with a suspended press, the vertical ties U, connecting the massive iron parts of the press to the top of the wood gallows-frame G, with the vertical struts G' between the said ties U, and serving therewith, as and for the purposes herein specified.

169,589. Machines for Scouring and Decorticating Grain. Wm. Pim Robinson, Buffalo, N. Y. [Filed July 20, 1875.]

Brief.—The horizontal ridges on under side of scouring-wheels delay the grain against the stationary hoppers, and the vertical ridges serve to agitate the grain. The stationary hoppers are vertically adjustable upon upright posts by means of slots and screws.

1. The combination of the post E, provided with a series of vertical slots, e, the button-headed screws e', and the hoppers G G B B B, adapted to hold up the frame and to hold said hoppers in an adjustable manner, substantially as shown and described.

2. The scouring-wheels B, having horizontal ridges or beaters o on their under sides, in combination with stationary hoppers D and C, substantially as and for the purpose described.



3. The combination of the scouring-wheels B, having radial or vertical ridges n in their under sides, and the series of stationary hoppers D C, constructed and arranged substantially as and for the purpose described.

4. The combination of the scouring-wheels B, having the horizontal ridges or beaters o, and the vertical or radial ridges n, and the series of stationary hoppers D C, substantially as and for the purpose described.

5. The scouring-wheel B, provided with the radial ridges n and the horizontal ridges o on its under side, substantially as and for the purpose described.

169,590. Earth-Boring Apparatus. M. H. Ruth, Claiborne Parish, and W. Crain, Farmerville, La. [Filed June 26, 1875.]

Brief.—The auger consists of a hollow central shaft, with a screw-blade below, having a rim at its upper side, a cutting-blade, and a screw-bit, and a guide above, with flanged rim. The shaft-sections are provided with disks at their adjacent ends, to preserve verticality, and are connected by notched projections, sliding pieces, and slots to secure them. The winch-drum is formed with two parts of different diameters, to lower the auger quickly and raise it slowly, the rope passing over a pulley above secured to the frame.

1. The auger F, constructed with a hollow central shaft, F', screw-blade F', rim f', cutting-blade f', bit G, and plate or extension H, and rim h, substantially as and for the purposes described.

2. The combination, with a well-auger, of a shaft, E, composed of a series of sections provided with plates or disks E' at their adjacent ends, substantially as and for the purpose specified.

3. The combination, with a well-auger, of a shaft, E, composed of a series of sections provided with plates or disks E' at their adjacent ends, and connected together by notched projections E', sliding pieces e', and slots and recesses e', substantially as set forth.

4. The combination, with a well-auger shaft, K, composed of a series of sections provided with plates or disks E' at their adjacent ends, of the swivel-piece K, provided with a notched end, K', and retaining-piece k', and swivel-hook k, substantially as described.

5. The combination, with a derrick, A, provided with a winch-drum, D, formed with parts d d', of different diameters, the rope O, and pulley B, of the sectional shafting E, provided with plates or disks E' and the auger F, substantially as and for the purposes described.

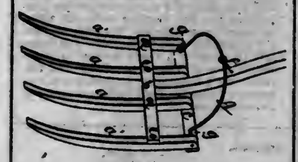
169,591. Processes for Preserving Fruits. Frederick H. L. C. Saco, Neufchatel, Switzerland. [Filed Oct. 20, 1875.]

The method herein described of preserving fruits, by the employment of sugar and alcohol, either alone or in connection with other ingredients, substantially in the manner herein set forth.

169,592. Preservation of Meats. Frederick H. L. C. Saco, Neufchatel, Switzerland. [Filed Oct. 20, 1875.]

The method herein described of preserving butcher's meat, game, fish, molluscs, &c., by the employment of chloride of sodium, alcohol, and water, in combination, either alone or in connection with other ingredients, substantially as herein set forth.

169,593. Car-Brakes. James N. Hawkins, Philadelphia, Pa. [Filed Oct. 2, 1875.]

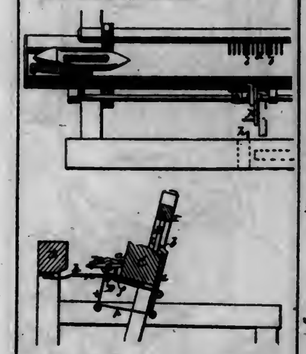


1. The eccentric shoe D and lever E, constructed and intermixed in the manner herein described, so that the bearing-surface d will move in a direction nearly tangential to the wheel on which it acts.

2. The combination of the shoe D, levers E H, pedal J, and the rack L, for graduating the pressure and locking the brake, as explained.

169,594. Barley-Forks. Sylvester Scull, Watertown, N. Y. [Filed Sept. 6, 1875.]

Brief.—The tines and cross-pieces are made of wood, and held together by screws, and the handle is attached by means of screws in the same manner. The cradle-bow to support the grain is inserted into holes in the heel end of the outside tines, and is held in place by the elasticity of the metal.



A barley-fork constructed substantially as described, and having the braced cradle-bow or grain-guard A, with its angle ends g g retained in sockets in the inner sides of the outer tines a' a' by the spring force of the bow, as shown, and for the purposes described.

169,595. Bee-Preserving Compounds. E. A. Snyder, Philadelphia, Pa. [Filed Sept. 16, 1875.]

Brief.—Places in the bottom of the barrel a layer of slaked lime, which is covered with a piece of muslin; then place in a few dozen eggs, and cover with the composition claimed, and continue to put in eggs and liquor until the barrel is full.

An egg-preserving composition composed of the following ingredients, to wit: Sal-ammoniac, gum-arabic, niter, borax, and water, substantially as described.

169,596. Weft-Stop Mechanism for Looms. Orsemus M. Stillman, Westerly, R. I. [Filed Apr. 6, 1875.]

1. In combination with a lever, H, pivoted to a stand on the lay of a loom, one or more thin plates, h, projecting between the dents of the reed toward the cloth, and a connecting mechanism, substantially as described, whereby, when the plate or plates are driven back by the filling, the lever will be moved sufficiently to prevent its acting on the belt-shipping lever of the loom, substantially as herein set forth.

2. The combination, with the lay and reed of a loom, of the thin plates h, arms c, plate f, and pivoted lever H, with sustaining-spring s, all substantially as and for the purposes herein set forth.

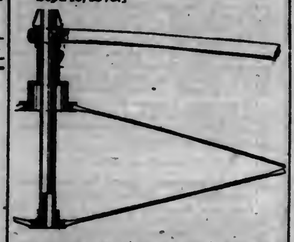
3. The supporting arm or plate h, attached to the breast-beam B, in combination with the bar or lever H, for sustaining and guiding such latter device against or below the belt-shifting lever, substantially as herein set forth.

4. The combination, with the plates h and arms c, of the protecting-rod D, arm i, loose link p, and the arm c, for removing the plates from the path of the shuttle by the rocking of the protecting-rod, substantially as herein set forth.

169,597. Draftsmen's Ink-Saucers. F. Stith, Washington, D. C. [Filed Apr. 7, 1875.]

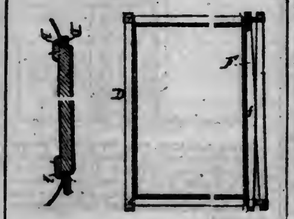
1. The india-ink saucer, having a central well encircled by an ink-grinding track, substantially as set forth.

2. The combination of the ink-saucer, having a central well, the removable cover having an orifice in its crown above said well, and a stopple fitting said orifice, and provided with a pen-feeder extending down into the well, substantially as, and for the purposes set forth.



169,598. Drive-Well Packings. V. F. Thomasich, Mobile, Ala. [Filed Aug. 12, 1875.]

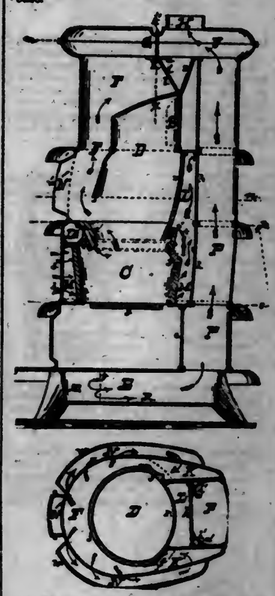
Brief.—Introducing beneath the packing a metallic ring-support, concaved on the inside, and bracing the leather on the outer upturned portion, whereby the latter is entirely protected against curling or turning over.



The piston-packing metallic ring-support E, concaved on the inside, and bracing the leather packing, as and for the purpose specified.

169,599. Umbrella-Tops for Carriages. Lewis P. Tibbals, New York, N. Y. [Filed Sept. 13, 1875.]

In an umbrella-top for carriages, adjustable springs in the projecting end of the stem, in combination with the umbrella and standard or support, substantially as shown and described.



169,600. Ironing-Boards. William M. Tobey, New London, Conn. [Filed Aug. 12, 1875.]

The clamping frame consisting of the pieces C C D and cross-head composed of the rigid bar E, secured to the pieces C C, and spring-bar F, provided with a central projection, f, and having its ends slid up on said side pieces, in combination with the board A, substantially as described.

169,601. Heating-Stoves. William B. Treadwell, Albany, N. Y. [Filed Oct. 15, 1875.]

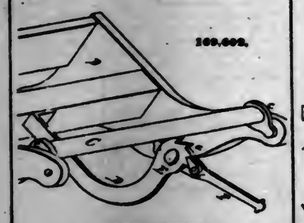
Brief.—Air is supplied to the burning fuel through the passages. In the indirect draft the products of combustion pass to the rear through the expansion-flues, and dive to the base.

1. Plates b, r, and c', in combination with plates c and y', and with fire-pot a, forming an air-distributing chamber, L, and extended air-passages p and c, and with valve t, substantially as described, and for the purpose set forth.

2. Fire-pot a, rings y and y', in combination with plates c, r', and r, arranged and constructed in the manner and for the purpose herein set forth.

3. Illuminated or expansion chamber or flues N N, in combination with flues F, K, T, E, and P, substantially as herein described and shown.

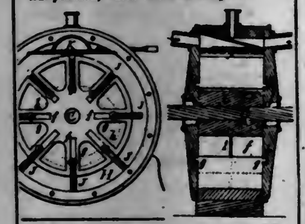
4. Air-flues c' c', in combination with air-chamber L, valve t, and ash-pit E, all arranged and operating in the manner herein described.



5. Gate O, pivoted and constructed as herein shown, in combination with chamber U, flues F and K, and outlet H, as herein set forth.

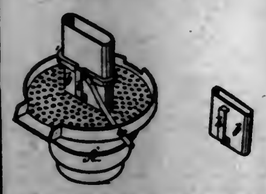
6. Open-work jacket b b, fire-pot a, air-valve t, air-chamber L, air-flues c, c, p, and c' c', and magazine D, arranged, combined, and operating as and for the purpose herein described.

169,602. Lifting Devices for Seeders and Cultivators. W. A. Van Brunt, Horicon, Wis. [Filed Sept. 27, 1875.]



In combination with the eccentrically-journaled lifting-shaft C, the bracket D, extending and bent upwardly below said shaft, and terminating in a ratchet-segment, c, and the lifting-lever F, fulcrumed to said segment, rigidly attached to the shaft C, and provided with a pawl, f, to engage with said ratchet, substantially as shown and described.

160,602.



160,603. ROTARY ENGINE. I. Van Kuren, Kalamazoo, Mich. (Filed Jan. 16, 1875.)

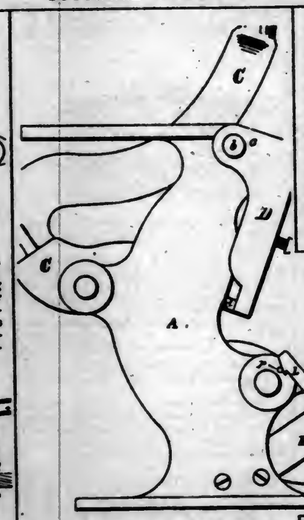
Brief.—The engine is reversed by moving the valve, so as to open ports on one side of the other of the diagonal partition, the corresponding exhaust-port on the inside of the partition is opened at the same time. The engine is stopped by moving the valve to its central position, which closes all the ports.

The combination of the diagonal wall M, the valve K, having ports *f f*, the valve-seat and abutment, having ports k, and the cylinder I, having slides J, substantially as set forth.

160,604. LAMP-EXTINGUISHER. Henry J. Warren, Lexington, and Henry P. Packard, Brockton, assignors, by mesne assignments, to Loris A. Proby, Charles Swift, and Jonathan Swift, Boston, Mass. (Filed June 8, 1875.)

The spring-stop *b*, secured to a friction-sleeve, *b'*, or to the burner A, in combination with the sleeve *c*, with its weight *d* attached directly thereto, or formed in one and the same piece therewith, and to be raised by the lever *e*, all constructed to operate substantially as and for the purpose set forth.

160,605. OSCILLATING PRINTING-PRESS. Joseph Watson, Everett, and John L. De Huff, Woburn, Mass.; said De Huff assignor to said Watson. (Filed Aug. 20, 1875.)

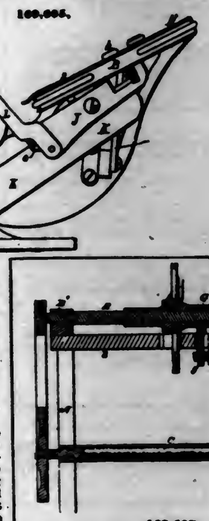


Brief.—Bed swings up to permit easy access to the form. A spring-finger operated by the platen throws off the printed cards.

1. A type-bed of a printing-press, pivoted, at or near its upper edge, to the frame, and adapted to be raised and held in position, with its face-surface upward, substantially as and for the purposes described.

2. The combination of a type-bed, pivoted as set forth, and provided with a lug, 4, with a vibratory platen adapted to engage with said bed, and lug to hold the bed in position, with its face-surface uppermost, substantially as described.

3. The combination of a type-bed, pivoted as set forth, and one or more adjustable bearing or regulating screws, *c c*, arranged to operate substantially as described.

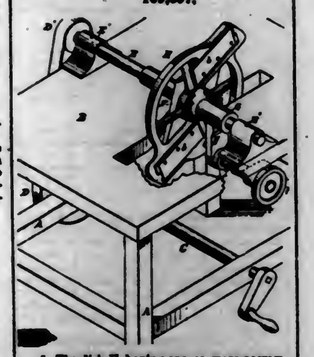


160,606.

160,607. MACHINES FOR MAKING EXCELSIOR. Levi H. Whitney, Lowell, Mass. (Filed Oct. 15, 1875.)

Brief.—Wood for stuffing mattresses and similar purposes can be cut into layers of any desired thickness by a revolving and adjustable disk provided with two rectangular openings, through which pass suitable cutting-blades attached to a cutter-carrying bar journaled on the disk-carrying shaft, and suitable operating mechanism. The disk is laterally adjustable, while the machine is in operation, by means of a sleeve secured in a concentric groove in the hub of the disk, provided with a downwardly-projecting arm, and actuated by a screw-shaft working in the lower end of said arm.

160,605.



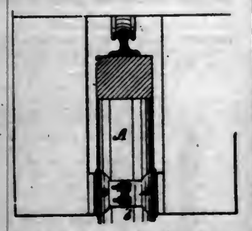
4. The knock-off finger A, rod E, spring F, radius-arm *l*, provided with the toe *m* and cam *k l*, the latch J adapted to engage with the toe *m*, and stationary arm K, for retracting the rod E and spring F, and mechanism, substantially as herein set forth, for tripping the latch J, all constructed, combined, and operated substantially as described.

5. The combination of the finger A, rod E, spring F, radius-arm I, toe *m*, latch J, book-pawl L, pin *p*, and stationary arm K, all constructed, arranged, and operating substantially as described.

6. The knock-off finger A, adapted to be moved in one direction by the spring F, the cam-shaped radius-arm *l*, the latch J, provided with the pawl-hook L, all attached to and moving with a vibrating or swinging platen, in combination with a fixed pin, *p*, and arm K, when said parts are so arranged that the movement of the platen away from the type-form shall release the toe *m* from the latch J, allowing the spring F to operate the finger A, to knock off the card, and then retract the finger A, cause the latch J to again engage with the toe *m*, and retain them in such position till another impression has been made, substantially as described.

160,607.

1. The disk H, having one or more narrow bearing-surfaces, and made relatively adjustable to the cutter-carrying bar F, substantially as and for the purpose specified.



2. The open adjustable disk, provided with rectangular openings *c*, which inclose the cutting-bars, having guiding-faces, as shown.

3. The combination of the disk H, cutter-bar F, knives A, gears G, hand-wheel K, and adjusting-screw I, substantially as and for the purpose set forth.

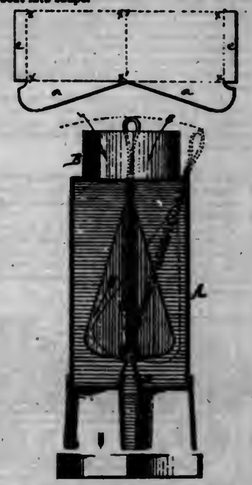
4. The guiding-tongues *c* upon the disk H, in combination with the cutter-bar F, provided with a recess for their reception, as and for the purpose specified.

160,608. ELEVATED RAILWAYS. Jno. Westcott, Tocoi, Fla. (Filed Oct. 5, 1875.)

Brief.—A fender or guard to protect the supporting-columns of elevated railways from injury from passing cars, consisting of two metallic plates, cushioned underneath, surrounding each pillar at the place where it comes in contact with the car comes.

The combination, with the piles of an elevated railway and the bearing-surfaces of the car, of the fender-plates B B, having cushions C, flanges *b b*, to accommodate screw-bolts for clamping said plates, and lugs *a* upon the inside, to insure rigidity, substantially as described.

160,609. PATTERN-CHAINS FOR LOOMS. J. F. Wicks, Providence, R. I., assignor of part of his right to E. P. Chapin, same place. (Filed Feb. 24, 1875.)



Brief.—The harness-controlling chain is divided into independent longitudinal sections, all operated simultaneously on the same cylinder, which permits the assignment of divisible portions of the pattern to be produced to each of said sections, whereby said portions of the pattern may be consecutively repeated, without repeating in the chain any of the series of bars required for weaving any one of said portions of the pattern.

The combination of a harness-controlling chain, constructed in independent longitudinal sections, with a chain-shaft or cylinder which is provided with engaging surfaces for rotating all the sections simultaneously with the cylinder, and with guides which confine each section to its proper space on the cylinder, substantially as and for the purposes specified.

160,610. RAIN-WATER CUT-OFFS. Horatio Wilkins, Paris, Ky. (Filed Sept. 10, 1875.)

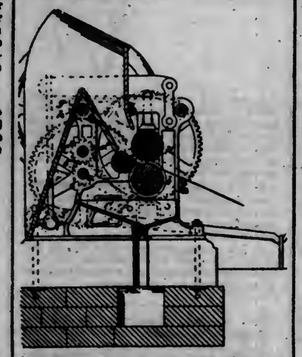
Brief.—The valve is constructed of a single piece of metal, in the form shown, and then bent into shape.

The valve G, constructed of a single piece of metal, the blank being cut in the form shown in Fig. 3, and bent so as to form the wings *a a a a* on opposite sides, with the ends *e e* curved to form the hinge for the same, in combination with the chamber A, partition D, and pipes O C, as herein set forth.

REISSUES.

6,720.

6,720. STOVE-PIPE DRUMS. Edwd. S. Blake, Pittsburg, Pa., assignor, by mesne assignments, to Abner A. Griffing. Patent No. 59,178, dated Oct. 30, 1866. (Filed Oct. 12, 1875.)



Brief.—The valve controls the direct and indirect drafts. The device admits the ready removal of soot.

1. The radiator made in the form of an elongated ring or loop, leading from the single tubular neck, by which the radiator is attached, the tubular neck being a longitudinal prolongation of the loop.

2. The loop-pipe radiator B, provided with the lateral pipe C and openings *o* and *f*, substantially as and for the purposes described.

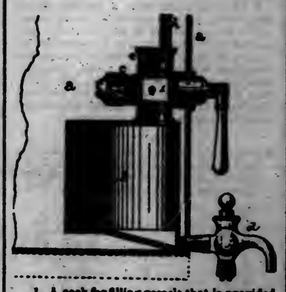
3. The gate-valve J, in combination with the legs *l* and *m* of a loop-pipe radiator, substantially as and for the purposes described.

6,721. APPARATUS FOR REFRESHING LIQUIDS. Laurent Breval, Paris, France. Patent No. 135,217, dated Jan. 28, 1873. (Filed Apr. 26, 1875.)

1. The combination, with a pressure-roller arranged to slide vertically and automatically within the frame of the machine, of a delivery-roller having annular flanges, which overlap the ends of the pressure-roller, and act as guides to prevent any lateral displacement of the same, substantially as and for the purpose specified.

2. The delivery-roller having annular flanges, which overlap the ends of the pressure-roller, and formed with grooves upon their periphery, for the purpose of conducting off such portions of the expressed liquid as may be carried up by and dropped from the ends of the grooves upon the face of the pressure-roller, substantially as and for the purpose set forth.

3. The combination, with a delivery-roller and a grooved or fluted pressure-roller, having their axes in the same vertical plane, and a grooved or fluted feed-roller arranged in the front of and with its axis on a line between the axes of the delivery and pressure rollers, of a bar or plate placed above and over the space between the feed and delivery rollers, to sustain the finely-divided particles of material and subject them to a continuous pressure while they are fed along by the grooved surfaces of the feed and pressure rollers, substantially as and for the purpose set forth.



4. The combination, with a feed, a pressure, and a delivery roller, of a pivoted bar or plate, substantially as and for the purpose set forth.

5. The combination, with a delivery-roller, of a pivoted bar or plate formed with corrugations upon its outer edge, to allow the escape of the expressed liquid between it and the face of the delivery-roller, substantially as and for the purpose specified.

6. The combination, with a delivery-roller, of a hinged chute, provided with a means of adjustment, substantially as and for the purpose set forth.

7. The combination, with a flanged delivery-roller and a feed-roller, of a pressure-roller, having its journals in vertically-sliding boxes, and connecting with a system of weighted levers, substantially as and for the purpose described.

6,722. MEASURING-FAUCETS. Francis C. Hoier, Brooklyn, N. Y., assignor to Jos. M. Hopkins, Louisville, Ky. Patent No. 106,813, dated Aug. 30, 1870. (Filed Sept. 2, 1875.)

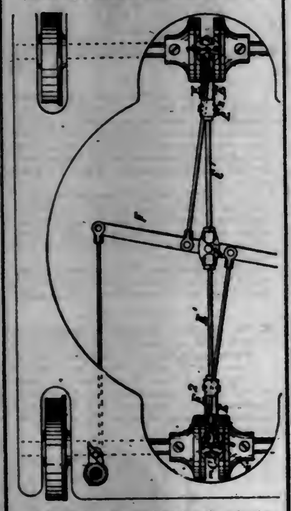
1. A cock for filling vessels that is provided with a passage for the inflow of liquid, a passage for the outflow of the displaced air that communicates with the air-space of the reservoir, and a passage that communicates with the outside of the reservoir for the introduction of air to the vessel as the liquid is being drawn off.

2. A cock for filling vessels, consisting of the plug *c*, having an opening, 1, in combination with a pipe having the passage *f* for the inflow of liquid, and a pipe, h, that extends up above the highest level of the liquid, substantially as shown.

3. The combination of the reservoir *a*, vessels *b*, cock *c*, faucet *d*, pipe *e*, passages 1 2, tube h, and pipe 3, substantially as set forth.

6,723. STOVES. George W. Herrick, Detroit, Mich., assignor to the Detroit Stove-Works, same place. Patent No. 163,776, dated May 25, 1875. (Filed Oct. 5, 1875.)

Brief.—Heated air from about the upper part of the magazine is supplied to the combustion-chamber by means of a flue formed by the strips extending vertically to the division-plate.



1. The combination, with a magazine-stove, of a combustion-chamber located at the place of the fire-pot and sub-pot, and outside thereof, the said combustion-chamber being provided with a pendent diaphragm and a means for delivering air thereto in front of said diaphragm, substantially as described.

2. The illuminated combustion-chamber D D^1 D^2, and pendent diaphragm M, in combination with a magazine-stove having a throat to pass the gaseous products of combustion into said combustion-chamber, and a flue between the magazine and its casing for delivering air to the gases of combustion as they enter the said chamber, substantially as described.

3. The flanged division-plate *f* and flexible strips *k k*, in combination with the magazine *J J'*, casing K, and perforated cap-chamber L, for supplying a current of heated air to the combustion-chamber D, substantially as set forth.

4. In a magazine-stove, a pendent magazine, flaring at its lower end, in combination with a fire-pot flaring at its top, so that the lower end of the former is of the same size as the top of the latter, and the two flaring ends connected together in the whole circumference, except at the outlet-opening, for the escape of the products of combustion, and with the fuel and the supplementary combustion-chamber, substantially as described.

6,726. CAR-BRAKES. Solon G. Howe, Detroit, Mich., assignor to himself and J. W. Chaney, same place. Patent No. 162,556, dated Apr. 27, 1875. [Filed Oct. 6, 1875.]

1. In a brake, the combination of a pair of reversely-cut conical shells and a pair of reversely-cut cones, suitable mechanism for simultaneously moving the cones apart and toward one another, and an axle, substantially as and for the purpose described.

2. In a brake, the wedged-shaped ball, in combination with the pair of reversely-cut cones, a pair of reversely-cut conical shells, and an axle, substantially as and for the purpose described.

3. The sliding friction-cones, provided with friction-rollers, in combination with a wedge, to act thereon for pressing the cones against the shells, substantially as and for the purpose set forth.

4. The combination, with the car-axle, of the center-pins of the upper friction-rollers of the cones, having oil-channels through them for lubricating the axle, cones, and rollers, substantially as described.

5. The converging spring-braces E E, in combination with the sliding cones and the tapering blocks F', for the purpose of preventing the cones turning, permitting them to slide apart, and for returning them to their original position, substantially as and for the purpose described.

6. The combination of the pair of sliding cones, having an annular groove formed between them, a pair of shells, and the axle, having the stop-pin *a*, or its equivalent, substantially as and for the purposes described.

7. The combination of a pair of friction-cones, a pair of conical shells, and two pair of spring-braces, attached to the cones above and below the car-axle and to the blocks F and F', substantially as and for the purpose set forth.

6,725. OVERSHOES. John I. McKee, Pana, Ill. Patent No. 132,681, dated Oct. 29, 1872. [Filed Aug. 20, 1874.]

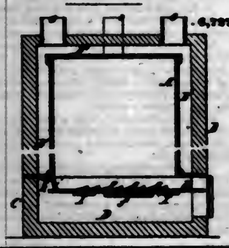
6,725.

1. As a new article of manufacture, a combined overshoe and gaiter having the sole C, heel-opening D, and vertically-divided ankle portion B, whereof the front flap *a* overlaps the rear flap *c*, and is united thereto by suitable fastenings, substantially as and for the purpose set forth.

2. The strap *e*, attached to the upper forward portion of the overshoe, to enable the portion A to be easily drawn off or on the corresponding part of the inner shoe, as shown and described.

3. The hook *e'*, arranged upon the free end of the strap *e*, and in relation to an eye or orifice formed in the adjacent portion of the overshoe, substantially as set forth.

6,726. SEWING-MACHINES. W. P. Penn, Belleville, Ill., assignor of one-half interest to H. Bentchler, same place. Patent No. 59,629, dated Nov. 13, 1866. [Filed May 10, 1875.]



Brief.—Drill-teeth pivoted to a swinging frame hinged to the front of the main frame.

1. The swinging transverse beam P', with the bars N thereto attached, in combination with the frame A and arms I' P, substantially as specified, for the purpose of carrying the forward ends of the bars N, as specified.

2. The combination of the pivoted arms P I', frame A, and swinging transverse beam P', with the bars N pivoted thereto, substantially as specified, for the purpose of allowing the beam to adjust separately, as specified.

3. The combination of the swinging transverse beam P' with the bars N pivoted thereto, beam G, lever, and lifting-chains, substantially as described, for the purpose stated.

6,727.

6,727. HOT-AIR FURNACES. John S. Perry, Albany, N. Y., assignee, by mesne assignments, of Samuel R. Foster. Patent No. 44,836, dated Oct. 26, 1864. [Filed Jan. 27, 1875.]

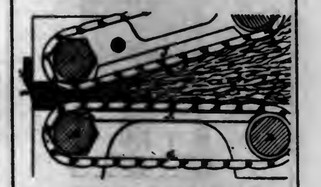
Brief.—The longitudinal movement of the bars, by reason of their serrations, tends to move the clinkers and refuse resting on them toward the front of the grate, opposite the opening in the wall of the furnace.

1. The grate or fire-bed of a heater composed of a series of toothed or serrated bars adapted to vibrate longitudinally, substantially as shown and described.

2. The combination of a grate or fire-bed composed of a series of toothed or serrated bars adapted to vibrate longitudinally, and the open space between the top surface of the same and the base of the fire pot or chamber on the front, substantially as shown and described.

3. The combination of a grate or fire-bed composed of a series of toothed or serrated bars adapted to vibrate longitudinally and the vertical spaces between the front and rear outer edges of said grate or fire-bed and the walls of the draft-chamber base-section, substantially as shown and described.

4. The combination of a grate or fire-bed composed of a series of toothed or serrated bars, the open space between the top surface of the grate or fire-bed and the base of the fire pot or chamber on the front, the vertical spaces between the front and rear outer edges of the same and the walls of the draft-chamber base-section, said grate or fire-bed being of greater length from front to rear than the corresponding diameter of the fire pot or chamber at its base, substantially as shown and described.



5. The combination of a grate or fire-bed composed of a series of toothed or serrated bars, adapted to vibrate longitudinally with a doorway or opening opposite the same, substantially as shown and described.

6. The combination of a grate or fire-bed composed of a series of toothed or serrated bars, adapted to vibrate longitudinally with a draft-chamber base-section of larger area front and rear than the grate or fire-bed, substantially as shown and described.

7. The combination of a grate or fire-bed composed of a series of toothed or serrated bars, adapted to vibrate longitudinally with the stops *f* on the base of said bars, substantially as shown and described.

6,728. TOBACCO CUTTERS. Webster H. Pease, Edgerton, Wis. Patent No. 30,929, dated Dec. 18, 1860; extended seven years. [Filed Sept. 3, 1875.]

Brief.—The tobacco, as it is fed to the cutters, is compressed by two converging endless chains, which are held against the material by a rigid backing. The shaft that carries the cutters conveys a positive movement to the belts and their rollers.

1. The automatic and continuous feed and press herein described, consisting essentially of endless chains or belts provided with rigid and continuous guides, and supported and operated by rolls, relatively situated to form a converging throat.

2. The endless chains F G, both provided with rigid and continuous guide-surfaces, supported and operated by rolls relatively situated to form a continuous feed and press, combined with a rigid throat, K, through which the compressed matter is delivered.

3. The combination of means for making positive and direct connection between the rotating cutter and converging endless chains, consisting of the combination of the chain-carrying rollers, geared positively together, and they, in turn, geared positively to the shaft that carries the knife.

4. Combined with the chain-carrying rollers C R, the shaft M, bearing the cutter at one end, and provided with the worm P and intermediate positive gearing, whereby motion of said shaft is transmitted to said rollers

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 8.—NO. 19. TUESDAY, NOVEMBER 9, 1875. PRICE { $5,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1875 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

UNITED STATES PATENT OFFICE,
Washington, D. C., October 5, 1875.

The COMMISSIONER OF PATENTS respectfully requests manufacturers of and dealers in engines, machines, apparatus, tools, and appliances of whatever kind, to send to this Office duplicate copies of all catalogues and circulars which they have issued or may issue from time to time.

R. H. DUELL, *Commissioner.*

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, DISTRICT OF CONNECTICUT.

THE MAGIC RUFFLE COMPANY *vs.* THE ELM CITY COMPANY.

[*In equity.—Before* SHIPMAN, *J.*]

The plaintiffs file their bill for an account and discovery under an agreement, contract, or license, granted by them to, and made with, the defendants, the latter admitting the validity of the patents owned by plaintiffs: *Held*, that defendants are estopped from denying the truth of their admissions, unless such agreement was obtained by fraud, surprise, or imposition.

In this case it was competent for the complainants to take either one of the two remedies for the alleged injuries growing out of a violation of the agreement or license. They could bring a bill alleging an injury to their exclusive rights, or could bring a proper suit, setting up the breach of contract as the *gravamen* of their action.

Although the suit is upon the contract, the damage to complainants, if any, is the damage sustained from the injury to their patent-rights.

[*Seward* and *Shipman*, for complainants.
Ingersoll and *Stoughton*, for defendants.]

165

SHIPMAN, *J.*:

The parties in the case are corporations. The complainants were created under the laws of the State of New York, and the defendants were incorporated under the laws of the State of Connecticut, and are established at New Haven, in this district. The bill alleges that the complainants are, and have been since September 18, 1860, the owners of Letters Patent No. 28,244, granted to George B. Arnold on May 8, 1860, for a new and useful improvement in ruffles, and were also, in the month of February, 1863, the owners of three other patents, theretofore issued to George B. Arnold and Alfred Arnold, for other improvements in machines for making ruffles, and in ruffles, which improvements were generally known as the "Double-Feed Separator" and "Ruffle without a Band;" that prior to the month of February, 1863, upon a suit of the complainants against Douglas & Sherwood, in the Circuit Court of the United States for the southern district of New York, a verdict was rendered by which Patent No. 28,244 was sustained; that the defendants had at that time been engaged in manufacturing and selling ruffles containing the improvements described in said letters patent, and in order to avoid further litigation, and for peace sake, and for the purpose of harmonizing the business conducted by the two corporations, an agreement, dated February 21, 1863, was entered into, and was thereafter an executed agreement of license, and no legal proceedings against the defendants were commenced. The material portions of this agreement are as follows:

The Magic Ruffle Company hereby agree to license the said Elm City Company under four several patents, granted to George B. Arnold, and George B. and Alfred Arnold, to wit: the double feed, the separator and its combinations, the ruffle with a band, and the ruffle without a band, to manufacture and sell, under said license exclusively, the ruffles now manufactured and sold by the said Elm City Company, at their manufactory, in New Haven, Connecticut, and known as the double ruffle, and to use the machines patented to the said George B. Arnold and George B. and Alfred Arnold, in the manufacture only of the said double ruffle. In consideration of the said license the said Elm City Company do hereby expressly recognize the validity of each of said patents, and hereby agree to receive licenses, as aforesaid, under each of them, and hereby expressly agree that they will manufacture and sell only the said double ruffle, and that the said double ruffle shall not be divided by the said party of the second part.

The Elm City Company also agreed to submit at all times their manufactory to inspection, so that the Magic Ruffle Company should be advised of the kind of ruffles which were being manufactured, and to pay counsel in the suit of Douglas & Sherwood, and to retain and pay counsel thereafter in suits relating to and in support of said patents, and to pay one-half of

the other expenses of sustaining said patent. It was mutually agreed that each party was to assist the other in suits which might be instituted by either party for the purpose of maintaining its rights under either of said patents. The bill also alleges that thereafter the defendants continued to manufacture and sell the double ruffle of the kind referred to in the agreement, and that after February 21, 1863, they made and sold, in violation of said agreement and of said letters patent, many thousand yards of single ruffles, each of which contained the invention described and claimed in the said letters patent, and prays that the defendants may be required to make a disclosure of all their gains and profits, and of the precise number of yards of single ruffle containing the said improvement, which they have made and sold, and to account for and pay over such gains and profits as have arisen to them, and also all damages which the complainants have sustained by reason of the premises.

The answer denies that the defendants have made and sold any ruffles in violation of Letters Patent No. 28,244; alleges that the ruffles which they have made were made by the aid of machinery, which was invented by and patented unto Crosby & Kellogg, and that, at and prior to said agreement, they were manufacturing, by the use of said machinery, as they lawfully might, double ruffles of a peculiar kind, which were afterward divided, so as to form single ruffles of a form and arrangement some of which somewhat resembled the ruffles manufactured by the complainants; and to avoid any possible controversy with said complainants, the said defendants agreed not so to manufacture single ruffles thereafter, but that said agreement was intended only to prevent the manufacture of that particular kind of single ruffles; that the defendants have not, since the date of said agreement, made or sold a gathered ruffle having a single series of stitches, which is the only kind of ruffle claimed in Patent No. 28,244.

The answer denies the novelty of the alleged improvement described in said patent, and alleges that the defendants have, ever since the execution of said agreement, been engaged, to the knowledge of the complainants, in the sale of ruffles which were not claimed by them until about the time of the commencement of this suit, to be in violation of said patent, and that this action is brought upon a stale claim, and one which is unfounded in equity.

The first question in this case is, Are the defendants estopped, by their covenants in the agreement, from denying the validity of the complainants' patent?

The defendants contend that the suit is against them simply as infringers for a violation of the complainants' patent rights, and that the covenant, which is claimed to be an estoppel, being contained in an instrument collateral to the patent, cannot operate as an estoppel in a suit which is not founded upon the agreement, but upon the patent, and that no bill in equity can be sustained upon the agreement, inasmuch as for a breach of that contract the complainants have a full and adequate remedy at law.

The contract is not merely an agreement for a license, but is an executed license. Such was the intention of the parties, as it is to be collected from the whole of the instrument. (*Buell* vs. *Cook*, 4 Conn., 242.) By the agreement the defendants were licensed to manufacture and sell the double ruffle only. If they manufactured and sold any other ruffle, which was protected by either of the patents, they became, as to such ruffle so improperly manufactured, infringers, and the complainants could resort to an action at law or in equity to obtain redress for this violation of their exclusive patent rights. If the licensee "uses the patented invention beyond the limits of the license or grant, or in any way not authorized by the license or grant, then there has been a violation of a right secured to the patentee under a law of the United States, giving to him the exclusive right to use the thing patented, although such licensee perform, according to their terms, all the covenants entered into by him." (*Goodyear* vs. *Union India Rubber Co.*, 4 Blatchf., C. C. R. 65; *Wood* vs. *Wells, Crittenden & Co.*, 6 Fisher's Patent Cases, 382.) And if the licensees have also expressly covenanted in their agreement of license that they will do, or will not do, a particular act, or will not use the invention for a particular purpose, a violation of such covenant is also a breach of contract, not arising under the laws of the United States, but for which remedy may be sought in the Circuit Courts of the United States, provided the citizenship of the parties gives jurisdiction to such court. (*Goodyear* vs. *Union India Rubber Co.*, cited *supra*; *Goodyear* vs. *Congress Rubber Co.*, 3 Blatchf., C. C. R., 455; *Wilson* vs. *Sanford*, 10 Howard, 99.) In this case it was competent for the complainants to take either one of the two remedies for the alleged injury which have been mentioned. They could bring a bill alleging an injury to their exclusive rights under the laws of the United States, or, as the residence of the party gave this court jurisdiction, could bring a proper suit, setting up the breach of the contract as the *gravamen* of their action. The averments of their bill are sufficient to justify a court in holding it necessary that it is a bill for an injury to their patent rights, but it is manifest, from an examination of the stating part of the bill, that the pleader intended to make the alleged breach of agreement the foundation of the action, and that he is seeking to recover damages for an injury to the complainants, arising out of the violation of the contract.

But the defendants insist that a bill in equity, based upon the contract, cannot be sustained, because for a breach of the contract there is complete and adequate remedy at law. There is undoubtedly a remedy at law for the alleged injury. The only question is whether it is complete and adequate. If the complainants were seeking to recover royalties which the defendants had agreed to pay, inasmuch as the account is particularly within the knowledge of the defendants, or if the patent was still in existence, and the prevention remedy by injunction against future injuries could be administered, there would be no question that a bill in equity would be a proper remedy. (*Eureka Co.* vs. *Bailey*, 11 Wall., 488; *Goodyear* vs. *Congress Rubber Co.*, 3 Blatchf., C. C. R., 449; *Rich et al.* vs. *Atwater*, 16 Conn., 409.) In this case the defendants had not agreed to pay royalties, and an injunction cannot be granted, inasmuch as the patent has expired. It is alleged that the defendants have violated the contract of license by manufacturing and selling a ruffle which they were not authorized to make, and which they had agreed not to make. By this violation the complainants say that they have been injured, and the redress which they ultimately seek is the payment of damages. Although the suit is upon the contract, the damage to the complainants, if any, is the damage which they have sustained from the injury to their patent rights. The ascertainment of the facts from which such damages can be estimated is in cases of injury to property in letters patent peculiarly within the province of a court of equity, because the facts from which damages are to be computed can only be ascertained by an account and a discovery of the number and amount of articles which have been sold by the defendants, facts which are exclusively within their knowledge. They alone have the evidence which can enable the complainants to recover either at law or in equity.

It is true that damages are not ordinarily assessed by a court of equity, (*Livingston* vs. *Woodworth*, 15 Howard, 547,) and prior to the act of 1870, authorizing the circuit court, as a court of equity, to decree the payment of damages in patent cases, damages were not recoverable in this class of equity suits. A bill in equity proceeded, prior to that act, upon the theory that the infringer was equitably bound as a trustee to pay to the patentee the profits which had been made by an unlawful use of the invention. (*Cowing* vs. *Rumsey*, 8 Blatchf., C. C. R., 38.) But this bill is a bill for an account and a discovery. It avers that the complainants do not know and cannot set forth the number of yards of ruffles which have been made in violation of the patent and of the agreement, and prays for a disclosure of the quantity which has been made and sold. Whether having jurisdiction of the case the court will proceed to grant further and complete relief, and to exercise a power which courts of equity have in certain cases heretofore exercised, (*Russell* vs. *Clarkes, executor*, 7 Cranch, 69; *Pratt* vs. *Law*, 9 Cranch, 456; *Insurance Co.* vs. *Colt*, 20 Wall., 560;) and what relief will be granted are questions which can be determined more properly after the report of the master shall have been received.

It is well settled that where the suit is upon a license, or upon a contract, which license or contract contains covenants on the part of the defendants by which they admit the validity of the plaintiffs' patent, and agree to maintain it by suits or legal proceedings, and there has been an enjoyment of the license by the defendants, they are estopped from denying the truth of their admission, unless it shall be averred by cross-bill or answer that such agreement was obtained by fraud, surprise, or imposition. (*Eureka Co.* vs. *Bailey*, 11 Wall., 488; *Crossley* vs. *Dickson*, 10 House of Lords Case, 293.) It is coincident from an inspection of this agreement and from the answer, that there had been litigation in regard to the validity of the patents between the plaintiffs and Douglas & Sherwood, and that the parties to the agreement entered into it in order to avoid similar litigation between themselves, and to prevent future violation of the patents by others, "the agreement was manifestly intended to adjust conflicting rights," and it cannot be permitted in the absence of fraud on the part of the plaintiffs, that the defendants should deny the truth of their careful and deliberate admissions, especially since the contract has become executed and they have enjoyed its benefits.

2. Is the ruffle which has been manufactured and sold by the defendants, and which is styled the Princess Ruffle, an infringement of Patent No. 28,244?

The specification of the patent states that the nature of the invention "consists in confining the tucks or gathers in place and securing them to a binding or ungathered piece of cloth by one and the same series of stitches; or, in other words, causing one series of stitches to perform the double duty of confining the plaits and attaching them to the binding or other material."

The claim is for the ruffle—

As a new article of manufacture, the gathered cloth A, [the ruffled strip,] being secured to the binding B [the band] by the single series of stitches C, which perform the double duty of confining the gathers and of securing the gathered cloth to the binding, substantially as herein set forth.

The article is a plaited or gathered piece of cloth, the gathers of which are confined in their places by a row of stitches, which also at the same time secure the gathered cloth to a band, and this band is an unhemmed strip of cloth, which is to be attached by the purchaser to whatever garment the ruffle is to ornament. "The distinguishing features of this article by which it is materially different from all ruffles known before" have been declared to be in the case of the *Magic Ruffle Co.* vs. *Douglas*, (12 Fisher's Patent Cases, 330,) "the single series of stitches and the unvarying regularity of the plaits and gathers, thus dispensing with the gathering-thread, avoiding the injurious process of whipping or scratching the fabric with a sharp needle and the perforations in the ruffle piece, which the needle and thread make in gathering." The defendants' ruffle is a plaited strip combined with a band, a single row of stitches performing the office of securing the gathers and uniting the gathered cloth to the band, but it has, in addition, a second row of stitches in the band not securing the band to the gathered cloth. The ruffle can be cut in two between the two rows of stitches—one part would be a ruffle, and the other a piece of stitched cloth. The magic ruffle of the plaintiffs is an unfinished article to be attached by the band to ladies' or children's undergarments. The Princess ruffle is a finished article, having a band with an even and finished edge, and is designed to be worn as a neck-ruffle. Still the distinguishing character of the Magic ruffle is found in the Princess ruffle, which contains the row of stitches performing the double office of confining the gathers and attaching the ruffled cloth to the band, and although the Princess ruffle has a second series of stitches, and is a completed article, different in appearance, and used for a different purpose from the Magic ruffle, yet in its patentable characteristics it contains the single feature which had been previously patented by the plaintiffs' grantee. It has other and additional features which render it a different article from the Magic ruffle in the eye of the trade and of the purchaser, but those additional features do not vary the one peculiarity in which it resembles the Magic ruffle. If that peculiarity is a patentable one, it follows that the defendants' ruffle is an infringement of the plaintiffs' patent.

An attempt was made to claim that the Princess ruffle was a double ruffle, and so within the license to the defendants; but it is obvious that if the Princess ruffle is divided, the narrow strip which remains after the ruffle proper has been cut off is a useless strip of stitched cloth, and is not, in any proper sense of the word, a ruffle.

The answer further alleges that after the execution of the agreement the defendants discovered the existence of letters patent to Isaac M. Singer, dated on or about March 18, 1856, and that the complainants, believing that this invention substantially contained that described in Patent 28,244, desired to join with the defendant in purchasing the same; that it was purchased by both parties about April 2, 1863, and since that time the complainants have made no attempt to enforce their patent, but have regarded the same as substantially inoperative and worthless, and that, by reason of said Singer patent, the Patent No. 28,244 is void.

Whether the Singer patent does or does not anticipate the patent of the complainants is not material, inasmuch as the validity of the latter patent is not here in issue. This part of the answer is material only upon the question of the laches of the complainants in the vindication of their alleged rights. The only evidence in regard to the reason of the purchase of the Singer patent, or the opinions of the complainants in regard to the effect of the Singer invention upon the validity of their own patent, is contained in the testimony of the defendants' treasurer, who says that the defendants discovered the existence of the Singer patent, and thinking that if left "in the hands of other parties it might possibly be used for purposes of litigation and annoyance, causing expense and trouble, they thought best to secure it, and the Magic Ruffle Company, regarding it an anticipation of their patent, wished to unite with us in securing it, and as that would save one-half of the expense, and, as we thought answer our purpose, we consented to do so, and it was bought jointly by them and the defendants."

This does not maintain the position of the defendants, that the agreement in regard to the manufacture of ruffles other than the double ruffle was substantially abandoned in consequence of the purchase of the Singer patent. This purchase seems to have had no material influence upon the relations of the parties or upon this agreement.

The most important point of the defendants is that they have been manufacturing the Princess ruffle ever since the date of the agreement, with the knowledge and acquiescence of the complainants, and were not notified that such manufacture and sale were regarded by the complainants as a violation of the agreement or of the patent until after it had expired, and about the time of the commencement of this suit, and that this claim, if it ever had any validity, had become stale, and should not be favored by courts of equity by reason of the laches of the complainants in the vindication of their rights and their acquiescence in the operation of adverse rights.

If I was satisfied from the evidence that the defendants had manufactured and sold the Princess ruffle since 1862 in such quantities that the attention of the plaintiffs must have been early called to the infringement, or that they actually knew of the violation of the agreement ever since the year 1862, I should be of opinion that their delay in making known their claim was such as to prevent them from now receiving the aid of a court of equity to the extent of its powers. The testimony of the treasurer of the defendants' corporation upon this part of the case is guarded, as will be seen by the following quotation:

Question. Subsequent to the date of that agreement, and up to the time of the commencement of this suit, have the defendants manufactured and sold ruffles like Exhibit Barney No. 3?
Answer. Yes; more or less.
Q. Has the same been sold in New York? If so, name a few of the houses to whom it has been sold.
A. Yes. Calhoun & Robbins, J. B. Spelman & Son, L. H. Mandlebaum & Co., and a number of others whom I could not positively swear to know by name.
Q. It has been in the market to a considerable extent, has it not; and under what name?
A. It has; under the name of Princess.

The testimony in the case as it now stands does not show that the Princess ruffle has been in market to any large extent, and that the complainants must necessarily have known that the defendants were manufacturing and selling this ruffle, and thus show that the complainants were negligent in the enforcement of their rights, or were wilfully permitting the defendants to continue the manufacture under the supposition that their conduct was not open to criticism.

As I have said, I am not now called upon to decide as to the measure of damages. The only decree which can now be made is to order an accounting and a disclosure and a reference to a master to ascertain the number of yards of Princess ruffles which have been manufactured and sold, and the amount of such sales during each year, and to ascertain the profits which have accrued to the defendants from such manufacture, for the purpose of ascertaining the amount of the complainants' damages. Other questions in regard to damages will be determined upon the hearing after the accounting shall have taken place.

Let a decree be entered for a reference and an account.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date November 9, 1875.]

8,770.—Carpets.—JOSEPH BARRETT, New York, N. Y., assignor to THE ROXBURY CARPET COMPANY, Boston, Mass. Application filed October 19, 1875. Term of patent 3½ years.

8,771.—Sash-Pulleys.—GEORGE A. BLAKE, New Haven, Conn., assignor to BLAKE BROTHERS HARDWARE COMPANY, same place. Application filed October 26, 1875. Term of patent 7 years.

8,772.—Door-Knobs.—BURTON MALLORY, New Haven, Conn., assignor to MALLORY, WHEELER & Co., same place. Application filed October 26, 1875. Term of patent 7 years.

8,773 to 8,775, inclusive.—Oil-Cloth.—CHARLES T. MEYER and VICTOR E. MEYER, Bergen, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y. Applications filed October 19, 1875. Term of patents 3½ years.

8,776.—Satchel-Handle Tip.—GEORGE O. MONROE, Newark, N. J. Applications filed June 21, 1875. Term of patent 7 years.

8,777.—Tobacco-Pipe.—LEONARD NAX and FRANZ A. KÜHN, Philadelphia, Pa. Application filed October 25, 1875. Term of patent 7 years.

8,778 and 8,779.—Casing of a Soda-Water Apparatus. FRANK H. SHEPHERD, Boston, assignor to JAMES W. TUFTS, Medford, Mass. Cases A and B. Applications filed October 27, 1875. Term of patents 14 years.

8,780.—Carpets.—THOMAS J. STEARNS, Boston, Mass., assignor to THE ROXBURY CARPET COMPANY, same place. Application filed October 30, 1875. Term of patent 3½ years.

8,781.—Crochet-Pattern.—WILLIAM STEINHAUS, New York, assignor of one-half his right to OTTO FRICKENHAUS, Brooklyn, N. Y. Application filed October 20, 1875. Term of patent 3½ years.

8,782.—Metal Frame in Pianos.—CHRISTIAN F. T. STEINWAY, New York, N. Y. Application filed October 29, 1875. Term of patent 14 years.

8,783.—Flower-Stands.—HENRY P. ROBERTS, De Ruyter, N. Y. Application filed October 9, 1875. Term of patent 7 years.

8,784.—Metal Sheets for Covering Trunks.—ANTHONY V. ROMADKA, Milwaukee, Wis. Application filed October 23, 1875. Term of patent 7 years.

8,785.—Watch-Chain Links.—EDWARD E. BARROWS, Attleborough, Mass. Application filed September 15, 1875. Term of patent 3½ years.

8,786.—Chain-Link.—DANIEL A. BEAM, Newark, N. J. Application filed October 23, 1875. Term of patent 3½ years.

8,787.—Show-Case.—WILLIAM H. GROVE, Philadelphia, Pa. Application filed October 29, 1875. Term of patent 7 years.

8,788.—Satchel and Bag Handles.—GEORGE O. MONROE, Newark, N. J. Application filed August 6, 1875. Term of patent 7 years.

8,789.—Clock-Cases.—HERMANN J. MÜLLER, New York, N. Y. Application filed October 29, 1875. Term of patent 7 years.

8,790.—Handle for Stove-Cover Lifter.—JOSIAH M. READ, Everett, Mass. Application filed November 2, 1875. Term of patent 14 years.

8,791.—Coffin-Handle Bases.—WILLIAM M. SMITH, West Meriden, Conn., assignor to THE MERIDEN BRITANNIA COMPANY, same place. Application filed November 2, 1875. Term of patent 7 years.

8,792.—Steam-Radiator Pipes.—GEORGE W. WALKER, Malden, Mass. Application filed October 25, 1875. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each certificate bearing date November 9, 1875.]

3,125.—Hats, Caps, Furs, and Straw Goods.—BOYDEN, MALLOY & Co., New York, N. Y. Application filed June 7, 1875.

"an upright bear, with a basket on its back filled with an assortment of such goods as we sell, consisting of hats, caps, furs, and straw goods, and holding in its right paw a card, consisting of the words: 'Boyden, Malloy & Co., manufacturers and wholesale dealers in hats, caps, furs, straw goods, umbrellas, &c., 520 and 522 Broadway, N. Y.'"

3,126.—Cigars.—JOHN B. COHEN, Philadelphia, Pa. Application filed August 26, 1875.

"representation of a log cabin."

3,127.—Soap.—EDWARD S. MORRIS & Co., Philadelphia, Pa. Application filed October 19, 1875.

"words 'Pure Palm Soap, made in Liberia, Africa,' in connection with the pictorial representation of a palm-nut, natural size and color."

3,128.—Cigars.—SULLIVAN & BURK, Detroit, Mich. Application filed November 5, 1875.

"name 'Iron Cross,' and the design of the cross."

LABELS REGISTERED DURING THE WEEK.

[Each certificate bearing date November 9, 1875.]

375.—Title: **"Garden Tomatoes—Benjamin & Yerks, Albany, N. Y."**—BENJAMIN & YERKS, Albany, N. Y. Application filed November 3, 1875.

376.—Title: **"Holt's Champion Copying and Writing Fluid."**—DE LANG & OSTERLIND, Chicago, Ill. Application filed October 22, 1875.

377.—Title: **"Pure Palm Soap, Made in Liberia, Africa."**—EDWARD S. MORRIS & Co., Philadelphia, Pa. Application filed November 3, 1875.

378.—Title: **"Weaver's Florida Water."**—JAMES B. WEAVER, Philadelphia, Pa. Application filed November 5, 1875.

INDEX OF INVENTIONS PATENTED NOVEMBER 9, 1875.

	Class No.	No. of Patent
Alarm, burglar, L. F. Drake	24	169,788
Alarm, burglar, C. O. Malmgren	24	169,821
Alarm, till lock, S. C. Frink	24	169,632
Alloy for bell metal, H. L. Macker	10	169,648
Alloy for preventing incrustation upon metals, O. Holden	99	169,810
Bale tie, S. N. Drake	7	169,789
Barrels, construction of berry, C. C. Paul	63	169,657
Bed bottom, spring, W. W. Bartlett	62	169,615
Bed bottom, spring, C. T. Segar	62	169,851
Bedstead, cot, Worcester and Howe	62	169,880
Bedstead, folding, J. Flinn	62	169,699
Bedstead, invalid, W. Huntress	62	169,705
Bedstead, sofa, S. Bendit	62	169,672
Bedstead, sofa, C. Burnitz	62	169,771
Bedstead, sofa, J. K. and M. L. Stockton	62	169,862
Beer, &c., extract of, P. E. Lockwood	19	169,818
Beer, &c., treating, Mussgiller and Schedler	19	169,830
Bell, door, J. P. Connell	24	169,675
Binder, temporary, W. A. Amberg	15	169,667
Blackboard attachment, H. B. Marshall	146	169,649
Blackboards or slates, forming, H. R. Stewart	146	169,861
Blind slat adjuster, Johnston and Hopkins	24	169,644
Blind stiles, machine for boring, F. H. Dam	30	169,679
Boat, ice, W. H. Fairbank	137	169,794
Boiler, sectional steam, V. D. Anderson	148	169,758
Boilers, water regulator and indicator for steam, D. Cook	148	169,676
Bolt, king, A. G. Pickett, Jr	31	169,738
Book, account, Mott and Carroll	146	169,826
Boot and shoe nailing machine, F. M. Shaw	16	169,661
Boot and shoe sole lining mechanism, R. Dwyer	16	169,790
Boxes, machine for making heads of wooden, E. Hersey	174	169,700
Bracelets, slide for, J. S. Carrow	86	169,775
Bridge, metallic arched truss, J. B. Eads	21	169,791
Bridle bit, B. Miller	72	169,718
Brush holder, C. B. Clark, (reissue)	22	6,731
Buildings, construction of fire-proof, T. Sharp	4	169,852
Burner, aero gas, J. H. Knights	65	169,711
Calves, &c., anti-sucking bit for, J. H. Bailey	144	169,670
Car axle box, J. Eccles	122	169,792
Car axle box, G. Williams	122	169,664
Car coupling, R. A. Cowell	122	169,624
Car coupling, J. C. Mitchell	122	169,720
Car propeller, E. H. Leveaux	122	169,816
Car, sleeping, J. F. Goodridge	121	169,633
Cars, apparatus for lighting railroad, I. F. Randolph	64	169,658
Carbureters, air blowing apparatus for, C. M. Gearing	27	169,802
Carbureting apparatus, A. C. Read	27	169,843
Carbureting apparatus, P. Werni	27	169,872
Carriage axle, W. W. Simmons	31	169,856
Carriage spring, W. H. Elliot	31	169,681
Carriage top, J. C. Goold	31	169,634
Carriages, apparatus for detaching horses from, I. L. Fallis	72	169,685
Cartridge, G. E. Hart	32	169,806
Cartridge, G. E. Hart	32	169,807
Cartridge belt, G. C. Henning	32	169,639
Cartridges, block for holding, R. T. Hare	32	169,636
Cask, metallic, G. W. McKim	136	169,824
Caviar, preserving, M. Ams	58	169,668
Chain link, W. Roemer	66	169,731
Chain, convertible, C. N. Cadwallader	62	169,772
Chain, convertible, F. H. Waste	62	169,752
Chair, dental and barber, S. C. Megill	62	169,825
Chair, folding, J. E. Wakefield	62	169,748
Check rower, J. Thompson	133	169,865
Churn, rotary, M. Payne	45	169,835
Chute for discharging coal from vehicles, D. P. Bitner	31	169 618
Cigar box, C. S. Brown	160	169,709
Cigar machine, Donath and Jasper	160	169,786
Cigar mold, J. D. Culp	160	169,778
Clocks, globe attachment to, H. Fick	36	169,687
Cloth napping machine, B. Thackrah	37	169,742
Clothes wringer, M. A. Johnson	91	169,643
Clutch, friction, T. E. Barrow	87	169,614
Coal breakers or crackers, toothed roller for, W. Munson	124	169,654
Cock, anti-freezing, S. T. Harper	167	169,804
Cock, compression, P. White	167	169,873
Coke oven, H. Aitken	61	169 756
Colorado buga, machine for catching, J. Ney, Jr	63	169,656
Colter, F. and J. H. Culver	114	169,678
Cracker machine, J. Parr	6	169,834
Cradle, Borgman and Lamson	62	169,767
Cultivator and harrow, combined, G. Croll	43	169,677
Curtain fixture, W. Gates	62	169,801
Curtain fixture, G. C. Mathers	62	169,822
Dental polishing tool, S. S. White	46	169,753
Designs on wire cloth, producing multi-colored, G. R. Hoffman	54	169,640
Desk, J. McClurg	62	169,651
Digger, potato, O. F. Warren	114	169,870
Door hanger, T. Harris	24	169,695
Door hanger, J. Lumbert, (reissue)	24	6,735

	Class No.	No. of Patent.
Dropper, revolving, J. Johnson	74	169,707
Dyeing apparatus, S. M. and C. T. Smith	11	169,859
Engines, governor and cut off for steam, M. D. Miller	69	169,719
Elevator for saccharine liquids, E. P. Larée	155	169,712
Eyeglass, E. Want	157	169,868
Faucet, vent, C. Dehlinger	167	169,782
Faucets, adjusting plumbers', J. H. Lawless	167	169,645
Fence wire stretcher, N. Burnham	52	169,770
Fifth wheel, J. Cunningham	31	169,627
Filtering liquids, apparatus for, T. R. Sinclaire	167	169,857
Fire arm, breech loading, B. B. Hotchkiss	18	169,641
Fire arm, revolving, J. Rupertus	123	169,848
Fire arms, lock for, Kirkwood and Mortimer	55	169,710
Fire kindler, F. Boolsen	154	169,773
Fire place screen, W. C. Williamson	154	169,876
Floor for refrigerator buildings, Voigt and Ellmann	58	169,866
Fork, horse hay, J. H. Fletcher	77	169,668
Fork, horse hay, O. Taber	77	169,740
Fruit box, D. Pritzmann	63	169,841
Furnace, hot air, Pierce and Pinkham	154	169,739
Furnace, hydrocarbon, J. C. Ramsden	149	169,842
Furnace, ore roasting, H. G. Livermore	99	169,713
Furnace, tinmen's, L. F. Betts	136	169,673
Fuse, electric, F. A. Canfield	105	169,622
Gage and heat regulator, combined pressure, Van Kannel and Towsley	64	169,745
Gaiter, button, A. Kenny	16	169,708
Gas, &c., apparatus for lighting, Z. Woodworth	64	169,879
Gas machine retort, Van Kannel and Towsley	66	169,747
Gas machines, automatic check valve for, Van Kannel and Towsley	66	169,746
Gas, manufacturing illuminating and heating, G. W. Harris	66	169,637
Gas retorts, process and apparatus for decarbonizing, D. Davison	66	169,628
Glass and furnace therefor, tempering, F. B. A. R. De La Bastie	68	169,783
Governor, steam, Judson and Cogswell	69	169,815
Grain conveyer, N. G. Simonds	79	169,662
Grain distributer for seed drills, C. F. Johnson, Jr.	133	169,813
Grain, machine for binding, A. W. Tucker	74	169,743
Grate bar, T. Murphy	149	169,655
Gun, machine, W. B. Farwell	105	169,686
Guns, wad for rifled, G. Schalck	105	169,734
Harrow, W. Frank	73	169,798
Harrow, wheel, T. A. Cole	73	169,623
Harvester, W. N. Whiteley	74	169,874
Harvesters, knife head for, G. W. Harrison	74	169,696
Hat bodies, machine for stretching, J. E. Wells	76	169,663
Hatchet, shingling, H. K. W. Perry	29	169,836
Horse powers, endless chain for, S. W. Davis	139	169,780
Horses, feed bag for, A. Nye, Jr	144	169,726
Horses from carriages, apparatus for detaching, L. L. Fallis	72	169,685
Hose, water proof, S. W. Baker	81	166,760
Hydrant, Stacy and Lewis	167	169,738
Inkstand, H. Schirmer	146	169,735
Kiln, brick, Evans and Kemper	20	169,684
Lamp trimmer, H. L. De Zeng	90	169,785
Letter file, permanent, J. F. Adams	146	169,665
Life preserver, H. G. Dayton	138	169,781
Liquid measure, C. G. Morgan	132	169,652
Lock, door, D. F. Austin	93	169,611
Loom shuttle, R. W. Porter	95	169,837
Loom temple, S. S. Walker	95	169,749
Lubricator, L. W. Hoagland	87	169,809
Mangle, A. B. Barnard	91	169,702
Matches, machine for making, P. Wallace	174	169,867
Measure, liquid, C. G. Morgan	132	169,652
Meat, preserving, F. H. L. C. Sacc	58	169,849
Mechanical movement, J. Hughes	67	169,704
Meter, fluid, B. Huber	42	169,703
Mill, hominy, B. Harvey	57	169,698
Mill spindle, Root and Robinson	57	169,847
Millstone staff, G. T. Smith	57	169,858
Monument, J. N. and T. Wallis	54	169,751
Mowing machine, J. Ashcraft	133	169,669
Nail, picture, T. C. Richards	103	169,730
Nail, picture, J. P. Stockton, Jr	103	169,739
Nut lock, R. Long	14	169,647
Oil tank, W. C. Strickler, (reissue)	58	6,736
Paddle wheel, feathering, P. Gregerson	139	169,690
Panel raising machine, F. D. Green	173	169,803
Paper tube machine, W. H. Brock	109	169,620
Paper vessels, apparatus for making, W. H. Brock	109	169,619
Pawl and ratchet mechanism, G. D. Hamblin	67	169,804
Pegging machines, &c., metallic rod and wire for use in, T. T. Prosser	16	169,838
Perfuming and disinfecting apparatus, C. L. C. Battmann	98	169,671
Photographic plate holder, F. A. and W. S. Howson	111	169,702
Piano attachment, A. D. B. Wolff	142	169,877
Pile, box, E. G. Scovil	125	169,850
Pipe, R. M. C. Broas	167	169,674
Pipe elbows, machine for making, A. Syverson	136	169,863
Pipe joint, cold packed, A. N. Rankin	167	169,659
Pipes, enamel for tobacco, F. G. Merriam	115	169,827
Plaiting machine, E. L. Howard	98	169,642
Planter and drill, seed, W. C. Walker	133	169,750
Planter, corn, J. G. Mole	133	169,721
Planter, pilot wheel corn, J. Campbell	133	169,691
Planter, seed, W. Nevins	133	169,725
Plow, I. Freeman	114	169,709
Plow, W. H. McCune	114	169,716
Pot, coffee, S. Crowell	136	169,626
Press, clay, J. Watson	20	169,871
Press, cotton, L. S. Pearce	7	169,763
Press, rotary perfecting, J. L. Firm	117	169,795
Press, rotary perfecting, J. L. Firm	117	169,796
Printers' leads and rules, machine for mitering, H. W. Henley	117	169,638
Propulsion, screw, J. E. Wilson	139	169,754
Pump handle link, C. Adams	116	169,755
Punching machines, feeding device for, F. Deming	119	169,784
Rail joint, G. A. Mead	120	169,717
Railroad, elevated, A. E. Lozier	120	169,819
Railroad switch, J. L. Arms	120	169,610
Railroad time signal, J. A. Talpey	120	169,741
Railroad track scales, T. Fairbanks	132	169,630
Rake, horse hay, W. H. Ryer	74	169,733
Rake, horse hay, D. P. Sharp	74	169,853
Refrigerator, M. Shaw	58	169,854
Refrigerator buildings, floor for, Voigt and Ellmann	58	169,866
Register, Gresbeck and Müllendorff	143	169,691
Roll for rolling blanks for pole caps, W. J. Lewis	125	169,646
Roller for coal breakers or crackers, toothed, W. Munson	124	169,654
Rower, check, J. Thompson	133	169,865
Saddle clips, die for forging, W. S. Ward	31	169,869
Safe, kitchen, J. B. Harrison	88	169,697
Sash pulley, W. H. Bicknell	24	169,766
Saw mill dog, H. D. Dann, (reissue)	130	6,733
Screw, wood, A. Cummings, (reissue)	171	6,729
Screw, wood, A. Cummings, (reissue)	171	6,730
Seat, school, S. L. Melhorn	62	169,826
Sewing machine, G. L. Du Laney	134	169,682
Sewing machine, Wormald and Dobson	134	169,881
Sewing machine, self-adjusting guide for sewing lap seams in, W. A. Springer	134	169,860
Sewing machines, tuck folding attachment for, G. L. Du Laney	134	169,629
Shafting, bearing for upright, J. H. Teahl	87	169,864
Shears, barbers', S. Nicholson	44	169,832
Sheep scratch box, I. B. Dillon	135	169,681
Shingle, D. Altman	126	169,666
Ship's log, T. C. Robinson	138	169,660
Ships, pneumatic steering apparatus for, Baird and Lewis	137	169,612
Shoe peg or nail, T. T. Prosser	16	169,839
Sign plate, H. T. Dewey	146	169,680
Signal, switch, J. Imray	120	169,811
Skipping apparatus, J. A. Crandall	143	169,625
Smoke house, C. D. Harb	58	169,693
Soda, manufacturing caustic, H. Gaskell, Jr	35	169,800
Soldering tool, W. S. Macqueen	136	169,820
Spark arrester, J. W. Nesmith	94	169,831
Spiegeleisen, manufacture of, J. H. Etheridge	85	169,793
Stave jointing machine, E. J. Granger	40	169,635
Steel, tempering and forming articles of, G. F. Simonds	85	169,736
Steering apparatus for ships, pneumatic, Baird and Lewis	137	169,612
Stove, heating, G. R. Moore, (reissue)	154	6,732
Stove, heating and ventilating, C. S. Bell	154	169,765
Stove pipes, manufacture of, L. Bancroft	136	169,761
Sugar, refining, F. O. Matthiessen	155	169,823
Suspender button strap, A. Shenfield	38	169,855
Swing, rotary, I. N. Forrester	143	169,797
Table, knock down, F. P. Beaver	62	169,764
Table leg, adjustable, J. H. Baisley	62	169,613
Tag fastener, T. P. Marston	146	169,650
Tailors' patterns, apparatus for drafting, F. M. Ullrich	38	169,744
Telegraph, printing, C. J. Wiley	158	169,875
Telegraphs, coupling for train, A. Ryder	158	169,739
Tire tightener, W. O. Johnson	31	169,814
Tobacco, curing, J. D. Culp	160	169,777
Tobacco pipes, enamel for, F. G. Merriam	115	169,827
Toe weight, L. W. Moses	144	169,653
Tool grinding machine, M. L. Mowrer	70	169,829
Toy building block, E. U. Kinsey	143	169,709
Toy money box, C. C. Johnson, (reissue)	143	6,734
Track clearer, G. P. W. Ray	122	169,844
Treadle for machinery, A. N. Hagerty	67	169,692
Truck, band, J. Biggerstaff	31	169,617
Truss, Norris and Sweet	156	169,833
Tube for railings, posts, &c., D. W. Hazelton	4	169,699
Tubing, machine for making, G. H. M. Munts	163	169,723
Tubing, manufacture of metal, S. W. Wood	163	169,878
Tumbling rods, cover for, J. B. Hutchinson	67	169,706
Type machine, A. M. Howard	164	169,701
Type writing machine, M. Aliasoff	117	169,757
Valve, globe, N. C. Locke	152	169,817
Valve, safety, S. Harrison	148	169,805
Varnish, composition for, Mayer, Loewenstein, and Mayer	107	169,714
Vegetable steamer, P. D. Damon	154	169,779
Vehicle axle, C. W. Richardson	31	169,845
Vehicle running gear, C. Behlen	31	169,616
Vehicle spring, H. A. Hight, Sr	31	169,808
Vehicles, chute for discharging coal from, D. P. Bitner	31	169,618
Velocipede, Bodel, Masse, and Webster	31	169,774
Veneer cutting machine, Annin and Nutt	176	169,759
Vinegar, reagent for testing the strength of, C. Peters	35	169,727
Wagon tongue support, Clow and Webster	31	169,776
Washing machine, Smith and Roy	91	169,737
Watch plate, V. Doriot	36	169,787
Water filter, E. S. Farson	167	169,631
Water supply and vent for traps, J. H. Morrell	167	169,729
Wheel hub, W. H. Masterman	31	169,715
Whip, Bronson and Jewsbury	72	169,768
Whip socket, G. M. Rising	31	169,846
Windmill, W. C. Nelson	118	169,724
Wire cloth, producing multi-colored designs on, G. R. Hoffman	54	169,640
Wire, machine for indenting the surface of, T. T. Prosser	163	169,840
Wrench, R. Jack	100	169,812

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED NOVEMBER 9, 1875.

	Patent No.
Adams, C., Pump handle link	169,755
Adams, J. F., Permanent letter file	169,665
Aitken, H., Coke oven	169,756
Alissoff, M., Type writing machine	169,757
Allen, G. H., assignee	169,649
Altman, D., Shingle	169,666
Amberg, W. A., Temporary binder	169,667
Ams, M., Preserving caviar	169,668
Anderson, V. D., Sectional steam boiler	169,758
Annin, J. B., and J. A. Nutt, Veneer cutting machine	169,759
Arms, J. L., Railroad switch	169,610
Ashcroft, J., Mowing machine	169,669
Austin, D. F., Door lock	169,611
Babcock, N., assignee	169,795 169,796
Bailey, J. H., Anti-sucking bit for calves, &c	169,670
Baird, G. W., and J. C. Lewis, Pneumatic steering apparatus for ships	169,612
Baker, S. W., Water proof hose	169,760
Baisley, J. H., Adjustable table leg	169,613
Bancroft, L., Manufacture of stove pipes	169,761
Barnard, A. B., Mangle	169,762
Barrow, T. E., Friction clutch	169,614
Bartlett, W. W., Spring bed bottom	169,615
Base, M. L., assignee	169,688
Battmann, C. C. C., Perfuming and disinfecting apparatus	169,670
Bearce, L. S., Cotton press	169,763
Beard, B. C. and H., assignees	169,695
Beaver, F. P., Knock down table	169,764
Behlen, C., Vehicle running gear	169,616
Bell, C. S., Heating and ventilating stove	169,765
Bendit, S., Sofa bedstead	169,672
Betts, L. F., Tinmen's furnace	169,673
Bicknell, W. H., Sash pulley	169,766
Biggerstaff, J., Hand truck	169,617
Bitner, D. P., Chute for discharging coal from vehicles	169,618
Bodel, L. G., J. Masse, and W. Webster, Velocipede	169,774
Boese, C., & Co., assignees	169,727
Boolsen, F., Fire kindler	169,773
Borgman, M. V., and W. F. Lamson, Cradle	169,767
Bostwick, J. A., assignee	169,619 169,690
Broas, R. M. C., Pipe	169,674
Brock, W. H., Apparatus for making paper vessels	169,619
Brock, W. H., Paper tube machine	169,620
Bronson, T. J., and T. N. Jewsbury, Whip	169,768
Brown, C. S., Cigar box	169,769
Burnham, N., Fence wire stretcher	169,770
Burnita, C., Sofa bedstead	169,771
Bushnell, W., assignee	169,840
Cadwallader, C. N., Convertible chair	169,772
Calkins, A. C., assignee	169,840
Campbell, J., Pilot wheel corn planter	169,621
Canfield, F. A., Electric fuse	169,622
Cape, R., assignee	169,712
Carroll and Mott	169,828
Carrow, J. S., Click for bracelets	169,775
Chard, R. J., assignee	169,809
Clark & Co., assignees, (reissue)	6,731
Clark, C. B., Brush holder, (reissue)	6,731
Clow, G. E., and P. H. Webster, Wagon tongue support	169,776
Cogswell and Judson	169,815
Cole, T. A., Wheel harrow	169,623
Connell, J. P., Door bell	169,675
Cook, D., Water regulator and indicator for steam boilers	169,676
Cottrell, C. B., assignee	169,795 169,796
Cowell, R. A., Car coupling	169,624
Cowles, C., & Co., assignees	169,801
Crandall, J. A., Skipping apparatus	169,625
Croll, G., Combined cultivator and harrow	169,677
Crowell, S., Coffee pot	169,626
Culp, J. D., Curing tobacco	169,777
Culp, J. D., Cigar mold	169,778
Culver, F. and J. H., Colter	169,678
Culver, J. P., assignee	169,674
Cummings, A., Wood screw, (reissue)	6,729
Cummings, A., Wood screw, (reissue)	6,730
Cunningham, J., Fifth wheel	169,627
Dam, F. H., Machine for boring blind stiles	169,679
Damon, P. D., Vegetable steamer	169,779
Dann, H. D., Saw mill dog, (reissue)	6,733
Davis Metallic Wheel Manufacturing Company, assignee	169,845
Davis, S. W., Endless chain for horse powers	169,780
Davis, T. S., assignee	169,835
Davison, D., Process and apparatus for decarborizing gas retorts	169,628
Dayton, H. G., Life preserver	169,781
Dehlinger, C., Vent faucet	169,782
De La Bastie, F. B. A. R., Tempering glass and furnace therefor	169,783
Deming, F., Feeding device for punching machines	169,784
Dewey, H. T., Sign plate	169,680
De Zeng, H. L., Lamp trimmer	169,785
Dillon, I. B., Sheep scratch box	169,681
Dobson and Wormald	169,881
Donath, F. A. H., and C. E. F. Jasper, Cigar machine	169,786
Doriot, V., Watch plate	169,787
Drake, L. F., Burglar alarm	169,788
Drake, S. N., Bale tie	169,789
Du Laney, G. L., Sewing machine tuck folding attachment	169,629
Du Laney, G. L., Sewing machine	169,682
Dwyer, R., Boot and shoe sole lining machine	169,790
Eads, J. B., Metallic arched truss bridge	169,791
Eccles, J., Car axle box	169,792
Ellmann and Voigt	169,866
Eley, A., assignee	169,656
Elliot, W. H., Carriage spring	169,683
Etheridge, J. H., Manufacture of spiegeleisen	169,793
Evans, H. B., and E. G. Kemper, Brick kiln	169,684
Evenden, J. G., assignee, (reissue)	6,736
Fairbank, W. H., Ice boat	169,794
Fairbanks, T., Railroad track scales	169,630
Fallis, L. L., Apparatus for detaching horses from carriages	169,685
Farson, E. S., Water filter	169,631
Farwell, W. B., Machine gun	169,686
Fick, H., Globe attachment to clocks	169,687
Firm, J. L., Rotary perfecting press	169,795
Firm, J. L., Rotary perfecting press	169,796
Fletcher, J. H., Horse hay fork	169,688
Flinn, J., Folding bedstead	169,689
Forrester, I. N., Rotary swing	169,797
Frank, W., Harrow	169,798
Freeman, I., Plow	169,799
Frink, S. C., Till lock alarm	169,632
Gannon, T., assignee	169,812
Gaskell, H., Jr., Manufacturing caustic soda	169,800
Gates, W., Curtain fixture	169,801
Gearing, C. M., Air blowing apparatus for carburetors	169,802
Gillespie, T. A., assignee	169,617
Goodridge, J. F., Sleeping car	169,633
Goold, J. C., Carriage top	169,634
Granger, E. J., assignee	169,759
Granger, E. J., Stave jointing machine	169,635
Graves, E. E., assignee	169,741
Graves, J. A. S., assignee	169,642
Green, F. D., Panel raising machine	169,803
Gregerson, P., Feathering paddle wheel	169,690
Gresbeck, F., and E. Müllendorff, Register	169,691
Hake, P., assignee	169,650
Hagerty, A. N., Treadle for machinery	169,692
Hamblin, G. D., Pawl and ratchet mechanism	169,804
Harb, C. D., Smoke house	169,693
Hare, R. T., Block for holding cartridges	169,636
Harper, S. T., Anti-freezing cock	169,694
Harris, G. W., Manufacturing illuminating and heating gas	169,637
Harris, T., Door hanger	169,695
Harrison, G. W., Knife head for harvesters	169,696
Harrison, J. B., Kitchen safe	169,697
Harrison, S., Safety valve	169,805
Hart, G. E., Cartridge	169,806
Hart, G. E., Cartridge	169,807
Harvey, B., Hominy mill	169,698
Hanbach, A. G., assignee	169,644
Haselton, D. W., Tube for railings, posts, &c	169,699
Hendrix, D. R., assignee	169,864
Henley, H. W., Machine for mitering printers' leads and rules	169,638
Henning, G. C., Cartridge belt	169,639
Hersey, E., Machine for making heads for wooden boxes	169,700
Hight, H. A., Sr., Vehicle spring	169,808
Hoagland, I. W., Lubricator	169,809
Hoffman, G. R., Producing multi-colored designs on wire cloth	169,640
Holden, O., Alloy for preventing incrustation upon metals	169,810
Holmes, F. A., assignee	169,664
Holton, H. A., assignee	169,794
Hopkins and Johnston	169,644
Hotchkiss, B. B., Breech loading fire arm	169,641
Howard, A. M., Type machine	169,701
Howard, E. L., Plaiting machine	169,642
Howe and Worcester	169,880
Howe, W., assignee	169,809
Howson, F. A. and W. S., Photographic plate holder	169,702
Huber, B., Fluid meter	169,703

	Patent No.
Huff, B., assignee	169 721
Hughan, S., assignee	169,788
Hughes, J., Mechanical movement	169,704
Huntress, W., Invalid bedstead	169,705
Hutchinson, J. B., Cover for tumbling rods	169,706
Imray, J., Switch signal	169,811
Jack, R., Wrench	169 812
Jarvis, S., assignee	169,755
Jasper and Donath	169,786
Jewsbury and Bronson	169,768
Johnson, C. C., Toy money box, (reissue)	6,734
Johnson, C. F., Jr., Grain distributer for seed drills	169,813
Johnson, J., Revolving dropper	169,707
Johnson, M. A., Clothes wringer	169,643
Johnson, W. O., Tire tightener	169,814
Johnston, J. L. A., and C. B. Hopkins, Blind slat adjuster	169,644
Judson, J., and W. A. Cogswell, Steam governor	169,815
Kemper and Evans	169,684
Kenny, A., Button gaiter	169,708
Kingsley, S. D., assignee	169,654
Kinsey, E. H., Toy building block	169,709
Kirkwood, D., and H. Mortimer, Lock for fire arms	169,710
Knights, J. H., Aero-gas burner	169,711
Kohlberg, J., assignee	169,674
Lamson and Borgman	169 767
Larée, E. P., Elevator for saccharine liquids	169,712
Lawless, J. H., Adjusting plumbers' faucets	169,645
Leveaux, E. H., Car propeller	169,816
Lewis and Baird	169,613
Lewis and Stacy	169 738
Lewis, W. J., Roll for rolling blanks for pole caps	169,646
Livermore, H. G., Ore roasting furnace	169 713
Locke, N. C., Globe valve	169,817
Lockwood, P. E., Extract of beer, &c	169,818
Loewenstein and Mayer	169,714
Long, R., Nut lock	169 647
Lozier, A. E., Elevated railway	169,819
Lumbert, J., Door hanger, (reissue)	6,735
Macker, H. L., Alloy for bell metal	169 648
Macqueen, W. S., Soldering tool	169,820
Mallory, H. P., assignee	169,851
Malmgren, C. O., Burglar alarm	169 821
Marshall, H. B., Blackboard attachment	169,649
Marston, T. P., Tag fastener	169,650
Masse, Webster, and Bodel	169,774
Masterman, W. H., Wheel hub	169,715
Mathers, G. C., Curtain fixture	169,822
Matthiessen, F. O., Refining sugar	169,823
Mayer, S. W., L. Loewenstein, and B. Mayer, Composition for varnish	169,714
McClurg, J., Desk	169,651
McCollum, L. A., assignee and executrix	169,834
McCune, W. H., Plow	169,716
McKim, G. W., Metallic cask	169,824
Mead, G. A., Rail joint	169,717
Megill, S. C., Dental and barber chair	169,825
Melhorn, S. L., School seat	169,826
Merriam, F. G., Enamel for tobacco pipes	169,827
Miller, B., Bridle bit	169,718
Miller, M. D., Governor and cut off for steam engines	169,719
Miller, P., assignee	169,690
Mitchell, J. C., Car coupling	169,720
Mole, J. G., Corn planter	169,721
Moore, G. R., Heating stove, (reissue)	6 732
Moore, J. A., assignee	169,751
Morgan C. G., Liquid measure	169,652
Morrell, J. H., Water supply and vent for traps	169,722
Mortimer and Kirkwood	169,710
Moses, L. W., Toe weight	169,653

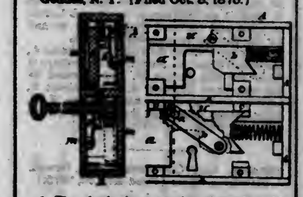
TITLES, DRAWINGS, AND CLAIMS

OF

PATENTS GRANTED NOV. 9, 1875.



169,610. RAILROAD-SWITCHES. John L. Arms, New Orleans, La., assignor of part of his right to Granville R. Ober and Wm. H. Renaud, same place. [Filed Sept. 14, 1875.]

Brief.—The switch is operated from the locomotive through knee-levers, in place of levers of the usual form.

The arrangement of the knee-levers l l' E E', bell-crank F, connecting-rods O, and links a' b', with the switch-bar D, as described, and for the purpose specified.

169,611. DOOR-LOCKS. David F. Austin, Geddes, N. Y. [Filed Oct. 8, 1875.]

1. The check-pin a, passing through rigid guide s, and provided with screw-threads on its outer end, the spring b, attached to cover m, and arranged to force the said pin inward, and the extra key k having a recess in its end with screw-threads therein, in combination with the spring-bolt e, provided with recesses o o and arranged to be retracted by the general key, all constructed to operate substantially as described, for the purpose specified.

2. The combination of two lock mechanisms, constructed as herein described, with the case A, consisting of four sides and a central longitudinal partition, and provided with the four removable plates m m m m in such a manner as to render the lock operative and applicable at either side of a door, substantially as described and shown.

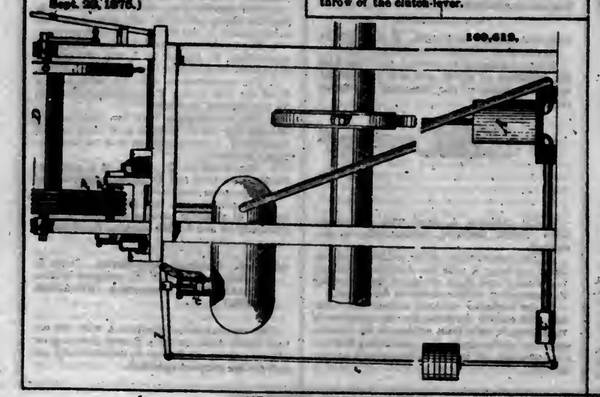
169,612. PNEUMATIC STEERING APPARATUS FOR SHIPS. Geo. W. Baird, U. S. N., and Jos. C. Lewis, Washington, D. C. [Filed Sept. 29, 1875.]

1. An air-pump, A, operated by the revolutions of a propeller-shaft, for forcing air or gas into a reservoir to give sufficient pressure to move a ship's rudder, through the intervention of an engine, substantially as set forth.

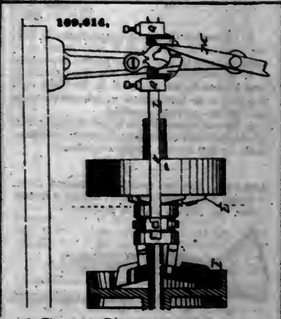
2. The combination of an automatic piston or valve, d, with lever l and rod r, for opening or closing a cock or valve, C, for the supply of the air or gas pump, substantially as set forth.

3. In an air, gas, or steam steering apparatus, the combination of the drum D, provided with the grooved friction-gear F and the pinion F' on the crank-shaft f, operated by the engine, whereby sudden concussions on the rudder are compensated for, substantially as described.

169,613. ADJUSTABLE TABLE-LEGS. John H. Baisley, Dayton, Ohio. [Filed Aug. 27, 1875.]



1. The metallic plate A, having a central web, a, flanges b, and projecting flanges f, secured to the rails B, in the manner and for the purpose specified.



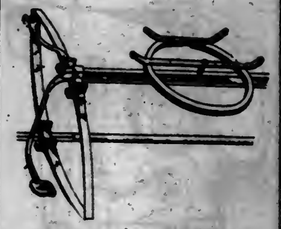
2. The leg D, arranged as shown, and clamped in position to the plate A, which is supported by the rails B by means of the wood-screws h, in the manner and for the purpose specified.

169,614. FRICTION-CLUTCHES. Thomas B. Barrow, Mansfield, Ohio. [Filed Feb. 26, 1875.]

Brief.—The clutch, in general form, is a double-frustum cone, base to base, the cones being prongs reciprocating in recesses on the sides of the slides, which, at their other ends, press and recede from the inner peripheries of the drums; also, a method of adjusting the throw of the clutch-lever.

169,614.

1. The crown B, provided with the prongs D, in combination with the spider E and slides F, substantially as shown and described.

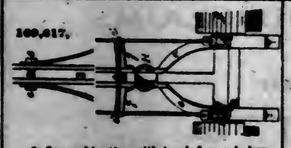


2. The combination of the lever M, arm N, and adjustable plates Q on the shifting-rod L, substantially as described, and for the purpose specified.

169,615. SPRING BED-BOTTOMS. William W. Bartlett, Baltimore, Md. [Filed July 20, 1875.]

In a bed-bottom, the combination, with a series of slats, a, springs b, provided with cross-pieces b', and prongs or clips b' b', adapted to embrace the slats a, and a frame, c, provided with cross-pieces c', of the clips d, having straight portions d', adapted to pass under the cross-pieces c' and hooks d' at each end, for holding the opposite sides of the lower ring of the springs b in position, substantially as shown and described.

169,616. RUNNING-GEARS FOR VEHICLES. Charles Bohlen, Cincinnati, Ohio. [Filed May 1, 1875.]



In a vehicle, the supporting-bar of the fifth-wheel, terminating in steps D, forming integral parts thereof, substantially as and for the purpose specified.

169,617. HAND-TRUCKS. John Haggerstaff, Pittsburg, Pa., assignor to himself and T. A. Gillespie, same place. [Filed Apr. 6, 1875.]

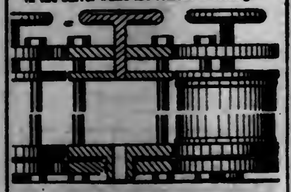
1. In combination with the truck-frame A, the guards or shield-plates D D, secured on the inner side to the truck-frame and on the outer side to the axle, substantially as and for the purpose specified.

160,617.

2. In combination with truck-frame A, having tongue B, braces B B and struts g g', substantially as and for the purpose specified.

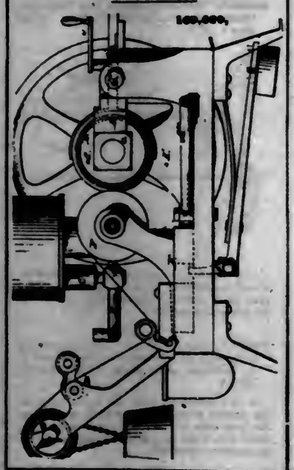
3. In combination with the truck-frame A and tongue B, the braces B B, provided with the points or projections e', substantially as and for the purpose specified.

4. In combination with a self-loading hand-truck, foot-rest H, attached thereto, substantially as and for the purpose specified.



160,618. CHUTES FOR DISCHARGING COAL FROM VESSELS. David P. Bitner, Lancaster, Pa. [Filed Sept. 6, 1875.]

The independent telescopic tubing B C D, with arresting flanges a b, funnel-mouth A, hooks G, scoop-terminus H, and handles F, as and for the purpose shown and specified.



160,619. APPARATUS FOR MAKING PAPER VESSELS. Wm. H. Brock, Hunter's Point, assignor to Jabez A. Bostwick, New York, N. Y. [Filed Jan. 7, 1875.]

Brief.—The heads are held under pressure in the barrel while the cement is setting.

The annular frame carrying the sievers, the platens, head-screws and perforated bone-plates, the whole combined and arranged for operation substantially as and for the purpose specified.

160,620.

160,621. PILOT-WHEEL CORN-PLANTERS. James Campbell, Harrison, Ohio. [Filed Dec. 19, 1874.]

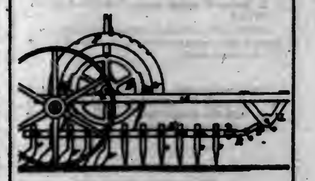
Brief.—The seed-hopper, being pivoted at one side, may be adjusted laterally, to cause the seed-wheel to engage with either of two endless screws, which are run at different rates of speed by gear upon each side of the pilot-wheel. The discharge of seed may thus be varied, while the machine is in motion, by a hand-lever acting upon the hopper and seed-wheel.

1. The two sets of driving-gear, one upon each side of the frame, in combination with the pivoted grain-box C, adapted to shift the speed of the dropping mechanism while the drill is in operation, substantially as herein set forth.

2. In combination with the pivoted hopper, the shifting-lever H, and notched adjusting-bar, substantially as set forth.

160,622. ELECTRIC FUSES. P. A. Caufield, Dover, N. J. [Filed Aug. 20, 1875.]

Brief.—Designed to protect the fuse from the influence of water, and also prevent accidental ignition of the fulminate by concussion.



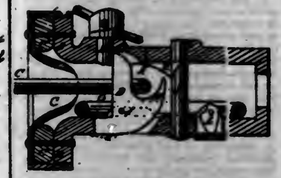
1. The exploder A, lined with rubber or other similar material, substantially as described.

2. The combination of the rubber-lined metallic exploder A with the entering conducting-wires d and d', so arranged as to render it water-proof, substantially as described.

3. An exploder covered within and without with elastic material, for the purpose of rendering it safe from explosion by concussion, and at the same time preventing it from the influence of water, substantially as described.

160,623. WHEEL-HARROWS. Thos. A. Cole, Trafalgar, Ind. [Filed Aug. 6, 1875.]

Brief.—The harrow is suspended from a frame-work that rests upon wheels, by means of chains that pass around a windlass. The side pieces of the harrow are made of thin iron bars, bent so as to form three walls, two of which constitute the top and bottom. Holes are made in these for the teeth, and one adjacent in the side plate for an eyebolt, to hold the teeth in place. The windlass is operated by rack and pinion.



1. The side frames K K of the harrow, constructed as shown, in combination with the teeth V, or cod-cutters V', eyebolt W, and nut a, constructed and operated substantially as and for the purpose hereinbefore set forth.

2. In combination with the harrow-frame K K', the hinged plate R, forked connecting-bars P, shaft O, and hangers or bearings L L, constructed and operated substantially as and for the purpose hereinbefore set forth.

3. In combination with the vehicle-frame A, the shafts C and E, provided with pulleys G G' G'' G''' and guides E', and operated by the rack-wheel D'', lever Z, and quadrant Y, to raise and lower the harrow-frame K K', substantially as and for the purpose hereinbefore set forth.

160,624. CAR-COUPLINGS. E. A. Cowell, Cleveland, Ohio. [Filed Aug. 10, 1875.]

1. The combination, with the draw-bar A, of a cap, C, provided with the lapels c', and intermediate cushion C', substantially as and for the purpose described.

2. The combination, with the draw-bar A, of the tilting or rotating pin D, provided with the hooked end D', and latch or key E, substantially as and for the purpose described.

3. The combination, with the draw-bar A and the tilting pin D, of the guide-block K, substantially as and for the purpose described.

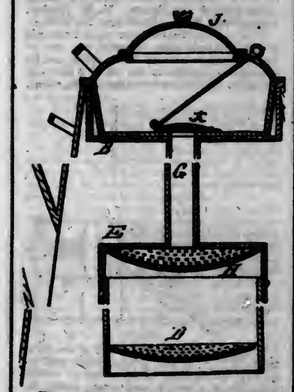
4. The combination, with the draw-bar A, of guide-block K, hinged at h, and the pin J, substantially as and for the purpose described.

5. The combination, with the latch or key E, of the link or dog F, substantially as and for the purpose described.

6. The combination, with the draw-bar, of the rotating pin D, pivoted at d, latch E, and shoulder d', substantially as and for the purpose described.

7. The tilting pin D, pivoted at d, and provided with a hook end, D', substantially as and for the purpose described.

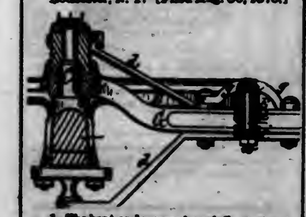
8. The combination in a draw-bar, with the link O, of yielding pivoted shoulder L, substantially as and for the purpose described.



160,625. SEWING APPARATUS. James A. Crandall, Brooklyn, N. Y., assignor to himself and H. White, same place. [Filed Sept. 4, 1875.]

The combination of the bolt A with the rotary crank shaft or wire B and jumping or shipping loop or hasps C, substantially as and for the purpose specified.

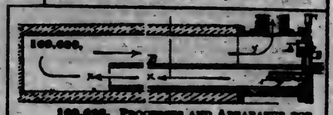
160,626.



160,626. COFFEE-POTS. Solomon Crowell, Cortland, N. Y. [Filed Apr. 20, 1875.]

The combination of the cover B, hinged lid J, cap I, having valve K, the tube G, coffee-receptacle O B, with perforated bottom D, and the perforated diaphragm H, all constructed as described, and arranged within a coffee-pot, substantially as and for the purposes herein set forth.

160,627. FIFTH-WHEELS. J. Cunningham, Rochester, N. Y. [Filed Aug. 30, 1875.]

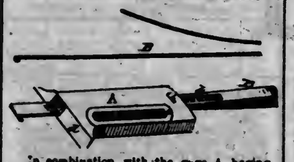


1. The bent or depressed reach G, constructed with the eye a, forming a direct connection of the reach with the king-bolt between the axle and head-block, as shown and described, and for the purposes specified.

2. The lugs g g, formed from the body of the upper half of the fifth-wheel, extending down and behind to the reach without intermediate parts, and inclosing the lower half of the fifth-wheel, and forming a guide therein, as shown and described, and for the purpose specified.

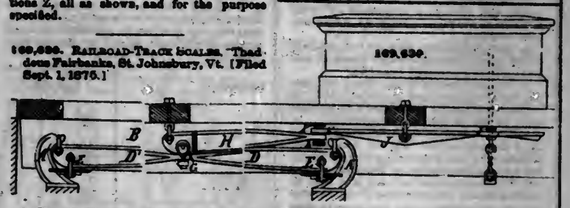
3. The combination, with the bent reach, having the eye a connected with the king-bolt C of the braces d d', extending from the reach to the head-block and axle, as shown and described, and for the purpose specified.

160,628.



160,628. PROCESSES AND APPARATUS FOR DECARBONIZING GAS-RETORTS. Darius Davison, New York, N. Y. [Filed Nov. 11, 1874.]

1. The lid D, having a stopper, E, and a tube, F, extending into the secondary retort B, in combination with a fluid-conducting pipe, I, the retort B, and the ordinary gas-retort and stand-pipe, the lid D covering the front ends of both retorts by luted gas-tight joints on each, substantially as described, for the purpose herein specified.



2. The process of periodically decarbonizing gas-retorts while the same and their connections with the gas-holder are all operated substantially gas-tight, whereby the fixed carbon therein is burned out, and the carbonic-oxide and hydrogen gases produced during such operation forced into the gas-holder for use, substantially in the manner and for the purpose herein described.

160,629. TUCK-FOLDING ATTACHMENTS FOR SEWING-MACHINES. George L. Du Laney, New York, N. Y. [Filed June 2, 1875.]

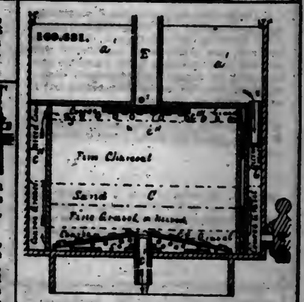
In combination with the gage A, having the aperture d and point e, the flexible graduating guide-piece B, provided with corrugations Z, all as shown, and for the purpose specified.

160,630. RAILROAD-TRACK SCALES. Thaddeus Fairbanks, St. Johnsbury, Vt. [Filed Sept. 1, 1875.]

1. The combination of a pair of first levers, D D, with a corresponding pair, D' D', mounted in a reverse position, and both arranged between the platform-sticks B, and extending longitudinally thereof, as and for purposes set forth.

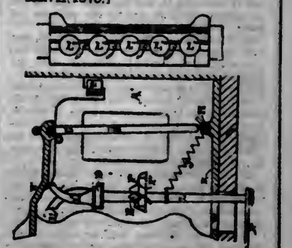
2. The V-shaped second lever H, in combination with the reversed pairs of longitudinal first levers D D', and with a third lever, J, which reverses the direction of the strain in communicating it to the last lever L, as and for the purposes herein specified.

160,631. WATER-FILTERS. R. S. Faroon, Philadelphia, Pa. [Filed Apr. 26, 1875.]



Brief.—A filter with conical slip-cover over the water-receptacle. The chamber is divided by a vertical partition into central and annular surrounding portions, the two communicating by a series of small holes. The bottom of the central chamber has a concavo-convex plate, with perforations punched so as to give upturned edges on the convex side to prevent sticking. The tube has a disk at the bottom, and serves the purpose to maintain a column of water, and to allow escape of air.

1. The combination, in a water-filter, substantially as described, of the water receptacle chamber a' and its tube B, with the channel C, having the series of small holes ?, the annular chamber c'', and central chamber C, packed with filtering materials, and communicating with each other through the series of small holes c''' at their upper ends, the perforated plate c', and the outlet-tube c', the said parts being arranged to operate in the manner and for the purposes hereinbefore set forth.



2. The combination, in a water-filter, substantially as described, of the tube E and perforated disk c'', with the opening in the bottom of the chamber a', and the space a' between said bottom and said disk c'', the layer of gravel between the said bottom of a' and the charcoal layer, upon which said gravel layer rests, the perforations c''', the annular chamber c'', packed with gravel, as described, the series of holes ? in the lower part of the channel C, and the outlet-cock D, the said parts being arranged to operate together substantially in the manner and for the purpose hereinbefore set forth and described.

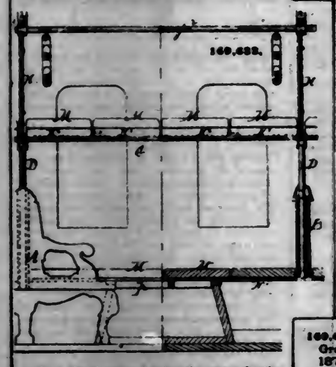
3. The arrangement of the upper surface of the layer of charcoal in chamber C, substantially in the same horizontal plane with the lower edges of the perforations c''', as indicated by the dotted line y in Fig. 1, for the purpose of causing the wash-water coming from the tube E to pass horizontally to and through the said perforations c''' to the annular chamber c'', substantially as and for the purpose hereinbefore described.

160,631.

160,632. TELL-LOCK ALARMS. Samuel G. Frink, Indianapolis, Ind., assignor to himself and E. O. Frink, same place. [Filed Mar. 11, 1875.]

1. The combination of the side frames A A', the bottom K, clamp T, swing C, tumbler-supporting bar F, and cap B, constructed, operated, and held together substantially as specified.

2. The combination of the lever-tumblers L with the tumbler-supporting bar F, cap B, swing C, springs J, and bar H, substantially as specified.



3. The tumbler-supporting bar F, constructed with openings L'', as described, and groove g, for receiving the tumblers L, in combination with the tumblers L, constructed with lateral lugs or bearings E, by which the tumblers may be turned around without removing them from the tumbler-supporting bar F, substantially as specified.

4. The combination of the projecting arm M of the swing C with the spring P and lug N on the side of the frame A, substantially as specified.

169,632. SLEEPING-CARS. J. P. Goodridge, New York, N. Y. (Filed Aug. 9, 1875.)

Brief.—Berths supported by vertical tubes arranged in sections, the lowest of which slides in vacant space between backs of seats.

169,632.

1. A sleeping-car, having the upper berths supported by tubes or rods sliding vertically in guides or bearings in the lower part of the car, independent of any support in the upper part, substantially as herein described.

2. The plates b^{2}, on the rails b^{1}, in combination with the lugs or projections d d^{1} on the tubes D, as shown and described, for the purpose specified.

3. The combination, with the bulk-heads B, of the tubes D and transverse braces E, substantially as shown and described.

4. The combination of the plates b^{2}, having the notches c^{1} and grooves c, with the tubes D, having the projections d d^{1}, substantially as and for the purpose specified.

5. The combination, with the upright tubes D, of the longitudinal tubes or rods G, constituting the side rails for supporting the upper berth, substantially as described.

6. The combination, with the side rails G, of the seat and back cushions E^{1} K^{2} for supporting the bedding of the upper berth, substantially as described.

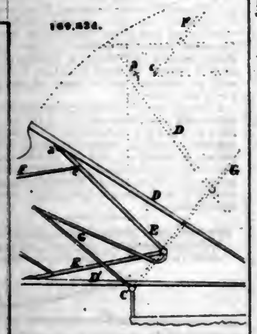
7. The partition I, provided with the hooks and eyes b c and the hooks or clasps L, constructed as described, in combination with the rod H and tube D, and the side wall of the car, substantially as and for the purpose set forth.

8. The combination, with the rod H, and tube D, and the partition I provided with the pocket b^{1}, of the hooks L, provided with the tongues b f, and the spring or elastic band l^{1}, substantially as and for the purpose described.

9. The combination of the bulk-heads B, the upright tubes D, transverse braces E, rods H, and partitions I, whereby a single berth "section" for night use or a "compartment" for day use may be formed without the side rails G, substantially as described.

10. The combination of the transverse brace E and the groove in the upper edge of the bulk-head B, whereby said brace is provided with a seat when not in use, and forms an ornamental molding, substantially as described.

11. The combination, with the seats A and the floor proper, of the false or additional floor S, whereby the seats are made of a convenient or comfortable height, and ample room is provided beneath them for storing bedding, &c., substantially as described.



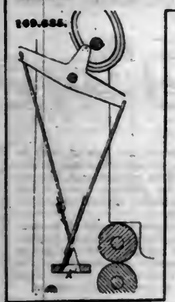
169,634. CARRIAGE-TOPS. John C. Goold, Albany, N. Y. (Filed Sept. 13, 1875.)

1. The combination, with the fall bows D and D^{1}, having no intermediate fall bows between, of the knuckle-jointed bar E, pivoted at its ends to the inner edges of the said bows from the eye-plates a a, substantially as described.

2. The combination, with the knuckle-joint bar E, pivoted between the bows D and D^{1} from their inner edges, of the short bows F F^{1}, pivoted to the said knuckle-joint bar, and substantially and carried by the same, substantially as described.

3. The combination, with the bows D and D^{1}, pivoted from their inner and opposite facing edges of said bows, and the short bows F F^{1}, pivoted to and carried by the said knuckle joint bar of the side lever U, when combined to operate as described.

169,634.



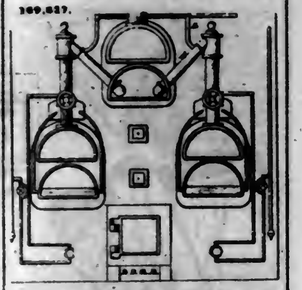
169,635. STAVE-JOINTING MACHINES. E. J. Granger, Brooklyn, N. Y. (Filed Aug. 10, 1875.)

Brief.—Staves are cut from a continuous sheet of veneer, of such width as to form the length of the staves, by means of two reciprocating knives acting alternately.

In a machine for cutting staves from a sheet of wood, the combination of an intermittent feeding device with two curved knives having reciprocating motions in oppositely-inclined planes, substantially as and for the purpose described.

169,635.

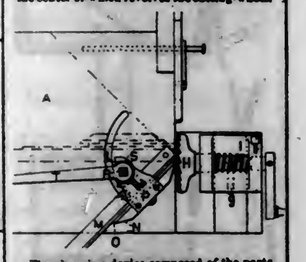
169,636.



169,636. BLOCKS FOR HOLDING CARTRIDGES. Richard T. Hare, Springfield, Mass. (Filed June 26, 1875.)

An independent or detached block for receiving and carrying cartridges, having a loop for maintaining the same in position adapted for the use herein described, constructed substantially as herein set forth.

169,637. PROCESSES OF MANUFACTURING ILLUMINATING AND HEATING GAS. George W. Harris, Elizabeth, N. J. (Filed Oct. 7, 1875.)



The process of manufacturing gas for heating and illuminating purposes, by decomposing steam in a highly heated retort by means of carbonaceous material, conducting the resultant gases into a retort at a high temperature, containing wood undergoing destructive distillation, and combining the water gas with the wood gas in a nascent state, and conducting the gases into a third retort, combining with the same on their way thereto vapor from liquid hydrocarbon, and finally converting the combined gases and vapors in said retort into a permanent gas, substantially as and for the purposes herein described.

169,637.

169,638. MACHINES FOR MITERING PRINTERS' LEADS AND RULES. H. W. Manley, New York, N. Y. (Filed Sept. 10, 1875.)

Brief.—An eccentric lever clamps the rule or lead between bars of metal, one end of which clamp is pivoted to the table, and its other end adjustable in the arc of a circle, at the center of which revolves the cutting-wheel.

169,639. CARTRIDGE-BELTS. G. C. Hensing, Washington, D. C. (Filed Sept. 4, 1875.)

The combination of a rotating cartridge-belt with a series of supporting-buttons secured at intervals around a vent or other suitable support, substantially as and for the purpose described.

169,640. PROCESSES FOR PRODUCING MULTICOLORED DESIGNS ON WIRE-CLOTH. G. B. Hoffman, Chicago, Ill. (Filed May 7, 1873.)

The process for producing multicolored designs on wire-cloth, consisting essentially of first coating the wire-cloth through a stencil-plate, by means of a roller, with white, which is allowed to dry, and then applying colors upon the whitened surface through successive stencil-plates, each plate being used before the previously-applied color is dry, that portion of the moist color exposed through each succeeding plate being exposed before the new color is used, substantially as and for the purpose herein before set forth.

169,641. BREECH-LOADING FIRE-ARMS. B. B. Hotchkiss, New York, N. Y. (Filed July 29, 1870.)

1. A fire-arm the trigger of which is made to form means for locking the system, substantially as herein specified.

2. The trigger C, formed with a lever, C^{1}, this lever having a notch, c^{1}, to prevent the gun from being accidentally fired.

3. On the lever C^{1}, the notch c^{1}, in combination with the projection c^{2}, entering the bolt, as and for the purposes described.

4. In combination with the trigger C and locking-lever C^{1}, the two springs S^{2} S^{3}, acting respectively on the parts, as and for the purposes herein specified.

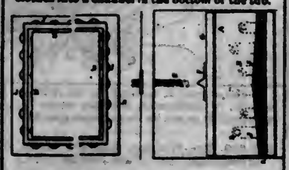
5. The notch c^{1} on the lever C^{1}, in combination with the projection c^{2}, arranged to control the holding and withdrawing of the system, as herein specified.

6. The forked extractor I i i^{1}, in combination with the hollow nose-piece H, and adapted to hold therein, as herein set forth.

7. The groove in the nose-piece, beveled at the rear end, in combination with the forked extractor I i i^{1}, to allow a rocking motion of the entire extractor, as and for the purposes herein set forth.

8. The nose-piece H, with a suitably-formed extractor, I, mounted thereon, adapted to operate upon the firing-pin as a wrench.

9. The nose-piece H and bar F, with the stud h^{1} in one part, and the groove f^{1} in the other part, in combination with each other, and with the extractor I, substantially as and for the purposes herein specified.



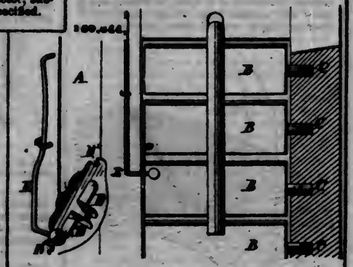
10. A spring-extractor mounted at the side of the place, and pressing laterally against the shell of the cartridge, in combination with a shoe or extension of the barrel, having a side opening or arranged so to eject the shell by swinging it horizontally, as herein specified.

11. The firing-pin G, directly united to the hammer E without a necessity for separate coupling means, in combination with the extractor I, serving as a stop to prevent its rotation, as herein specified.

12. The groove f in the pin G, engaging with the shorter arm f^{1} of the extractor, substantially as and for the purposes specified.

169,642. CLOTHES-WRINGERS. Mary Ann Johnson, Washington, D. C. (Filed Dec. 14, 1874.)

Brief.—A box has vertical channels cut in the sides. An inside lining of zinc has apertures that register with the vertical channels. A follower, operated by a vertical screw in a suitable frame, forces the water from the clothes into a channel in the bottom of the tub.

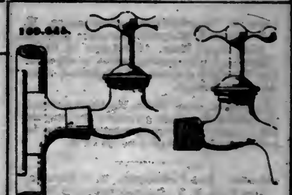


The square tub with double sides, the inside having apertures B B, and the outer sides having vertical channels J J, the lower surrounding gutter K, the discharge-opening C, the frame D, screw E, pressing-board G, constructed and combined substantially as described, and for the purposes set forth.

169,643. BLIND-SLAT ADJUSTERS. James L. A. Johnston and Charles B. Hopkins, Topeka, Kans., assignors of one-half their right to A. G. Hasbrook, same place. (Filed Oct. 30, 1875.)

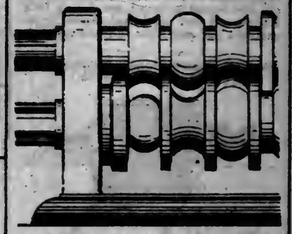
Brief.—A notched plate or disk, having two deep slots or seats, is secured by attaching-arms to one of the blind-slats, while a handled spring, fastened to the inside surface of the window-frame, plays upon and engages with the notches by an adjustable frictional bobbin, or, entering the seats, serves as a locking device. There are also suitable coil-springs inserted within the frame, against the ends of the blind-slat journals, which coact with the main device.

169,643.



The improved locking and adjusting device, consisting of the notched plate or disk D, having deep slots or seats D^{2} and attaching-arms D^{1}, in combination with the frame A, window-blind slats B, and springs C, together with the handled spring H, attached to the inside of the frame, all substantially as described and shown, for the purposes herein set forth.

169,644. ADJUSTING PLUMBERS' FAUCETS. John H. Lawless, Jersey City, N. J. (Filed Aug. 30, 1875.)



Brief.—To replace an old faucet, cuts through the neck of the faucet about an inch from the solder-joint, and then cuts a thread on the end of the neck, and cuts also a corresponding thread on the inside of a new faucet, and screws the one on the other.

169,644.

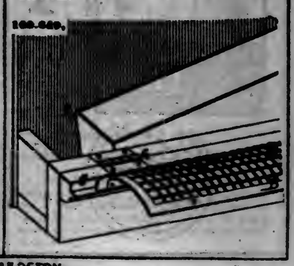
The improved mode of renewing, adjusting, and attaching plumbers' faucets to pipes, substantially as described, and for the purpose set forth.

169,645. ROLLS FOR ROLLING BLANKS FOR POLE-CAPS. William J. Lewis, Pittsburg, Pa. (Filed Sept. 11, 1875.)

A pair of metal rolls having a series of grooves for the gradual reduction of a billet from a rectangular to a crescent shape in cross-section, substantially as set forth.

169,647. NUT-LOCKS. Richard Long, Pittsburg, Pa. (Filed Aug. 4, 1875.)

Brief.—The end of the bolt has a cup-shaped projection, which is so beaten down by the punch or die as to form an annular rib, securing the nut.



1. The bolt A, having the smooth neck a formed on the end thereof, and the conical recess b, also in the end of the neck, substantially in the manner and for the purpose set forth.

2. The punch E, having the cup-shaped recess e e and the central stem or projection d, substantially in the manner and for the purpose set forth.

169,648. ALLOYS FOR BELL-METAL. Helen L. Mosher, Boston, Mass. (Filed Sept. 6, 1875.)

The herein-described improved alloy, consisting of copper, iron, zinc, and nickel in the proportions specified, as and for the purpose set forth.

169,649.

169,649.

169,649. PLAITING-MACHINES. Elijah L. Howard, Boston, Mass., assignor to himself and John R. S. Graves, same place. (Filed Feb. 23, 1876.)

In a machine for laying plaits, the combination of two endless aprons, geared to move in unison, and consisting each of jointed sections provided on their contiguous surfaces with undercut sloping blades, constructed and arranged for joint operation, as herein shown and described.

169,650.

The improved locking and adjusting device, consisting of the notched plate or disk D, having deep slots or seats D^{2} and attaching-arms D^{1}, in combination with the frame A, window-blind slats B, and springs C, together with the handled spring H, attached to the inside of the frame, all substantially as described and shown, for the purposes herein set forth.

169,650. ADJUSTING PLUMBERS' FAUCETS. John H. Lawless, Jersey City, N. J. (Filed Aug. 30, 1875.)

Brief.—To replace an old faucet, cuts through the neck of the faucet about an inch from the solder-joint, and then cuts a thread on the end of the neck, and cuts also a corresponding thread on the inside of a new faucet, and screws the one on the other.

169,650.
